File Definitions Used in ACB Examples

The following file definitions are used in the examples that follow in this documentation. Two file structures (files 1 and 2) are used.

The following tables show the structures of files 1 and 2 where

SF is standard format

SL is standard length

File 1

File 1 is neither security-protected nor ciphered. Certain examples in the documentation assume that file 1 has been coupled to file 2 using the descriptor AA as the basis for coupling.

Adabas Definition	Explanation
01,GA	Group GA, consisting of fields AA and AB.
02,AA,8,A,DE,NU	Elementary field AA; SL is 8 bytes, SF is alphanumeric, descriptor, null value suppression.
02,AB,2,P,DE,NU	Elementary field AB; SL is 2, SF is packed, descriptor, null value suppression.
01,AC,20,A,NU	Elementary field AC; SL is 20, SF is alphanumeric, null value suppression.
01,MF,3,A,MU,DE,NU	Multiple value field MF; SL is 3, SF is alphanumeric, descriptor, null value suppression.
01,GB,PE	Periodic group GB.
02,BA,1,B,DE,NU	Elementary field BA (within periodic group GB); SL is 1, SF is binary, descriptor, null value suppression.
02,BB,5,P,NU	Elementary field BB (within periodic group GB); SL is 5, SF is packed, null value suppression.
02,BC,10,A,NU	Elementary field BC (within periodic group GB); SL is 10, SF is alphanumeric, null value suppression.
01,GC,PE	Periodic group GC.
02,CA,7,A,DE,NU	Elementary field CA (within periodic group GC); SL is 7, SF is alphanumeric, descriptor, null value suppression.
02,CB,10,A,MU,NU SF	Multiple value field CB (within periodic group GC); SL is 10, is alphanumeric, null value suppression.

File 2

File 2 is security-protected. It is not ciphered. Certain examples in this documentation assume that file 2 is coupled to file 1 using field RA as the basis for coupling.

Adabas Definition	Explanation
01,RG	Group RG, consisting of all the fields in the record.
02,RA,8,A,DE,NU	Elementary field RA; SL is 8, SF is alphanumeric, descriptor, null value suppression.
02,RB,10,A,DE	Elementary field RB; SL is 10, SF is alphanumeric, descriptor.
02,GX	Group GX, consisting of the fields XA, XB, XC, XD, and XE.
03,XA,10,A	Elementary field XA; SL is 10, SF is alphanumeric.
03,XB,2,P,DE	Elementary field XB; SL is 2, SF is packed, descriptor.
03,XC,6,U	Elementary field XC; SL is 6, SF is unpacked.
03,XD,8,A,DE,NU	Elementary field XD; SL is 8, SF is alphanumeric, descriptor, null value suppression.
03,XE,5,A,DE,NU	Elementary field XE; SL is 5, SF is alphanumeric, descriptor, null value suppression.
SA=RA(1,4)	Subdescriptor SA; derived from bytes 1 through 4 of field RA, format is alphanumeric.
SB=RA(1,8),RB(1,4)	Superdescriptor SB; derived from bytes 1 through 8 of field RA and bytes 1 through 4 of field RB, format is alphanumeric.
SC=XB(1,2),XC(1,6)	Superdescriptor SC; derived from bytes 1 through 2 of field XB and bytes 1 through 6 of field XC, format is binary.

ACB Assembler Examples

This section contains examples of using direct Adabas calls in Assembler. The previously defined Adabas files defined are used in each example.

Example 2

- All records in file 1 are to be read in physical sequential order.
- Each record read is to be updated with the following values:
 - Field AA = ABCDEFGH
 - Field AB = 500
- User is to have exclusive control of file 1.

Issue Open Command

```

Update Record

- The same fields are to be updated as were read.
- The same CID and format buffer can be used for the update command.
- The ISN of the record to be updated is already in the ISN field as a result of the L2 command.

```

EX2C MVC  CCODE ,=C'A1'           UPDATE COMMAND

Example 3 : User Session with ET Logic

During user session initialization, the user program is to display information indicating the last successfully processed transaction of the previous user session.

For each user transaction, the user program is to

- accept from a terminal 8 characters of input to be used as the key for updating files 1 and 2; and
- issue the Find command for file 1 to determine if a record exists with field AA = input key.

If no record is found, the user program is to issue a message. If a record is found, the user program is to

- delete the record from file 1; and
- add a new record to file 2: Field RA = input key entered.

Other fields are to contain a null value.

If the record cannot be successfully added, the user program is to issue a BT command and display an error message.

If both updates are successful, the user program is to issue an ET command.

- Session Initialization
- Transaction Processing

Session Initialization

The section of the program illustrated is only executed during user session initialization:

Issue Open Command

The OP command is issued with ET data of the previous session being read:

```

EXMP3 EQU *

      MVC RB(8),=C'UPD=1,2.'   FILES 1 AND 2 TO BE UPDATED
      CALL ADABAS,(CB,FB,RB)   CALL ADABAS
      CLC RC,=H'0'             CHECK RESPONSE CODE
      BE EX3A                  BRANCH IF RESPONSE CODE 0

*                               . . .

```

Display ET Data

Display the ET data contained in the record buffer on the terminal screen to inform the user of the last successfully processed transaction of the previous user session:

```

      B EX3C                    BRANCH TO BEGIN TRANS. PROCESS.
EX3B EQU *

```

No ET Data Received

If no ET data was received, a message is displayed indicating that no transactions were successfully processed during the previous user session.

Transaction Processing

This section is executed for each user transaction:

```

EX3C EQU *

*                               ACCEPT INPUT FROM TERMINAL . . .

```

Issue Find Command

Issue the Find command for file 1 to determine if a record exists with the field AA equal to the input key entered:

```

EX3D EQU *

EX3E EQU *
CLC  ISNQ,=F'0'         CHECK NUMBER OF RECORDS FOUND
BNE  EX3F              BRANCH IF RECORD FOUND

```

Issue Message if No Record is Found

If no record is found, the user program issues a message requesting a correction:

```
B    EX3C                RETURN TO ACCEPT USER INPUT
```

Delete Record from File 1

The ISN of the record to be deleted is already in the ISN field and in hold status as a result of the S4 command.

```

EX3F EQU *

Example 2

- All records in file 1 are to be read in physical sequential order.
- Each record read is to be updated with the following values:
 - Field AA = ABCDEFGH

- Field AB = 500
- User is to have exclusive control of file 1.

Issue Open Command

```
EXMP2.
MOVE      'OP' TO COMMAND-CODE.
MOVE      'EXU=1.' TO RECORD-BUFFER.
CALL      'ADABAS' USING

IF RESPONSE-CODE = 0 GO TO EX2C.
IF RESPONSE-CODE = 3 GO TO EX2EXIT.
GO TO EX2ERR.
```

Update Record

- The same fields are to be updated as were read.
- The same CID and format buffer can be used for the update command.
- The ISN of the record to be updated is already in the ISN field as a result of the L2 command.

```
EX2C.
MOVE      'A1' TO COMMAND-CODE.
MOVE      'ABCDEFGH' TO RECORD-BUFFER-A.
MOVE      AB-VALUE TO RECORD-BUFFER-B.
CALL      'ADABAS' USING

Close User Session

```
EX2EXIT.
MOVE      'CL' TO COMMAND-CODE.
CALL      'ADABAS' USING CONTROL-BLOCK.
IF RESPONSE-CODE NOT EQUAL TO 0 GO TO EX2ERR.
```

Example 3 : User Session with ET Logic

During user session initialization, the user program is to display information indicating the last successfully processed transaction of the previous user session.

For each user transaction, the user program is to

- accept from a terminal 8 characters of input to be used as the key for updating files 1 and 2; and
- issue the Find command for file 1 to determine if a record exists with field AA = input key.

If no record is found, the user program is to issue a message. If a record is found, the user program is to

- delete the record from file 1; and
- add a new record to file 2: Field RA = input key entered.

Other fields are to contain a null value.

If the record cannot be successfully added, the user program is to issue a BT command and display an error message.

If both updates are successful, the user program is to issue an ET command.

Session Initialization

This section of the program is only executed during user session initialization.

- The OP command is issued with ET data of the previous session being read.
- A message is displayed on the terminal screen identifying the last successfully processed transaction of the user's previous session.

 - Issue a Find command for file 1 to determine if a record exists with field AA = input key.
 - If no record is found, issue a message.
 - If a record is found:

- Delete the record from file 1;
- Add a new record to file 2: Field RA = input key entered. Other fields to contain null value.
- If the record cannot be successfully added, issue a BT command, display error message.
- If both updates are successful, issue an ET command.
