# Preface

---

This document describes Adabas Administration Services and explains how to use and maintain it.

It is intended for system administrators in your enterprise.

This document is organized as follows:

<i>Concepts</i>	Introduces you to Adabas Administration Services.
<i>Release Notes</i>	Describes the new and changed features in this version of Adabas Administration Services.
<i>Installing and Uninstalling Adabas Administration Services</i>	Describes the prerequisites of the Adabas Administration Services how to install it.
<i>About the System Management Hub</i>	Introduces you to the System Management Hub and explains how to access it and leave it.
<i>Performing Adabas Administration Services Administration</i>	Describes administrative tasks you can perform for Adabas Administration Services.
<i>Using the aasutil Batch Program</i>	Describes how to use the batch program, <i>aasutil.exe</i> , to perform some basic Adabas Administration Services administrative functions.
<i>Using the adiutil Batch Program</i>	Describes how to use the batch program, <i>adiutil.exe</i> , to perform some basic Directory Server functions for Adabas Administration Services.
<i>Glossary</i>	Provides a glossary of terms in use for Adabas and Entire Net-Work products.

---

# 1 About this Documentation

---

- Document Conventions ..... 2
- Online Information and Support ..... 2
- Data Protection ..... 3

## Document Conventions

---

Convention	Description
<b>Bold</b>	Identifies elements on a screen.
Monospace font	Identifies service names and locations in the format <i>folder.subfolder.service</i> , APIs, Java classes, methods, properties.
<i>Italic</i>	Identifies:  Variables for which you must supply values specific to your own situation or environment. New terms the first time they occur in the text. References to other documentation sources.
Monospace font	Identifies:  Text you must type in. Messages displayed by the system. Program code.
{ }	Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols.
	Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the   symbol.
[ ]	Indicates one or more options. Type only the information inside the square brackets. Do not type the [ ] symbols.
...	Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis (...).

## Online Information and Support

---

### Software AG Documentation Website

You can find documentation on the Software AG Documentation website at <https://documentation.softwareag.com>.

### Software AG Empower Product Support Website

If you do not yet have an account for Empower, send an email to [empower@softwareag.com](mailto:empower@softwareag.com) with your name, company, and company email address and request an account.

Once you have an account, you can open Support Incidents online via the eService section of Empower at <https://empower.softwareag.com/>.

You can find product information on the Software AG Empower Product Support website at <https://empower.softwareag.com>.

To submit feature/enhancement requests, get information about product availability, and download products, go to [Products](#).

To get information about fixes and to read early warnings, technical papers, and knowledge base articles, go to the [Knowledge Center](#).

If you have any questions, you can find a local or toll-free number for your country in our Global Support Contact Directory at [https://empower.softwareag.com/public\\_directory.aspx](https://empower.softwareag.com/public_directory.aspx) and give us a call.

### **Software AG TECHcommunity**

You can find documentation and other technical information on the Software AG TECHcommunity website at <http://techcommunity.softwareag.com>. You can:

- Access product documentation, if you have TECHcommunity credentials. If you do not, you will need to register and specify "Documentation" as an area of interest.
- Access articles, code samples, demos, and tutorials.
- Use the online discussion forums, moderated by Software AG professionals, to ask questions, discuss best practices, and learn how other customers are using Software AG technology.
- Link to external websites that discuss open standards and web technology.

## **Data Protection**

---

Software AG products provide functionality with respect to processing of personal data according to the EU General Data Protection Regulation (GDPR). Where applicable, appropriate steps are documented in the respective administration documentation.

---

# 2 Concepts

---

- Understanding Partitioning ..... 6
- Understanding Filtering ..... 7

Adabas Administration Services (AAS) provides remote administration and system service support for Software AG products. Specifically, Adabas Administration Services allows you to perform the following remote administration tasks for Software AG products with which it is supported:

- You can start and stop the product remotely.
- You can obtain product log files remotely.
- You can read and write product files remotely.
- You can read directories remotely.

In addition, Adabas Administration Services allows you to operate the Software AG product as a system service.

Ordinarily, Adabas Administration Services starts up automatically after it is installed or whenever the machine on which it is installed is started. In UNIX environments, however, you may occasionally need to start it manually.

Adabas Administration Services allows remote administration of Adabas databases through Adabas Manager. Once activated, Adabas Administration Services queries the local environment to determine which databases are active in that environment. It then makes target access entries in a Software AG Directory Server repository. These entries are then used by Adabas Manager as a communication path to the database for local or remote administration.

This chapter also covers the following topics:

## Understanding Partitioning

---

Adabas Administration Services supports partitioning of Adabas Directory Server entries. Partitioning enhances your ability to use one Directory Server for your whole enterprise, rather than separate Directory Servers for different departments within your enterprise. The partitions need to be managed separately, but only one Directory Server needs to be installed.

Once you have defined a service, you can assign it to a specific partition. If you specify one for a service, the Directory Server entries created for that service are stored in a partition by that name in the Directory Server configuration or in the service configuration file (depending on where the partition is defined); the entries in the partition are maintained separately from the other entries in the appropriate configuration. The service is only able to direct requests to databases, clients, and client hosts that have entries in this partition.

Here are some of the advantages of partitioning:

- You can use partitioning to direct Adabas Administration Services support to specific databases.
- If you have created Adabas databases with identical database IDs, you can use partitioning to correctly identify which client calls get directed to which Adabas database.

- You can use partitioning to group client calls to an Adabas database, thus reducing the number of actual connections required for that database. This provides you with some level of client control: if you want to remove access to a specific database for clients in a given partition, simply remove the access URL entry for that database (using the System Management Hub) or stop the service in that partition.
- Using SSL, you can use impose real security requirements on calls made by clients in specific partitions.

For complete information about partitioning, including an example, read *Partitioning a Directory Server* in the *Software AG Directory Server Installation and Administration Guide*.

## Understanding Filtering

---

Adabas Administration Services supports filtering of databases, client hosts, Entire Net-Work Client configurations, and Entire Net-Work Kernel definitions by Adabas database ID. Filtering is set up in the System Management Hub (SMH) using parameters on the **Service Filters** panel. For more information about this panel, read [Maintaining Adabas Administration Services Filters](#), elsewhere in this guide.

You can filter services by requests:

- made to specific Adabas database IDs;
- submitted from Kernels, by Kernel name;
- submitted to and from specific machines, by machine name; and
- submitted from clients, by client name.

This section covers the following topics:

- [Filtering Requests to Adabas Databases](#)
- [Filtering Requests from Other Kernels](#)
- [Filtering Requests to and from Specific Machines](#)

- [Filtering Requests to and from Specific Clients](#)

### Filtering Requests to Adabas Databases

Using the **Service Filters** panel in SMH, you can identify databases for which requests should be processed by the service. If no databases are listed in the **ACCEPTED\_DBIDS** field, the service will process all requests to all databases defined in the Adabas Directory Server, except those listed in the **REJECTED\_DBIDS** field. Likewise, if no databases are listed in the **REJECTED\_DBIDS** field, the service will process all requests to all databases defined in the Adabas Directory Server, unless a specific list is provided in the **ACCEPTED\_DBIDS** field.

### Filtering Requests from Other Kernels

Using the **Service Filters** panel in SMH, you can identify Kernels for which requests should be processed by the service. If no Kernels are listed in the **ACCEPTED\_KERNELS** field, the service will process all requests to all Kernels, except those listed in the **REJECTED\_KERNELS** field. Likewise, if no Kernels are listed in the **REJECTED\_KERNELS** field, the service will process all requests to all Kernels, unless a specific list is provided in the **ACCEPTED\_KERNELS** field.

### Filtering Requests to and from Specific Machines

Using the **Service Filters** panel in SMH, you can identify host machines for which requests should be processed by the service. If no host machines are listed in the **ACCEPTED\_HOSTS** field, the service will process all requests to all host machines, except those listed in the **REJECTED\_HOSTS** field. Likewise, if no host machines are listed in the **REJECTED\_HOSTS** field, the service will process all requests to all host machines, unless a specific list is provided in the **ACCEPTED\_HOSTS** field.

### Filtering Requests to and from Specific Clients

Using the **Service Filters** panel in SMH, you can identify clients for which requests should be processed by the service. If no clients are listed in the **ACCEPTED\_CLIENTS** field, the service will process all requests to all clients, except those listed in the **REJECTED\_CLIENTS** field. Likewise, if no clients are listed in the **REJECTED\_CLIENTS** field, the service will process all requests to all clients, unless a specific list is provided in the **ACCEPTED\_CLIENTS** field.

# 3 Release Notes

---

- Enhancements ..... 10
- End of Maintenance ..... 10
- Documentation and Other Online Information ..... 10

Adabas Administration Services (AAS) provides remote administration and system service support for Software AG products.

This chapter describes the new and changed features of the 2.5 version of Adabas Administration Services.

## Enhancements

---

The primary change in the release of Adabas Administration Services Version 2.5 is enhanced functionality to support Adabas Manager Version 8.3 enhancements.

As of this release, fixes to Adabas Administration Services will be delivered using Software AG Update Manager. For more details, see section *Installing and Uninstalling Adabas Administration Services* of this documentation.

## End of Maintenance

---

For information on how long a product is supported by Software AG, access Software AG's Empower web site at <https://empower.softwareag.com>.

Log into Empower. Once you have logged in, you can expand **Products** in the left menu of the web page and select **Product Version Availability** to access the Product Version Availability application. This application allows you to review support information for specific products and releases.

## Documentation and Other Online Information

---

The following online resources are available for you to obtain up-to-date information about your Software AG products:

- [Software AG Documentation Website](#)
- [Software AG TECHcommunity](#)

- [Software AG Empower Product Support Website](#)

## Software AG Documentation Website

You can find documentation for all Software AG products on the Software AG Documentation website at <https://documentation.softwareag.com>. This site requires Empower credentials. If you do not have an Empower user ID and password yet, you will find instructions for registering on this site (free for customers with maintenance contracts) or you can also use the TECHcommunity website to access the latest documentation.

## Software AG TECHcommunity

You can find documentation and other technical information on the Software AG TECHcommunity website at <http://techcommunity.softwareag.com>. You can:

- Access product documentation, if you have TECHcommunity credentials. If you do not, you will need to register and specify "Documentation" as an area of interest. If you already have TECHcommunity credentials, you can adjust your areas of interest on the TECHcommunity website by editing your TECHcommunity profile. To access documentation in the TECHcommunity once you are logged in, select **Documentation** from the **Communities** menu.
- Access articles, demos, and tutorials.
- Use the online discussion forums, moderated by Software AG professionals, to ask questions, discuss best practices, and learn how other customers are using Software AG technology.
- Link to external websites that discuss open standards and web technology.

## Software AG Empower Product Support Website

You can find product information on the Software AG Empower Product Support website at <https://empower.softwareag.com>. This site requires Empower credentials. If you do not have an Empower user ID and password yet, you will find instructions for registering on this site (free for customers with maintenance contracts).

To submit feature/enhancement requests, get information about product availability, and download products and certified samples, select **Products & Documentation** from the menu once you are logged in.

To get information about fixes and to read early warnings, technical papers, and knowledge base articles, select **Knowledge Center** from the menu once you are logged in.

# 4 Installing and Uninstalling Adabas Administration Services

---

- Installation Overview ..... 14
- System Requirements ..... 15
- Configuration Considerations ..... 17
- Before You Begin ..... 18
- Installation Steps ..... 18
- Configuring Product Components for Windows Personal Firewall ..... 20
- Uninstallation Steps ..... 21
- Installing Fixes Using Software AG Update Manager ..... 21
- Uninstalling Fixes Using Software AG Update Manager ..... 22

Adabas Administration Services is installed using the Software AG Installer. It does not require a license key.

One instance of Adabas Administration Services is required for each Adabas LUW installation to be managed. Adabas Administration Services will be automatically selected for installation when Adabas LUW is selected in the Software AG Installer tree. The service is installed and configured when the Adabas installation is activated.

You can download the Software AG Installer from the Software AG Empower website at <https://empower.softwareag.com/>.

This chapter provides product-specific instructions for installing Adabas Administration Services. It is intended for use with *Using the Software AG Installer*, which explains how to prepare your machine to use the Software AG Installer and how to use the Software AG Installer and Software AG Uninstaller to install and uninstall your products. The most up-to-date version of *Using the Software AG Installer* is always available in the webMethods product documentation located on the Software AG Empower website (<https://empower.softwareag.com/>).

This chapter covers the following topics:

## Installation Overview

---

This product is installed using the Software AG Installer, which you can download from the Software AG Empower website at <https://empower.softwareag.com/>.

If you have a Directory Server already installed at your site from an earlier release of Software AG products, you do not need to install it again; your new products can use the existing installation instead.

The Directory Server must be installed on a machine in your network that can be accessed by all machines where Entire Net-Work will be installed (both Entire Net-Work Server and Entire Net-Work Client). It should be installed on a dedicated system that is operational 24 hours a day, with a UPS.

We recommend that you install one Directory Server for use with all the Software AG products that require it.

The Adabas Administration Services installation is paired (grouped) with the installation of Adabas LUW. One Adabas Administration Services instance should be installed in each suite (root) where Adabas version 6.4 or later is installed, to allow administration of that Adabas instance by Adabas Manager.

If you are planning to use Adabas Manager to administer an existing version 6.3 of Adabas, install Adabas Administration Services in a root without Adabas version 6.4 installed. By default, if no

Adabas is found in this suite, Adabas Administration Services configures itself during installation to administer the existing Adabas 6.3 version.

Adabas Administration Services requires the use of the Adabas Directory Server; so be sure to have already installed the Directory Server before attempting an Adabas Administration Services installation or install the Directory Server at the same time as Adabas Administration Services.

## System Requirements

---

This section describes the system requirements of Adabas Administration Services.

- [Supported Operating System Platforms](#)
- [Supported Hardware](#)
- [Supported Browsers](#)
- [Space Requirements](#)
- [Windows Requirements](#)
- [Firewall Requirements](#)

### Supported Operating System Platforms

Software AG generally provides support for the operating system platform versions supported by their respective manufacturers; when an operating system platform provider stops supporting a version of an operating system, Software AG will stop supporting that version.

For information regarding Software AG product compatibility with IBM platforms and any IBM requirements for Software AG products, please review the [Product Compatibility for IBM Platforms](#) web page.

Before attempting to install this product, ensure that your host operating system is at the minimum required level. For information on the operating system platform versions supported by Software AG products, complete the following steps.

1. Access Software AG's Empower web site at <https://empower.softwareag.com>.
2. Log into Empower. Once you have logged in, you can expand **Products & Documentation** in the left menu of the web page and select **Product Version Availability** to access the Product Version Availability screen.
3. Use the fields on the top of this screen to filter its results for your Software AG product. When you click the **Search** button, the supported Software AG products that meet the filter criteria are listed in the table below the filter criteria.

This list provides, by supported operating system platform:

- the Software AG general availability (GA) date of the Software AG product;
- the date the operating system platform is scheduled for retirement (OS Retirement);

- the Software AG end-of-maintenance (EOM) date for the product; and
- the Software AG end-of-sustained-support (EOSS) date for the product.

**Note:** Although it may be technically possible to run a new version of your Software AG product on an older operating system, Software AG cannot continue to support operating system versions that are no longer supported by the system's provider. If you have questions about support, or if you plan to install this product on a release, version, or type of operating system other than one listed on the Product Version Availability screen described above, consult Software AG technical support to determine whether support is possible, and under what circumstances.

## Supported Hardware

For general information regarding Software AG product compatibility with other platforms and their requirements for Software AG products, visit Software AG's [Hardware Supported](#) web page.

## Supported Browsers

The Adabas Manager requires an Internet browser. For information on supported browsers, see the *webMethods System Requirements* documentation on the Empower web site.

## Space Requirements

The following table displays the minimum disk space requirements on Windows and UNIX systems for various Adabas LUW and Entire Net-Work LUW products, including the Adabas Directory Server:

Product	Space Requirement
Entire Net-Work Client	25 MB
Entire Net-Work Server	30 MB
Adabas Directory Server	20 MB

## Windows Requirements

In Windows environments, be sure to install Microsoft Visual Studio 2008 Redistributable Package.

## Firewall Requirements

If you attempt to install and use this software in a system with a firewall in place, be sure that your system administrator has set up the firewall so that the component applications can access the ports they need (including the Adabas Directory Server port and any ports Entire Net-Work dynamically assigns during its own processing). For more information about port usage, read the *Port Number Reference* found elsewhere in this documentation.

## Configuration Considerations

---

This section describes configuration issues you should consider before you install Adabas Administration Services.

Adabas Administration Services requires the use of the Adabas Directory Server; so be sure to have already installed the Directory Server before attempting an Adabas Administration Services installation or install the Directory Server at the same time as Adabas Administration Services.

- [How Many Adabas Administration Services Should You Install?](#)
- [Where Should You Install the Adabas Administration Services?](#)

### How Many Adabas Administration Services Should You Install?

One Adabas Administration Services instance should be installed in each suite (root) where Adabas version 6.6 or later is installed, to allow administration of that Adabas instance by Adabas Manager.

If you are planning to use Adabas Manager to administer an existing version 6.5 of Adabas LUW, install Adabas Administration Services in a root without Adabas version 6.6 installed. By default, if no Adabas is found in this suite, Adabas Administration Services configures itself during installation to administer the existing Adabas 6.5 version.

### Where Should You Install the Adabas Administration Services?

An Adabas Administration Services instance should be installed in the suite (root) where Adabas version 6.6 or later is installed.

## Before You Begin

---

Before you begin installing this product, ensure that the following prerequisites have been met:

1. Software AG strongly recommends that you create an installation image of your existing Software products and store the image on your internal network. You should create an image for each operating system on which you plan to run the installation (for example, 32-bit, 64-bit, or both). This will help you reduce WAN traffic and speed up installation and will ensure consistency across installations over time, since the Software AG Installer provides only the latest release of each product.
2. Close (stop) all open applications, especially those applications interacting with or depending on your Adabas databases. This includes Natural, Adabas Manager, the Adabas DBA Workbench, and prior releases of any other Adabas products. To be on the safe side, also shut down all Software AG services.

**Important:** For some Software AG products, the Software AG Uninstaller will not be able to remove key files that are locked by the operating system if the associated Software AG products are not shut down.

3. Disable any antivirus software.
4. Ensure the target computer is connected to the network.
5. If this product requires a license key file, verify the license key file is copied somewhere in your environment. Products requiring license key files will not run without valid license keys. For more information, read *The License Key*, elsewhere in this section.
6. Verify your environment supports the system requirements for this product, as described in *System Requirements*, elsewhere in this section.

## Installation Steps

---

Adabas Administration Services is installed using the Software AG Installer. This installation documentation provides a brief description on how to install the Adabas Administration Services directly on the target machine using the installer wizard. For detailed information on the installer wizard, read *Using the Software AG Installer*.

**Note:** Read *Using the Software AG Installer* also if you want to use console mode, or if you want to install using an installation script or installation image.

➤ **To install Adabas Administration Services, complete the following steps:**

- 1 Start the Software AG Installer as described in *Using the Software AG Installer*.

- 2 When the first page of the Software AG Installer wizard (the Welcome panel) appears, choose the **Next** button repeatedly, specifying all required information on the displayed panels, until the panel containing the product selection tree appears.

All Adabas-related products (including Adabas Directory Server) can be selected for installation within the **Adabas Family** product selection tree.

In addition to the **Adabas Family** product selection tree, two other trees, **Event-Driven Architecture** and **Infrastructure** (which includes the System Management Hub installation) are available for installation. The **Infrastructure** tree must be selected for all Software AG products; it provides the necessary Java runtime environment for the Software AG Installer.

- 3 To install Adabas Administration Services, select (check) the Adabas Administration Services entry from the **Adabas Family** product selection tree.

**Note:** When you select Adabas Administration Services, Adabas Client is also selected unless an Adabas Client is already installed on the machine. You can opt to install other Software AG products from this list at the same time. This section just describes the installation of Adabas Administration Services.

- 4 On the License panel, read the license agreement and select the check box to agree to the terms of the license agreement and then click **Next** to continue. If you do not accept the license agreement, the installation will stop.
- 5 When the **Configure** panel appears, specify the URL and port number for the Directory Server that should be used for this installation. The default is `tcpip://localhost:4952`. For complete information on the port used by the Directory Server, read [Port Number Reference](#), elsewhere in this guide.

In addition, select the radio button indicating whether Adabas Administration Services should be installed as an application or a service. You can only select one. By default, it is installed as a service.

Click **Next** to continue.

- 6 On the last panel, review the items you have selected for installation. If the list is correct, choose the **Next** button to start the installation process.

After Adabas Administration Services has been installed, it will start automatically if it has been started as a system service. You can start and stop it as you would any system service.

## Configuring Product Components for Windows Personal Firewall

If you have the default Microsoft Windows personal firewall enabled on a PC and you would like to install and run Adabas and Entire Net-Work components on that PC, you will need to allow communications through the firewall on certain ports. You can do this in one of two ways: you can allow ports for a specific executable program or you can open specific ports.

- [Allow Ports for a Specific Executable Program](#)
- [Open a Specific Port](#)

**Note:** If you attempt to install Adabas or Entire Net-Work in a system with a firewall in place, be sure that your system administrator has opened the firewall for the Adabas Directory Server port or the installation may not complete successfully.

### Allow Ports for a Specific Executable Program

You can allow a specific executable program to open a port. To do so, issue the following command:

```
C:\>netsh firewall add allowedprogram program="<path and file name>"
name="<component-name>" profile=ALL
```

where *<path and file name>* is the path and file name of the file you want to allow and *<component-name>* is a user-specified name to identify the file you are allowing. The following table lists the common Adabas and Entire Net-Work component files that might need to be allowed if Windows personal firewall is enabled:

Component Name	Path and File Name
Entire Net-Work Client Service	<i>&lt;your-installation-location&gt;</i> \EntireNetWorkClient\bin\wclservice.exe
Entire Net-Work Kernel program	<i>&lt;your-installation-location&gt;</i> \EntireNetWorkServer\bin\wcpkernel.exe
Entire Net-Work Server Service	<i>&lt;your-installation-location&gt;</i> \EntireNetWorkServer\bin\wcpervice.exe
Adabas Directory Server Service	<i>&lt;your-installation-location&gt;</i> \SoftwareAG\SoftwareAgDirectoryServer\bin\xtsdssvcadi.exe

To remove the Adabas or Entire Net-Work component as an allowed program, issue the following command:

```
C:\>netsh firewall delete allowedprogram program="<path and file name>"
profile=ALL
```

where *<path and file name>* is the path and file name of the file you want to disallow.

## Open a Specific Port

To open a specific port for use by an Adabas or Entire Net-Work component in the firewall, issue the following command:

```
C:\>netsh firewall add portopening protocol=TCP port=nnnn  
name="<component-name>" profile=ALL
```

where *nnnn* is the port number you want to open and *<component-name>* is a user-specified name to identify the port you are allowing.

To avoid port number conflicts, read [Port Number Reference](#), later in this guide, for a general list of the ports used by Software AG products.

To close a specific port in the firewall, issue the following command:

```
C:\>netsh firewall delete portopening protocol=TCP port=nnnn profile=ALL
```

where *nnnn* is the port number you want to close.

## Uninstallation Steps

You uninstall this product using the Software AG Uninstaller. For information on how to use the uninstaller, read the *Using the Software AG Installer* guide.

## Installing Fixes Using Software AG Update Manager

Adabas Administration Services is updated using the Software AG Update Manager (SUM).

You can download the Software AG Update Manager from the Software AG Empower website at <https://empower.softwareag.com/>.

This SUM installation documentation on Empower provides a brief description on how to update Software AG products directly on the target machine using the Update Manager wizard. The SUM documentation also includes instructions on how to apply updates in console mode or using scripts.

➤ **To update Adabas Administration Services, complete the following steps:**

- 1 Download and install Software AG Update Manager for your platform from Empower.
- 2 Shut down any running instances of the product. Updates cannot successfully apply if the application is active.

- 3 From a console prompt in the SUM */bin* directory, enter `UpdateManagerGUI.bat` (`UpdateManagerGUI.sh` on UNIX/Linux).
- 4 On the opening page of the SUM tool, select **Install Fixes from Empower**, enter your SAG product directory root location and provide your Empower User ID and password. Click **Next**.
- 5 Expand through the **Adabas Family** product selection tree to find the entry for this product.

**Tip:** If the product is not shown in the tree, there is either no update available or the product is not installed in the location you specified.

- 6 Select (check) the **Adabas Administration Service** entry in the product selection tree. Click **Next**.

**Tip:** You can select more than one product to update before proceeding.

- 7 The next screen presents a summary of products that are about to be updated. If any of them require manual pre-installation steps, they will be highlighted in red and you will be directed to read the update readme file for that product before proceeding.

Complete any pre-installation steps outlined in the readme file and check the box next to **Pre-installation steps have been completed**. Click **Next**.

**Note:** If any pre-installation steps are required, the **Next** button will be unavailable until you confirm these steps have been completed.

- 8 The tool will apply updates to all selected products and present you with a final screen confirming updates have been applied. Click **Close** to exit SUM or **Home** to return to the tool's starting panel.

## Uninstalling Fixes Using Software AG Update Manager

---

➤ To remove an installed update, complete the following steps:

- 1 Shut down any running instances of the product.
- 2 Start Software AG Update Manager.
- 3 On the opening page, select **Uninstall Fixes** from the selection panel. Click **Next**.
- 4 If any product selected for uninstall requires manual steps, you will be directed to review the update readme and confirm you have performed any pre-uninstallation steps. Click **Next**.
- 5 The fix(es) you selected for uninstall will be removed and the product(s) returned to their previous state. Click **Close** to exit SUM or **Home** to return to the tool's starting panel.

# 5

## About the Adabas Manager

---

The Adabas Manager (AMN) is a Web-based graphical user interface (GUI) you can use to perform administrative tasks for some Software AG products, including Adabas Directory Server, and Entire Net-Work. It runs in a standard Web browser.

Before you start using the Adabas Manager, you must set up an administrative user for the product. To do so, consult the section of the *Adabas Manager* documentation, available on Empower.

# 6 Performing Adabas Administration Services Administration

---

▪ Starting and Stopping Adabas Administration Services .....	27
▪ The Adabas Administration Services SMH Administration Area .....	28
▪ Listing, Selecting, and Reviewing Installed Services .....	30
▪ Reviewing the Access Status of a Service .....	33
▪ Reviewing Service Statistics .....	34
▪ Dynamically Collecting Detailed Statistics .....	35
▪ Generating a Service Configuration Dump .....	36
▪ Setting Service Parameters Offline .....	37
▪ Reviewing the Service Parameter Summary .....	39
▪ Setting Basic Service Parameters .....	40
▪ Setting Advanced Service Parameters .....	44
▪ Specifying Adabas Administration Services Scalability .....	47
▪ Maintaining Adabas Administration Services Filters .....	48
▪ Changing the Adabas Directory Server .....	51
▪ Reviewing Service Status .....	52

▪ Dynamically Managing Service Client Hosts .....	60
▪ Shutting Down a Service .....	62
▪ Managing Adabas Administration Services Log Files .....	63
▪ Tracing Adabas Administration Services Processing .....	66

This chapter describes the administration tasks you can perform for Adabas Administration Services using SMH. It is organized as follows:

<i>Starting and Stopping Adabas Administration Services</i>	Describes how to start and stop Adabas Administration Services.
<i>The Adabas Administration Services SMH Administration Area</i>	Describes how to access the Adabas Administration Services SMH administration area, how to get online help for it, and how to refresh the data that appears in the area.
<i>Listing, Selecting, and Reviewing Installed Services</i>	Describes how to list, review, and select services.
<i>Reviewing the Access Status of a Service</i>	Describes how to review the access status of a service.
<i>Reviewing Service Statistics</i>	Describes how to review the statistics for a service.
<i>Dynamically Collecting Detailed Statistics</i>	Describes how to activate the collection of detailed service statistics.
<i>Generating a Service Configuration Dump</i>	Describes how to generate a service configuration dump in the log file.
<i>Setting Service Parameters Offline</i>	Describes how you can set service parameters offline.
<i>Reviewing the Service Parameter Summary</i>	Describes how to review a summary of parameter settings for a service.
<i>Setting Basic Service Parameters</i>	Describes how to set basic service parameters.
<i>Setting Advanced Service Parameters</i>	Describes how to set advanced service parameters.
<i>Specifying Adabas Administration Services Scalability</i>	Describes how to set Adabas Administration Services scalability settings, as a way of improving the performance of your system.
<i>Maintaining Adabas Administration Services Filters</i>	Describes how to apply filters to the databases, Kernels, clients, and client hosts that can interact with Adabas Administration Services.
<i>Changing the Adabas Directory Server</i>	Describes how to change the Adabas Directory Server used by the service.
<i>Reviewing Service Status</i>	Describes how to review the status of a service.
<i>Checking Service Databases</i>	Describes how to check the status of the databases managed by Adabas Administration Services.
<i>Pinging Databases</i>	Describes how to ping a database managed by Adabas Administration Services.
<i>Dynamically Managing Direct Clients and Adabas Contexts</i>	Describes how to dynamically manage direct clients and Adabas contexts of a service.
<i>Dynamically Managing Service Client Hosts</i>	Describes how to dynamically connect and disconnect to host machines of a service.
<i>Shutting Down a Service</i>	Describes how to shut down a service.
<i>Managing Adabas Administration Services Log Files</i>	Describes how to view and manage Adabas Administration Services log files.

**Tracing Adabas Administration Services Processing**

Describes the different ways you can trace Adabas Administration Services processing. Tracing should be used only for problem analysis and, preferably, with the assistance of a Software AG technical support representative.

## Starting and Stopping Adabas Administration Services

---

This section describes what you need to do to start and stop Adabas Administration Services.

- [Starting Adabas Administration Services](#)
- [Stopping Adabas Administration Services](#)

During installation of Adabas Administration Services, the Adabas Administration Services service or daemon is started automatically when the computer is started.

**Note:** The Adabas Administration Services service is for the Adabas Administration Services alone and is named "Software AG Adabas Administration Service". If a given system does not have Adabas Administration Services installed, no service will be available.

### Starting Adabas Administration Services

If, for some reason, the Adabas Administration Services service or daemon is manually stopped, you will need to manually start it before Adabas Administration Services can function correctly.

#### ➤ To manually start the Adabas Administration Services service on Windows systems:

- Start it from the Windows Services window (usually located under Administrative Tools on the Control Panel). For more information on the Windows Services window, refer to the documentation for your Windows system.

The Adabas Administration Services service is started.

### Stopping Adabas Administration Services

You can shut down (stop) the Adabas Administration Services Windows service using SMH or using the Windows Services window. You can shut down (stop) the Adabas Administration Services UNIX daemon using SMH or using a shell script. This section describes all methods.

#### ➤ To stop the Adabas Administration Services Windows service from the Windows Services window:

- Stop it from the Windows Services window (usually located under Administrative Tools on the Control Panel). For more information on the Services window, refer to the documentation for your Windows system.

The Adabas Administration Services service is stopped.

➤ **To stop the Adabas Administration Services Windows service or daemon from the System Management Hub (SMH):**

- Read *Shutting Down a Service*, elsewhere in this guide for complete information.

## The Adabas Administration Services SMH Administration Area

---

This section describes how to access the Adabas Administration Services SMH administration area, how to get online help for it, and how to refresh the data that appears in the area.

- [Accessing the Adabas Administration Services SMH Administration Area](#)
- [Getting Help](#)
- [Refreshing the Displays](#)

### Accessing the Adabas Administration Services SMH Administration Area

➤ **To access the Adabas Administration Services administration area of the System Management Hub (SMH):**

Make sure you have started and logged into the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

The Adabas Administration Services administration area lists the services and communicators you can manage.

The following commands are available in the command menu for the Adabas Administration Services administration area or by right-clicking on **Adabas Administration Services** in tree-view:

 **Note:** You must have **Adabas Administration Services** selected in the tree-view frame to see these commands.

Command	Use this command to:
<b>Add to Browser Favorites</b>	Add a node in tree-view to your browser favorites.
<b>Add to View</b>	Add a node in tree-view to System Management View. For more information about System Management View, read your System Management Hub documentation.
<b>Help</b>	Link to help for your use of SMH as it pertains to the Adabas Administration Services administration area.
<b>Refresh</b>	Refresh the screen.
<b>Remove from View</b>	Remove a node in tree-view from System Management View. For more information about System Management View, read your System Management Hub documentation.

The remainder of this section describes administrative tasks for services. For information on administrative tasks for communicators, refer to your Adabas Manager Communicator documentation.

## Getting Help

➤ **To get help on an Adabas Administration Services management task or SMH panel:**

- 1 Access the Adabas Administration Services SMH administration area, as described in [Accessing the Adabas Administration Services SMH Administration Area](#), elsewhere in this section.
- 2 Right-click **Adabas Administration Services** in tree-view and select the **Help** option from the resulting drop-down menu.

Or:

Navigate to any panel within the Adabas Administration Services SMH administration area and click the **Help** button on the panel.

Help for the panel or Adabas Administration Services SMH administration area appears.

## Refreshing the Displays

➤ **To refresh the displays in the Adabas Administration Services SMH administration area:**

- 1 Access the Adabas Administration Services SMH administration area, as described in [Accessing the Adabas Administration Services SMH Administration Area](#), elsewhere in this section.
- 2 Right-click **Adabas Administration Services** or other Adabas Administration Services SMH administration item in tree-view and select the **Refresh** option from the resulting drop-down menu.

The data for the Adabas Administration Services SMH administration area is refreshed.

## Listing, Selecting, and Reviewing Installed Services

---

➤ **To list and review the services managed by SMH:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

Services

Service Name	Host	Version	URL	Status
TEST-PC_1	TEST-PC	2.1.0.0	TCP/IP://TEST-PC:49157?AASSERVICE=ON&Version=2.1.0.0	Active

The following commands are available:

 **Note:** You must right-click on **Services** in the tree-view frame to see these commands.

Command	Use this command to:
<b>Add to Browser Favorites</b>	Add a node in tree-view to your browser favorites.
<b>Add to View</b>	Add a node in tree-view to System Management View. For more information about System Management View, read your System Management Hub documentation.
<b>Help</b>	Link to help for your use of SMH as it pertains to the Adabas Administration Services administration area.
<b>Refresh</b>	Refresh the screen.
<b>Remove from View</b>	Remove a node in tree-view from System Management View. For more information about System Management View, read your System Management Hub documentation.

- Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

TEST-PC\_1 v2.1 on TEST-PC

Service Name	Version	Tcpip	Active Clients	Max Clients	Age
TEST-PC_1	2.1.0.0	IPv4	0	65535	411h:36m

The following commands are available for each service:

**Note:** You must right-click on a specific service in the tree-view frame to see these commands.

Command	Use this command to:
<b>Access Status</b>	Review the access status of the selected service. For more information, read <a href="#">Reviewing the Access Status of a Service</a> , elsewhere in this section
<b>Add to Browser Favorites</b>	Add a node in tree-view to your browser favorites.
<b>Add to View</b>	Add a node in tree-view to System Management View. For more information about System Management View, read your System Management Hub documentation.
<b>Dump configuration</b>	Generate a service configuration dump in the log file. For more information, read <a href="#">Generating a Service Configuration Dump</a> , elsewhere in this section.
<b>Help</b>	Link to help for your use of the System Management Hub (SMH) as it pertains to the Adabas Administration Services administration area.
<b>New Log File</b>	Close the current Adabas Administration Services log file and start a new one. For more information, read <a href="#">Managing Adabas Administration Services Log Files</a> , elsewhere in this section.
<b>Refresh</b>	Refresh the screen.
<b>Remove from View</b>	Remove a node in tree-view from System Management View. For more information about System Management View, read your System Management Hub documentation.
<b>Set Detailed Statistics Online</b>	Indicate whether detailed statistics should be collected. For more information, read <a href="#">Dynamically Collecting Detailed Statistics</a> , elsewhere in this section.
<b>Shutdown</b>	Shut down the service. For more information, read <a href="#">Shutting Down a Service</a> , elsewhere in this section.
<b>Set Trace Level Online</b>	Set the Adabas Administration Services trace level. For more information, read <a href="#">Dynamically Setting the Trace Level</a> , elsewhere in this section.
<b>Statistics</b>	View statistics about the service. For more information, read <a href="#">Reviewing Service Statistics</a> , elsewhere in this section.
<b>View Log File</b>	View the current Adabas Administration Services log file. For more information, read <a href="#">Managing Adabas Administration Services Log Files</a> , elsewhere in this section.

## Reviewing the Access Status of a Service

➤ To review the access status of a service:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Right-click on the name of the service whose access status you want to review and select the **Access Status** command from the drop-down menu.

The access status for the selected service is displayed in the detail-view frame:

TEST-PC_1 v2.1 on TEST-PC								
▣	Name	▣	Protocol	▣	Port	▣	Status	▣
●	Client Access		TCPIP		49160		Running	
●	SMH Interface		TCPIP		49157		Running	

## Reviewing Service Statistics

---

➤ **To review the statistics for a service:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 In tree-view, right-click on the name of the service for which you want to review statistics, and select **Statistics**.

Statistics for the service appears in detail-view. For example:

TEST-PC\_1 v2.1 on TEST-PC

Statistics for Service TEST-PC_1	Count
Nodes	0
Connections	0
Clients	0
Relay Clients	0
Databases	1
Adabas Contexts	0
Adabas Calls	0
RDA Messages	0
Ebz Messages	0
Total Requests	0
Total Replies	0
Bytes Received	0
Bytes Sent	0
Relayed Messages	0
Admin Messages	0
Errors	0

## Dynamically Collecting Detailed Statistics

Collecting detailed statistics for a service can provide useful data in resolving problems. However, we do not recommend that you collect detailed statistics all the time as the performance of your system may be affected by their collection.

➤ **To dynamically turn on the collection of detailed statistics for a service:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 In tree-view, right-click on the name of the service for which you want to set detailed statistics, and select **Set Detailed Statistics On Line**.

The **Set Detailed Statistics Online** panel appears in detail-view. For example:

- 7 Click **OK** to turn on the collection of detailed statistics.

Detailed statistic collection for the service is started.

## Generating a Service Configuration Dump

---

You can request that a service configuration dump be written to the log file. This dump information includes the servers, database IDs, connections, clients, host machines, and Adabas contexts associated with the service.

### ➤ To generate a service configuration dump in the log file:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.

- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 In tree-view, right-click on the name of the service for which you want to generate a configuration dump, and select **Dump configuration**.

The **Dump Configuration** panel appears in detail-view. For example:

- 7 Click **OK** to dump the service configuration.

The dump is generated

## Setting Service Parameters Offline

You can set service parameters offline using the **Set Parameters Offline** node in tree-view.

### ➤ To set service parameters offline:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.

- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.

The following commands are available for each service:

**Note:** You must right-click on **Set Parameters Offline** in the tree-view frame to see these commands.

Command	Use this command to:
<b>Add Service Access</b>	This command is not currently functional.
<b>Add to Browser Favorites</b>	Add a node in tree-view to your browser favorites.
<b>Add to View</b>	Add a node in tree-view to System Management View. For more information about System Management View, read your System Management Hub documentation.
<b>Help</b>	Link to help for your use of the System Management Hub (SMH) as it pertains to the Adabas Administration Services administration area.
<b>Parameters Summary</b>	Review a summary of parameter settings for the selected service. For more information, read <a href="#">Reviewing the Service Parameter Summary</a> , elsewhere in this section.
<b>Refresh</b>	Refresh the screen.
<b>Remove from View</b>	Remove a node in tree-view from System Management View. For more information about System Management View, read your System Management Hub documentation.
<b>Service Filters</b>	Apply a filter to the databases, Kernels, clients, and client hosts that can interact with this service. For more information, read <a href="#">Maintaining Adabas Administration Services Filters</a> , elsewhere in this section
<b>Set Advanced Parameters</b>	Set advanced parameters for the service. For more information, read <a href="#">Setting Advanced Service Parameters</a> , elsewhere in this section.
<b>Set Basic Parameters</b>	Set basic parameters for the service. For more information, read <a href="#">Setting Basic Service Parameters</a> , elsewhere in this section.

Command	Use this command to:
<b>Set Directory Server</b>	Change the Adabas Directory Server used by the service. For more information, read <a href="#">Changing the Adabas Directory Server</a> , elsewhere in this section
<b>Set Service Scalability</b>	Set Adabas Administration Services scalability settings, as a way of improving the performance of your system. For more information, read <a href="#">Specifying Adabas Administration Services Scalability</a> , elsewhere in this section.
<b>Set Service Trace Granularity</b>	Set the Adabas Administration Services trace level. For more information, read <a href="#">Permanently Setting the Trace Level</a> , elsewhere in this section.
<b>Shutdown</b>	Shut down the service. For more information, read <a href="#">Shutting Down a Service</a> , elsewhere in this section.
<b>Status</b>	Review the status of a service. For more information, read <a href="#">Reviewing Service Status</a> , elsewhere in this section.

## Reviewing the Service Parameter Summary

➤ To review a summary of parameter settings for a service:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.

- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Parameters Summary** command from the resulting drop-down menu.

A summary of the service definition parameters appears in detail-view.

Set Parameters Offline		
☐	Parameter	Value
✓	SAGXTSDSHOST	localhost
✓	SAGXTSDSPORT	4952
✓	AASPARTITION	SAGADMIN
✓	ACCEPTED_DBIDS	
✓	REJECTED_DBIDS	
✓	SVCTRACE	0x3FF
✓	XTSTRACE	0xFFFE
✓	LNKTRACE	0xff

## Setting Basic Service Parameters

---

➤ To set basic Adabas Administration Services definition parameters:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Set Basic Parameters** command from the resulting drop-down menu.

The **Service Basic Parameters** panel appears in detail-view.

**Service Basic Parameters**

AASPARTITION ..... SAGADMIN

SERVER\_NAME ..... TEST-PC\_1

SERVER\_HOST ..... <not defined>

SERVER\_PORT ..... <not defined>

SVCTRACE ..... 0x3FF \*

Full SVC Trace

XTSTRACE ..... 0xFFFE \*

Full XTS Trace

LNKTRACE ..... 0xff \*

Full LNK Trace

LOGDIR ..... C:\TEST\AAS\log\

LOGSIZE ..... 100

DATE\_STAMP ..... <not defined>

OK Cancel Help

- 8 Modify the parameters on the **Service Basic Parameters** panel, as described in the following table. When all parameters are set as you want, click **OK** to save them.

Parameter	Description
AASPARTITION	Specify the partition in which the service is assigned, if any. For more information, read <a href="#">Understanding Partitioning</a> , elsewhere in this guide.

Parameter	Description
SERVER_NAME	<p>Optionally, specify the name for this service definition. Service names are required for connections between mainframe and open systems nodes, but if you do not specify one for the service in this parameter, Adabas Administration Services will generate one for you. In fact, whenever a new service is defined, a random name is automatically generated for it.</p> <p><b>Note:</b> Service names must be unique across the system. If two services have the same name, network connections obtained through those services may not be handled accurately. We therefore recommend that you keep a list of your service names and ensure that any generated (or manually specified) names are unique.</p> <p>Adabas Administration Services generates a random name for a new service. However, there is a small risk that a duplicate name might be generated with a service that is not started. You will want to check any generated service names against your service name list to ensure the generated name is unique.</p>
SERVER_HOST	Optionally, specify the server host name for this service.
SERVER_PORT	Optionally, specify the server port number for this service.
SVCTRACE	<p>Set the hexadecimal service trace level using this parameter. Valid values are any of the following hexadecimal values:</p> <ul style="list-style-type: none"> <li>■ 0x1 - produce trace snapshot on any error code</li> <li>■ 0x2 - trace error paths only</li> <li>■ 0x4 - trace flow control only</li> <li>■ 0x8 - produce full dumps of all activity</li> <li>■ 0x10 - trace SMH-related activity</li> <li>■ 0x100 - trace ADALNKX (Adabas calls)</li> <li>■ 0x200 - trace XTS (Software AG transport services)</li> </ul> <p>Do not specify full tracing unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.</p> <p>For more information about service tracing, read <a href="#">Tracing Adabas Administration Services Processing</a>, elsewhere in this guide.</p>
Full SVC Trace	Click in this checkbox to set the SVCTRACE value to obtain full tracing of this service's processing. Do not check this checkbox unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.
XTSTRACE	<p>Set the hexadecimal XTS trace level using this parameter. This is the trace level for Software AG transport services. Valid values are any of the following hexadecimal values:</p> <ul style="list-style-type: none"> <li>■ 0x1 - buffer the log messages</li> </ul>

Parameter	Description
	<ul style="list-style-type: none"> <li>■ 0x2 - connect calls trace</li> <li>■ 0x4 - listen calls trace</li> <li>■ 0x8 - send calls trace</li> <li>■ 0x10 - receive calls trace</li> <li>■ 0x20 - dump send/receive buffers</li> <li>■ 0x40 - directory service trace</li> <li>■ 0x80 - miscellaneous code</li> <li>■ 0x100 - internal interface trace</li> <li>■ 0x200 - TCP driver trace</li> <li>■ 0x400 - SMP trace</li> <li>■ 0x800 - Directory Server trace</li> <li>■ 0x1000 - trace statistics</li> </ul> <p>Do not specify full tracing unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.</p> <p>For more information about service tracing, read <a href="#">Tracing Adabas Administration Services Processing</a>, elsewhere in this guide.</p>
Full XTS Trace	<p>Click in this checkbox to set the XTSTRACE value to obtain full tracing of Software AG transport services processing. Do not check this checkbox unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.</p>
LNKTRACE	<p>Set the hexadecimal ADALNK trace level using this parameter. This is the trace level for Adabas calls. Valid values are the hexadecimal values "00" (no tracing) or "0x1F" (full tracing). At this time, there is no granularity to ADALNK trace levels. Do not specify full tracing unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.</p> <p>For more information about service tracing, read <a href="#">Tracing Adabas Administration Services Processing</a>, elsewhere in this guide.</p>
Full LNK Trace	<p>Click in this checkbox to set the LNKTRACE value to obtain full tracing of ADALNK processing. Do not check this checkbox unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.</p>
LOGDIR	<p>Specify the fully-qualified path of the directory where service log files should be written. For more information, read <a href="#">Specifying the Adabas Administration Services Log File Location</a>, elsewhere in this section.</p>

Parameter	Description
LOGSIZE	Specify the number of megabytes (MB) to which a service log file can grow before it is automatically closed and a new log file is started. The default is 500 MB. For more information about service log files, read <i>Managing Adabas Administration Services Log Files</i> , elsewhere in this guide.
DATE_STAMP	Indicate whether or not you want the date and time stamp to be added to every Adabas Administration Services trace statement written. Valid values are "YES" (include the date and time stamp) or "NO" (do not include the date and time stamp). The default is "NO".

The Adabas Administration Services basic parameters are updated in the appropriate service definition file. You must restart Adabas Administration Services in order for these parameter changes to take effect.

## Setting Advanced Service Parameters

» To set advanced Adabas Administration Services definition parameters:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Set Advanced Parameters** command from the resulting drop-down menu.

The **Service Advanced Parameters** panel appears in detail-view.

**Service Advanced Parameters**

ADABAS\_TIMEOUT ..... 60

TIMER\_TIMEOUT ..... 6

STATISTICS\_DETAILS ..... NO

STATISTICS\_INTERVAL ..... 60

PING\_DB\_INTERVAL ..... 0

CHECK\_DBS\_INTERVAL ..... 600

SERVICE\_THREADS ..... <not defined>

CHECK\_CXT\_INTERVAL ..... <not defined>

Protocol Family

Unspecified

IPV4 Only

IPV6 Only

OK Cancel Help

- 8 Modify the parameters on the **Service Advanced Parameters** panel, as described in the following table. When all parameters are set as you want, click **OK** to save them.

Parameter	Description
ADABAS_TIMEOUT	Specify the number of seconds the service should wait for a response from either a local or remote Adabas call before it times out. The default is 60 seconds; the minimum value you can specify is 5 seconds.
TIMER_TIMEOUT	Specify the frequency (in seconds) at which the service should check to see if it needs to run the STATISTICS_INTERVAL, PING_DB_INTERVAL, or CHECK_DBS_INTERVAL processing. The default is 6 seconds.
STATISTICS_DETAILS	Indicate whether detail statistics should be collected and displayed for clients and client hosts. Valid values for this parameter are "YES" and "NO"; the default is "NO". Note that there is the performance of your system could be affected when statistic details are collected.
STATISTICS_INTERVAL	Specify the frequency at which statistics are collected for the service, in minutes. The default is 60 minutes.
PING_DB_INTERVAL	Specify the frequency at which remote databases should be pinged to determine their status, in minutes. The default is zero (0) minutes (no pinging).
CHECK_DBS_INTERVAL	Specify the frequency at which local databases should be pinged to determine their status, in seconds. The default is 20 seconds.

Parameter	Description
SERVICE_THREADS	Specify the number of threads available for a network node. When this limit is exceeded, service requests will wait until a thread becomes available. Use this parameter to tune how your network processes requests. The default (and minimum) is 5 threads; the maximum is 1024 threads.
CHECK_CXT_INTERVAL	<p>Specify how old the Adabas contexts that are created by Adabas Administration Services clients can be, in seconds. Valid values are zero (0) or an integer between 60 and 43,200 seconds (30 days).</p> <p>Anytime a client connects with Adabas Administration Services, a context (a memory table with client information) for that specific client is created. When a client disconnects, the context is deleted. In situations when clients are disconnected abnormally (for example, they crash) or they are not disconnected for a long time (for example, when navigating on a web page), the size of Adabas Administration Services unused memory increases significantly, which can affect Adabas Administration Services performance. To avoid such situations, you can use this parameter to indicate how long contexts should be allowed to remain.</p> <p>If CHECK_CXT_INTERVAL is not zero, an Adabas Administration Services thread periodically (every minute) checks the Adabas contexts created by clients connected to Adabas Administration Services. Contexts older than the time set by this parameter are deleted.</p>
Protocol Family	<p>Select the TCP/IP protocol family used for the service. Click (check) <b>Unspecified, IPV4 Only, or IPV6 Only</b>. If you select <b>IPV4 Only</b> or <b>IPV6 Only</b>, only the selected protocol is used for communications with this service. If you select <b>Unspecified</b>, the domain name server (DNS) will determine which protocol is used; <b>Unspecified</b> is the default.</p> <p><b>Caution:</b> We recommend that you use the default value (<b>Unspecified</b>) for this parameter, allowing the DNS to determine which communication protocol is appropriate. If you do specify a specific protocol, calls to Adabas Administration Services via the other protocol type are ignored.</p>

The Adabas Administration Services advanced parameters are updated in the appropriate service definition file. You must restart Adabas Administration Services in order for these parameter changes to take effect.

## Specifying Adabas Administration Services Scalability

---

Use Adabas Administration Services scalability settings to adjust the amount in which the service is used as a way of improving the performance of your system.

➤ **To specify Adabas Administration Services scalability settings:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Set Service Scalability** command from the resulting drop-down menu.

The **Service Scalability** panel appears in detail-view.

- 8 Modify the parameters on the **Service Scalability** panel, as described in the following table. When all parameters are set as you want, click **OK** to save them.

Parameter	Description
MAX_CLIENTS	Specify the maximum number of client requests that can be processed concurrently by this service. When this limit is exceeded, client requests are rejected. The minimum value you can specify is "5"; the maximum value you can specify is "65535" or the number of clients allowed by your product license, whichever is lower.
MAX_CPU_THRESHOLD	Specify the maximum CPU usage (the threshold) for this service that can be used by clients of this service. When this CPU usage is exceeded, new clients are not accepted by the service. Valid CPU usage thresholds are expressed as percentages. The minimum value you can specify is "10"; the maximum value you can specify is "99".

The Adabas Administration Services scalability settings are updated in the appropriate service definition file. You must restart Adabas Administration Services in order for these settings to take effect.

## Maintaining Adabas Administration Services Filters

➤ To maintain the Adabas Administration Services filter list:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Service Filters** command from the resulting drop-down menu.

The **Service Filters** panel appears in detail-view.

**Service Filters**

ACCEPTED_DBIDS .....	<not defined>
REJECTED_DBIDS .....	<not defined>
ACCEPTED_KERNELS .....	<not defined>
REJECTED_KERNELS .....	<not defined>
ACCEPTED_HOSTS .....	<not defined>
REJECTED_HOSTS .....	<not defined>
ACCEPTED_CLIENTS .....	<not defined>
REJECTED_CLIENTS .....	<not defined>

- 8 Modify the parameters on the **Service Filters** panel, as described in the following table. When all parameters are set as you want, click **OK** to save them.

Parameter	Description
ACCEPTED_DBIDS	<p>Specify the database IDs for which requests should be processed by this service. If more than one database ID is needed, separate them with commas. If a range of database numbers is needed, separate them with a dash. For example, "4,12-15,62" indicates that the service should process requests to databases 4, 62, and any databases with numbers between 12 and 15 (inclusive). For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p> <p>If no databases are listed in the <b>ACCEPTED_DBIDS</b> field, the service will process all requests to all databases defined in the Adabas Directory Server, except those listed in the <b>REJECTED_DBIDS</b> field.</p>
REJECTED_DBIDS	<p>Specify the database IDs for which requests should <i>not</i> be processed by this service. If more than one database ID is needed, separate them with commas. If a range of database numbers is needed, separate them with a dash. For example, "4,12-15,62" indicates that the service should <i>not</i> process requests to databases 4, 62, and any databases with numbers between 12 and 15 (inclusive). For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p> <p>If no databases are listed in the <b>REJECTED_DBIDS</b> field, the service will process all requests to all databases defined in the Adabas Directory Server, unless a specific list is provided in the <b>ACCEPTED_DBIDS</b> field.</p>
ACCEPTED_KERNELS	<p>Specify the Kernel names for which requests should be processed by this service. If more than one Kernel name is needed, separate them with commas. For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p>
REJECTED_KERNELS	<p>Specify the Kernel names for which requests should <i>not</i> be processed by this service. If more than one Kernel name is needed, separate them with commas. For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p>
ACCEPTED_HOSTS	<p>Specify the host machine names from and to which requests should be processed by this service. If more than host machine name is needed, separate them with commas. For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p>
REJECTED_HOSTS	<p>Specify the host machine names from and to which requests should <i>not</i> be processed by this service. If more than host machine name is needed, separate them with commas. For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p>
ACCEPTED_CLIENTS	<p>Specify the client names from which requests should be processed by this service. If more than client name is needed, separate them with commas. For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p>
REJECTED_CLIENTS	<p>Specify the client names from which service requests should <i>not</i> be processed by this service. If more than client name is needed, separate them with commas. For more information, read <a href="#">Understanding Filtering</a>, elsewhere in this guide.</p>

The Adabas Administration Services filters are updated in the appropriate service definition file. You must restart Adabas Administration Services in order for these filter changes to take effect.

## Changing the Adabas Directory Server

While you can specify that different Directory Servers be used by Adabas Administration Services, this is not recommended. The ability to do this is useful for testing only, but when your network testing is complete, we recommend that the same Directory Server be used for all Software AG products.

### » To change the Directory Server for Adabas Administration Services:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Set Directory Server** command from the resulting drop-down menu.

The **Directory Server Parameters** panel appears in detail-view.

8 Fill in the fields on this panel, as described in the following table:

Field	Description	Required?
SAGXTSDSHOST	The host name on which the Directory Server is installed.	Yes
SAGXTSDSPORT	The port number assigned the Directory Server. The default is 4952. If this field is set to zero (0) or left blank, the default will be used.	No

9 Click **OK**.

The Directory Server is changed for Adabas Administration Services. You must restart Adabas Administration Services in order for this change to take effect.

## Reviewing Service Status

---

You can review the status of a service.

### ➤ To review the status of a service:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Status** command from the resulting drop-down menu.

The status of the service appears in detail-view.

## Checking Service Databases

You can check the databases managed by a service. Checking the databases causes Adabas Administration Services to search for any Adabas databases that were started recently and to refresh its internal table and corresponding SMH information. This is useful, for example, when you want to obtain the latest status of the databases that a specific service manages.

### » To check the databases managed by a service:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting services, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Right-click on **Databases** in tree-view and select **Check Databases** from the resulting drop-down menu.

A **Check Databases** panel appears in detail-view.

- 8 Click **OK** to check the service databases.

The databases are checked and the list and status of the databases is refreshed.

## Pinging Databases

---

### ➤ To ping a database managed by Adabas Administration Services:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting services, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Expand **Databases** in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases managed by the service are listed in tree-view.

- 8 Right-click on the database you want to ping and select **Ping** from the resulting drop-down menu.

A Ping panel appears in detail-view.

- 9 Specify the number of ping messages that should be sent from the service to the database in the **Number of Ping messages** box.
- 10 Click **OK** to start pinging.

The results of the ping attempts appears in detail-view, indicating whether or not the database is active.

## Dynamically Managing Direct Clients and Adabas Contexts

Direct clients are clients that process Adabas calls on the current service. Using Adabas Administration Services you can dynamically manage the direct clients of a service. You can also view statistical information about clients and contexts.

Adabas contexts are memory tokens that associate clients and Adabas databases and are used for Adabas session identification and statistics purposes.

This section covers the following topics:

- [Listing Direct Clients and Adabas Contexts](#)
- [Viewing Direct Client and Adabas Context Statistics](#)
- [Dynamically Disconnecting Direct Clients](#)
- [Dynamically Deleting Adabas Contexts](#)

## Listing Direct Clients and Adabas Contexts

### ➤ To dynamically list the clients and Adabas contexts of a service:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting service, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Expand **Clients** in tree-view, by clicking on the plus sign (+) to the left of its label.

The client and Adabas context definitions for the service are listed in categories in tree-view. Two categories are listed: **Direct Clients** and **Adabas Contexts**.

- 8 Expand the appropriate category (**Direct Clients** or **Adabas Contexts**) in tree-view, by clicking on the plus sign (+) to the left of its label.

The client or Adabas context definitions for the category you selected are listed in tree-view.

## Viewing Direct Client and Adabas Context Statistics

To activate this feature, set the `STATISTICS_DETAILS` parameter to "YES" on the [Service Advanced Parameters](#) screen.

### ➤ To dynamically view statistics for a direct client or Adabas context:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting services, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Expand **Clients** in tree-view, by clicking on the plus sign (+) to the left of its label.

The client and Adabas context definitions for the service are listed in categories in tree-view. Two categories are listed: **Direct Clients** and **Adabas Contexts**.

- **Direct Clients:** Direct clients are clients directly connected to this service. These clients are included in Adabas Administration Services counts for currently active clients.
  - **Adabas Contexts:** Adabas contexts are memory tokens that associate clients and Adabas databases and are used for Adabas session identification and statistics purposes.
- 8 Expand the appropriate category (**Direct Clients** or **Adabas Contexts**) in tree-view, by clicking on the plus sign (+) to the left of its label.

The client or Adabas context definitions for the category you selected are listed in tree-view.

- 9 Click on the client or Adabas context name whose statistics you wish to view.

A panel appears in detail-view listing statistics about the client or Adabas context.

## Dynamically Disconnecting Direct Clients

### ➤ To dynamically disconnect a direct client of a service:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting services, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Expand **Clients** in tree-view, by clicking on the plus sign (+) to the left of its label.

The client and Adabas context definitions for the service are listed in categories in tree-view. Two categories are listed: **Direct Clients** and **Adabas Contexts**.

- 8 Expand the **Direct Clients** category in tree-view, by clicking on the plus sign (+) to the left of its label.

The client definitions are listed in tree-view.

- 9 Right-click on the name of the client you wish to disconnect and select **Disconnect** from the resulting drop-down menu.

A panel appears in detail-view requesting confirmation of the disconnect request.

- 10 Click **OK** to disconnect the selected client.

The client is disconnected.

## Dynamically Deleting Adabas Contexts

### ➤ To dynamically delete an Adabas context of a service:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting services, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Expand **Clients** in tree-view, by clicking on the plus sign (+) to the left of its label.

The client and Adabas context definitions for the service are listed in categories in tree-view. Two categories are listed: **Direct Clients** and **Adabas Contexts**.

- 8 Expand **Adabas Contexts** category in tree-view, by clicking on the plus sign (+) to the left of its label.

The Adabas context definitions for the service are listed in tree-view.

- 9 Right-click on the name of the Adabas context you wish to delete and select **Delete** from the resulting drop-down menu.

A panel appears in detail-view requesting confirmation of the deletion request.

- 10 Click **OK** to delete the selected Adabas context.

The Adabas context is deleted.

## Dynamically Managing Service Client Hosts

---

Client hosts are the host machines from which client requests are sent to the service. Adabas Administration Services lets you dynamically manage your service's interaction with client hosts.

This section covers the following topics:

- [Listing Client Hosts](#)
- [Viewing Client Host Statistics](#)
- [Dynamically Disconnecting All Clients and Contexts of a Client Host](#)

### Listing Client Hosts

➤ **To dynamically list the client hosts of a service:**

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting service, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Expand **Client Hosts** in tree-view, by clicking on the plus sign (+) to the left of its label.

The client host definitions for the service are listed in tree-view.

## Viewing Client Host Statistics

### ➤ To dynamically view statistics for a service client host:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting service, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.
- 7 Expand **Client Hosts** in tree-view, by clicking on the plus sign (+) to the left of its label.

The client host definitions for the service are listed in tree-view.

- 8 Click on the client host name whose statistics you wish to view.

A panel appears in detail-view listing statistics about the client host.

## Dynamically Disconnecting All Clients and Contexts of a Client Host

### ➤ To dynamically disconnect all the clients and context of a client host:

Make sure you have accessed the System Management Hub and that the service is started. For complete information about starting service, read [Starting Adabas Administration Services](#), elsewhere in this guide.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.

2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.

3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label.

7 Expand **Client Hosts** in tree-view, by clicking on the plus sign (+) to the left of its label.

The client host definitions for the service are listed in tree-view.

8 Right-click on the name of the client host whose clients and Adabas contexts you wish to disconnect and select **Disconnect all clients** from the resulting drop-down menu.

A panel appears in detail-view requesting confirmation of the disconnect request.

9 Click **OK** to disconnect all of the clients on the selected client host.

The clients and Adabas contexts are disconnected.

## Shutting Down a Service

---

### ➤ To shut down a service:

Make sure you have accessed the System Management Hub.

1 Select the name of the managed host on which Adabas Administration Services is installed.

2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.

3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 In tree-view, right-click on the name of the service you want to shut down and select **Shutdown** command from the resulting drop-down menu.

A request to confirm that you want to shut down the service appears in detail-view.

- 7 Click **OK**.

The service is shut down.

## Managing Adabas Administration Services Log Files

---

You can view the current Adabas Administration Services log file or start a new one. This section describes both processes.

- [Viewing the Service Log File](#)
- [Starting a New Adabas Administration Services Log File](#)
- [Specifying the Adabas Administration Services Log File Location](#)

### Viewing the Service Log File

» **To view the log file for the Adabas Administration Services:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of services appears.

- 5 In tree-view, right-click on the name of the service whose log file you want to view and select the **View Log File** command from the resulting drop-down menu.

The console log for the services appears in detail-view.

### Starting a New Adabas Administration Services Log File

You can close the current log file for an Adabas Administration Services and start a new one at any time. When you do this, the current log file (*aas-svc.log*) is saved under a new name and is cleared of all log entries. The name of the renamed log file is assigned in the format *aasnnnnn.log*, where *nnnnn* is an incremental number determined by the number of the most recent log file that was renamed and saved. The log file with the name that includes the highest number is the most recently saved log file.

By default, Adabas Administration Services log files are stored in the *logsvc* directory in one of the following locations:

- In Windows 7 environments: ProgramData\Software AG\Entire Net-Work Server\logsvc75
- In UNIX environments: \$SAG\aas\.

If you would like to specify the location in which server log files should be stored, read [Specifying the Adabas Administration Services Log File Location](#), elsewhere in this section.

#### ➤ To start a new log file for Adabas Administration Services:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of services appears.

- 5 In tree-view, right-click on the name of the service for which you want to start a new log file and select the **New Log File** command from the resulting drop-down menu.

The **Start New Log File** panel appears in detail-view.

- 6 Click **OK**.

A new log file is started for Adabas Administration Services and the old one is closed.

### Specifying the Adabas Administration Services Log File Location

You can specify the fully-qualified path of the directory in which log files should be stored. If you do not specify a log file location, the default location for Adabas Administration Services log files (the *logsvc* directory) will be used. This directory will be stored in one of the following locations:

- In Windows 7 environments: `ProgramData\Software AG\Entire Net-Work Server\logsvc75`
- In UNIX environments: `$SAG\wcp\.`

#### ➤ To specify the log file location:

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.

The drop-down menu for setting service parameters offline appears in tree-view.

- 6 In tree-view, right-click on **Set Parameters Offline** and select the **Set Basic Parameters** command from the resulting drop-down menu.

The **Service Basic Parameters** panel appears in detail-view.

**Service Basic Parameters**

AASPARTITION ..... SAGADMIN

SERVER\_NAME ..... TEST-PC\_1

SERVER\_HOST ..... <not defined>

SERVER\_PORT ..... <not defined>

SVCTRACE ..... 0x3FF \*

Full SVC Trace

XTSTRACE ..... 0xFFFF \*

Full XTS Trace

LNKTRACE ..... 0xff \*

Full LNK Trace

LOGDIR ..... C:\TEST\AAS\log\

LOGSIZE ..... 100

DATE\_STAMP ..... <not defined>

OK Cancel Help

7

8 Specify the fully-qualified path of the directory in which you want log files stored in the **LOGDIR** parameter. When all parameters are set as you want, click **OK**.

The Adabas Administration Services parameters are updated.

## Tracing Adabas Administration Services Processing

There are three kinds of trace processing that can occur when using Adabas Administration Services:

- Traces can be performed for individual service processing.
- Traces can be performed for Software AG transport services processing (XTSTRACE).
- Traces can be performed for Software AG communications processing (ADALNK).

Tracing should be used only for problem analysis. When you specify trace levels, large trace files will be stored on your disks and performance will be affected. Therefore, we recommend that you perform this function only under the advisement of your Software AG technical support representative.

- [Managing Service Tracing](#)
- [Managing Software AG Transport Services Tracing](#)
- [Managing Software AG Communications Tracing](#)

## Managing Service Tracing

Tracing should be used only for problem analysis. When you specify trace levels, large trace files will be stored on your disks and performance will be affected.

**Caution:** While you can set the trace level for a service using SMH, we recommend that you perform this function only under the advisement of your Software AG technical support representative.

You can set the trace level for a service dynamically (immediately and for only this execution of the service) or permanently (for future executions of the service). The dynamic trace level setting occurs immediately, but if the service is restarted, it is reset to the trace level specified in the service definition. The permanent trace level setting occurs in the service definition and takes effect only when the service is restarted.

This section covers the following topics:

- [Permanently Setting the Trace Level](#)
- [Dynamically Setting the Trace Level](#)

### Permanently Setting the Trace Level

➤ **To set the trace level offline in SMH for the service:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Set Service Trace Granularity** command from the resulting drop-down menu.

The **Set Service Trace Granularity** panel appears in detail-view.

- 8 Select appropriate trace levels as requested by your Software AG support representative.

The **Trace All**, **No Trace**, and **Ignore global settings** radio buttons are mutually exclusive selections. The **Trace All** and **No Trace** radio buttons are provided as *global* trace settings.

- If you select **Trace All**, data is collected for all of the trace levels listed on the panel, regardless of what you have selected (checked).

- If you select the **No Trace** radio button, data is collected for *none* of the trace levels listed on the panel, regardless of what you have selected (checked).
- The **Ignore global settings** radio button *must* be selected if you want to collect trace data for only some of the trace levels listed on the panel. This ensures that neither the **Trace All** and **No Trace** radio buttons are selected and indicates to Adabas Administration Services that specific trace level data collection is requested.

9 Click **OK**.

The trace level is set. You must restart the service in order for these trace level changes to take effect.

### Dynamically Setting the Trace Level

➤ **To dynamically set the trace level for the service:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 In tree-view, right-click on the name of the service for which you want to set the trace level and select **Set Trace Level Online** command from the resulting drop-down menu.

The **Set Trace Level Online** panel appears in detail-view.

7 Select appropriate trace levels as requested by your Software AG support representative.

The **Trace All**, **No Trace**, and **Ignore global settings** radio buttons are mutually exclusive selections. The **Trace All** and **No Trace** radio buttons are provided as *global* trace settings.

- If you select **Trace All**, data is collected for all of the trace levels listed on the panel, regardless of what you have selected (checked).
- If you select the **No Trace** radio button, data is collected for *none* of the trace levels listed on the panel, regardless of what you have selected (checked).
- The **Ignore global settings** radio button *must* be selected if you want to collect trace data for only some of the trace levels listed on the panel. This ensures that neither the **Trace All** and **No Trace** radio buttons are selected and indicates to Adabas Administration Services that specific trace level data collection is requested.

8 Click **OK**.

The trace level is set. You must stop and restart the service in order for these settings to take effect.

## Managing Software AG Transport Services Tracing

Tracing should be used only for problem analysis. When you specify trace levels, large trace files will be stored on your disks and performance will be affected.

 **Caution:** We recommend that you perform this function only under the advisement of your Software AG support representative.

Once Software AG transport services tracing is activated, the trace messages are written to the Adabas Administration Services log file. For more information about the Adabas Administration Services log file, read [Managing Adabas Administration Services Log Files](#), elsewhere in this guide.

➤ **To set the Software AG transport services trace level and activate transport services tracing:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Set Basic Parameters** command from the resulting drop-down menu.

The **Service Basic Parameters** panel appears in detail-view.

**Service Basic Parameters**

AASPARTITION ..... SAGADMIN

SERVER\_NAME ..... TEST-PC\_1

SERVER\_HOST ..... <not defined>

SERVER\_PORT ..... <not defined>

SVCTRACE ..... 0x3FF \*

Full SVC Trace

XTSTRACE ..... 0xFFFF \*

Full XTS Trace

LNKTRACE ..... 0xff \*

Full LNK Trace

LOGDIR ..... C:\TEST\AAS\log\

LOGSIZE ..... 100

DATE\_STAMP ..... <not defined>

OK Cancel Help

- 8 Modify the **XTSTRACE** parameter and **Full XTS Trace** checkbox on the **Service Basic Parameters** panel, as requested by your Software AG technical support representative. These parameters are described in the following table. When all parameters are set as you want, click **OK** to save them.

Parameter	Description
XTSTRACE	Set the XTS trace level using this parameter.
Full XTS Trace	Click in this checkbox to set the XTSTRACE value to obtain full tracing of Software AG transport services processing. Do not check this checkbox unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.

The transport services trace levels are set and activated.

## Managing Software AG Communications Tracing

Tracing should be used only for problem analysis. When you specify trace levels, large trace files will be stored on your disks and performance will be affected.

 **Caution:** We recommend that you perform this function only under the advisement of your Software AG support representative.

Once Software AG communications tracing is activated, the trace messages are written to the Adabas Administration Services log file. For more information about the Adabas Administration Services log file, read [Managing Adabas Administration Services Log Files](#), elsewhere in this guide.

➤ **To set the Software AG communications trace level and activate communications tracing:**

Make sure you have accessed the System Management Hub.

- 1 Select the name of the managed host on which Adabas Administration Services is installed.
- 2 Expand the tree-view frame for the managed host by clicking on the plus sign (+) to the left of its name.
- 3 Select **Adabas Administration Services** in the tree-view under the managed host.

The Adabas Administration Services administration area of the System Management Hub becomes available to you.

- 4 Expand **Services** in tree-view, by clicking on the plus sign (+) to the left of its label.

The list of installed services appears.

- 5 Expand the name of a service in the server list in tree-view, by clicking on the plus sign (+) to the left of its label.

The databases, clients, and client hosts that are supported by the service are listed in groups in tree-view, as well as access to the offline service parameters you can set. In addition, details about the selected service are displayed in detail-view.

- 6 Expand the specific service name in tree-view, by clicking on the plus sign (+) to the left of its label and then select the **Set Parameters Offline** node in tree-view.
- 7 In tree-view, right-click on **Set Parameters Offline** and select the **Set Basic Parameters** command from the resulting drop-down menu.

The **Service Basic Parameters** panel appears in detail-view.

**Service Basic Parameters**

AASPARTITION ..... SAGADMIN

SERVER\_NAME ..... TEST-PC\_1

SERVER\_HOST ..... <not defined>

SERVER\_PORT ..... <not defined>

SVCTRACE ..... 0x3FF \*

XTSTRACE ..... 0xFFFF \*

Full XTS Trace

LNKTRACE ..... 0xff \*

Full LNK Trace

LOGDIR ..... C:\TEST\AAS\log\

LOGSIZE ..... 100

DATE\_STAMP ..... <not defined>

OK Cancel Help

- 8 Modify the **LNKTRACE** parameter and **Full LNK Trace** checkbox on the **Service Basic Parameters** panel, as requested by your Software AG technical support representative. These parameters are described in the following table. When all parameters are set as you want, click **OK** to save them.

Parameter	Description
LNKTRACE	Set the ADALNK trace level using this parameter.
Full LNK Trace	Click in this checkbox to set the LNKTRACE value to obtain full tracing of ADALNK processing. Do not check this checkbox unless specifically instructed to do so by a Software AG technical support representative. If you do, your installation could be overrun with trace messages that would be meaningless to you and would likely affect system performance.

The communications trace levels are set and activated.

The *aasutil.exe* batch utility program allows you to perform Adabas Administration Services administration functions in a batch environment on the Adabas Administration Services installed on the local machine. The *aasutil.exe* program can be found in the */bin* directory wherever Adabas Administration Services is installed.

This chapter covers the following topics:

## Syntax for Starting the Utility

---

The syntax of the *aasutil.exe* batch program is:

```
aasutil [help=yes]
```

This command should be entered on the command prompt after switching to the */bin* directory wherever Adabas Administration Services is installed.

After entering this command, the utility is started and the following instructions are displayed, prompting you to make a selection:

```
Software AG Adabas Administration Service 2.5 Utility Program
(c) Copyright Software AG 1998-2017. All Rights Reserved.
USAGE: aasutil [trace=tracevalue (0-65534)] [help=yes]
Adabas Administration Service URL
TCPIP://AMV76402:49155?AASSERVICE=ON&Version=2.5.0.0
AMV76402_1 is Active
Please, choose one of the following functions:
(1) List Adabas Administration Service parameters
(2) Show service statistics
(3) List all databases
(4) Show a database statistics
(5) List listens
(6) List all clients
(7) Show a client statistics
(8) Stop a client
(9) Stop all clients
(10) List all ADABAS contexts
(11) Show a context statistics
(12) Delete a context
(13) Delete all contexts
(14) List all hosts
(15) Show a host statistics
(16) Disconnect a host
(17) Shutdown this service
(18) Exit this utility
:
```

---

## Getting Help

---

To get help with the *aasutil.exe* batch program, enter the following command prompt after switching to the */bin* directory wherever Directory Server is installed:

```
aasutil help=yes
```

Help for the *aasutil.exe* batch program displays on the screen.

---

## Exiting the Utility

---

➤ To exit the *aasutil.exe* batch program, complete the following steps:

- Enter an "18" at the utility prompt to select function 8 (Exit this utility).

The utility stops.

---

## Listing Adabas Administration Services Parameters

---

➤ To list the parameters in the configuration file for this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "1" at the utility prompt to select function 1 (List Adabas Administration Services parameters).

A list of all parameters the Adabas Administration Services configuration file, *sagadmin.config*, displays on the screen.

---

## Displaying Adabas Administration Services Statistics

---

➤ To display statistics for this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "2" at the utility prompt to select function 2 (Show service statistics).

Statistics associated with the Adabas Administration Services display on the screen.

## Listing Databases Registered by this Adabas Administration Services

---

➤ To list databases registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "3" at the utility prompt to select function 3 (List all databases).

A list of all databases registered by this Adabas Administration Services displays on the screen.

## Displaying Statistics for a Database Registered by this Adabas Administration Services

---

➤ To display statistics for a database registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "4" at the utility prompt to select function 4 (Show a database statistics).

You are prompted to enter a database ID (DBID).

- 3 Enter a DBID at the utility prompt.

Statistics for the database display on the screen.

Statistics for all databases registered by this Adabas Administration Services display on the screen.

## Listing Listens Performed by this Adabas Administration Services

---

➤ To list the listens performed by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "5" at the utility prompt to select function 5 (List listens).

Listen statistics for this Adabas Administration Services display on the screen.

## Listing Clients Registered by this Adabas Administration Services

---

➤ To list the clients registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "6" at the utility prompt to select function 6 (List all clients).

A list of the clients registered by this Adabas Administration Services displays on the screen.

## Displaying Statistics for a Client Registered by this Adabas Administration Services

---

➤ To display statistics for a client registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "7" at the utility prompt to select function 7 (Show a client statistics).

You are prompted to enter a client ID.

- 3 Enter a client ID at the utility prompt.

Statistics for the client display on the screen.

## Stopping a Client Registered by this Adabas Administration Services

---

➤ To stop a client registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "8" at the utility prompt to select function 8 (Stop a client).

You are prompted to enter a client ID.

- 3 Enter a client ID at the utility prompt.

The selected client is stopped.

## Stopping All Clients Registered by this Adabas Administration Services

---

➤ To stop all clients registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "9" at the utility prompt to select function 9 (Stop all clients).

All clients registered to this Adabas Administration Services are stopped.

## Listing All Adabas Contexts Registered by this Adabas Administration Services

---

➤ To list all Adabas contexts registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "10" at the utility prompt to select function 10 (Stop all Adabas contexts).

All Adabas contexts registered to this Adabas Administration Services display on the screen.

## Displaying Statistics for an Adabas Context Registered by this Adabas Administration Services

---

➤ To display statistics for a context registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "11" at the utility prompt to select function 11 (Show a context statistics).

You are prompted to enter a context ID.

- 3 Enter a context ID at the utility prompt.

Statistics for the context display on the screen.

## Deleting an Adabas Context Registered by this Adabas Administration Services

---

› To delete an Adabas context registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "12" at the utility prompt to select function 12 (Delete a context).

You are prompted to enter a context ID.

- 3 Enter a context ID at the utility prompt.

The selected context is deleted.

## Deleting All Adabas Contexts Registered by this Adabas Administration Services

---

› To delete all Adabas contexts registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "13" at the utility prompt to select function 13 (Delete all contexts).

The contexts are deleted.

## Listing All Hosts Registered by this Adabas Administration Services

---

› To list all hosts registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "14" at the utility prompt to select function 14 (List all hosts).

A list of the hosts registered by this Adabas Administration Services displays on the screen.

## Displaying Statistics for a Host Registered by this Adabas Administration Services

---

➤ To display statistics for a host registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "15" at the utility prompt to select function 15 (Show a host statistics).

You are prompted to enter a host ID.

- 3 Enter a host ID at the utility prompt.

Statistics for the host display on the screen.

## Disconnecting a Host Registered by this Adabas Administration Services

---

➤ To display statistics for a host registered by this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "16" at the utility prompt to select function 16 (Disconnect a host).

You are prompted to enter a host ID.

- 3 Enter a host ID at the utility prompt.

The selected host is disconnected.

## Shutting Down this Adabas Administration Services

---

➤ To shut down this Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section.
- 2 Enter a "17" at the utility prompt to select function 17 (Shutdown this service).

The Adabas Administration Services is shut down.

# 8

## Using the adiutil Batch Program

---

▪ Syntax for Starting the Utility .....	84
▪ Getting Help .....	85
▪ Exiting the Utility .....	85
▪ Locating an Active Directory Server .....	85
▪ Determining If a Directory Server is Active .....	86
▪ Listing Databases Registered by All Adabas Administration Services .....	86
▪ Listing Databases Registered by a Specific Adabas Administration Services .....	87
▪ List all Registered Adabas Administration Services .....	87
▪ List all Registered Adabas Manager Communicators .....	88
▪ Changing the Directory Server for the Local Adabas Administration Services .....	88

The Directory Server utility program, *adiutil.exe*, allows you to detect Directory Servers on the host machine and to obtain lists of databases, Adabas Administration Services, and Adabas Manager Communicators registered in a Directory Server. This utility can also be used to change the Directory Server used by the local Adabas Administration Services. The *adiutil.exe* program can be found in the */bin* directory wherever Adabas Administration Services is installed.

By default, the Directory Server host and port are the values defined in the local Adabas Administration Services configuration file, *sagadmin.config*. If you want to use a different Directory Server, specify the host and port parameters on the *adiutil.exe* batch program.

This chapter covers the following topics:

### Syntax for Starting the Utility

---

The syntax of the *adiutil.exe* batch program is:

```
adiutil [host=hostname port=portnum] [help=yes]
```

This command should be entered on the command prompt after switching to the */bin* directory wherever Adabas Administration Services is installed.

By default, the Directory Server host and port are the values defined in the local Adabas Administration Services configuration file, *sagadmin.config*. If you want to use a different Directory Server, use the host and port parameters to specify the host name and port number of the machine on which the other Directory Server is installed.

After entering this command, the utility is started and the following instructions are displayed, prompting you to make a selection:

```
Please, choose one of the following functions:  
(1) Find a Directory Server  
(2) Check if a Directory Server is active by host and port  
(3) List all databases registered by Adabas Administration Services  
(4) List the databases registered by a specific Adabas Administration Service  
(5) List all Adabas Administration Services  
(6) List all Adabas Manager Communicators  
(7) Change the Directory Server for the local Adabas Administration Service  
(8) Exit the utility  
:
```

---

## Getting Help

---

To get help with the *adiutil.exe* batch program, enter the following command prompt after switching to the */bin* directory wherever Directory Server is installed:

```
adiutil help=yes
```

Help for the *adiutil.exe* batch program displays on the screen.

---

## Exiting the Utility

---

➤ To exit the *adiutil.exe* batch program, complete the following steps:

- Enter an "8" at the utility prompt to select function 8 (Exit the utility).

The utility stops.

---

## Locating an Active Directory Server

---

➤ To locate an active Directory Server using the *adiutil.exe* batch program, complete the following steps:

- 1 Start the utility, as described in [Syntax for Starting the Utility](#), elsewhere in this section, if you want to locate a Directory Server on the machine defined in the local Adabas Administration Services configuration file, *sagadmin.config*.

Or:

Start the utility, specifying an alternate host name and port number, as described in [Syntax for Starting the Utility](#), elsewhere in this section, if you want to locate a Directory Server on a remote machine (in a remote Adabas Administration Services configuration file).

- 2 Enter a "1" at the utility prompt to select function 1 (Find a Directory Server).

A list of active Directory Servers found by the utility displays on the screen.

The utility locates active Directory Servers by searching the following system elements, using the following search order:

1. The utility searches the local configuration file (file *sagadmin.config*).
2. The utility searches for an XTSDSURL environment variable setting.

3. The utility searches for the SAGXTSDSHOST AND SAGXTSDDSPORT DNS entries.
4. The utility searches the local machine for port 4952.

## Determining If a Directory Server is Active

---

➤ To determine whether a Directory Server is active using the *adiutil.exe* batch program, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to determine whether the Directory Server defined in the local Adabas Administration Services configuration file, *sagadmin.config*, is active.

Or:

Start the utility, specifying an alternate host name and port number, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to determine whether a Directory Server on a remote machine (in a remote Adabas Administration Services configuration file) is active.

- 2 Enter a "2" at the utility prompt to select function 2 (Check if a Directory Server is active by host and port).

A single sentence indicating whether the Directory Server is active or not displays on the screen.

## Listing Databases Registered by All Adabas Administration Services

---

➤ To list databases registered by all Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list databases registered by all Adabas Administration Services in the Directory Server defined in the local Adabas Administration Services configuration file, *sagadmin.config*.

Or:

Start the utility, specifying an alternate host name and port number, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list databases registered by all Adabas Administration Services in a remote Directory Server (in a remote Adabas Administration Services configuration file).

- 2 Enter a "3" at the utility prompt to select function 3 (List all databases registered by Adabas Administration Services).

A list of all databases registered by all Adabas Administration Services displays on the screen.

---

## Listing Databases Registered by a Specific Adabas Administration Services

---

➤ To list databases registered by a specific Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list databases registered by a specific Adabas Administration Services in the Directory Server defined in the local Adabas Administration Services configuration file, *sagadmin.config*.

Or:

Start the utility, specifying an alternate host name and port number, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list databases registered by a specific Adabas Administration Services in a remote Directory Server (in a remote Adabas Administration Services configuration file).

- 2 Enter a "4" at the utility prompt to select function 4 (List all databases registered by a specific Adabas Administration Services).

You are prompted to supply the server name of the specific Adabas Administration Services.

- 3 Enter the server name of the specific Adabas Administration Services.

A list of all databases registered by the specific Adabas Administration Services displays on the screen.

---

## List all Registered Adabas Administration Services

---

➤ To list all Adabas Administration Services registered to an Directory Server, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list Adabas Administration Services registered by the Directory Server defined in the local Adabas Administration Services configuration file, *sagadmin.config*.

Or:

Start the utility, specifying an alternate host name and port number, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list Adabas Administration

Services registered by a remote Directory Server (in a remote Adabas Administration Services configuration file).

- 2 Enter a "5" at the utility prompt to select function 5 (List all Adabas Administration Services).

A list of all Adabas Administration Services registered by the Directory Server displays on the screen.

## List all Registered Adabas Manager Communicators

---

➤ To list all Adabas Manager Communicators registered to an Directory Server, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list Adabas Manager Communicators registered by the Directory Server defined in the local Adabas Administration Services configuration file, *sagadmin.config*.

Or:

Start the utility, specifying an alternate host name and port number, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to list Adabas Manager Communicators registered by a remote Directory Server (in a remote Adabas Administration Services configuration file).

- 2 Enter a "6" at the utility prompt to select function 6 (List all Adabas Manager Communicators).

A list of all Adabas Manager Communicators registered by the Directory Server displays on the screen.

## Changing the Directory Server for the Local Adabas Administration Services

---

➤ To change the Directory Server for the local Adabas Administration Services, complete the following steps:

- 1 Start the utility, as described in *Syntax for Starting the Utility*, elsewhere in this section, if you want to change the Directory Server used by the local Adabas Administration Services (in the local Adabas Administration Services configuration file, *sagadmin.config*).
- 2 Enter a "7" at the utility prompt to select function 7 (Change the Directory Server for the local Adabas Administration Services).

You are prompted to enter the host name of the Directory Server to which you would like to switch.

- 3 At the prompt, enter the host name of the Directory Server to which you would like to switch.

You are prompted to enter the port number of the Directory Server to which you would like to switch.

- 4 At the prompt, enter the port number of the Directory Server to which you would like to switch.

You are prompted to verify that you want to make the change.

- 5 At the prompt, enter the "y" (Yes) to make the change or "n" (No) to void the change.

If you enter "y", the Directory Server used by the local Adabas Administration Services is changed; if you enter "n", no change is made.

# 9 Port Number Reference

---

- Port Overview and General Assignments ..... 92

This chapter describes the ports that are needed by Adabas LUW and Entire Net-Work LUW products to perform its processing and how they can be assigned.

## Port Overview and General Assignments

The following table describes the ports that are needed by Entire Net-Work to perform its processing and any default ports assumed by Entire Net-Work. You should consider avoiding the use of these default port numbers for other applications.

Software AG Product Component	Ports Needed	Default Port Number
Adabas Manager Communicator	One port is needed.	4980
Adabas Directory Server	One port is needed for Entire Net-Work requests to the Directory Server	4952 (IANA port)  <b>Note:</b> If older versions of Entire Net-Work (older than 7.3) are in use, this port number may need to be changed to 12731.
Adabas Manager	One port is needed for Adabas Manager administration tasks	dynamically assigned
Entire Net-Work Kernel	A port is needed for Kernel access by clients	dynamically assigned
	A port is needed for Kernel access via connections (Entire Net-Work 7 or later)	dynamically assigned
	A port is needed for Kernel access via RDA connections (Entire Net-Work 2)	7869
	A port is needed for Adabas Manager administration of Kernels	dynamically assigned

Software AG has registered port number 4952 with the Internet Assigned Numbers Authority (IANA) for use by the Adabas Directory Server. For more information about Directory Server port number specifications, read *The Directory Server Port Number* in the *Software AG Directory Server Installation and Administration Guide*.

In general, there are no default port numbers assigned to Entire Net-Work Kernels or clients. These are dynamically assigned by Entire Net-Work when the Kernel or client is started, unless you specify a specific port or range of ports to use when you define the Kernel or client. If you set the port number to "0", the Entire Net-Work will dynamically assign a port.
