

FDTPRINT: Print/ Dump Field Definition Table

```
ADAICK FDTPRINT FILE = file-number  
[NOUSERABEND]
```

Use the FDTPRINT function to print and dump the field definition table (FDT) of a file.

Note:

Report output produced by the ADAICK FDTPRINT utility function lists logically deleted fields as asterisks (**).

Note:

The NOOPEN parameter can be specified for this function, but is ignored by Adabas.

This chapter covers the following topics:

- Essential Parameter
- Optional Parameters

Essential Parameter

FILE: File Number

The number of the file for which the FDT is to be printed/dumped. A file number is required the first time you execute ADAICK.

If FILE is omitted on subsequent executions, the last file accessed by ADAICK is used.

Optional Parameters

NOUSERABEND: Termination without Abend

When an error is encountered while the function is running, the utility prints an error message and terminates with user abend 34 (with a dump) or user abend 35 (without a dump). When NOUSERABEND is specified, it must be specified as the first parameter (before all other parameters) for the utility function.

If NOUSERABEND is specified, the utility will *not* abend after printing the error message. Instead, the message "utility TERMINATED DUE TO ERROR CONDITION" is displayed and the utility terminates with condition code 20.
