XML Related System Variables

This chapter covers the following topics:

- *PARSE-COL (r)
- *PARSE-LEVEL (r)
- *PARSE-NAMESPACE-URI (r)
- *PARSE-ROW (r)
- *PARSE-TYPE (r)

These system variables, which are available when using the PARSE statement, are only valid in the current loop context.

*PARSE-COL (r)

Format/length: I4
Content modifiable: No

This system variable contains the column where the parser is currently working at.

(r) notation after *PARSE-COL is used to indicate the statement label or source-code line number of the PARSE statement. If (r) is not specified, *PARSE-COL represents the column where the parser in the currently active processing loop is working at.

*PARSE-LEVEL (r)

Format/length: I4
Content modifiable: No

This system variable contains the level of currently nested elements.

(r) notation after *PARSE-LEVEL is used to indicate the statement label or source-code line number of the PARSE statement. If (r) is not specified, *PARSE-LEVEL represents the level where the parser in the currently active processing loop is working at.

*PARSE-NAMESPACE-URI (r)

Format/length: A (dynamic)

Content modifiable: No

This system variable contains the namespace URI of the current element/attribute, if the element/attributes belong to a namespace. If the NAME (*operand3*) value of the PARSE statement is empty, then there is also no namespace and *LENGTH(*PARSE-NAMESPACE-URI) is set to 0.

(r) notation after *PARSE-NAMESPACE-URI is used to indicate the statement label or source-code line number of the PARSE statement. If (r) is not specified, *PARSE-NAMESPACE-URI represents the namespace URI of the current element/attribute in the currently active processing loop.

*PARSE-ROW(r)

Format/length: I4
Content modifiable: No

This system variable contains the row where the parser is currently working at.

(r) notation after *PARSE-ROW is used to indicate the statement label or source-code line number of the PARSE statement. If (r) is not specified, *PARSE-ROW represents the row where the parser in the currently active processing loop is working at.

*PARSE-TYPE (r)

Format/length: A1
Content modifiable: No

This Natural system variable is automatically created for each PARSE statement issued.

This system variable contains the type of the delivered data.

(r) notation after *PARSE-TYPE is used to indicate the statement label or source-code line number of the PARSE statement. If (r) is not specified, *PARSE-TYPE represents the type of the delivered data in the currently active processing loop.

Possible values for ASCII-based systems are:

| ? | Processing instruction (but not first XML ?). |
|----|---|
| ! | Comment. |
| C | CDATA section. |
| Т | Starting tag. |
| @ | Attribute (on mainframes: § or @, depending on session code page and terminal emulation). |
| / | Closing tag. |
| \$ | Parsed data. |
