

%K and %KP - Simulate PF- and PA-Key

These terminal commands can be used to simulate the terminal function (PF, ENTER) and program attention (PA) keys.

Command	Function
%K <i>nn</i>	Simulates the terminal function key numbered <i>nn</i> (PF1 to PF99). This permits PF-keys 13-24 to be assigned to PF-keys 1-12, or the activation of PF-keys not available on the keyboard used. This terminal command also makes function keys available in batch mode.
%K0	Simulates the ENTER key.
%KP <i>n</i>	Simulates the program attention key numbered <i>n</i> (PA1 to PA3) (see %K <i>nn</i>).
