

%K and %KP - Simulate PF- and PA-Key

$\%K \left\{ \begin{array}{l} nn \\ Pn \end{array} \right\}$
--

These terminal commands can be used to simulate the terminal function (PF, ENTER) and program attention (PA) keys. Before a key can be simulated, it must have been made sensitive using the SET KEY statement.

Command	Function
%Knn	<p>Simulates the terminal function key numbered <i>nn</i> (PF1 to PF48). This permits PF-keys 13-24 to be assigned to PF-keys 1-12, or the activation of PF-keys not available on the keyboard used.</p> <p>This terminal command also makes function keys available in batch mode.</p>
%K0	Simulates the ENTER key.
%KPn	Simulates the program attention key numbered <i>n</i> (PA1 to PA3) (see %Knn).
