

External Objects

This section describes the supplied programs, subprograms, and helproutines that help simplify and standardize the model creation process. These utilities can be invoked by the supplied models or by user-written models.

Note:

The source code for external objects is not supplied.

This section covers the following topics:

- Introduction
 - Natural-Related Subprograms (CNU*)
 - Natural-Related Helproutines (CNH*)
 - Natural Construct Generation Utility Subprograms (CSU*)
 - Predict-Related Subprograms (CPU*)
 - Predict-Related Helproutines (CPH*)
 - General Purpose Generation Subprograms (CU--*)
-

Introduction

All model subprograms use external parameter data areas (PDAs) stored in the SYSCST library. The source for the PDAs is provided and contains details about each parameter. For example, some of the listings for the CPAEL PDA are:

Parameter CPAEL	Library SAG	DBID 18 FNR 4
Command		> +
I T L Name		F Leng Index/Init/EM/Name/Comment
Top -----	-----	-----
1 CPAEL	A 32 /* File Name.	
2 INPUTS	A 32 /* Field name to be found in the	
3 FILE-NAME	L /* True if interested in	
3 FIELD-NAME	/* #FIELD-FOUND only	
3 #SIMPLE-OUTPUTS-ONLY	/* given file	
*		
*		
2 INPUT-OUTPUTS	P 8 /* If this code is known,	
3 FILE-CODE	/* NSC checks are avoided.	
*		
3 DDM-PREFIX	A 16 /* Field prefix on DDM,	
*	/* this will be set if correct	
*	/* FILE-CODE is not provided.	
2 SIMPLE-OUTPUTS	L /* True if field found on file	
3 #FIELD-FOUND	L /* The field is redefined.	
3 FIELD-IS-REDEFINED	----- S 70 L 1	

CPAEL contains a level 1 structure called CPAEL. Depending on the type of parameter, the remaining parameters are grouped into the following structures: INPUTS, INPUT-OUTPUTS, and OUTPUTS. This layout is the same for all PDAs used by the supplied subprograms.

Note:

Be careful when modifying fields in the INPUT-OUTPUTS structure; these fields may retain information across multiple calls.

You can define the PDAs as local data areas (LDAs) within the model subprograms that invoke the utilities. CPAEL is the PDA corresponding to the CPUEL subprogram utility, which returns information about a field in Predict.

The following example shows a model subprogram that requires field information from Predict:

```
DEFINE DATA PARAMETER
PARAMETER
.

.

LOCAL USING CPAEL
LOCAL USING CSASTD
.

.

END-DEFINE
.

.

ASSIGN CPAEL.FILE-NAME = #PDAX-FILE-NAME
ASSIGN CPAEL.FIELD-NAME = #PDAX-FIELD-NAME
CALLNAT 'CPUEL' CPAEL CSASTD
*
*Check outputs of CPUEL
.

.

END
```

This section provides a brief description of the supplied program, subprogram, and helproutine utilities. For examples of how to invoke the utilities, refer to the source code for the supplied model subprograms in the SYSCST library (prefixed by CU).

Note:

Driver programs for many of the supplied model programs and subprograms are included on the Natural Construct tape (prefixed by CTE). These driver programs are also available through the Drivers menu option on the Administration main menu. If a driver program is available, its location is listed in the *Drivers Menu Option* section for the program or subprogram. For information about invoking the driver programs, see Drivers Menu Function.

This section covers the following topics:

- Object Categories
- Error Processing

- Passing of Structure Names
- Restricted Data Areas
- Callback Functions
- Subprogram Chaining

Object Categories

The supplied objects are divided into three categories, based on the type of information they access. Each category is identified by its prefix as follows:

Prefix	Object Categories
CN*	Identifies objects that return or generate data based on information in the Natural system files.
CP*	Identifies objects that return or generate data based on information in Predict.
CS*	Identifies objects that are miscellaneous validation, calculation, or translation routines. Most of these routines do not access system file information, but some access Natural Construct system files.

Whenever possible, use the supplied programs, subprograms, and helproutines instead of accessing the system file information directly. This helps protect your programs from unwanted changes to the internal structure. Natural Construct maintains the upward compatibility of the supplied programs, subprograms, and helproutines.

Error Processing

Many of the supplied subprograms return information through the CSASTD parameter data area (PDA). The value in the RETURN-CODE field should be checked after each call. If it is not blank, it should be passed back to the generation nucleus so the user is aware of the problem.

The following example shows a model subprogram that invokes the CPUEL utility:

```

DEFINE DATA
PARAMETER USING CUMYPDA
PARAMETER USING CU--PDA
PARAMETER USING CSASTD
LOCAL USING CPAEL
.
.
.
END-DEFINE
.

.

CALLNAT 'CPUEL' CPAEL CSASTD
IF CSASTD.RETURN-CODE NE '' THEN
  ESCAPE ROUTINE IMMEDIATE
END-IF

```

Passing of Structure Names

To invoke the supplied subprograms, pass only the level 1 structures in the PDA. This way, if new parameters are added to the utilities in future versions of Natural Construct, you need only recatalog your model subprograms to incorporate the changes.

Restricted Data Areas

Some subprograms have restricted data areas to retain information across multiple calls. The restricted data areas are identified by an R in the third position of the data area name (CPRELNX, for example).

You do not need to be concerned with the contents of these data areas. Define them as local data areas within the invoking subprograms and pass them to the subprogram that is invoked.

Tip:

As with all PDAs, the name of the structure passed to the subprogram always matches the name of the data area itself.

Callback Functions

Many of the Natural Construct utility subprograms iterate through system data and, for each record found, call a user-supplied routine. For example, CPURLRD is used to retrieve all relationships related to a particular file. Rather than returning these relationships to the caller of CPURLRD, the caller must supply the name of a subprogram CPURLRD should call for each relationship found.

These routines accept an A1 array to allow the caller of the utility to communicate information to and from the subprogram called by the utility. This data area is represented by CSAPASS. It is accepted by the utility as a 1:v array so that the actual size of the data area can be determined by the requirements of the caller.

Subprogram Chaining

When a subprogram performs read logical processing and returns a series of records, it is sometimes difficult or inefficient for the subprogram to “remember” where it left off in a previous call. Also, this type of processing can be awkward to code in the invoking object because it must define looping logic and issue iterative CALLNATs until a certain end condition is reached.

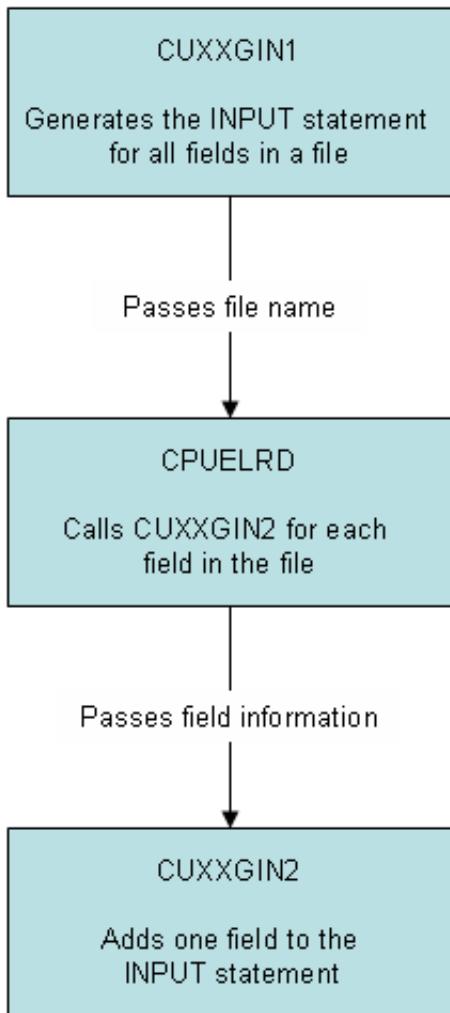

To avoid these problems, some subprograms do not return the information to the calling object. Instead, the calling object passes the name of a subprogram that is invoked for each record encountered. To generate an INPUT statement containing all fields in a file, for example, you can use the CPUELNX and CPUELRD subprograms. This section describes these subprograms.

Without Subprogram Chaining (CPUELNX)

The CPUELNX subprogram can be called iteratively to continually return the next field in the file until an end-of-file condition is reached. The model subprogram that generates the INPUT statement must define the looping logic and make iterative CALLNATs to include each field in the INPUT statement.

With Subprogram Chaining (CPUELRD)

The CPUELRD subprogram can be invoked once by the model subprogram (CUXXGIN1, for example). This subprogram receives the name of a file and a subprogram to CALLNAT (CUXXGIN2, for example). It traverses the file and CALLNATs the subprogram for each field. That subprogram adds the current field to the INPUT statement generated. For example:

To allow CPUELRD to remember information across iterative calls, a 1K area is passed to CUXXGIN2. This area can be redefined into individual fields, such as current status information, that are required by CUXXGIN2 across multiple calls. It can also pass additional information between CUXXGIN1 and CUXXGIN2.

Note:

For an example of how subprogram chaining is used, refer to the CUFMGIN1 and CUFMGIN2 programs in the SYSCST library.

Natural-Related Subprograms (CNU*)

The subprograms described in this section retrieve information from the Natural system files to assist in the generation process. For subprograms that return information about Natural objects (programs, data areas, etc.), the specified data area object must exist in the current library or one of its steplibs.

Tip:

Driver programs for many of the supplied model programs and subprograms are included on the Natural Construct tape (prefixed by CTE). These driver programs are also available through the Drivers menu option on the Administration main menu. If a driver program is available, its location is listed in the *Drivers Menu Option* section for the program or subprogram. For information about invoking the driver programs, see Drivers Menu Function.

This section describes the following subprograms:

- CNUEL Subprogram
- CNUELNX Subprogram
- CNUERMSG Subprogram
- CNUEXIST Subprogram
- CNUGDABL Subprogram
- CNUGDAEL Subprogram
- CNUGENDA Subprogram
- CNUMPPRF Subprogram
- CNUMSG Subprogram
- CNUPEXST Subprogram
- CNUSEL Subprogram
- CNUSRCNX Subprogram
- CNUSRCRD Subprogram

CNUEL Subprogram

CNUEL	Description
What it does	Retrieves information about a field in a local data area (LDA) or parameter data area (PDA). This subprogram receives the name of a field and data area (CNAEL.INPUTS) and returns information about the field (CNAEL.OUTPUTS), such as the structure to which the field belongs, the field format and type, the level number, and the starting and ending index for arrays.

CNUELNX On Unix Platforms

On Unix platforms, it is necessary to explicitly close any open cursors. CNUELNX does this automatically whenever a data area is read in its entirety. However, if you want the calling program to only read a portion of the data area, you must insert additional code to close the open cursor. For example:

```
/* close the object
IF CNRELNX.NATA1500-END-OF-FILE
  IGNORE
ELSE
  CNAELNX.#CLOSE-OBJECT := TRUE
  CALLNAT 'CNUELNX' CNAELNX CNRELNX CSASTD
END-IF
```

CNUMSG Subprogram

CNUMSG	Description
What it does	<p>Returns application message text from the SYSERR message file. This subprogram receives the following input:</p> <ul style="list-style-type: none"> ● message number ● message library (CSTMSG by default) ● message text ● substitution data members ● message libraries for data members (CSTLDA by default) ● retrieval method ● default languages (used if message number is not located using *Language) <p>It processes message text based on one of the following retrieval methods:</p> <ul style="list-style-type: none"> ● R <p>Performs text retrieval based on message numbers. A message number can be entered in either the Message Number or Message Text (Input) field. If a message number is entered in the Message Number field, the corresponding text is retrieved from the message library (CSTMSG by default) and displayed at runtime. If the Message Number field is blank, the subprogram scans the Message Text (Input) field for a message number. If one is located, it is replaced with its corresponding text from the message library.</p> <p>For example, assume message number *2309 corresponds to the message text “:1::2::3:does not exist”. If this message number is located in either the Message Number or Message Text (Input) fields, the subsystem will retrieve the message text “:1::2::3:does not exist”.</p> <ul style="list-style-type: none"> ● S <p>Performs text substitutions in the Message Text (Input) field. A substitution will occur if placeholders are found in the message text. Placeholders are replaced at runtime with a value entered in one of the Message Substitution Data fields (1, 2, and 3). Placeholders are entered in the following format: “:N:”, where N identifies one of the three Message Substitution Data fields.</p> <p>For example, if you enter the following message text: “:1::2::3:does not exist”, and the Message Substitution Data field 1 is “File”, and the Message Substitution Data field 2 is “NCST-CUSTOMER”, the message text “File NCST-CUSTOMER does not exist” is returned.</p> <ul style="list-style-type: none"> ● B <p>Performs text retrieval using methods R and S. This method also supports inline retrieval and substitution; that is, typing the message number and substitution values directly in the Message Text (Input) field.</p> <p>For example, if you enter the following entry in the Message Text (Input) field: “*2309,*2075.1.NCST-CUSTOMER”, the subprogram assigns 2309 as the message number and retrieves the message “:1::2::3:does not exist”. The first substitution value is retrieved from message 2075.1, which is “File”. The second substitution value is the text “NCST-CUSTOMER”. At runtime, “File NCST-CUSTOMER does not exist” is displayed.</p> <p>If you are using message numbers, you can specify up to eight default languages. If the message text for the message number is not found using the currently selected language (*Language), the subprogram will search for the message in each of the specified default languages.</p> <p>The search begins with the *Language code specified in the first Default Language field through to the last Default Language field in which a code is specified. If the message is still not located, the subprogram will search the message text for the default system *Language code of 1 (English).</p> <p>Note: You can center text entered in the Message Text (Input) field using the “,+/NN” notation, where NN is the number of characters to be centered. For more information about message numbers and placeholders, see Use SYSERR References.</p>

CNUSRCRD Subprogram

CNUSRCRD	Description
What it does	<p>Reads source text and performs specified processing. This subprogram receives the name of a Natural object (in the CNASRCRD.#OBJECT-NAME field) and the name of the subprogram invoked to process each source line (in the CNASRCRD.#CALLNAT field). It passes the fields it receives to the subprogram it invokes.</p> <p>CU--PDA, which contains the model parameters, is also passed to CNUSRCRD, as well as CSAPASS (redefined as required). It “remembers” information between calls to the subprogram that processes each source line.</p>

Natural-Related Helpoutines (CNH*)

You can attach the helpoutines in this section to fields that require the input of Natural information (such as object names, message numbers, etc.). They are active helpoutines that populate the field to which they are attached.

CNHMDL Helpoutine

CNHMDL	Description
What it does	Browses all the Natural Construct models for selection. Valid restriction parameters are: <ul style="list-style-type: none"> ● S (display statement models only) ● M (display program models only) ● B (display all models)
Attached to	Input of a Natural Construct model name.
Parameters used	<ul style="list-style-type: none"> ● #PDA-RESTRICTION(A1) ● #PDA-KEY(A32) (model name)
Files accessed	● NCST-MODEL

CNHMSG Helpoutine

CNHMSG	Description
What it does	Browses for and displays the application error message text. You can add new messages to the application by pressing the Add PF-key (the new message number is always adjusted to the next available number).
Attached to	Input of a message number field.
Parameters used	<ul style="list-style-type: none">● #PDA-MESSAGE(A65)● #PDA-MESSAGE-LIBRARY(A8)● #PDA-KEY(N4)
Files accessed	<ul style="list-style-type: none">● SYSTEM-FUSER

CNHOBJ Helproutine

CNHOBJ	Description
What it does	<p>Browses all objects of a specified type in the current library. This helproutine receives an object type and browses all the objects with that type that exist in the current library. Valid object types are:</p> <ul style="list-style-type: none"> ● P (program) ● N (subprogram) ● S (subroutine) ● M (map) ● H (helproutine) ● C (copycode) ● A (parameter) ● G (global) ● L (local) ● T (text) ● * (all) ● 2 (subprogram/helproutine) ● 3 (subprogram/helproutine/subroutine) ● 4 (program/subprogram/helproutine/subroutine) ● 5 (command processor) ● D (data area)
Attached to	Input of a Natural object name field.
Parameters used	<ul style="list-style-type: none"> ● #PDA-TYPE(A1) ● #PDA-KEY(A8) /* Start/Return key
Files accessed	<ul style="list-style-type: none"> ● SYSTEM-FUSER

Natural Construct Generation Utility Subprograms (CSU*)

The subprograms in this section perform specialized functions to assist in the generation process.

Note:

Driver programs for many of the supplied programs/subprograms are available through the Drivers menu option on the Administration main menu. If a driver program is available, its location is listed in the *Drivers Menu Option* section in the program/subprogram description. For more information about the supplied driver programs, see Drivers Menu Function.

These subprograms are:

- CSU-VAR Subprogram
- CSUBANN Subprogram
- CSUBLDRP Subprogram
- CSUBMIT Subprogram (Mainframe)
- CSUBYTES Subprogram
- CSUCASE Subprogram
- CSUCCMD Subprogram

CSULENGT Subprogram

CSULENGT	Description
What it does	Builds an input prompt and calculates the length of the heading. This subprogram receives a field name, format, and length. It builds the input prompt from the field headings (if no heading was given, the field name is converted to mixed case) and calculates the length from the format, length, and edit mask. It also returns the heading length and sign option (based on the field format and edit mask).

CSUMORE Subprogram

CSUMORE	Description
What it does	<p>Builds the initial assignment for the LEFT-MORE/RIGHT-MORE array. This subprogram receives a function (L for the LEFT-MORE array, R for the RIGHT-MORE) and the number of panels used by a program. These arrays contain the prompts displayed at the top left or right corner of the panels. The prompts indicate the number of panels located to the left or right of the current panel.</p> <p>For example, to generate the initial value for the LEFT-MORE-PROMPT array for a program with two panels, enter:</p> <pre>CSAMORE .#LEFT-RIGHT = 'L' CSAMORE .#MAX-WINDOW = 2</pre> <p>The subprogram writes the following to the source buffer:</p> <pre>INIT < ' ', '<1 more' ></pre> <p>To generate the initial value for the RIGHT-MORE-PROMPT array for a program with two panels, enter:</p> <pre>CSAMORE .#LEFT-RIGHT = 'R'</pre> <p>The subprogram writes the following to the source buffer:</p> <pre>INIT < '1 more >', '' ></pre> <p>Note: If the value of *Language is not 1 during generation, the word “more” is not included in the initial values.</p> <p>Tip: Use a scalar field rather than an occurrence of this array. Before the map is displayed, assign the array occurrence to the scalar field. Using arrays on maps makes them difficult to maintain and less suitable to use as standard layouts.</p>

CSUREADS Subprogram

CSUREADS	Description
What it does	<p>Reads the specification parameters for a module. This subprogram receives the name of a source module. If the module was generated using Natural Construct, the subprogram reads the source code and returns the model parameter data area (PDA) containing the parameters used to generate the module.</p> <p>You can use the passed model PDA to call the model subprograms for the model used to generate the module.</p> <p>This subprogram also returns a data area describing the model and listing the names of the model subprograms.</p> <p>Note: This subprogram requires a NATPARM SSIZE of 55 or greater.</p>
Parameters/PDAs used	<ul style="list-style-type: none"> ● #READ-THIS-MODULE(A8) ● CSAMODEL ● CU--PDA ● CSASTD
Files accessed	<ul style="list-style-type: none"> ● NCST-ADA ● SYSTEM-FUSER

Tip:

If you know the name of the model used to generate the specified module, you can pass its model PDA to CSUREADS rather than CU--PDA. After the call to CSUREADS, the model PDA is populated with the parameters used to generate that module.

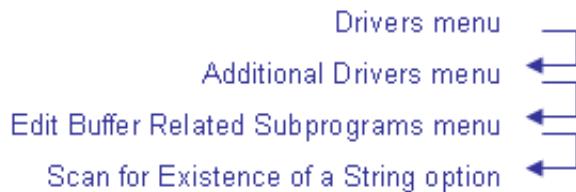

CSUREF Subprogram

CSUREF	Description
What it does	<p>Generates referential integrity checks against foreign files. This subprogram is typically called three times: once to generate the data structures (DATA) required by the generated code, once to generate the update edits (UPDATE), and once to generate the delete edits (DELETE). Set the value of CSAREF.FUNCTION-CODE to either DATA, UPDATE, or DELETE.</p> <p>After the first call, this subprogram returns the number of update and delete edits found. This avoids unnecessary subsequent calls.</p>

CSUTLATE Subprogram

CSUTLATE	Description
What it does	Translates message text at runtime. This subprogram receives a message number and position value and retrieves the appropriate text. If the message text contains multiple items delimited by a slash (/), the position value identifies which text is translated. This subprogram is invoked from the CSUCURS and CSUCURS1 subprograms.

CSUTRANS Subprogram

CSUTRANS	Description
What it does	<p>Translates screen prompts before they are displayed. This subprogram receives a defined data structure (typically a translation LDA) containing SYSERR message numbers and translates them into the appropriate text.</p> <p>CSUTRANS reads the supplied data structure, searching for one of two message number patterns: *NNNN or *NNNN.A, where *NNNN identifies the message number and .A identifies a position within the message number. If a message number of the type *NNNN is located, the entire SYSERR message is retrieved. If a message number of type *NNNN.A is located, the portion of the message corresponding to the .A notation is retrieved. A message number can have up to 15 positions: the values 1 to 9 represent the first nine positions, and the values A to F represent the 10th to 15th positions.</p> <p>To locate the text corresponding to a message number, specify the library in which the SYSERR message numbers and text reside. By default, CSUTRANS checks the SYSERR message CSTLDA library. In most cases, you will create your own SYSERR message library. When you do, enter the library name in the #MESSAGE-LIBRARY field.</p> <p>In addition to retrieving the appropriate language message text, CSUTRANS searches for any formatting characters and formats the text as appropriate.</p> <p>CSUTRANS requires a specific data structure. The following example shows the translation LDA for the Standard Parameters panel for the Batch model:</p> <pre>* * **SAG TRANSLATION LDA * * * used by CTETRANS. 1 CTE-MAL 2 TEXT /* Corresponds to syserr message 3 #GEN-PROGRAM A 20 INIT<'*2000.1..' 3 #SYSTEM A 20 INIT<'*2000.2..' 3 #GDA A 20 INIT<'*2000.3..' 3 #TITLE A 20 INIT<'*2001.1..16' 3 #DESCS A 20 INIT<'*2001.2..' 3 #GDA-BLOCK A 20 INIT<'*2001.3..' 3 #MAP-HEADER1 A 20 INIT<'*2049.1..18' 3 #MAP-HEADER2 A 20 INIT<'*2049.2..18' 3 #USE-MSG-NR A 20 INIT<'*2050.1..' 3 #PASSWORD-CHECK A 20 INIT<'*2050.2..20' 2 TEXT 3 TRANSLATION-TEXT 4 TEXT-ARRAY A 1 (1:200) 2 ADDITIONAL-PARMS 3 #MESSAGE-LIBRARY A 8 INIT<'CSTLDA' 3 #LDA-NAME A 8 INIT<'CTE-MAL' 3 #TEXT-REQUIRED L INIT<TRUE> 3 #LENGTH-OVERRIDE I 4 /* Length to translate</pre>
	<p>Other details about the structural elements include:</p> <ul style="list-style-type: none"> The first comment line (**SAG TRANSLATION LDA) indicates that this is a translation LDA. During a static install, Natural Construct scans for this comment line and replaces the SYSERR numbers with the appropriate text. The CTE-MAL level 1 structure name is typically the LDA name; use this qualifier whenever the variables are accessed. The level 3 variables (#GEN-PROGRAM, #SYSTEM, #GDA, etc.) are screen prompts that are initialized with a valid SYSERR number. All SYSERR numbers use the *NNNN.A notation and are listed in sequential order. <p>Note: This sequence does not apply to positions after the period within the *NNNN.A notation. For example, you can list *2000.2 before *2001.1.</p> <ul style="list-style-type: none"> The TEXT-ARRAY value must match the total number of bytes in all prompt variables to be translated. The #MESSAGE-LIBRARY value indicates the SYSERR library in which the text is stored. The #TEXT-REQUIRED logical indicates whether translation is required. If it is, this field ensures that translation is performed only once. <p>Notes:</p> <ol style="list-style-type: none"> For more information about SYSERR message numbers, see Use SYSERR References. For more information about formatting the message text, see Format SYSERR Message Text.

CSU2LONG Subprogram

CSU2LONG	Description
What it does	<p>Converts a long variable name to an abbreviation. This subprogram receives a long character string (32 characters) and a desired length, and returns the truncated string (abbreviation). The sixth position of the string is the first position truncated. If no length is given, the default is 30.</p> <p>If the long string is not longer than the desired length, the string is still truncated. For example, if the long string is “THIS-IS-A-LONG-VARIABLE” and the desired length is 20, the short string is “THIS-A-LONG-VARIABLE”.</p> <p>Tip: Use this subprogram when you add characters to a file or field name that is already 32 characters long.</p>

Predict-Related Subprograms (CPU*)

The subprograms described in this section retrieve information from the Predict data dictionary. While some of these subprograms generate code, most supply information to the calling subprogram and the calling subprogram generates the code.

Notes:

1. If you use Software AG's Entire Net-work, the Predict data can reside on a platform other than the platform on which Natural Construct is running.
2. Driver programs for many of the supplied programs/subprograms are available through the Drivers menu option on the Administration main menu. If a driver program is available, its location is listed in the *Drivers Menu Option* section in the program/subprogram's description. For more information about the supplied driver programs, see Drivers Menu Function.

This section covers the following topics:

- With Natural Security Installed
- CPU-OBJ Subprogram
- CPU-OBJ2 Subprogram
- CPU-OREL Subprogram
- CPU-VIEW Subprogram
- CPUEL Subprogram
- CPUELDE Subprogram
- CPUELKY Subprogram
- CPU-FREL Subprogram
- CPUELNX Subprogram
- CPUELRD Subprogram
- CPUELVE Subprogram

- CPUEXIST Subprogram
- CPUFI Subprogram
- CPUHOLD Subprogram
- CPUTKY Subprogram
- CPUREDEF Subprogram
- CPURL Subprogram
- CPURLRD Subprogram
- CPUSUPER Subprogram
- CPUUNIQ Subprogram
- CPUVE Subprogram
- CPUVERUL Subprogram
- CPUXPAND Subprogram

With Natural Security Installed

If Natural Security is installed, the Predict-related subprograms restrict access to file and field information. Users can only retrieve information for files linked to the current application.

While generating a program, the program may access information about the same file many times. To avoid security checks each time, the access subprograms use the FILE-CODE field. This INPUT/OUTPUT field accesses file information and acts as a cipher code to avoid multiple security checks on the same file; it is available for all supplied subprograms.

If you are developing under Natural Security, include the FILE-CODE field in the model PDA for each file used multiple times during generation. The FILE-CODE field is passed in the PDA of the access subprogram and reassigned back to the model PDA after each call.

To avoid security checks for each access, the model subprogram that invokes CPUEL contains the following statements:

```
ASSIGN CPAEL.FILE-CODE = #PDA-FILE-CODE  
CALLNAT 'CPUEL' CPAEL CSASTD  
ASSIGN #PDA-FILE-CODE = CPAEL.FILE-CODE
```

Note:

For an example of using these subprograms to restrict access to file and field information, refer to the CUSCGPR program in the SYSCST library.

CPU-OBJ Subprogram

CPU-OBJ	Description
What it does	<p>Generates an external data area based on a Predict file view. This subprogram receives the view name and a set of logical variables that define the generation options. It generates an external data area structure to match the view. It can also generate the C# variables for each C* variable that corresponds to an MU or PE and/or includes the corresponding REDEFINE fields for redefined fields or superdescriptors.</p> <p>Note: For information about INPUT/OUTPUT parameters, refer to the CPA-OBJ data area in the SYSCST library.</p>

CPU-OBJ2 Subprogram

CPU-OBJ2	Description
What it does	<p>Issues CALLNAT to the #CALLNAT subprogram and passes information about elements that make up an object. This subprogram receives:</p> <ul style="list-style-type: none"> ● a view name ● a key name ● a set of options ● the name of a passed subprogram to CALLNAT <p>An object is derived from view and key names. The view and key names are based on intra-object relationships defined in Predict (for example, ORDER-HEADER-HAS-ORDER-LINES).</p> <p>The elements of an object are the individual fields in the files that make up the object. This subprogram traverses the object tree and checks each element. For each element, it CALLNATs the #CALLNAT subprogram and passes it information about the element (for example, the format, length, and type).</p> <p>You can set options to limit or extend the number of elements to check (for example, whether to include all field redefinitions or just the lowest levels).</p> <p>Note: This subprogram replaces the CPU-OBJ subprogram; for all new development, use CPU-OBJ2.</p>
Parameters/PDAs used	<ul style="list-style-type: none"> ● CPA-OBJ2 ● CPA-ODAT ● CU--PDA ● #PASS(A1/1:V) ● CSASTD

CPU-VIEW Subprogram

CPU-VIEW	Description
What it does	<p>Generates field definitions based on the contents of a Predict view. This subprogram receives the name of a Predict view and a set of logical parameters defining the options to be generated. It generates the view definition as it should appear in the DEFINE DATA . . . END-DEFINE block of a Natural program, subprogram, or helproutine.</p> <p>This subprogram can also generate the C# variables for each C* variable that corresponds to an MU (multiple-valued) or PE (periodic group), and/or includes the corresponding REDEFINE fields for redefined fields or superdescriptors.</p> <p>You can use this subprogram to define a structure based on a view in Predict. The format and length for each field is generated.</p> <p>Notes:</p> <ol style="list-style-type: none"> 1. This subprogram differs from CPU-OBJ in that it generates internal rather than external data structures. 2. For information about INPUT/OUTPUT parameters, refer to the CPA-VIEW data area in the SYSCST library.

CPURLRD Subprogram

CPURLRD	Description
What it does	<p>Retrieves the Predict relationships for a specified file, and optionally a specified type. This subprogram receives:</p> <ul style="list-style-type: none"> ● the name of a file ● a relationship type (optional) ● the name of a subprogram (in CPARLRD.INPUTS) <p>It finds relationships for the specified file, issues a CALLNAT to the specified subprogram, and passes the information about the relationship to the subprogram for processing.</p>
PDAs used	<ul style="list-style-type: none"> ● CPARLRD ● CU--SYSLIBSPDA (model PDA) ● CSAPASS (can be redefined as required and used to store additional information that must be preserved between CALLNATs) ● CSASTD
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-FI ● SYSDIC-KL

CPUSUPER Subprogram

CPUSUPER	Description
What it does	Returns the definition for a super/subdescriptor (or DB2 compound key). This subprogram receives the name of a superdescriptor or subdescriptor (or DB2 compound key) and the name of the Predict file or table to which it belongs. It returns information about the derived fields.
PDAs used	<ul style="list-style-type: none"> ● CPASUPER ● CSASTD

Predict-Related Helpoutines (CPH*)

You can attach the following helpoutines to fields that require the input of Predict information. They are active helpoutines that fill the field to which they are attached.

Note:

Some of the following routines provide help information, although they are coded as subprograms and not as helpoutines. This provides greater flexibility to access help information.

This section covers the following topics:

- CPHEL Subprogram
- CPHELB Subprogram
- CPHFI Helproutine
- CPHFIB Subprogram
- CPHPRED Helproutine
- CPHRL Helproutine
- CPHSET Helproutine

CPHEL Subprogram

CPHEL	Description
What it does	Browses the fields in a file for selection. This subprogram receives the name of a Predict file. (If no file name is specified, it provides file selection.) It browses all the fields in the specified file and returns the selected field.
Attached to	Input of a Predict field name.
PDAs used	<ul style="list-style-type: none"> ● CPAHEL ● CSASTD
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-FI

CPHELB Subprogram

CPHELB	Description
What it does	<p>Browses the fields in a file for selection. This subprogram receives the name of a file and browses all the fields in the file for selection. Optionally, this subprogram can browse only the descriptor fields.</p> <p>Note: For information about INPUT/OUTPUT parameters, refer to the CPHELBA data area in the SYSCST library.</p>
PDAs used	<ul style="list-style-type: none"> ● CPAHEL ● CSASTD
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-EL

CPHFI Helproutine

CPHFI	Description
What it does	Browses Predict views/files for selection. This helproutine browses all the views and files in Predict for selection.
Attached to	Input of a Predict file name.
Parameters used	<ul style="list-style-type: none"> ● #PDA-FILE(A32)
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-FI

CPHFIB Subprogram

CPHFIB	Description
What it does	Browses Predict views and files for selection.
Parameters/PDAs used	<ul style="list-style-type: none"> ● #PDA-KEY(A32) ● CSASTD
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-FI

CPHPRED Helproutine

CPHPRED	Description
What it does	<p>Browses Predict objects (by object type) for selection. This helproutine receives an object type and browses the Predict objects of that type for selection. Valid object types are:</p> <ul style="list-style-type: none"> ● S (system) ● P (program) ● K (keyword) ● M (module) ● R (report)
Attached to	Input of a Predict object type.
Parameters used	<ul style="list-style-type: none"> ● #PDA-TYPE(A1) ● #PDA-KEY(A32)
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-SY ● SYSDIC-PR ● SYSDIC-KY ● SYSDIC-RE ● SYSDIC-MO

CPHRL Helproutine

CPHRL	Description
What it does	Browses the names of Predict relationships for selection. This helproutine receives the names of a Predict relationship and a file and returns the selected relationship. If a file name is specified, the helproutine browses only the Predict relationships for that file. If no file name is specified, it browses all existing relationships.
Attached to	Input of a Predict relationship name.
Parameters used	<ul style="list-style-type: none"> ● #PDA-FILE(A32) ● #PDA-RELATIONSHIP-NAME(A32)
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-FI ● SYSDIC-RL

CPHSET Helproutine

CPHSET	Description
What it does	<p>Sets a flag to indicate that help was requested for a field. This helproutine receives the name of a parameter and sets a flag to indicate help was requested. The parameter should be checked after the INPUT statement. If a flag is set, for example, reset the flag and issue CALLNATs to do the help processing.</p> <p>This technique allows the helproutine to access all data entered in a single panel transaction. When you generate a browse subprogram, for example, you can type the file name (without pressing Enter) on the Additional Parameters panel and request help for a field.</p>
Attached to	Any input field.
Parameters used	<ul style="list-style-type: none"> ● #PDA-SET-HELP(L)
Files accessed	<ul style="list-style-type: none"> ● SYSDIC-FI ● SYSDIC-RL

General Purpose Generation Subprograms (CU--*)

The subprograms described in this section are general purpose generation subprograms. These subprograms are identified by a CU-- prefix.

CU--EM Subprogram

CU--EM	Description
What it does	Returns edit masks used by the generated programs for displaying date and time fields. This subprogram can be changed to suit your standards. Changes to this routine should be made in a higher level steplib to minimize maintenance. Unless you modify your models, the date and time field edit masks should not be longer than nine characters.
PDAs used	<ul style="list-style-type: none"> ● CU--EMA

CU--LRP Subprogram

CU--LRP	Description
What it does	Returns the left and right prompt displayed on the Natural Construct panels. The left prompt displays the current month and day in *DATX (EM=LLL''DD), which can be language sensitive. The right prompt displays the “1 of 1” or “1 of 3” panel indicators, depending on the number of panels. This prompt uses several control record fields to build the prompt position indicators, which are compressed on both sides of the “of” indicator.
Parameters/PDAs used	<ul style="list-style-type: none"> ● #PDA-LEFT-PROMPT(A9) ● #PDA-LEFT-INDICATOR(A4) ● #PDA-RIGHT-PROMPT-OF(A4) ● #PDA-RIGHT-INDICATOR(A4) ● #PDA-RIGHT-PROMPT(A9) ● CSASTD

CU--MSG Subprogram

CU--MSG	Description
What it does	<p>Returns the text for an application error message. It receives a message number in #PDA-FRAME-PARM. After ensuring this literal is numeric, it retrieves the short message for the SYSTEM application and the *Language variable.</p> <p>The error message is written (left-justified and enclosed within single quotes) to the source buffer, thus substituting for the frame parameter. The usual search criteria and defaults (English) apply. The following example shows a code frame:</p> <pre data-bbox="494 555 1179 692">USE-MSG-NR 1 ASSIGN MSG-INFO.##MSG-NR = 8123 " ELSE 1 ASSIGN MSG-INFO.##MSG = " SUBPROGRAM:CU--MSG PARAM: 8123 N "</pre>
PDAs used	<ul style="list-style-type: none"> ● CU--PDA ● CSASTD
Files accessed	<ul style="list-style-type: none"> ● Application error message file

CU--UL Subprogram

CU--UL	Description
What it does	<p>Returns the underscore line used on Natural Construct panels. This subprogram receives an underscore character set and creates the underscore line. The character(s) specified on the control record (A4) is duplicated to fill the A80 length.</p>
Parameters/PDAs used	<ul style="list-style-type: none"> ● #PDA-UNDERSCORE(A4) ● #PDA-UNDERSCORE-LINE(A80) ● CSASTD
