

# Overview

This document describes the enhancements and changes provided in Adabas Parallel Services version 7.5. Adabas Parallel Services is the multi-update-nuclei implementation of an earlier product, Adabas Support for Multiprocessing (ADASMP).

Error messages, ADARUN parameters associated with the Adabas nucleus, and utility functions used with Adabas Parallel Services are documented in the base Adabas version 7.4 documentation. Parameters associated with the ADACOM program are documented in section *ADACOM Initialization Parameters*.

See the section *Utility Processing* for pointers to relevant information in the Adabas Utilities documentation.

This document is organized as follows:

	<i>Required Environment</i>	Describes the operating system, Software AG product, and zap requirements for this release.
	<i>Migration from Earlier Releases of Adabas Parallel Services</i>	Provides information on migrating Adabas Parallel Services cluster from older releases to this one.
	<i>Enhancements</i>	Describes the new features in this release of Adabas Parallel Services
	<i>Adabas Add-on Products Overview</i>	Lists the Adabas add-on products supported by this release of Adabas Parallel Services.
