

# Operator Commands

Operator commands must be directed at the Adabas System Coordinator daemon since it is the daemon that handles the physical interaction with the system. However, operator commands can be passed onto the Fastpath Buffer Management service executing inside the daemon – provided the “AFP” prefix precedes the details of the command, as shown below. The following commands are available through the MVS Modify (F) command, VSE operator command, VM/ESA after switching to VM READ mode, and BS2000 commands.

Command	Description
AFP RESTART	Perform an orderly shutdown immediately followed by buffer initialization.
AFP NEWCOPY	Perform an orderly shutdown, load a new copy of the Fastpath nucleus for all connected Fastpath components, and initialize the buffer.
AFP STAT AFP DSTAT	Display general performance statistics.
AFP SNAP	Take a snap dump of the Fastpath buffer. Operation is <i>not</i> terminated.

**Note:**

You can achieve all the above actions using Adabas Fastpath Online Services (See SYSAFP Special Services) without needing to enter an operator command.

Command	Description
AFP HELP	Display all possible operator commands.
