

ADAULD User Exit 9

User exit 9 is called (when present) for each record selected before writing the record to the output dataset. The user exit is supplied with the record address, and returns an action code as follows:

1	Write record to DD/OUT1;
2	Write record to DD/OUT2;
3	Write record to DD/OUT1 and DD/OUT2;
I	Ignore this record.

The above datasets must have the same blocksize. See the *Adabas DBA Reference* documentation for more information about user exits.
