Please explore the Adabas Administration Services
documentation at the Software AG web site:

http://documentation.softwareag.com/

The documentation at this site will be updated as
required.

Contents:

A. About Adabas Administration Services

B. Software Requirements

C. Administration of Adabas v6.6 Databases

D. Updates to This Version

A. About Adabas Administration Services
****

Adabas Administration Services allows remote administration of Adabas
databases through Adabas Manager. Upon activation, Adabas
Administration Services queries the local environment to find out
which databases are on the machine and makes target access entries in
a Software AG Directory Server repository. These entries are then used
by Adabas Manager as a communication path to the database for local or
remote administration.

One instance of Adabas Administration Services is required for each
Adabas installation to be managed.

B. Software Requirements
****

The following software is required by Adabas Administration Services:

*   Software AG Directory Server. If you do not already have the
Software AG Directory Server, you can install one from the Software AG
Empower site. Although we recommend upgrading any existing directory
servers to the latest available version, previous versions of the
Directory Server are compatible with Adabas Administration Services.
We recommend only one Directory Server in your enterprise. Please see
the product documentation for the Software AG Directory server for a
full explanation of Directory Server contents and setting up a
directory server in your enterprise.

*   An Adabas version 6.4 or higher to be managed by this installation
of Adabas Administration Services. Installing Adabas v6.6 will
select Adabas Administration Services v2.5 as a dependency in the
SAGInstaller installation tree.

*   Adabas Client version 6.5_SP3 or later, with all applicable fixes
applied.
Adabas Client is selected as a dependency of Adabas and Adabas
Administration
Services when selected for installation in the installer tree. Fixes are
released and available in Empower.

*   After installation of Adabas Administraiton Services, please check
Empower and apply all current Adabas fixes applicable to Adabas
Administration
Services.

C. Administration of Adabas v6.6 Databases
****

On both Windows and Unix/Linux, Install Adabas Administration Services
into the same root directory specified in the SAGInstaller
installation where Adabas v6.6 is installed. Ideally, install Adabas
and Adabas Administration Services at the same time (the selection of
Adabas in the products tree will pre-select Adabas Administration
Services for installation). Upon installation, Adabas Administration
Services will self-configure to manage this instance of the Adabas
installation.

D. Updates to This Version
****

Please check for and apply any applicable fix to this version immediately
after installation and before using the product.

Beginning with this release, any updates or fixes to Adabas Administration
Services v2.5 will be made available through Software AG's Software Update
Manager. Please visit the Empower website for instructions on installing
and using Software Update Manager.

The http://documentation.softwareag.com Web
site may contain more current information as
updates become available.

Thank you for using Software AG's Adabas Administration Services.
