TRGUNLD and **TRGLOAD** Utilities

The unload and load utilities for the Adabas triggers and stored procedures facility are part of the online Trigger Maintenance facility and are run in a Natural environment:

Utility	is used to
TRGUNLD	unload trigger definitions from the Adabas trigger file and related file-field table entries and write them to a work file.
TRGLOAD	load trigger definitions and related file-field tables from the TRGUNLD work file into the trigger file.

The work file for TRGUNLD is a Natural work file (work file 1) that is defined either

- in the batch job; or
- to the Natural environment where the unload utility is running.

The TRGUNLD work file is used as input to the TRGLOAD utility.

A report is prepared at the end of the unload or load summarizing the triggers processed.

This chapter covers the following topics:

- Starting a Utility
- Utility Parameters
- End of Processing Reports
- Utility Response Codes

Starting a Utility

To invoke a utility:

• Issue the name of the utility (TRGUNLD or TRGLOAD) as a command, optionally followed by a parameter list.

Parameters are used to limit the triggers to be processed.

Individual parameter values must be separated by the input delimiter (ID): the default is a comma ",". The input-mode parameter IM should be set to delimiter mode IM=D.

When executing a utility as a batch job, the batch job must log on to the SYSTRG library before executing the selected utility and its parameter list.

TRGUNLD

If the TRGULND utility is invoked from the command line in the online system without a parameter list, the following window is presented:

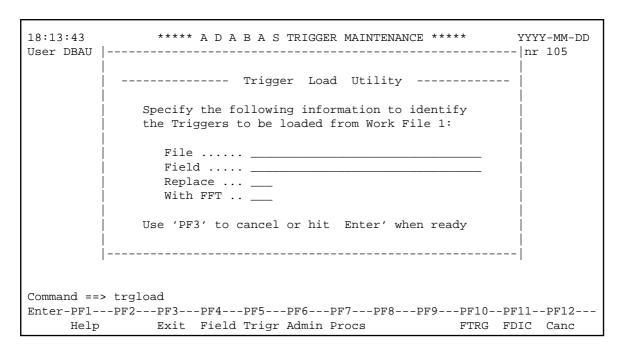

```
17:51:42
              **** A D A B A S TRIGGER MAINTENANCE *****
                                                       YYYY-MM-DD
User
     ______
    | 17:51:46 **** A D A B A S TRIGGER MAINTENANCE **** YYYY-MM-DD
     ----- Trigger Unload Utility -----
          Specify the following information to identify
          the Triggers to be unloaded to Work File 1:
           File Name ..... _
           Field .....___
           Pre-triggers .. ____
           Command Type .. ___
           Active State .. _
          Trigger Type .. _
          Use 'PF3' to cancel or hit Enter' when ready
Command ==> trgunld
Enter-PF1---PF3---PF4---PF5---PF6---PF7---PF8---PF9---PF10--PF11--PF12---
    Help Exit Field Trigr Admin Procs FTRG FDIC Canc
```

Enter values for the parameters as needed to limit the trigger definitions being unloaded. Any parameters left blank assume the default values.

If no parameters are specified for TRGUNLD, *all* triggers on the trigger file are unloaded and the related file-field table entries as well.

TRGLOAD

If the TRGLOAD utility is invoked from the command line in the online system without a parameter list, the following window is presented:

If no parameters are specified for TRGLOAD, *all* triggers and file-field table entries found on the TRGUNLD work file are loaded into the trigger file.

Utility Parameters

Wildcard Notation

The following "wildcard" or special character notation can be used in values specified for FILE and FIELD parameters discussed in the following sections for each utility:

Character	Example	Load triggers with file or field names
*	PERS*	that start with "PERS"
>	PERS>	that have a value greater than "PERS"
<	PERS<	that have a value less than "PERS"

TRGUNLD Parameters

The following parameters are available to limit the triggers unloaded from the trigger file into the work file during TRGUNLD processing (the default value for each parameter is "*" to include all possibilities):

Parameter	Description	
FILE	Name of a file found in the trigger definition. Valid values are	
	a file name ("wildcard" notation allowed)	
	* all files (the default)	

Parameter	Description			
FIELD	Name of a fi	Name of a field found in the trigger definition. Valid values are		
	a field name	("wildcard" notation allowed)		
	*	all fields (the default)		
PRE	Specifies pro	e-trigger or post-trigger. Valid values are		
	Y	pre-trigger		
	N	post-trigger		
	*	both		
CMD	Command ty	ype that causes trigger to fire. Valid values are		
	R	read		
	F	find		
	I	insert		
	U	update		
	D	delete		
	*	all command types (the default)		
ACT	State of the	trigger to be processed. Valid values are		
	A	active		
	D	not active (deactive)		
	*	both		
TYPE	Type of part	icipation of trigger in user's ET logic. Valid values are		
	A	asynchronous		
	N	non-participating		
	P	participating		
	*	all participation types		

TRGUNLD Parameter Examples

TRGUNLD FILE=EMPLOYEES

Specifying the FILE parameter limits the triggers unloaded to those defined for the specified file, in this case the EMPLOYEES file.

TRGUNLD FILE=VEHICLES, PRE=Y, ACT=A, TYPE=N

Combining parameters further limits the triggers unloaded. In this case, only active, non-participating pre-triggers defined for the VEHICLES file are unloaded. Note that the parameters must be separated by the input delimiter as specified in the ID parameter in the Natural environment.

TRGLOAD Parameters

The following parameters are available to limit the triggers loaded from the TRGUNLD work file to the trigger file during TRGLOAD processing:

Parameter	Description
FILE	Name of a file found in the trigger definition. Valid values are a file name ("wildcard" notation allowed) * all files (the default)
FIELD	Name of a field found in the trigger definition. Valid values are a field name ("wildcard" notation allowed) * all fields (the default)
FFT	Request that the file-field table entry found on the TRGUNLD input data set be loaded with the trigger. Valid values are Y yes (the default) N no
REPLACE	Request that a trigger definition being loaded that already exists on the database replace the old one. Valid values are Y yes: replace the existing definition with the new one N no (the default): do not replace the existing definition and return an error message

TRGLOAD Parameter Examples

TRGLOAD FILE=EMP*

Load into the trigger file all file-field table entries and triggers found on the TRGUNLD input work file for files starting with "EMP".

TRGLOAD FFT=N,REPLACE=Y

Ignore any file-field table entries read from the work file. If any trigger definition read from the work file has the same specifications as an existing trigger definition, replace the existing definition with the definition from the work file.

End of Processing Reports

Unload Report (TRGUNLD)

A report is written out at the end of the unload process stating the number of trigger definitions and the number of file-field table entries unloaded.

Example

The first page of the report indicates the source file and database for unloading the triggers and summarizes the selection criteria. Following this is a list of each record being unloaded into the work file:

```
18:12:00
                   ***** TRIGGERS UNLOAD UTILITY *****
                                                                   YYYY-MM-DD

Utility Response Codes

Code	Meaning
000	Function completed successfully.
013	Invalid file-field table entry specified. Triggers requires access to a file-field table that maps long file names to file numbers and field names to Adabas two-character field identifiers. See section <i>File-Field Tables</i> for more information.
016	No trigger definition found with this criteria.
023	Field name not found for this file. The field name specified does not exist in the file-field table for this file. See section <i>File-Field Tables</i> for more information.
025	Invalid command type. See list above for valid values.
027	No field found for this file and command type.
029	No trigger found for this file, command, and field criteria.
039	Natural subprogram name is invalid.
041	Trigger type may be "A", "N", or "P" only.
042	CALLNAT type may be "C", "E", or "N" only.
043	Record buffer usage may be "A", "N", or "U" only.
047	Trigger already exists with this criteria.
103	File name must not be blank.
110	File-field table entry already exists for file.
1xxx	Function resulted in an Adabas response code 22 where "xxx" represents the subcode.
3xxx	Nonzero Adabas response code was returned, where "xxx" is the actual Adabas response code.
9999	Function not successful. Verify parameters and existing trigger definitions. For more information, contact your Software AG technical support representative.
