

Installation and Operations for z/VSE

Adabas Review is a set of tools for monitoring the performance of Adabas environments and the applications executing within them. Information retrieved about Adabas usage helps you tune application programs to achieve maximum performance with minimal resources.

This part of the Adabas Review documentation provides information for installing and maintaining Adabas Review

- in local mode in the Adabas address space; or
- in hub mode as a hub (server) in its own address space with only interface (client) modules in the Adabas address space.

The Adabas Review installation documentation for z/VSE is organized as follows:

• <i>Preparing for the Installation</i>	Provides the information needed to prepare for the installation of Adabas Review under z/VSE operating system environments under the teleprocessing monitors Complete or CICS.
• <i>Installation: Phase 1</i>	Provides instructions for installing the components of Adabas Review that are independent of any particular TP monitor (phase 1).
• <i>Installation: Phase 2</i>	Provides instructions for installing the components of Adabas Review that depend on a particular TP monitor (phase 2).
• <i>Starting Adabas Review</i>	Discusses the initialization procedures performed by Adabas Review during startup.
• <i>Operations</i>	Describes operation procedures for Adabas Review.
• <i>ADARUN Parameters for Adabas Review in z/VSE</i>	Discusses the Adabas ADARUN initialization parameters, most for use with the hub only, in z/VSE environments.
• <i>Operator Commands</i>	Describes operator commands for use with the hub only.
