Restrictions

The following restrictions exist for this release of Adabas Review:

- Running Adabas Review in hub mode with communication between the Adabas nucleus and the Adabas Review hub handled by Entire Net-Work is not supported.

- When an Adabas command log record in the new ACBX structure has multiple buffers specified, only the first buffer of each ABD type (for example, the first format buffer) is used by Adabas Review for building the contents of the Adabas Buffer Fields.

- In z/VSE environments, the hub node ID cannot be greater than 255.
