

# About this Documentation

This section describes the parameters and client runtime controls which are used to control Adabas Vista processing. These parameters and controls are defined and maintained using Adabas Vista Online Services.

- Adabas Vista Parameters
- Adabas Vista Client Runtime Controls

Vista shares some runtime controls with Adabas System Coordinator. When a new runtime control is added a panel appears with the title System Coordinator Runtime Controls. Please refer to the Adabas System Coordinator for further information on the controls appearing in this panel.
