Platform Coverage and Prerequisites

At this time, SAF-secured Replicator databases are not supported.

This chapter describes the supported platforms, database requirements, and the prerequisite Software AG products, for this version of Event Replicator Administration. It contains the following topics:

- Supported Platforms

- Database Requirements

- Prerequisite Software AG Products

Supported Platforms

This release of Event Replicator Administration supports the same platforms as Adabas Manager. For more information, read *Platform Coverage and Prerequisites* .

Database Requirements

Event Replicator Administration requires that all Event Replicator Servers be defined with the ADARUN parameter NONDES set to YES (nondescriptors are allowed in search buffers). This requirement does not apply to non-replicator targets accessed by Event Replicator Administration.

Prerequisite Software AG Products

If you want to use the Data Mapping Tool to generated GFBs and field tables, read *Prerequisites* for a list of prerequisites for using the Data Mapping Tool.

If you want to use Event Replicator Administration to maintain replication definitions, please make sure that you have all the prerequisite products installed for Adabas Manager. Event Replicator Administration runs under Adabas Manager and has the same requirements. For more information about the prerequisite products for Adabas Manager, read *The Adabas Manager Environment*.
