SEPARATE

```
SEPARATE   ⎰ operand1                                              ⎱
           ⎱ SUBSTRING (operand1,operand2,operand3)                ⎰

           [LEFT [JUSTIFIED]] INTO operand4...

           ⎡ IGNORE                  ⎤
           ⎢                         ⎥
           ⎣ REMAINDER operand5      ⎦

           ⎡ WITH [RETAINED]   ⎰ [ANY] DELIMITERS        ⎱ ⎤
           ⎢                   ⎱ INPUT DELIMITERS        ⎰ ⎥
           ⎣                     DELIMITERS   operand6     ⎦

           [[GIVING] NUMBER  [IN] operand7]
```
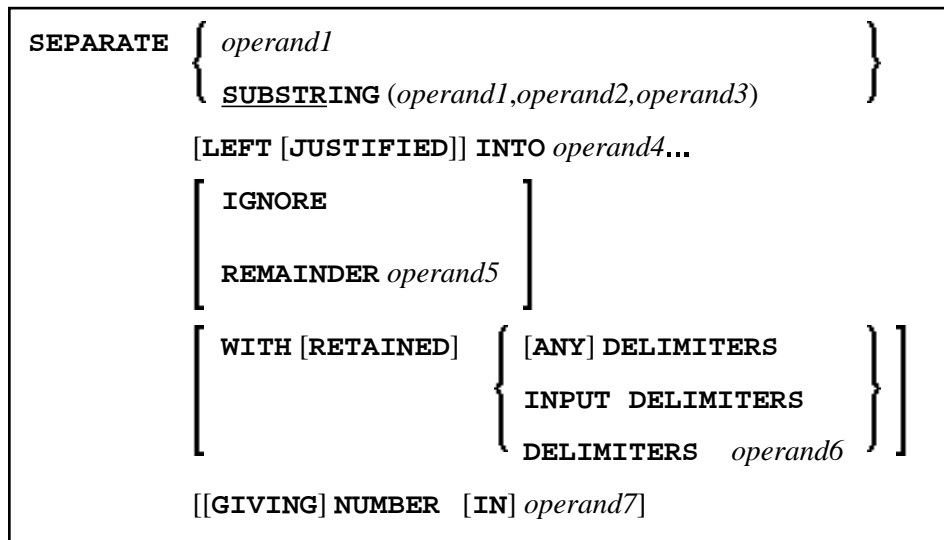

This chapter covers the following topics:

- Function

- Syntax Description

- Examples

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: COMPRESS | COMPUTE | EXAMINE | MOVE | MOVE ALL | RESET

Belongs to Function Group: *Arithmetic and Data Movement Operations*

Function

The SEPARATE statement is used to separate the content of an alphanumeric or binary operand into two or more alphanumeric or binary operands (or into multiple occurrences of an alphanumeric or binary array).

Syntax Description

Operand Definition Table:

Operand	Possible Structure				Possible Formats											Referencing Permitted	Dynamic Definition
operand1	C	S			A	U				B						yes	no
operand2	C	S					N	P	I	B*						yes	no
operand3	C	S					N	P	I	B*						yes	no
operand4		S	A	G	A	U				B						yes	yes
operand5		S			A	U				B						yes	yes
operand6	C	S			A	U				B						yes	no
operand7		S					N	P	I							yes	yes

* Format B of *operand2* and *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

operand1	**Source Operand:**
	operand1 is the alphanumeric/binary constant or variable whose content is to be separated.
	Trailing blanks in *operand1* are removed before the value is processed (even if the blank is used as a delimiter character; see also the DELIMITERS option).
SUBSTRING	Normally, the whole content of a field is separated, starting from the beginning of the field.
	The SUBSTRING option allows you to separate only a certain part of the field. After the field name (*operand1*) in the SUBSTRING clause you specify first the starting position (*operand2*) and then the length (*operand3*) of the field portion to be separated. For example, if a field #A contained CONTRAPTION, SUBSTRING(#A,5,3) would contain RAP.
	Note: If you omit *operand2*, the starting position is assumed to be 1. If you omit *operand3*, the length is assumed to be from the starting position to the end of the field.
LEFT JUSTIFIED	This option causes leading blanks which may occur between the delimiter character and the next non-blank character to be removed from the target operand.

operand4	**Target Operand:**
	operand4 represents the target operands. If an array is specified as target operand, it is filled occurrence by occurrence with the separated values.
	The number of target operands corresponds to the number of delimiter characters (including trailing delimiter characters) in *operand1*, plus 1.
	If *operand4* is a dynamic variable, its length may be modified by the SEPARATE operation. The current length of a dynamic variable can be ascertained by using the system variable `*LENGTH`.
	For general information on dynamic variables, see the section *Using Dynamic and Large Variables*.
IGNORE / **REMAINDER** *operand5*	If you do not specify enough target fields for the source value to be separated into, you will receive an appropriate error message.
	To avoid this, you have two options:
	- If you specify IGNORE, Natural will ignore it if there are not enough target operands to receive the source value. - If you specify REMAINDER *operand5*, that section of the source value which could not be placed into target operands will be placed into *operand5*. You may then use the content of *operand5* for further processing, for example in a subsequent SEPARATE statement.
	See also *Example 3*.
DELIMITERS	See *Delimiters Option* below.
WITH RETAINED DELIMITERS	Normally, the delimiter characters themselves are not moved into the target operands.
	When you specify RETAINED, however, each delimiter (that is, either default delimiters and blanks, or the delimiter specified with *operand6*) will also be placed into a target operand.
	Example:
	The following SEPARATE statement would place 150 into #B, + into #C, and 30 into #D:
	```\n...\nMOVE '150+30' TO #A\nSEPARATE #A INTO #B #C #D WITH RETAINED DELIMITER '+'\n...\n```
	See also *Example 3*.

GIVING NUMBER *operand7*	The GIVING NUMBER option causes the number of filled target operands (including those filled with blanks) to be returned in *operand7*. The number actually obtained is the number of delimiters plus 1.
	If you use the IGNORE option, the maximum possible number returned in *operand7* will be the number of target operands (*operand4*).
	If you use the REMAINDER option, the maximum possible number returned in *operand7* will be the number of target operands (*operand4*) plus *operand5*.

Delimiters Option:

```
┌                  ┌                      ┐ ┐
│ WITH [RETAINED]  │ [ANY] DELIMITERS     │ │
│                  │ INPUT DELIMITERS     │ │
│                  │ DELIMITERS operand6  │ │
└                  └                      ┘ ┘
```

Delimiter characters within *operand1* indicate the positions at which the value is to be separated.

- If you omit the DELIMITERS option (or specify WITH ANY DELIMITERS), a blank and any character which is neither a letter nor a numeric character will be treated as delimiter character.

- WITH INPUT DELIMITERS indicates that the blank and the default input delimiter character (as specified with the session parameter ID) is to be used as delimiter character.

- WITH DELIMITERS *operand6* indicates that each of the specified characters (*operand6*) is to be treated as delimiter character. If *operand6* contains trailing blanks, these will be ignored.

Examples

- Example 1 - Various Samples

- Example 2 - Using an Array

- Example 3 - Using REMAINDER/RETAINED Options

Example 1 - Various Samples

```
** Example 'SEPEX1': SEPARATE
************************************************************************
DEFINE DATA LOCAL
1 #TEXT1   (A6) INIT <'AAABBB'>
1 #TEXT2   (A7) INIT <'AAA BBB'>
1 #TEXT3   (A7) INIT <'AAA-BBB'>
1 #TEXT4   (A7) INIT <'A.B/C,D'>
1 #FIELD1A (A6)
1 #FIELD1B (A6)
1 #FIELD2A (A3)
1 #FIELD2B (A3)
1 #FIELD3A (A3)
```

Example 1 - Various Samples   **SEPARATE**

```
1 #FIELD3B (A3)
1 #FIELD4A (A3)
1 #FIELD4B (A3)
1 #FIELD4C (A3)
1 #FIELD4D (A3)
1 #NBT    (N1)
1 #DEL    (A5)
END-DEFINE
*
WRITE NOTITLE 'EXAMPLE A (SOURCE HAS NO BLANKS)'
SEPARATE #TEXT1 INTO #FIELD1A #FIELD1B GIVING NUMBER #NBT
WRITE     / '=' #TEXT1 5X '=' #FIELD1A 4X '=' #FIELD1B 4X '=' #NBT
*
WRITE NOTITLE /// 'EXAMPLE B (SOURCE HAS EMBEDDED BLANK)'
SEPARATE #TEXT2 INTO #FIELD2A #FIELD2B GIVING NUMBER #NBT
WRITE     / '=' #TEXT2 4X '=' #FIELD2A 7X '=' #FIELD2B 7X '=' #NBT
*
WRITE NOTITLE /// 'EXAMPLE C (USING DELIMITER ''-'')'
SEPARATE #TEXT3 INTO #FIELD3A #FIELD3B WITH DELIMITER '-'
WRITE     /    '=' #TEXT3 4X '=' #FIELD3A 7X '=' #FIELD3B
*
MOVE ',/' TO #DEL
WRITE NOTITLE /// 'EXAMPLE D USING DELIMITER' '=' #DEL
*
SEPARATE #TEXT4 INTO #FIELD4A #FIELD4B
         #FIELD4C #FIELD4D WITH DELIMITER #DEL
WRITE     /    '=' #TEXT4 4X '=' #FIELD4A 7X '=' #FIELD4B
          /            19X '=' #FIELD4C 7X '=' #FIELD4D
*
END
```

Output of Program SEPEX1:

```
EXAMPLE A (SOURCE HAS NO BLANKS)

#TEXT1: AAABBB     #FIELD1A: AAABBB     #FIELD1B:            #NBT:  1

EXAMPLE B (SOURCE HAS EMBEDDED BLANK)

#TEXT2: AAA BBB    #FIELD2A: AAA        #FIELD2B: BBB        #NBT:  2

EXAMPLE C (USING DELIMITER '-')

#TEXT3: AAA-BBB    #FIELD3A: AAA        #FIELD3B: BBB

EXAMPLE D USING DELIMITER #DEL: ,/

#TEXT4: A.B/C,D    #FIELD4A: A.B        #FIELD4B: C
                   #FIELD4C: D          #FIELD4D:
```

Example 2 - Using an Array

```
** Example 'SEPEX2': SEPARATE (using array variable)
************************************************************************
DEFINE DATA LOCAL
1 #INPUT-LINE (A60) INIT <'VALUE1,   VALUE2,VALUE3'>
1 #FIELD     (A20/1:5)
