2 Common Fields on the Standard Parameters Panel	
3 Set Up a Password File	
4 Change the Default Window Settings	
Test the Modified Window Settings	13
5 Determine Which Condition Codes are Set	

1

Common Model Specifications and Development Tasks

Common Model Specifications and Development Tasks describes the common specifications for the Natural Construct models and how to perform common development tasks.

Notes:

- 1. Although the screen examples used in this documentation are from a mainframe environment, the information applies to all server environments.
- 2. For information about the additional specification panels for a specific model, see the documentation in which that model is described.

Common Model Specifications and Development Tasks covers the following topics:

9	Common Fields on the Standard Parameters Panel	Describes the common fields on the Standard Parameters panel.
•	Set Up a Password File	Describes how to set up a password file to implement password checking for generated modules.
•	Change the Default Window Settings	Describes how to change the default window settings for your generated modules, such as the size and position of the window and whether it uses a frame (border). Includes information on testing the new window settings.
•	Determine Which Condition Codes are Set	Explains how to verify which condition codes have been set for your generated module.

2

Common Fields on the Standard Parameters Panel

The Standard Parameters panel is similar for all program models; it is the first and sometimes the only specification panel. The following example shows the Standard Parameters panel for the Object-Maint-Dialog model:

CUOMMA	Object-Maint-Dialog Program	CUMAO
Sep 16	Standard Parameters	1 of 4
Global data area	CST52S	
	Object Dialog This program is used to maintain	the
Command Message numbers Password		
Enter-PF1PF2PF3-right help retrn quit	PF4 PF5 PF6 PF7 PF8 I	PF9PF10PF11PF12 right main

Note: The Standard Parameters panel for other models may not contain all the fields shown.

The fields on the Standard Parameters panel are:

Field	Description	
Module	Name of the module (by default, the name specified in the Module name field on the Generation main menu). This is a required field.	
	The module name must be alphanumeric, a maximum of eight characters in length, and cannot contain blanks.	
System	Name of the system (by default, the name of the current library). This is a required field.	
	The system name must be alphanumeric, not exceed 32 characters in length, and does not have to be associated with a Natural library ID. (The combination of the module name and system name is used as a key to access help information for the generated module.)	
Global data area Name of the global data area (GDA) used by the generated module. By defau is displayed. This is a required field.		
	To allow inter-program communication, generated modules require a small number of global variables. The CDGDA global data area contains the global variables required to test a generated module.	
	Before creating a new application, copy this GDA from the SYSTEM library and rename it to match your naming conventions. Then add any additional global variables your application may require.	
With block	Name of the GDA block used by the generated module. This is an optional field.	
	To use a GDA block, you need only specify the lowest level block name; the corresponding path name is determined automatically. For more information about GDA blocks, see the Natural documentation.	
Title	Title for the generated module. The title is used internally to identify modules for the List Generated Modules function on the Generation main menu. This is a required field.	
Description	Brief description of what the generated module does. This is an optional field and is used internally for documentation purposes.	
First header	First header (heading) for the generated module. This header is centered at the top of the generated panel and intensified. This is a required field.	
Second header	Second header (heading) for the generated module. This header is centered under the first header and intensified. This is an optional field.	
Command	If this field is marked, the generated module supports direct command processing. In this field is blank, the generated module does not support direct commands.	
Message numbers	If this field is marked, the generated module uses message numbers rather than message text for all REINPUT and INPUT messages.	
	Note: Use the same technique consistently throughout your application, since passing	
	messages between modules using different techniques will not always produce the desired results.	

Field	Description
Password	If this field is marked, the generated module performs password checking. If this field is blank, the generated module does not perform password checking.
	To include password checking, you must set up a password file. For information, see Set Up a Password File .

3

Set Up a Password File

You can specify password checking for many of the generated modules. Natural Construct builds the mechanism for password checking into your module by including the CCPASSW copycode member. Within this copycode, the CDPASSW subprogram is invoked and passed the module and system names.

To include password checking, you must set up a password file. The file is keyed on the module name used to catalog the module and the system name used to generate the module.

The password file can be a view of any file with Natural-Construct-Password as the data definition module name. The view must contain the following fields:

Field	Format
PASSWORD-KEY	A40 (32-character system name, plus an 8-character module name)
PASSWORD	A8 (8-character password)

When a user attempts to invoke the module, the CDPASSW subprogram reads the password file. If the module/system name combination exists in the file and does not have a password, the user can invoke the module. If the module/system name combination exists and has a password, the user must enter the correct password before the module is invoked. If a user enters five incorrect passwords, execution is aborted.

If you specify password checking, you must modify the CDPASSW subprogram to include a valid password view and any final processing you want to perform and then catalog the modified subprogram. For more specific password checking, you can modify the CCPASSW copycode member (to call a different subprogram) or modify the CDPASSW subprogram (to refine your security standards).

4 Change the Default Window Settings

- Took the Medified Window Cottings	4
I lest the Monthey Window Settings	- 1

To change the default window settings for your generated module:

1 Press PF5 (windw).

The Window Parameters window is displayed. For example:

2 Use the following fields to build the DEFINE WINDOW statement:

Field	Description
Size	■ Height
	Number of lines the window spans.
	■ Width
	Number of columns the window spans.
Position	■ Line
	Number of lines from the top of the panel to the top of the window.
	■ Column
	Number of columns from the left side of the panel to the left side of the window. The line and column values form the top left corner of the window.
Frame OFF	If this field is marked, the window is displayed without a border (frame).

3 Press Enter to confirm the changes.

Test the Modified Window Settings

You can view a test version of the window with the characteristics specified in the Window Parameters window.

To test the modified window settings:

■ Press PF4 (test) in the Window Parameters window.

Determine Which Condition Codes are Set

To determine which condition codes are set:

- 1 Mark the Condition codes field in the Optional Parameters window.
- 2 Press PF2 (retrn).

The Generation main menu is displayed.

3 Generate the module.

After generation is complete, the Condition Codes Trace window is displayed, showing the condition codes set for the current module. For example:

CSGCTRAC	Natural Const	ruct	CSGCTRCO
Jan 13 (Condition codes	Trace	1 of 1
Condition codes		Condition codes	
1 X MULTIPLE-ENTITIES	14	DB2-TIMESTAMP	
2 X KEY-NOT-DEFINED-AS-	·UQ 15	CONFINED-KEY-PREFI>	<
3 KEY-IS-ALPHA	16	RESET-REDEFINES	
4 KEY-IS-LOGICAL	17	LOGGING-UPDATES	
5 HOLD-FIELD-EQ-TIME	18	DB2-REFERENTIAL-IN	ΓEGRITY
6 X PRIME-FILE-IS-ADABA	\S 19	DB2-INTRA-CASCADE-	DELETE
7 PRIME-FILE-IS-DB2	20	KEY-IS-REDEFINED	
8 CLAUSE-IS-DB2-SPECI	IFIC 21	DERIVED-DATA	
9 PRIME-FILE-IS-IMS	22	NAT-REFACTORING	
10 PRIME-FILE-IS-VSAM	23	X GET-BY-ISN	
11 KEY-IS-A-SUPER	24	X HASH-LOCKING	
12 X USE-MSG-NR	25	NAT4-OR-HIGHER	
13 KEY-IS-PRIME			

Tip: If the condition code is not marked, ensure that the code is being generated in a Natural V4 (Natural V6 on open systems) or higher environment and that the option is set to True

in the CSXDEFLT subprogram. CSXDEFLT is installed in the SYSCSTX library. To use the code, compile the subprogram in the SYSCST library and then copy the object code to the SYSLIBS library. For information on CSXDEFLT, see Use CSXDEFLT Overrides.
