Programmable Command Interface

The Entire Net-Work Programmable Command Interface (PCI) is a callable interface that allows application programs to issue Entire Net-Work operator commands and process results from the commands.

- For 3GL applications, the Entire Net-Work subroutine NETPCI is provided. 3GL applications must be linked with both NETPCI and the ADAUSER module.

- For Natural applications, the CALLNAT subroutine USR1070N and the sample program USR1070P are provided in the library SYSEXT.

- For C applications, a sample program is provided.

This section covers the following topics:

- NODE Statement Parameters

- Calling the PCI from a 3GL Program

- Sample C Program

NODE Statement Parameters

The PCI is controlled using the following NODE statement parameters (for more information, see the section *Entire Net-Work NODE Statement*):

Parameter	Function
ENDCMD	Controls whether operator commands such as NETEND that end Entire Net-Work operation are accepted through the PCI.
LOGSIZE	Specifies the size of a wrap-around buffer used to contain the most recent output written to DDPRINT.
PASSWORD	Enables or disables the Entire Net-Work PCI.
REMCMD	Controls the acceptance of remote PCI calls.

Calling the PCI from a 3GL Program

3GL programs use the NETPCI subroutine to communicate with the PCI. Each call must provide the following ten parameters:

Parameter	Description
TARGET	Target ID of the Entire Net-Work node being addressed.
PASSWORD	Value specified by the PASSWORD parameter on the NODE statement.
FUNCTION	PCI function: COMMAND, CONSOLE, or LOGON.
PLEN	Length of the parameter for the PCI function.
PARM	Parameter for the PCI function.
LINENO	Line number from the CONSOLE function.
RLEN	Length of the PCI reply buffer.
RESULT	PCI reply buffer.
RC	PCI response code.
REASON	PCI reason code.

TARGET

Format:	Unsigned binary, length 2.
Input:	The node ID of the Entire Net-Work node to be addressed. If TARGET is set to 0 (zero), the call is presented to the local Entire Net-Work node.
Output:	The node ID of the answering node. This is identical to the input value, except for the LOGON function, or when the input value is 0 (zero).

PASSWORD

Format:	Alphanumeric, length 8
Input:	The password of the Entire Net-Work node addressed. This must match the password specified on the NODE statement in the Entire Net-Work parameter file DDKARTE.

FUNCTION

Format:	Alphanumeric, length 8, left justified
Input:	The function to be executed by the Entire Net-Work node, i.e., LOGON, COMMAND, or CONSOLE

The following functions can be specified and are described in this section:

- LOGON
- COMMAND
- CONSOLE

LOGON

The LOGON function can be used by an application to verify a user-supplied password or determine an Entire Net-Work node ID for a given node name.

- A logon request is accepted by any Entire Net-Work Version 5.7 or later node, regardless of its PASSWORD setting.

- The request is then forwarded to the target node whose node name is specified by PARM.

- After successful logon, the node ID of the responding Entire Net-Work node is returned as the value of TARGET.

The return code (RC) is one of the following:

RC	Meaning
0	LOGON function was successful.
22	LOGON function was rejected. REASON Indicates the cause of the rejection.
148	The node specified by either TARGET or PARM could not be reached. REASON Net-Work node that generated the response code.

COMMAND

The COMMAND function causes the operator command specified by PARM to be executed on the node specified by TARGET.

Output generated during command execution that would normally be written to the local system console is placed in the RESULT output parameter. Each output line is followed by X'15'.

Output generated asynchronous to command execution is not included. For example, in response to a PROBE command, RESULT may contain the following message:

```
  NET0136I: PROBE MESSAGE SENT
```

The message is followed by X'15'. However, no indication of the failure or success of the probe message is returned (i.e., no message NET0135.)

The length of the response is returned in RLEN. The return code (RC) is one of the following:

RC	Meaning
0	COMMAND function was successful.
22	COMMAND function was rejected. REASON Indicates the cause of the rejection.
53	Resulting output is longer than the length of RESULT, as indicated in RLEN. The length needed is returned in the parameter REASON.
148	The node specified by TARGET could not be reached. REASON contains the node ID of the Entire Net-Work node that generated the response code.

CONSOLE

The CONSOLE function causes lines from the wrap-around log buffer to be returned in the RESULT parameter.

- Each line is followed by X'15'.

- As many lines are returned as fit into RESULT of length RLEN.

- Output parameter LINENO contains the line number of the first line in RESULT.

- Output parameter RLEN contains the length of the data returned.

The return code (RC) is one of the following:

RC	Meaning
0	CONSOLE function was successful and data was returned.
3	No data was returned; the NODE statement of the target node contains no LOGSIZE keyword.
22	CONSOLE function was rejected. REASON indicates the cause of the rejection.
148	The node specified by TARGET could not be reached. REASON contains the node ID of the Entire Net-Work node that generated the response code.

PLEN

Format:	Binary, length 2
Input:	The length of data in the PARM parameter. The length must not exceed 80 characters.

PARM

Format:	Alphanumeric, length 80 maximum	
Input:	The parameter for the PCI function, as follows:	
	Function	Parameter
	LOGON	The node name of the Entire Net-Work node.
	COMMAND	An Entire Net-Work operator command.
	CONSOLE	None

LINENO

Format:	Binary, length 4
Input:	Reserved for future use. Should be set to 0 (zero).
Output:	For the CONSOLE function only, the line number of the first line received in RESULT.

RLEN

Format:	Binary, length 2
Input:	The maximum length of data that can be received in the output parameter RESULT. The maximum length is 32767. For the LOGON function, RLEN can be set to zero.
Output:	The actual length of the data returned in RESULT.

RESULT

Format:	Alphanumeric, length must be less than 32768
Output:	The response buffer for the COMMAND and CONSOLE functions.

RC

Format:	Binary, length 4
Output:	The return code received from the Programmable Command Interface. For possible values, see the FUNCTION parameter. For any other value returned, see the section *Entire Net-Work Codes*.

REASON

Format:	Binary, length 4
Output:	For all return codes except 53 and 22, this parameter contains the node ID of the Entire Net-Work node that generated the return code.
	For return code 53, this parameter contains the length needed to receive the result.
	For return code 22, this parameter contains one of the following:

Value	Meaning
0	Target Entire Net-Work node is not Version 5.7 or later.
101	Remote commands are not accepted (REMCMD=NO).
103	The PCI is disabled (no value specified for the PASSWORD parameter on the NODE statement).
104	
Invalid password.	
105	Invalid FUNCTION (the value specified is not LOGON, CONSOLE, or COMMAND).

Sample C Program

The following C program calls the NETPCI subroutine.

```
/*    This program is a sample application demonstrating the use     */
/* of function 'netpci' as Programmable Command Interface for        */
/* Entire Entire Net-Work V5.7 or later. This interface allows the        */
/* programmer to 'logon' to a Net-work node, issue                   */
/* operator commands and receive the reply in a buffer.              */
/* Multiple output lines in the reply buffer are separated by        */
/* logical line-end X'15'. Also, a function is provided to retrieve   */
/* a wrap-around buffer that mirrors recent output to DDPRINT.        */
/*                                                                   */
/*                                                                   */
/* Programming Note:                                                 */
/*    In the data definition below, variable 'target' is initialized  */
/*    to zero.                                     */
/*                                                                   */
#include <stdio.h>
