MULTISELECT

The MULTISELECT control allows comfortable input of multiple selections of items from a defined number of items.

The following topics are covered below:

- Example
- Adapter Interface
- Properties

Example

The available items are rendered on the left and are brought to the right by choosing the corresponding button. There are buttons to bring all items from the left to the right, and back.

Adapter Interface

```
DEFINE DATA PARAMETER
1 TOWNS (1:*)
2 ID (U) DYNAMIC
2 SELECTED (L)
2 TEXT (U) DYNAMIC
END-DEFINE
```

Properties

Basic			
1 1	Name of the adapter parameter representing this control in the application.	Obligatory	

width	Width of the control.	Obligatory	100
	There are three possibilities to define the width:		120
	(A) You do not define a width at all. In this case the		140
	width of the control will either be a default width or - in case of container controls - it will follow the width that is occupied by its content.		160
			180
	(B) Pixel sizing: just input a number value (e.g. "100").		200
	(C) Percentage sizing: input a percantage value (e.g. "50%"). Pay attention: percentage sizing will only bring		50%
	up correct results if the parent element of the control properly defines a width this control can reference. If you specify this control to have a width of 50% then the parent element (e.g. an ITR-row) may itself define a width of "100%". If the parent element does not specify a width then the rendering result may not represent what you expect.		100%
height	Height of the control.	Obligatory	100
	There are three possibilities to define the height:		150
	(A) You do not define a height at all. As consequence		200
	the control will be rendered with its default height. If the control is a container control (containing) other controls		250
	then the height of the control will follow the height of its content.		300
	(B) Pixel sizing: just input a number value (e.g. "20").		250
	(C) Percentage sizing: input a percantage value (e.g.		400
	"50%"). Pay attention: percentage sizing will only bring up correct results if the parent element of the control		50%
	properly defines a height this control can reference. If you specify this control to have a height of 50% then the parent element (e.g. an ITR-row) may itself define a height of "100%". If the parent element does not specify a width then the rendering result may not represent what you expect.		100%
comment	Comment without any effect on rendering and behaviour. The comment is shown in the layout editor's tree view.	Optional	
Appearance			
displayonly	If set to true, the FIELD will not be accessible for input. It is just used as an output field.	Optional	true
	it is just used as an output neid.		false

withupdown	If set to true, corresponding up and down arrows appear	Optional	true
_	on the right hand side. These arrows allow for changing the order of the selected items.		false
align	Horizontal alignment of control in its column.	Optional	left
	Each control is "packaged" into a column. The column		center
	itself is part of a row (e.g. ITR or TR). Sometimes the size of the column is bigger than the size of the control itself. In this case the "align" property specifies the position of the control inside the column. In most cases you do not require the align control to be explicitly defined because the size of the column around the controls exactly is sized in the same way as the contained control.		right
	If you want to directly control the alignment of text: in most text based controls there is an explicit property "textalign" in which you align the control's contained text.		
valign	Vertical alignment of control in its column.	Optional	top
	Each control is "packaged" into a column. The column itself is part of a row (e.g. ITR or TR). Sometimtes the size of the column is bigger than the size of the control. In this case the "align" property specify the position of the control inside the column.		middle bottom
colspan	Column spanning of control.	Optional	1
	If you use TR table rows then you may sometimes want		2
	to control the number of columns your control occupies. By default it is "1" - but you may want to define the		3
	control to span over more than one columns.		4
	The property only makes sense in table rows that are snychronized within one container (i.e. TR, STR table		5
	rows). It does not make sense in ITR rows, because these rows are explicitly not synched.		50
			int-value

		1	1
rowspan	Row spanning of control.	Optional	1
	If you use TR table rows then you may sometimes want to control the number of rows your control occupies. By		2
	to control the number of rows your control occupies. By default it is "1" - but you may want to define the control two span over more than one columns.The property only makes sense in table rows that are snychronized within one container (i.e. TR, STR table rows). It does not make sense in ITR rows, because these rows are explicitly not synched.		3
			4
			5
			50
			int-value
msstyle	CSS style definition that is directly passed into this control.	Optional	
	With the style you can individually influence the rendering of the control. You can specify any style sheet expressions. Examples are:		
	border: 1px solid #FF0000		
	background-color: #808080		
	You can combine expressions by appending and separating them with a semicolon.		
	Sometimes it is useful to have a look into the generated HTML code in order to know where direct style definitions are applied. Press right mouse-button in your browser and select the "View source" or "View frame's source" function.		
Binding			
valueprop	(already explained above)		

	1		
flush	Flushing behaviour of the input control.	Optional	screen
	By default an input into the control is registered within the browser client - and communicated to the server adapter object when a user e.g. presses a button. By using the FLUSH property you can change this behaviour.		server
	Setting FLUSH to "server" means that directly after changing the input a synchronization with the server adapter is triggered. As consequence you directly can react inside your adapter logic onto the change of the corresponding value Please be aware of that during the synchronization always all changed properties - also the ones that were changed before - are transferred to the adapter object, not only the one that triggered the synchronization.		
	Setting FLUSH to "screen" means that the changed value is populated inside the page. You use this option if you have redundant usage of the same property inside one page and if you want to pass one changed value to all its representation directly after changing the value.		
flushmethod	When the data synchronization of the control is set to FLUSH="server" then you can specify an explicit event to be sent when the user updates the content of the control. By doing so you can distinguish on the server side from which control the flush of data was triggered.	Optional	
Online Help			
helpid	Help id that is passed to the online help management in case the user presses F1 on the control.	Optional
