

# ONLREORFDATA: Start Online Reorder Data for Files

The ONLREORFDATA function starts an online process to reorder the Data Storage of specified files.

## Notes:

1. The online reorder process does not change the existing file extents but only reorganizes the file's Data Storage records within these extents.
2. This function is not available in the Adabas Cluster Services or Adabas Parallel Services environments.

```
ADADBS ONLREORFDATA FILE = file-number
                        [DATAPFAC = data-padding-factor ]
                        [SORTSEQ = { ISN | de-name } ]
                        [PASSWORD = password ]
                        [NOUSERABEND]
                        [TEST]
                        [WAIT]
```

This chapter covers the following topics:

- Essential Parameters
- Optional Parameters
- Example

---

## Essential Parameters

### FILE: File Number

FILE specifies the file to which the parameters that follow in the statement sequence apply.

Several files and their related parameters may be specified within one ONLREORFDATA operation. In this case, the files are reordered in the specified sequence.

If a component file of an Adabas expanded file is specified, only that file's Data Storage is reordered; this has no adverse effect on the other component files.

The Adabas checkpoint or security file number must not be specified.

## Optional Parameters

### DATAPFAC: Data Storage Padding Factor

DATAPFAC specifies the Data Storage padding factor. The number specified represents the percentage of each Data Storage block that remains unused when the file is reordered. A value in the range 1-90 may be specified (see ADALOD utility for additional information about setting and using the Data Storage padding factor).

If this parameter is omitted, the current padding factor in effect for the file is used.

### **SORTSEQ: File Reordering Sequence**

SORTSEQ determines the sequence in which the file is processed. If this parameter is omitted, the records are processed in physical sequence.

#### **Note:**

Records within a single Data Storage block are not sorted according to the specified sequence.

If a descriptor is specified, the file is processed in the logical sequence of the descriptor values. *Do not* use a hyperdescriptor, a phonetic descriptor, a multiple-value field, or a descriptor contained in a periodic group.

If ISN is specified, the file is processed in ascending ISN sequence.

### **PASSWORD: File Password**

If the file is password-protected, use this parameter to specify the password.

### **NOUSERABEND: Termination without Abend**

When a parameter error or a functional error occurs while this utility function is running, the utility ordinarily prints an error message and terminates with user abend 34 (with a dump) or user abend 35 (without a dump). If NOUSERABEND is specified, the utility will *not* abend after printing the error message. Instead, the message "*utility* TERMINATED DUE TO ERROR CONDITION" is displayed and the utility terminates with condition code 20.

#### **Note:**

When NOUSERABEND is specified, we recommend that it be specified as the first parameter of the utility function (before all other parameters). This is necessary to ensure that its parameter error processing occurs properly.

### **TEST: Test Syntax**

The TEST parameter tests the operation syntax without actually performing the operation. Only the syntax of the specified parameters can be tested; not the validity of values and variables.

### **WAIT: Wait for End of Process**

Specify WAIT if ADADBS is to wait for the end of the online process before proceeding either with the next function or with termination.

If WAIT is not specified, ADADBS proceeds immediately after initiating the online process.

## Example

Initiate an online process that reorders the Data Storage of file 10 first, and then file 11. The Data Storage padding factor of file 11 is to be 5 percent.

```
ADADBS ONLREORFDATA FILE=10  
ADADBS FILE=11, DATAPFAC=5
```
