1 Adabas Vista Version 8.2 Release Notes

This document describes the changes and enhancements provided with Adabas Vista Version 8.2.

- **Prerequisites**
- **New Features**
- **Enhancements**
- **Installation Changes**
- **Required Maintenance**
- **Conversion Requirements**
- **Considerations for z/OS**
- **Considerations for z/VSE**
- **Considerations for BS2000**

2 Prerequisites

See Adabas Vista Install documentation, section Prerequisites.

3

New Features

- Alternate Console 6
- Allow new memory management operations, including CICS crash recovery 7
- Common Tracing Facility 7
- Display Vista activities for all jobs in the system 7
- Display Vista activities for all sessions in the system 8
- Extreme files 8
- Security protection for online administration 8
- Test partition settings 8
- XML EXPORT for configuration objects 8

This section provides an overview of new features and terminology for Adabas Vista Version 8.2.

Alternate Console

Console messages may be issued by Adabas Vista in client jobs, in databases and in System Coordinator daemons. Until now the console has been the only place where you can see them but now you can direct them to an alternate destination. You can accumulate messages as they have been in the past or you can now accumulate them in a file associated with individual client jobs or collect messages for all client jobs into a file in the Coordinator daemon, etc.

- [Vista Client Message Alternates](#)
- [Vista Database Message Alternates](#)
- [Vista Daemon Component Message Alternates](#)

Vista Client Message Alternates

The new Runtime messages client runtime control allows client messages to be routed to:

- The console.

This is compatible with previous releases.

- A local DDMSG file in the client job.

The JCL for the job must be altered to accommodate this option.

- A DDMSG defined by the System Coordinator daemon.

The daemon JCL must be altered.

Vista Database Message Alternates

The new daemon group setting Runtime messages – databases allows messages to be routed to:

- The console.

This is compatible with previous releases.

- A local DDMSG file in the database.

The JCL for the job must be altered to accommodate this option.

Vista Daemon Component Message Alternates

The new daemon group setting Runtime messages – daemon allows messages to be routed to:

- The console.

This is compatible with previous releases.

- A local DDMSG file.

The JCL for the job must be altered to accommodate this option.

Allow new memory management operations, including CICS crash recovery

Vista is fully compliant with the new memory management options introduced with Adabas System Coordinator. These options reduce the amount of memory consumed and also allow advanced crash-recovery capabilities for compliant TP systems such as CICS. Refer to the Adabas System Coordinator for more information on the types of operations you can choose. XML EXPORT for configuration objects Configuration objects can now be exported in XML form. For more information please refer to the Adabas System Coordinator documentation.

Common Tracing Facility

The new common tracing functionality will ultimately replace AVICLOG. AVIVLOG remains supported, in parallel, for this release. AVICLOG will be removed at the next release and fully replaced by the new tracing facility.

Display Vista activities for all jobs in the system

You can now display all Vista activities for every job in the system. All you have to do is configure the client runtime controls to make the activity details available to an Adabas System Coordinator group running in your system. Refer to the Adabas System Coordinator for more details on how to set this up and refer to the section Adabas System Coordinator online administration here in Vista for the information that is made available

Display Vista activities for all sessions in the system

You can now display all Vista activities for every session in the system. All you have to do is configure the client runtime controls to make the activity details available to an Adabas System Coordinator group running in your system. Refer to the Adabas System Coordinator for more details on how to set this up and refer to the section Adabas System Coordinator online administration here in Vista for the information that is made available

Extreme files

The Adabas Vista partition feature now accommodates files with record volumes that go way beyond the existing Adabas limit of 4 gigabytes. Now you can have files with essentially an unlimited number of records with all the benefits of partitioning too; to allow parallel maintenance etc. For more information, see Adabas Vista extreme files in the Programming Guidelines for more information.

Security protection for online administration

Adabas SAF Security sites who also use Vista can now secure the use of Vista online administration. Refer to the section SAF Security Settings for more information on how to implement this.

Test partition settings

Online administration now allows a test function to verify the partition settings are valid so you can have much more confidence in the settings you make. See Maintain Partitions: Test partition settings for more information.

XML EXPORT for configuration objects

Configuration objects can now be exported in XML form. For more information please refer to the Adabas System Coordinator documentation.

4 Enhancements

- AVICLOG 10
- Online Fix Description 10

This section provides an overview of the enhancements provided with Adabas Vista Version 8.2.

AVICLOG

Both the CLOG API and the SYSAVI program AVICLOG now support additional keywords to clear the log area and display the data either newest-to-oldest or oldest-to-newest.

See Adabas Vista Application Programming Interface for more information.

Online Fix Description

The fix display in SYSAVI has been enhanced to include a short description of each fix that is applied which helps you to get a better understanding of each fix that is in use.

5 Installation Changes

- 12

This section provides an overview of the installation changes for Adabas Vista Version 8.2.

.....

.....

6 Required Maintenance

.....

7 Conversion

Adabas Vista Version 8 requires a new configuration file, empty. When you first enter the online administration center you will be guided through the process to make the configuration file ready for purpose. This will include conversion from an existing Version 7.4 configuration file if you wish. This is done in conjunction with a general conversion for System Coordinator, which you will also be guided through.

8 Considerations for z/OS

No additional considerations are required.

9 Considerations for z/VSE

No additional considerations are required.

10

Considerations for BS2000

No additional considerations are required.
