Adabas Review terminates processing.

Action If another target was inadvertently initialized, quiesce and terminate the target and

restart Adabas Review. To prevent such problems, ensure that the FORCE=YES

parameter is not used for target initialization unless absolutely necessary.

AREV84 hub-id USER GONE ON MPM-8 CALL

Explanation The Adabas Review hub tried to process a request but the addressed data area was not

addressable, or no longer contained recognizable data. This error occurred while

Adabas Review was receiving the request (router-08 call processing). It is probable that the client nucleus was terminated while it was sending the request to Adabas Review.

Action None required. Adabas Review cannot process this request so it is cleared from the

queue.

Review, and restart Adabas Review.

AREV92 hub-id BREAK DETECTED IN SEQUENCE NUMBERS

hub-id EXPECTED SEQUENCE NUMBER xxxxx hub-id RECEIVED SEQUENCE NUMBER yyyyy

Explanation The Adabas Review hub processes the requests in the order that the numbered requests

are received. This means that Adabas Review always knows the next number in sequence that should be received. If there is a discrepancy, this message is displayed along with the expected sequence number and the sequence number actually received. A skipped or missing sequence number can indicate that a request has been dropped by

the router. Adabas Review continues processing.

Action Lost requests may indicate that the hub is overloaded. Check the client nuclei for

nonzero response codes received from the hub. In some cases, the number of commands (NC) parameter needs to be increased to accommodate the load from the client nuclei. Otherwise, divide up the Adabas Review monitoring work load on multiple hubs.
