

Adabas Fastpath

Adabas Fastpath Version 8.2 Release Notes

Version 8.2.1

May 2011

This document applies to Adabas Fastpath Version 8.2.1.

Specifications contained herein are subject to change and these changes will be reported in subsequent release notes or new editions.

5 Installation Changes	13
Distribution of Online Services Application SYSAFP	14
Use of Unmodified ADALNK	14
6 Required Maintenance	15
7 Conversion	17

1 Adabas Fastpath Version 8.2 Release Notes

This document describes the changes and enhancements provided with Adabas Fastpath Version 8.2.

- **Prerequisites**
- **New Features**
- **Enhancements**
- **Installation Changes**
- **Required Maintenance**
- **Conversion**

2 Prerequisites

See Adabas Fastpath Install documentation, section Prerequisites.

3 New Features

- New buffer memory allocation 6
- Job Execution History 7
- Support for READ and HISTOGRAM From/Through Ranges 6
- Alternate Console 6
- Display Fastpath activities for all jobs in the system 8
- Display Fastpath activities for all sessions in the system 8
- Allow new memory management operations, including CICS crash recovery 8
- XML EXPORT for configuration objects 8
- Security protection for online administration 9

This section provides an overview of new features for Adabas Fastpath Version 8.2.

New buffer memory allocation

The Fastpath buffer can now be allocated as a dataspace to alleviate shortages of shared memory, a critical resource. This new feature now allows you to run with the z/OS setting of USERC-SKEY=NO as recommended by IBM. For backwards compatibility the default remains shared memory (ECSA). To use a dataspace set a dataspace name in the Fastpath Buffer Parameters. For more information on dataspaces please refer to the IBM documentation *SA22-7614-00, MVS Programming: Extended Addressability Guide, second edition October 2001*, which applies to z/OS.

Job Execution History

Fastpath Client Runtime Controls are now enhanced to allow end-of-job (job-step) statistics to be saved as history in the configuration file. The existing feature to show end-of-job statistics as messages within the System Coordinator console messages remains as a choice too, and also remains as the default (where used) for compatibility purposes. Statistics for up to the last sixteen executions can be kept on file (see the Job History section in Maintaining Client Runtime Controls for more detail).

Note: More data stored in the configuration file will affect the space used. You should increase the space for the file as necessary.

Support for READ and HISTOGRAM From/Through Ranges

Direct access optimization now also applies to L3 and L9 commands with a from/through range ("S" operator in the search buffer syntax).

Alternate Console

Console messages may be issued by Adabas Fastpath in client jobs, in databases and in System Coordinator daemons. Until now the console has been the only place where you can see them but now you can direct them to an alternate destination. You can accumulate messages as they have been in the past or you can now accumulate them in a file associated with individual client jobs or collect messages for all client jobs into a file in the Coordinator daemon.

- [Fastpath Client Message Alternates](#)
- [Fastpath Database Message Alternates](#)

- [Fastpath Buffer Manager Message Alternates](#)

Fastpath Client Message Alternates

The new Runtime messages client runtime control allows client messages to be routed to:

- The console.

This is compatible with previous releases.

- A local DDMSG file in the client job.

The JCL for the job must be altered to accommodate this option.

- A DDMSG defined by the System Coordinator daemon.

The daemon JCL must be altered.

Fastpath Database Message Alternates

The new daemon group setting Runtime messages – databases allows messages to be routed to:

- The console.

This is compatible with previous releases.

- A local DDMSG file in the database.

The JCL for the job must be altered to accommodate this option.

Fastpath Buffer Manager Message Alternates

The new daemon group setting Runtime messages – daemon allows messages to be routed to:

- The console.

This is compatible with previous releases.

- A local DDMSG file.

The JCL for the job must be altered to accommodate this option.

Display Fastpath activities for all jobs in the system

You can now display all Fastpath activities for every job in the system. All you have to do is configure the client runtime controls to make the activity details available to the Adabas System Coordinator group running in your system. Refer to the Adabas System Coordinator for more details on how to set this up and refer to the section Adabas System Coordinator online administration here in Fastpath for the information that is made available.

Display Fastpath activities for all sessions in the system

You can now display all Fastpath activities for every session in the system. All you have to do is configure the client runtime controls to make the activity details available to the Adabas System Coordinator group running in your system. Refer to the Adabas System Coordinator for more details on how to set this up and refer to the section Adabas System Coordinator online administration here in Fastpath for the information that is made available.

Allow new memory management operations, including CICS crash recovery

Fastpath is fully compliant with the new memory management options introduced with Adabas System Coordinator. These options reduce the amount of memory consumed and also allow advanced crash-recovery capabilities for compliant TP systems such as CICS. Refer to the Adabas System Coordinator for more information on the types of operations you can choose.

XML EXPORT for configuration objects

Configuration objects can now be exported in XML form. For more information please refer to the Adabas System Coordinator documentation.

Security protection for online administration

Adabas SAF Security sites who also use Fastpath can now secure the use of Fastpath online administration. For more information on how to implement this refer to the Adabas SAF Security documentation.

4 Enhancements

- 24*7 Counters used in Statistics 12
- Daemon Network Node Number Included in Messages 12
- Online Fix Description 12
- Efficiency Enhancements 12

This section provides an overview of the enhancements for Adabas Fastpath Version 8.2.

24*7 Counters used in Statistics

Statistics displays now show much larger numbers so that limits are raised from around 4 billion to around 10 trillion.

Daemon Network Node Number Included in Messages

Messages issued by the Fastpath Manager now include the node number (in the Adabas network) of the System Coordinator daemon under which it is running. This helps you understand origin of messages more clearly, especially if you run multiple nodes in a large system. The new message format appears as:

```
xxxxx AFP-nnnn-ss MESSAGE TEXT
```

where *xxxxx* is the node number; *nnnn* is the message number and *ss* is the severity.

Online Fix Description

The fix display in SYSAFP has been enhanced to include a short description of each fix that is applied which helps you to get a better understanding of each fix that is in use.

Efficiency Enhancements

Internal memory management has been improved at Adabas Fastpath 8.2 with remedial action added to counter the effects of defragmentation that can be seen in high volume situations in caches that are active for extended periods.

5 Installation Changes

- Distribution of Online Services Application SYSAFP 14
- Use of Unmodified ADALNK 14

This section provides an overview of the installation changes for Adabas Fastpath Version 8.2.

Distribution of Online Services Application SYSAFP

The Adabas Fastpath Online Services application, SYSAFP, for Adabas Fastpath Version 8.1 is distributed in two forms:

- a demo version distributed with Adabas Version 8.2 or above, and
- a fully operable version distributed with Adabas Fastpath Version 8.2

In previous versions of Adabas Fastpath, there was a requirement to first install the demo version prior to installing the fully operable version. This is no longer the case.

A fully operable SYSAFP application will be available immediately on installing the Natural INPL object supplied on the Adabas Fastpath version 8.2 release tape.

Note: If you install the demo version distributed on the Adabas release tape after installing the fully operable version, then you must reapply the fully operable version from the Adabas Fastpath release tape along with any subsequently applied Adabas Fastpath INPL updates.

Use of Unmodified ADALNK

As in previous releases, there is a requirement to use an unmodified ADALNK in certain areas. With Version 8.2 an unmodified ADALNK is needed to run standalone Adabas utility jobs only.

6 Required Maintenance

During the final certification stages of this release fixes are produced after the final freeze of the installation kit. Depending upon timing some or all of the available fixes may be supplied with the kit in an "all zaps" dataset. These fixes, and any others that also appear in SL24, should be applied during the installation process. The following fixes are currently known to be required:

None

7 Conversion

Adabas Fastpath Version 8.2 requires a new configuration file, empty. When you first enter the online administration center you will be guided through the process to make the configuration file ready for purpose. This will include conversion from an existing Version 8.1 configuration file if you wish. This is done in conjunction with a general conversion for System Coordinator, which you will also be guided through.
