Maintaining Display Programs

When a report is saved, Adabas Review automatically generates a Natural program that is used to display the data collected by the report. When you issue the VW command for a history report or a report that has been started, the generated display program is executed and the data is displayed on your terminal screen.

This part of the documentation discusses the commands that enable you to process the Natural display program that corresponds to a report definition. You can

- generate a display program for a copied report definition;

- edit a display program;

- regenerate a display program; or

- change to a different display program.

The Adabas Review Maintaining Display Programs documentation is organized in the following topics:

●	Generating a Display Program
●	Editing the Display Program
●	Regenerating a Display Program
●	Changing to a Different Display Program
