## Tutorials

---

This section contains tutorials which will show you to access your Adabas database using SOA Gateway in an exemplary way, based on a number of programming languages and standard applications which have built-in SOAP facilities or extensions.

It also contains tutorials detailing how to set up and use the Usage Governace capability offered by SOA Gateway.

There is a tutorial demonstrating how EntireX can be used as a transport for SOAP messages to SOA Gateway.

- [Adabas Tutorials](#)
- [Usage Governance Tutorials](#)
- [EntireX Tutorial](#)

---

# 1 Adabas Tutorials

---

The Adabas tutorials are based on the well-known Adabas 'Employees' file. The following sample Resource definitions are put in place by the SOA Gateway server install process:

- adabas\_Employees
- adabas\_Employees\_9
- adabas\_Employees\_special
- adabas\_EmployeesMini
- adabas\_Vehicles

The default Adabas Database ID preset for the demo files is 212, which may not reflect the actual Database ID in your environment, so these will need to be adjusted before trying to run the sample programs. Please familiarize yourself with the SOA Gateway Control Center functions required to achieve this before continuing the tutorials trail.

## Basic Tutorials

The basic tutorials cover the following areas:

- [Using Java \(Axis2\) wrapper classes](#)
- [Using the PHP SOAP Extension](#)
- [Using Ruby](#)
- [Using C#](#)
- [Using soapUi](#)
- [Using Microsoft Office : Infopath](#)

## Advanced Tutorials

Dealing with LOBs (Large OBjects)

- [Preparing the LOB file](#)
- [Using LOBs with soapUi](#)
- [Using LOBs with PHP](#)
- [Using LOBs with your favourite browser](#)

Dealing with Transactions

- [Transactions using soapUi](#)

## Samples

This section also includes the following demo files and code samples that you can try out:

- [Tut\\_02\\_List.java](#)
- [ex01\\_SoaGatewayFirst.php](#)
- [ex02\\_SoaGatewayEmpList.php](#)
- [ex02a\\_SoaGatewayEmpListDescending.php](#)
- [ex02a\\_SoaGatewayEmpListSorted.php](#)
- [ex06\\_SoaGatewaySpecial\\_SubDescriptor.php](#)
- [ex06\\_SoaGatewaySpecial\\_SuperDescriptor.php](#)
- [ex03\\_SoaGatewayEmpAdd.php](#)
- [ex04\\_SoaGatewayEmpGet.php](#)
- [ex05\\_SoaGatewayEmpDel.php](#)
- [ex10\\_SoaGatewaySimpleForm.php](#)
- [ex15\\_SoaGatewayUpdateForm.php](#)
- [empMiniList.rb](#)
- [ASGDemo.cs](#)

## 2 Using Java (Axis2) wrapper classes

---

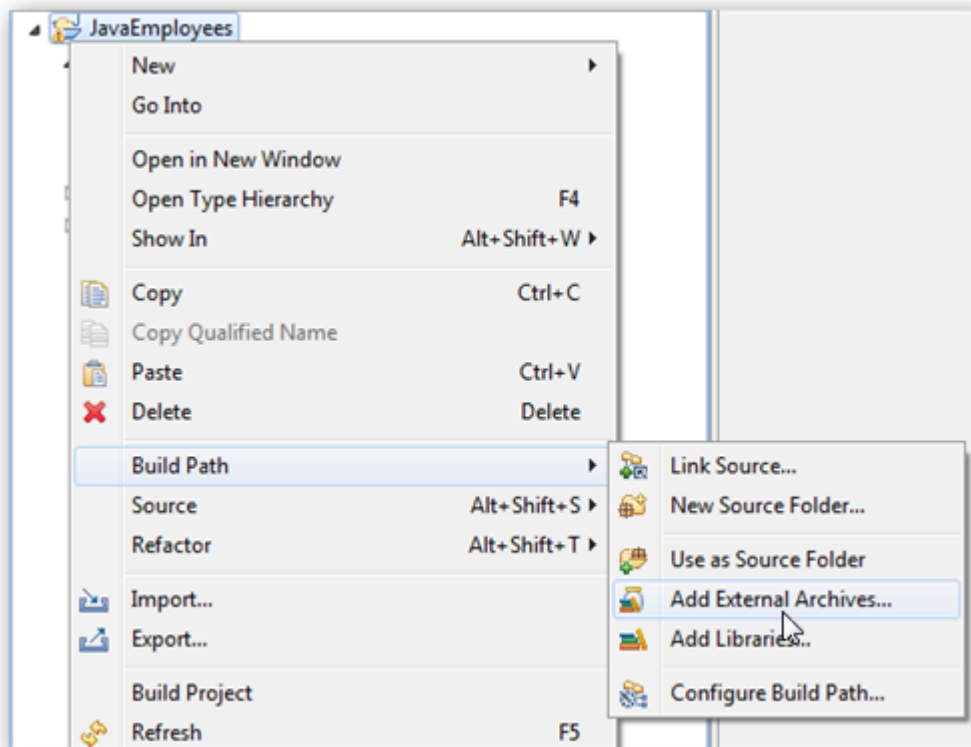

### **Tutorial: Generate a Java wrapper for the "Employees" file**

Java wrapper/stub classes are generated using the [Apache Axis2](#) feature [WSDL2Java](#).

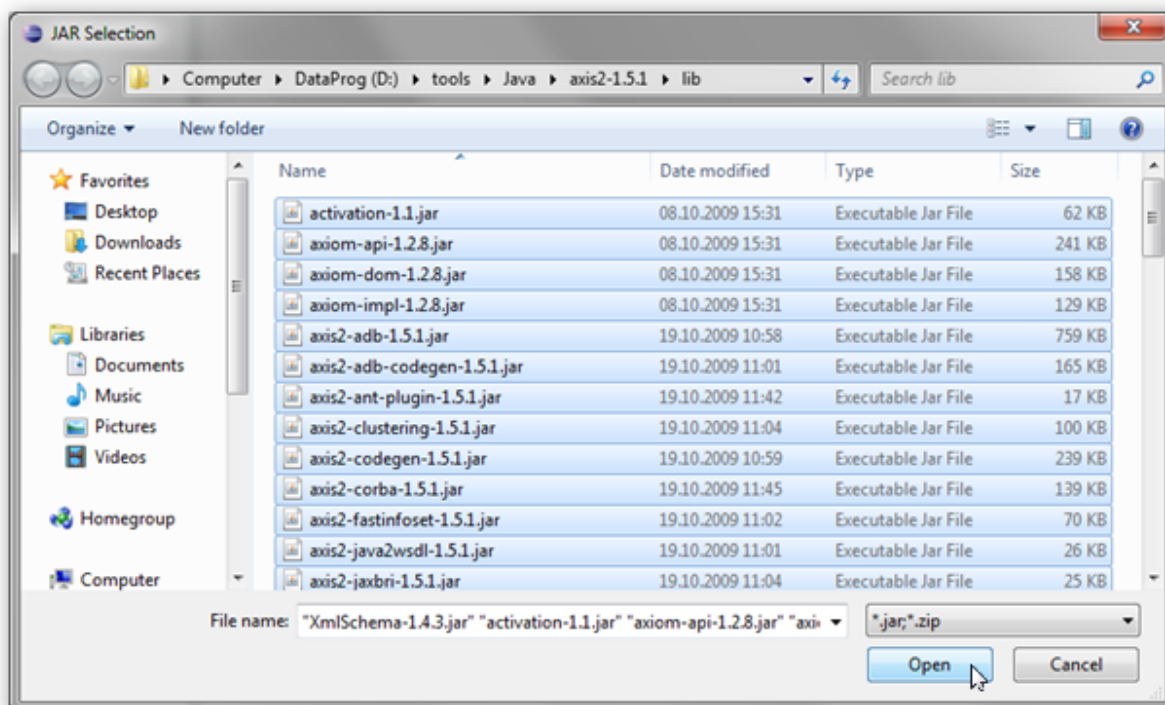

If you do not have it already, download and install the latest Axis2 kit.

These are the steps required to generate the Java wrapper classes for the "adabas\_EmployeesMini" DataView supplied with SOA Gateway:

1. Create a new Java-project (refer to Getting started with Eclipse), name it "JavaEmployees"
2. Right-click the "JavaEmployees" project folder, select "Build Path", then "Add External Archives..."

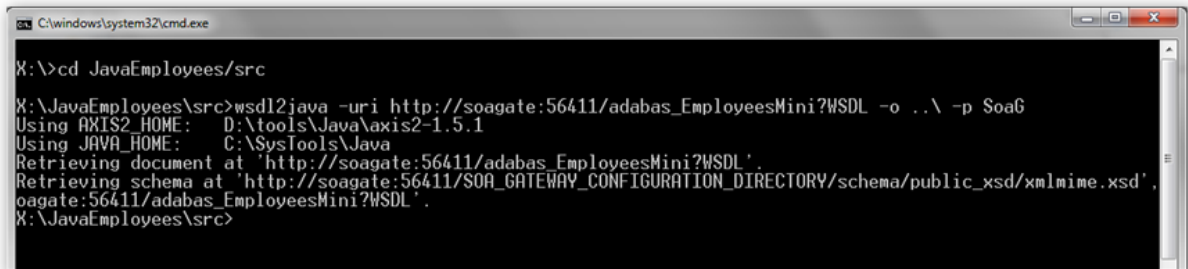

Add all .jar files from the axis2 "lib" directory to the project's Build-Path.

3. Open a command prompt (aka "DOS box"), change to the "JavaEmployees\src" directory and run the following command

```
wsdl2java -uri http://<yourserver>:<yourport>/adabas_EmployeesMini?WSDL -o ..\
-p SoaG
```

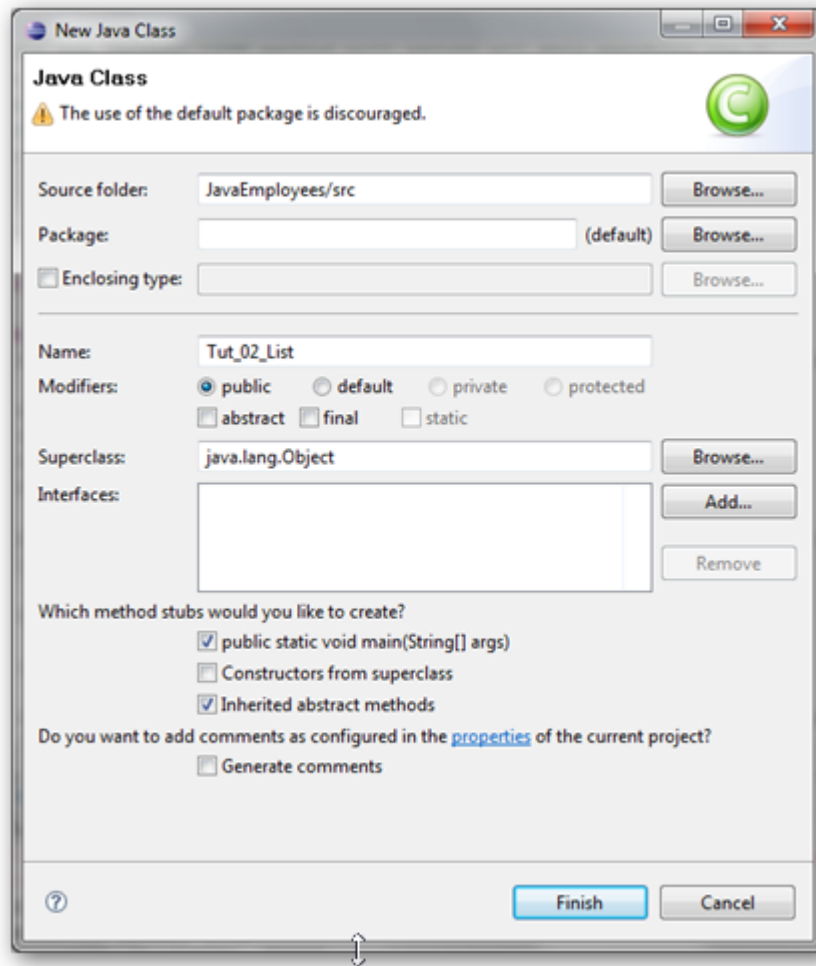

```
C:\windows\system32\cmd.exe
X:\>cd JavaEmployees/src
X:\JavaEmployees\src>wsdl2java -uri http://soagate:56411/adabas_EmployeesMini?WSDL -o ..\ -p SoaG
Using AXIS2_HOME: D:\tools\Java\axis2-1.5.1
Using JAVA_HOME: C:\SysTools\Java
Retrieving document at 'http://soagate:56411/adabas_EmployeesMini?WSDL'
Retrieving schema at 'http://soagate:56411/soa_gateway_configuration_directory/schema/public_xsd/xmlmime.xsd'
soagate:56411/adabas_EmployeesMini?WSDL'
X:\JavaEmployees\src>
```

The following items are generated from a SOA Gateway WSDL:

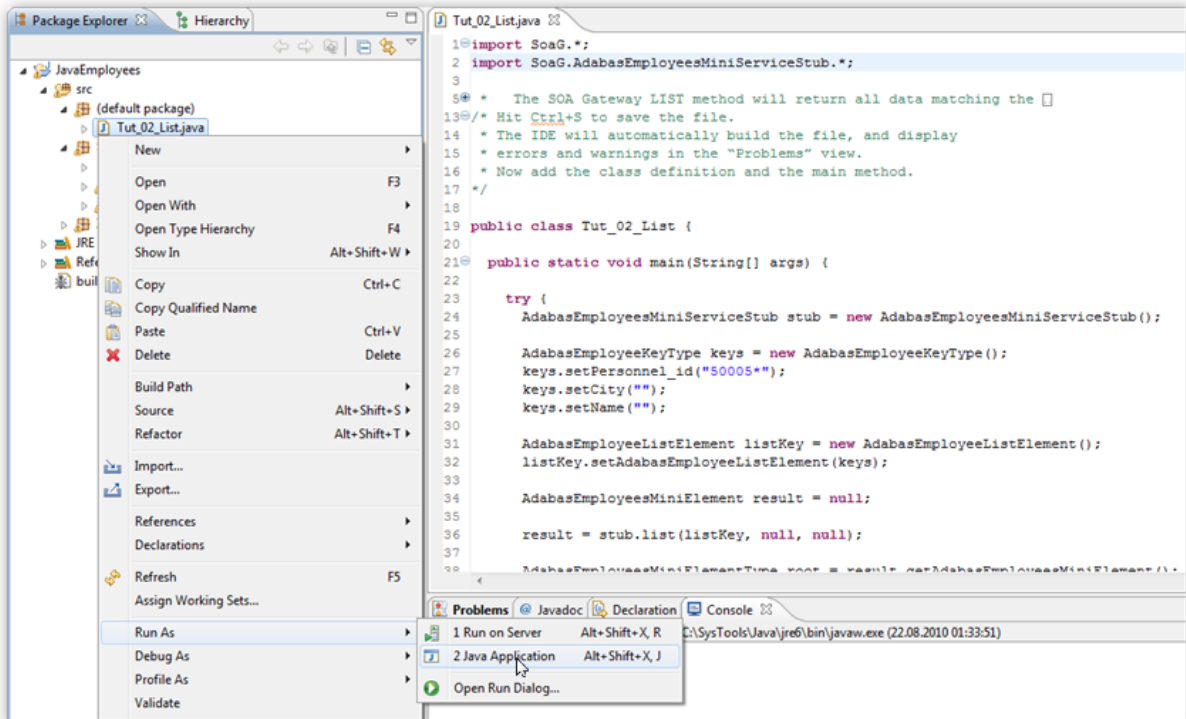

- A "Stub" class implementing all types and operations ( ports / bindings )
- A CallbackHandler - a stub class (not used in this tutorial) providing hooks for client-side extensions to the generated result- and error handlers.
- A Fault class

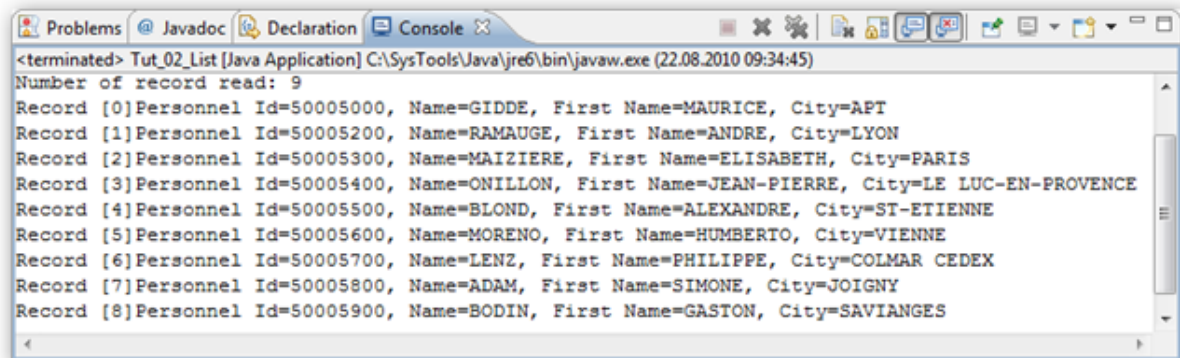

4. Add a new Java class named "Tut\_02\_List" to the project ( **File** -> **New** -> **Class** ), opt to create a "main" method, click "**Finish**".

5. Remove the generated code from the newly added class entirely, use (paste) the code from [Tut\\_02\\_List.java](#) to create your first test program accessing ADABAS data via SOA Gateway.
6. Run the program as a "Java Application"

7. The output appears in the "Console" window:

8. This sample selects all "Employees" records with a personnel-id of 50005nnn, you may want to experiment varying the key data, this is easily done by modifying the properties passed to the generated classes. E.g. try the following to list all records for "Employees" whose names start "SMI", living in cities with names starting "D".

```
keys.setPersonnel_id("");
```

```
keys.setName("SMI*");
```

```
keys.setCity("D*");
```

The following Java/Axis2 tutorial programs are available:

Tutorial	What it does
Tut_01a_Get.java	GET a single record by Personnel Id
Tut_01b_GetByISN.java	GET a single record by ISN
Tut_02_List.java	LIST some records
Tut_03a_SelectSimple.java	SELECT by a range of Personnel IDs
Tut_03b_SelectSorted.java	SELECT by a range of Personnel IDs and sort by Name
Tut_03c_SelectConversational.java	SELECT by multiple ranges of Personnel IDs, returned in "chunks" of 20 records each
Tut_04a_AddUpdateDelete.java	ADD + UPDATE + DELETE in "autocommit" mode
Tut_04b_AddTransactional.java	ADD in a transactional context

# 3

## Accessing Adabas using the PHP SOAP extension

---

■ What is PHP ? .....	10
■ Installing the Eclipse PHP Development Tools .....	24
■ Accessing Adabas from PHP .....	10
■ PHP Examples .....	18

This tutorial

- Demonstrates how to access SOA Gateway from a PHP script
- Provides a number of PHP examples.

## What is PHP ?

---

PHP is a widely-used general-purpose scripting language that is especially suited for Web development and can be embedded into HTML.

The PHP interpreter is available as source code or as pre-compiled binaries for major platforms, including most Linux™ distributions, Windows®, Mac OS X, and iSeries™.

The latest release is PHP 5 and is seeing increasing adoption. PHP 5 introduces improvements to the object model; also, the underlying memory management has been redesigned with multi-threading and performance in mind.

For more information about PHP, or to download the software, please refer to the [PHP homepage](#).

New in PHP 5 is a built-in SOAP extension. It is supplied as part of PHP.

For this tutorial to work, you should have PHP 5 up and running in your Web server, see the install.txt document in the PHP distribution library for details.

## Installing the Eclipse PHP Development Tools

---

The Eclipse PHP Development Tools (PDT) are not absolutely necessary, but using Eclipse greatly simplifies the development process. This tutorial assumes the PDT to be installed.

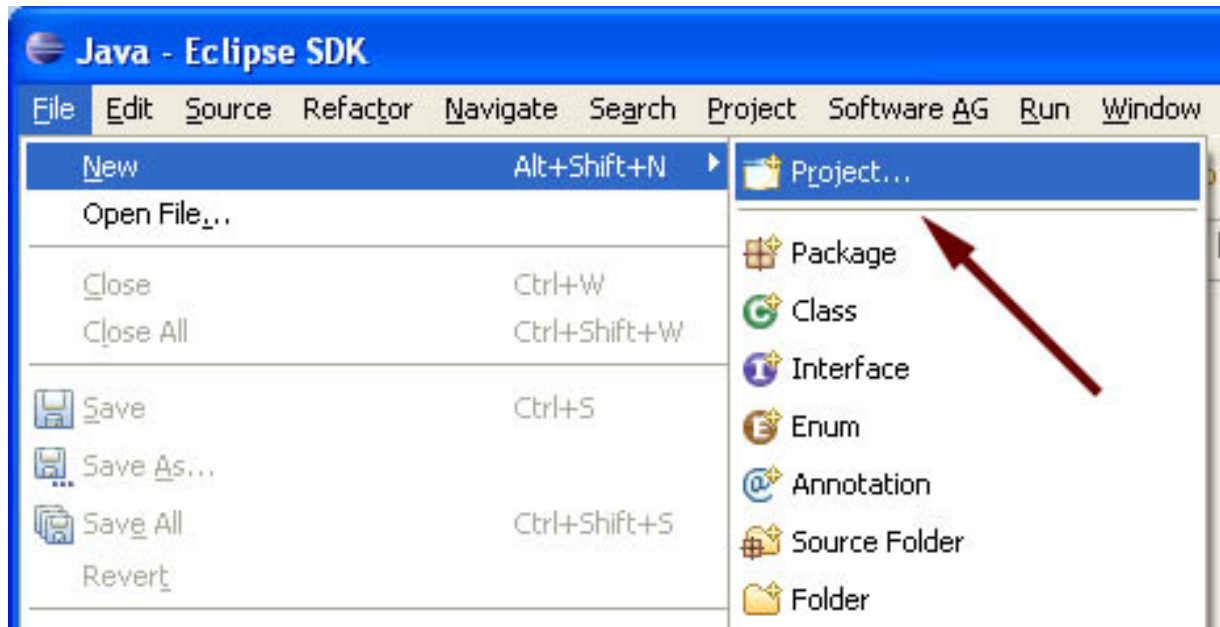

Please refer to the [Eclipse PDT project pages](#) for installation and configuration instructions.

## Accessing Adabas from PHP

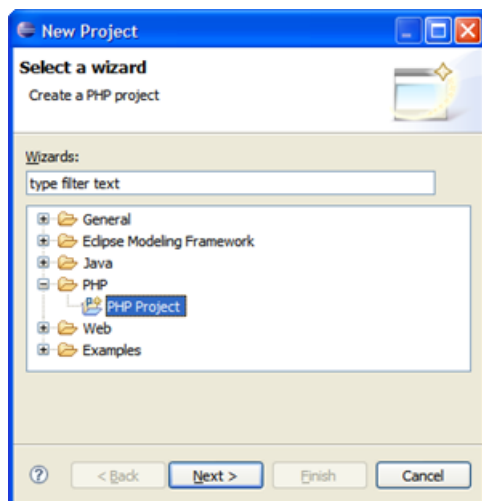

---

1. First, create a new project within your workspace.

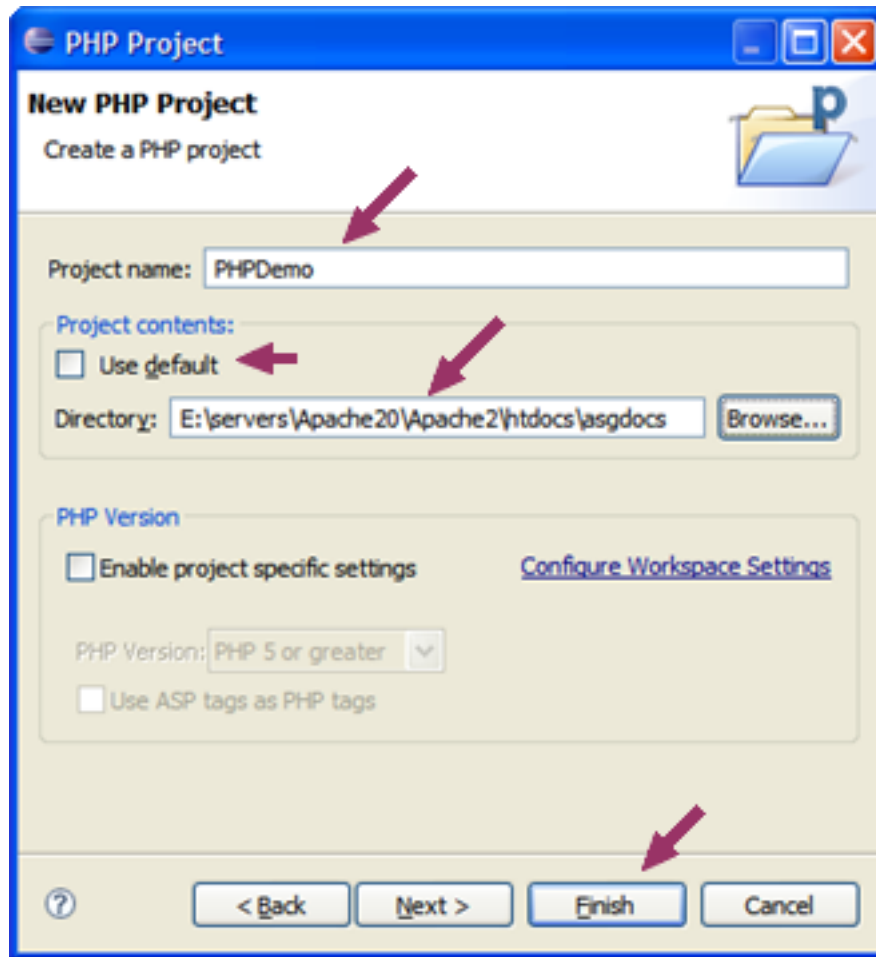

2. Opt to create a PHP Project, click **Next**

Give the project a name and unselect the "Use default" box. Browse to the default location of your html documents, in this case an Apache server document folder called "ASGdocs", click **Finish**

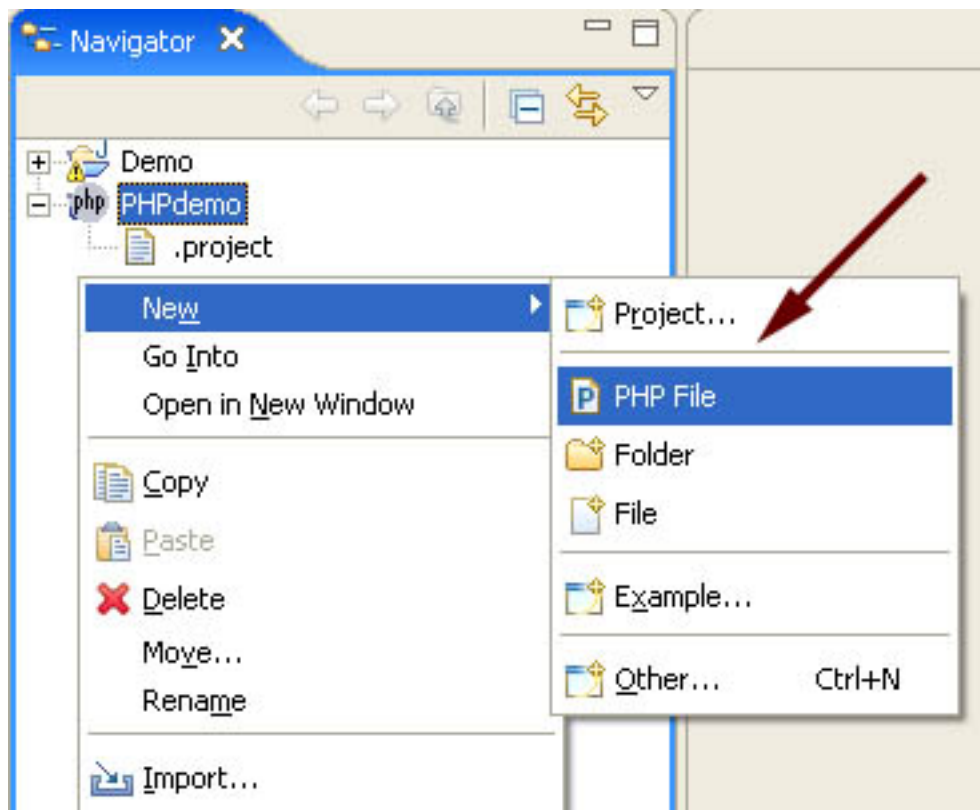

If you are asked to switch to the PHP perspective, opt to do so

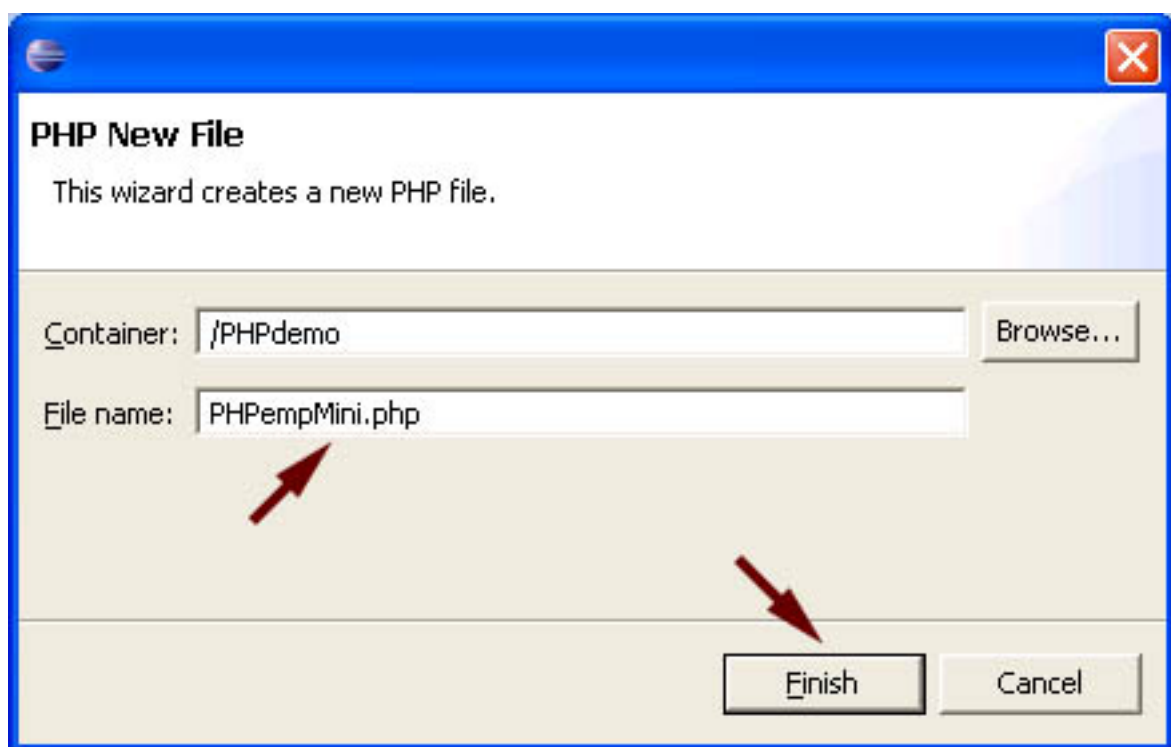

### 3. Create the PHP SOAP client

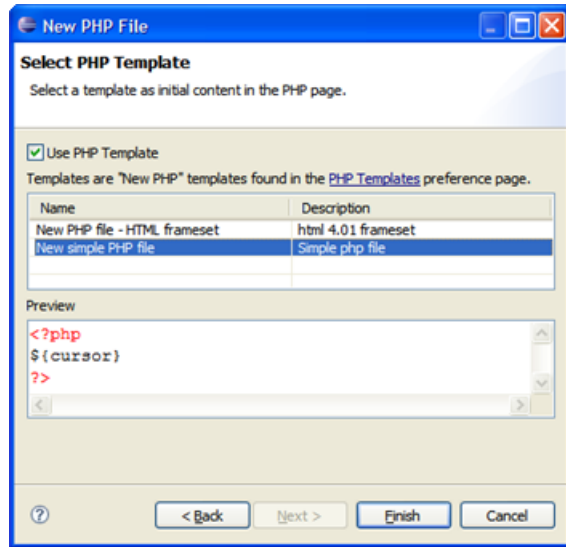

Create a PHP script file by right-clicking into the Eclipse Navigator area, select **New -> PHP File**

Specify a File name, click **Finish**

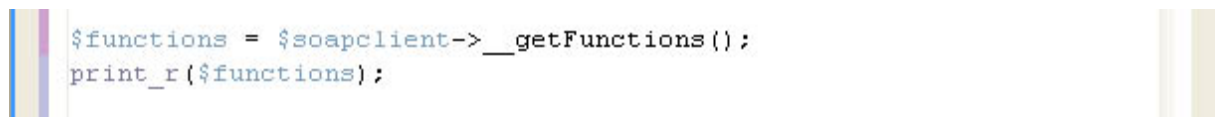

Opt to create a "Simple PHP File"

The PHP SOAP class to represent the Adabas Service is called SoapClient, the first step will be to instantiate SoapClient, passing the URL of an SOA Gateway WSDL as the parameter:

Now that we have instantiated our client we want to see what methods it provides and what parameters are required. Fortunately we can get PHP and the instantiated SoapClient class to do most of the work for us easily:

If you run this as a console application (via "Run") the output is much better formatted than running it in the PHP browser. The console window will show the following:

The screenshot shows a PHP application window titled "PHPdemo [PHP Application] PHP D:\Servers\php512\php-win.exe : PHPpmpMini.php". The console output displays an array of five SOAP operations:

```
<terminated> PHPdemo [PHP Application] PHP D:\Servers\php512\php-win.exe : PHPpmpMini.php
Array
(
    [0] => adabasEmployeesElementType list(adabasEmployeeKeyType $adabasEmployeeListKey)
    [1] => adabasEmployeesElementType get(adabasEmployeePrimaryKeyType $adabasEmployeeGetKey)
    [2] => operationResult delete(adabasEmployeePrimaryKeyType $adabasEmployeeDeleteKey)
    [3] => operationResult add(adabasEmployeesType $adabasEmployees)
    [4] => operationResult update(adabasEmployeesType $adabasEmployeesUpdate)
)
```

This shows that the service described by the WSDL provides five operations: list, get, delete, add and update; It also lists the required parameters and the responses given.

A description of the input and output parameters can be retrieve by calling the `__getTypes` class:

```
$types = $soapclient->__getTypes();
print_r($types);
```

The output will look like this:

This information is sufficient to construct the first simple call to the "list" operation.

First an array of the required input parameters needs to be constructed:

```
$AdabasEmployeeListKey = array (  
    'personnel_id'=> '300001*', 'firstName'=>'', 'name'=>'', 'city'=>'' );
```

Ready to invoke the "list" operation as a method of the soapclient class:

```
$Adabasresponse = $soapclient->list($AdabasEmployeeListKey);
```

Now it is just a matter of taking the returned object and outputting the required results in a table:

```
echo "<br /><br />";  
echo "<table border=1 cellpadding=5>";  
echo "<tr><th>Personnel ID</th><th>Name</th><th>City</th><th>Address</th></tr>";  
  
foreach ($Adabasresponse->adabasEmployees->adabasEmployee as $Employee) {  
  
    echo "<tr>",  
        "<td>$Employee->personnel_id</td>",  
        "<td>$Employee->firstname $Employee->name</td>",  
        "<td>$Employee->city</td>",  
        "<td>";  
  
        foreach ($Employee->address_line as $adline)  
            echo "$adline<br />";  
  
        echo "</td></tr>";  
  
}  
  
echo "</table>";
```

Run this in the built in PHP Browser (activated with "**Window**" -> "**Show view**" and select "**PHP Browser**") or an external browser: [http://<your\\_localhost\\_url>/PHPempMini.php](http://<your_localhost_url>/PHPempMini.php):

Problems Console Bookmarks PHP Browser X

http://localhost:8082/PHPempMini.php

Personnel ID	Name	City	Address
30000100	Lloyd	Ilkeston	276 Cotmanhay Road Ilkeston Derbyshire
30000107	O'Brien	Nottingham	25 Main Street Radcliffe-On-Trent Nottingham
30000110	Stilwell	Nottingham	11 Westwood Road Sneinton Nottingham

30000125	Manning	Derby	113 Derby Road Spondon

Fertig

## PHP Examples

---

The following PHP examples can be copied from here, moved to your web server's DocumentRoot (for example) and executed:

- [First steps](#)
- [List Employees](#)
- [List Employees descending](#)
- [List Employees sorted](#)
- [List by Sub Descriptor](#)
- [List by Super Descriptor](#)
- [Add an Employee](#)
- [Get an Employee](#)
- [Delete an Employee](#)
- [A simple PHP form for accessing Adabas](#)
- [All-in-one PHP form accessing the Employees file](#)

## 4 Accessing a SOA Gateway Resource from a Ruby program

---

■ Running a Ruby program .....	20
--------------------------------	----

Ruby ( [downloadable here](#)) is an Open Source object oriented language with a very simple, yet powerful SOAP interface.

## Running a Ruby program

---

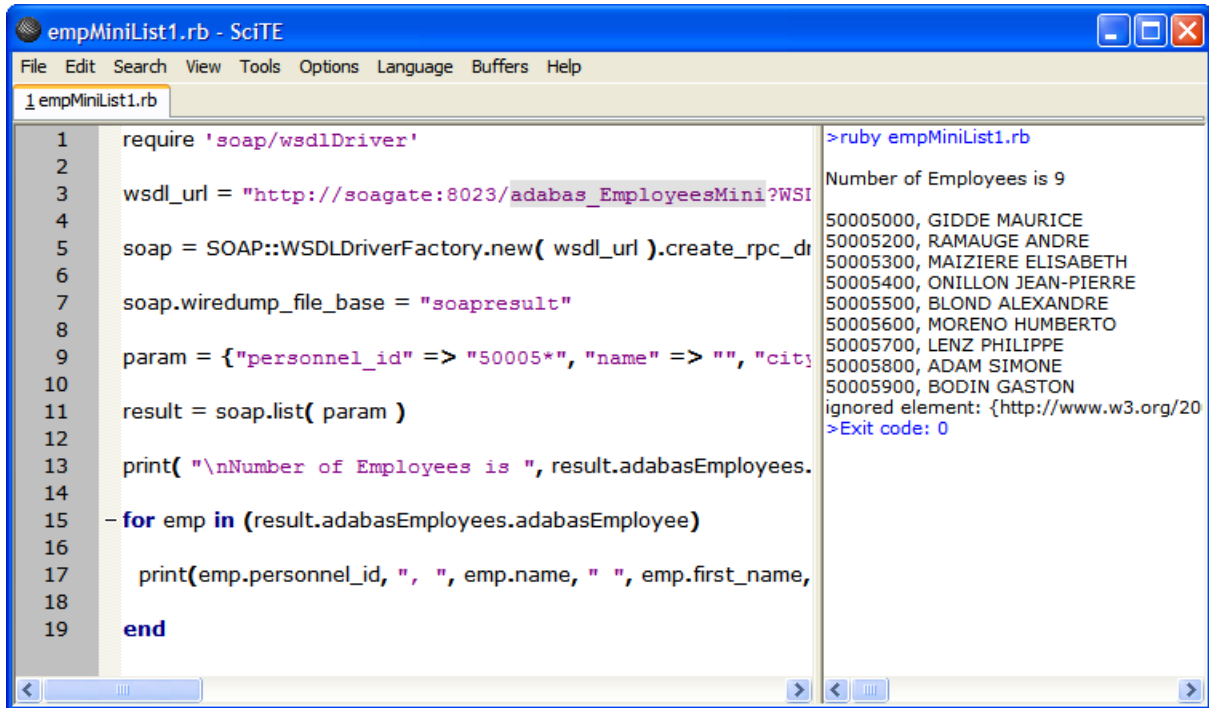

Ruby comes with a very powerful editor, SciTE, which not only allows editing, but also compiling & execution of programs.

This is an example of a complete Ruby program listing all Employees with personnel-IDs starting with 50005\*, using the 'adabas\_EmployeesMini' Resource that comes with the sample SOA Gateway configuration.

```
empMiniList1.rb - SciTE
File Edit Search View Tools Options Language Buffers Help
empMiniList1.rb
1  require 'soap/wsdlDriver'
2
3  wsdl_url = "http://soagate:8023/adabas_EmployeesMini?WSDL"
4
5  soap = SOAP::WSDLDriverFactory.new( wsdl_url ).create_rpc_driver
6
7  soap.wiredump_file_base = "soapresult"
8
9  param = {"personnel_id" => "50005*", "name" => "", "city" => ""}
10
11  result = soap.list( param )
12
13  print( "\nNumber of Employees is ", result.adabasEmployees.adabasEmployee.length, "\n\n")
14
15  - for emp in (result.adabasEmployees.adabasEmployee)
16
17      print(emp.personnel_id, " ", emp.name, " ", emp.first_name, "\n")
18
19  end
```

When running this program, by either pressing the F5 key, or selecting Tools->Go from the SciTE menu, an output window will be attached to the editing window, and show the result of the Ruby query against SOA Gateway

The screenshot shows a SciTE editor window titled 'empMiniList1.rb - SciTE'. The left pane contains a Ruby script that uses the SOAP::WSDLDriverFactory to interact with a service at 'http://soagate:8023/adabas\_EmployeesMini?WSDL'. The script sets a wire dump file base to 'soapresult', lists employees with a personnel ID filter of '50005\*', and prints the results. The right pane shows the output of the script, which includes the number of employees (9) and a list of employee details: 50005000, GIDDE MAURICE; 50005200, RAMAUGE ANDRE; 50005300, MAIZIERE ELISABETH; 50005400, ONILLON JEAN-PIERRE; 50005500, BLOND ALEXANDRE; 50005600, MORENO HUMBERTO; 50005700, LENZ PHILIPPE; 50005800, ADAM SIMONE; 50005900, BODIN GASTON. It also shows a warning about an ignored element and an exit code of 0.

```
1 require 'soap/wSDLDriver'
2
3 wSDL_url = "http://soagate:8023/adabas_EmployeesMini?WSDL"
4
5 soap = SOAP::WSDLDriverFactory.new( wSDL_url ).create_rpc_driver
6
7 soap.wire_dump_file_base = "soapresult"
8
9 param = {"personnel_id" => "50005*", "name" => "", "city" => ""}
10
11 result = soap.list( param )
12
13 print( "\nNumber of Employees is ", result.adabasEmployees.count
14
15 - for emp in (result.adabasEmployees.adabasEmployee)
16     print(emp.personnel_id, " ", emp.name, " ", emp.first_name,
17
18
19 end
```

>ruby empMiniList1.rb  
Number of Employees is 9  
50005000, GIDDE MAURICE  
50005200, RAMAUGE ANDRE  
50005300, MAIZIERE ELISABETH  
50005400, ONILLON JEAN-PIERRE  
50005500, BLOND ALEXANDRE  
50005600, MORENO HUMBERTO  
50005700, LENZ PHILIPPE  
50005800, ADAM SIMONE  
50005900, BODIN GASTON  
ignored element: {http://www.w3.org/2001/XMLSchema-instance}nil  
>Exit code: 0

## 5 Creating a sample C# application

---

### **Tutorial: A sample C# application listing "Employees"**

With a service description (WSDL), a proxy class can be created with the .NET Framework SDK Wsdll.exe tool. A XML Web service client can then invoke methods of the proxy class, which communicate with SOA Gateway over the network by processing the SOAP messages sent to and from the SOA Gateway server. The proxy class handles the work of mapping parameters to XML elements and then sending the SOAP message over the network.

Wsdll.exe is a Microsoft .NET tool which is used to create proxies for C#, Visual Basic .NET and JScript .NET. In this tutorial, we will be generating C#.

These are the steps required to generate the C# wrapper class using Wsdll.exe and create / run a program listing records from the Adabas demo file "Employees" using the generated proxy class:

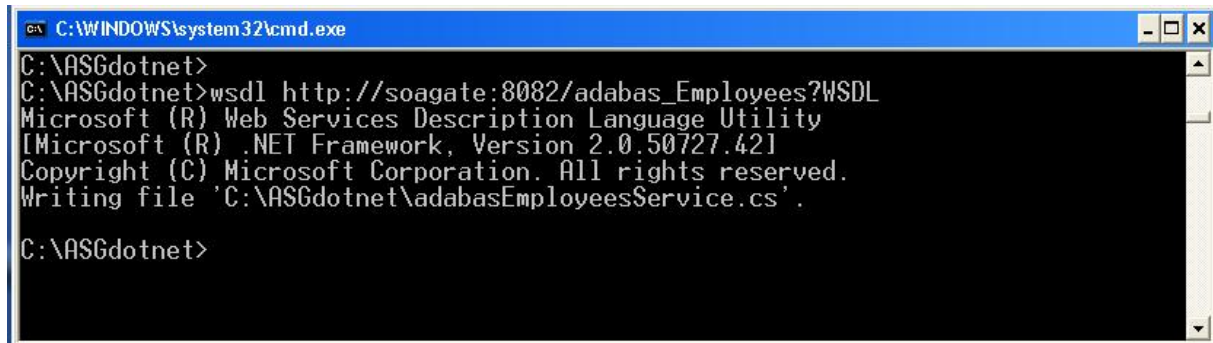

1. From a command prompt, execute Wsdll.exe, specifying the URL / URI of the SOA Gateway DataSource to be exposed, append ?WSDL to instruct the SOA Gateway server to return the WSDL, not data:

If the Wsdll.exe is not found, open the Visual Studio command prompt via the Start Menu. This location depends on what packages are installed, but often resides under "Microsoft Visual C#" or "Microsoft .NET Framework SDK".

```
C:\WINDOWS\system32\cmd.exe
C:\ASGdotnet>
C:\ASGdotnet>wsdl http://soagate:8082/adabas_Employees?WSDL_
```

2. A single source file is generated, its name is <rootElementName>Service.cs, in this case the "root element" within the XSD is "adabasEmployees", thus the name of the proxy class source file adabasEmployeesService.cs

```
C:\WINDOWS\system32\cmd.exe
C:\ASGdotnet>
C:\ASGdotnet>wsdl http://soagate:8082/adabas_Employees?WSDL
Microsoft (R) Web Services Description Language Utility
[Microsoft (R) .NET Framework, Version 2.0.50727.421]
Copyright (C) Microsoft Corporation. All rights reserved.
Writing file 'C:\ASGdotnet\adabasEmployeesService.cs'.
C:\ASGdotnet>
```

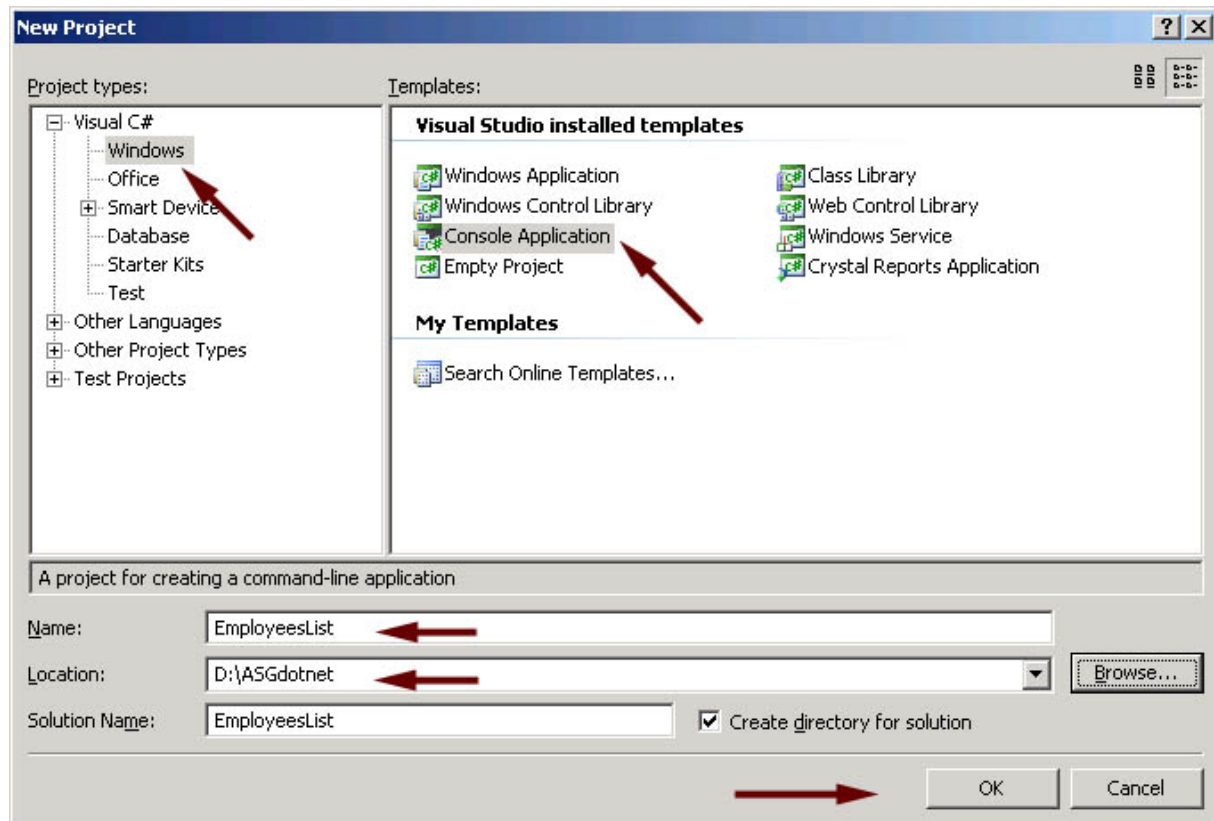

This file contains a proxy class exposing both synchronous and asynchronous methods for each SOAP operation provided by SOA Gateway for the DataSource. For instance, for the *list* operation, the proxy class has the following methods: *list*, *Beginlist*, and *Endlist*. The *list* method of the proxy class is used to communicate with SOA Gateway synchronously, but the *Beginlist* and *Endlist* methods are used to communicate with the SOA Gateway server asynchronously.

For more information about asynchronous communication with a Web Service please refer to the .NET documentation.

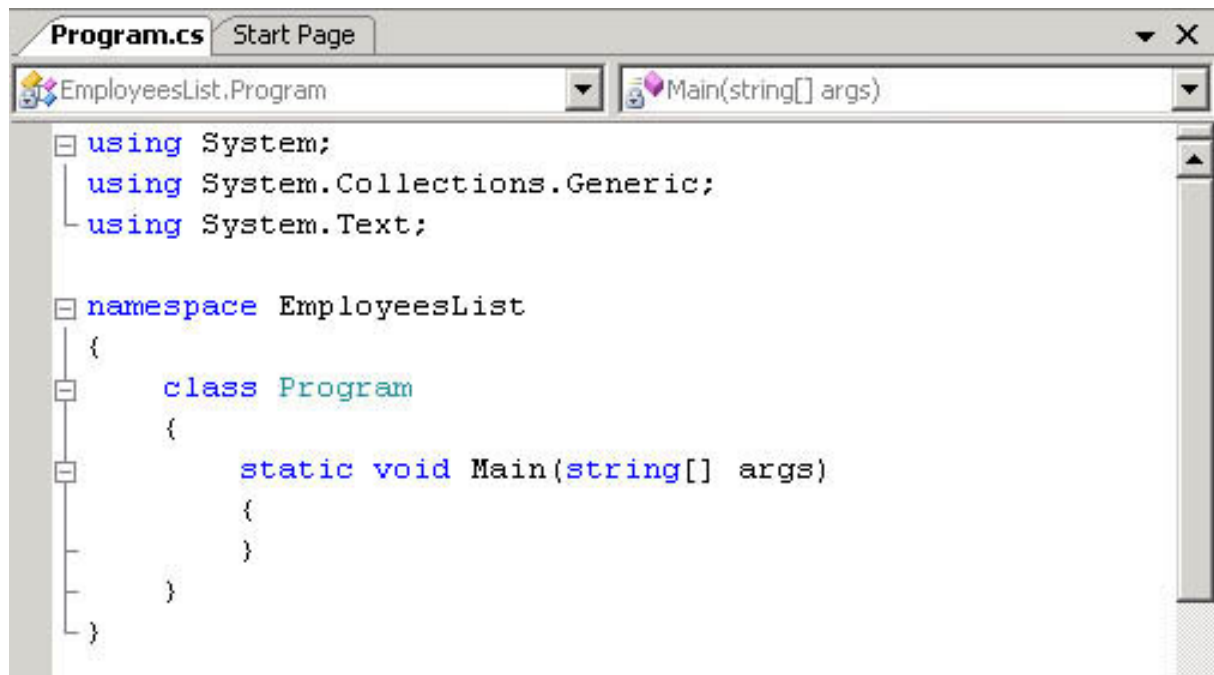

3. Start MS Visual Studio, create a new project with **File -> New - Project** (or the shortcut Ctrl+Shift+N):

Create a C# Console Application, assign a name to it, specify the storage location, click **OK**

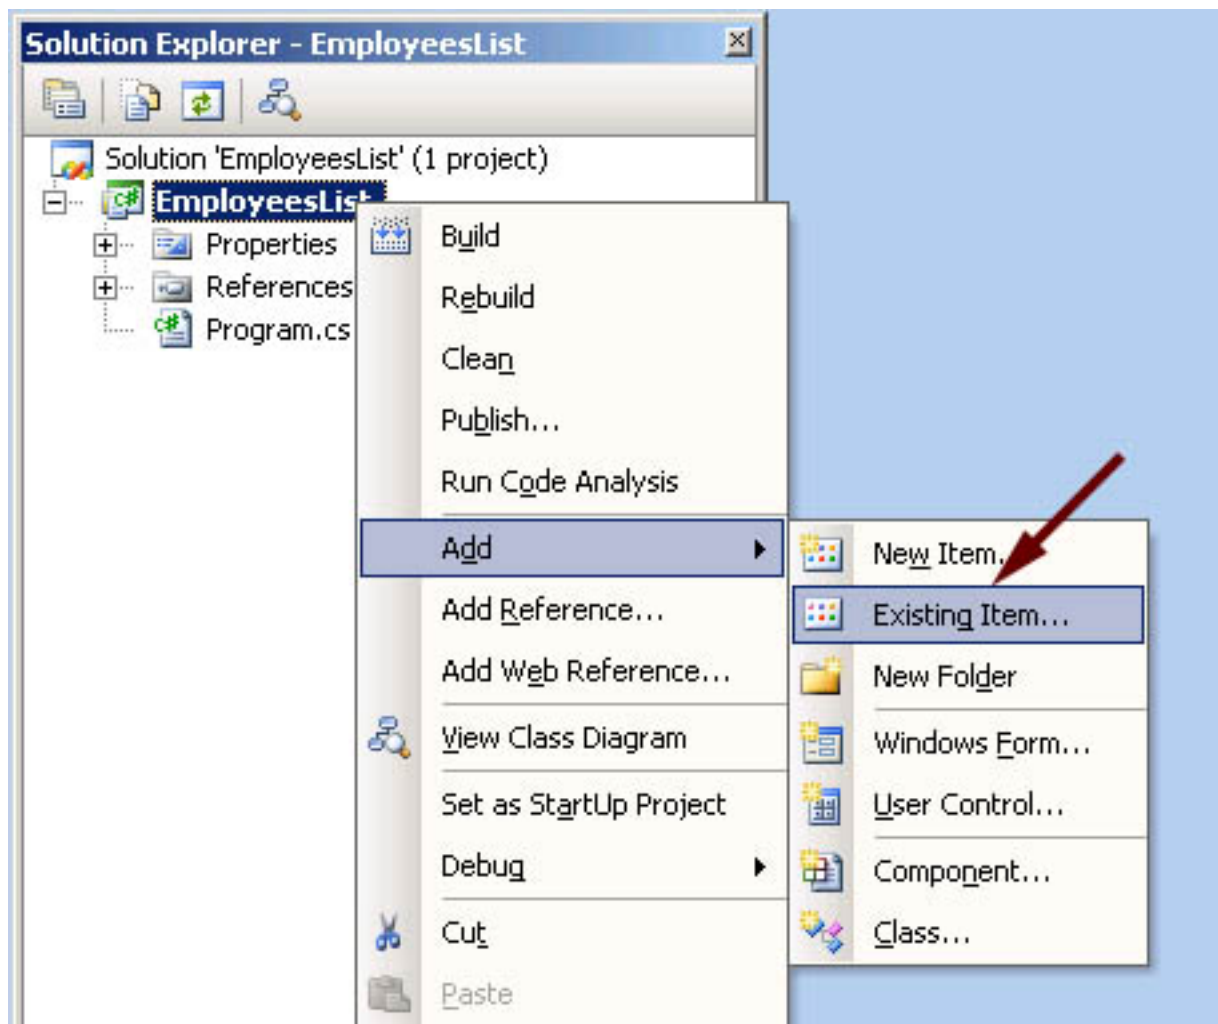

A skeleton class file has been generated into your project workspace, with the required class definition and an empty *Main* method

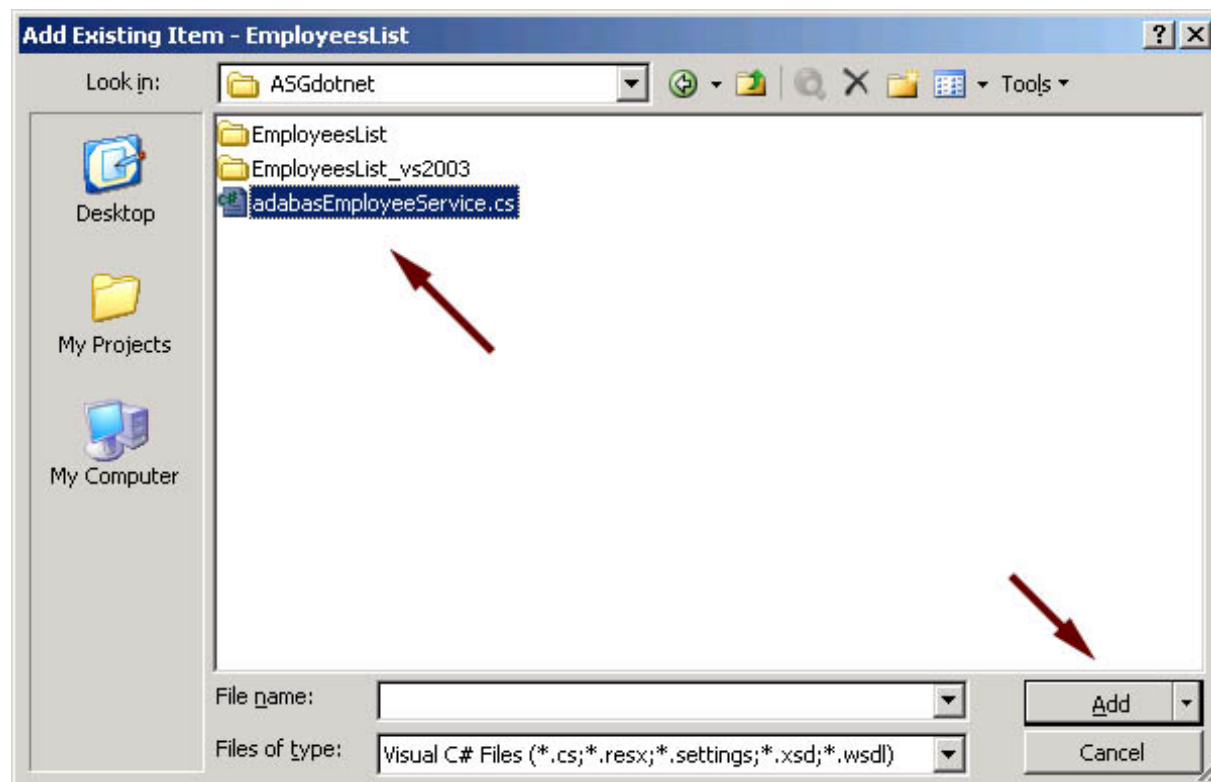

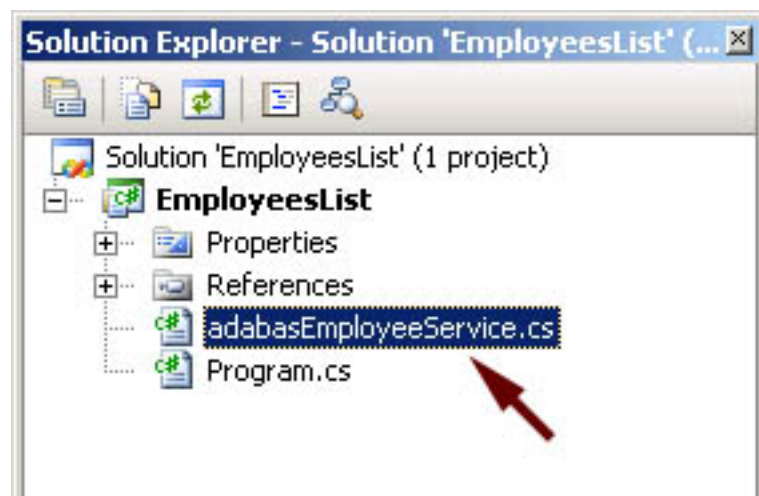

4. First of all, import the generated proxy into the project, right-click on the project name, select **Add -> Existing Item**

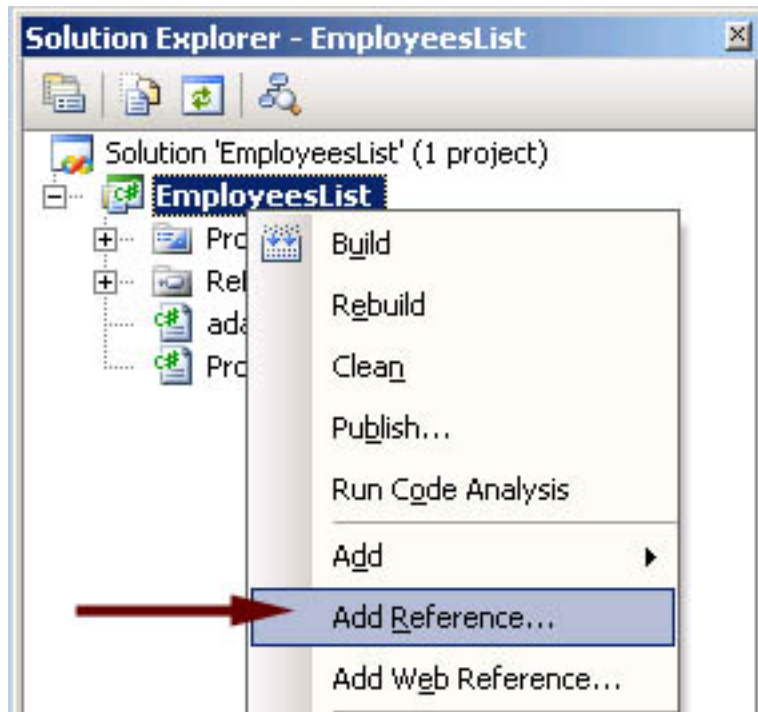

select the AdabasEmployeeService.cs proxy, click **Add**

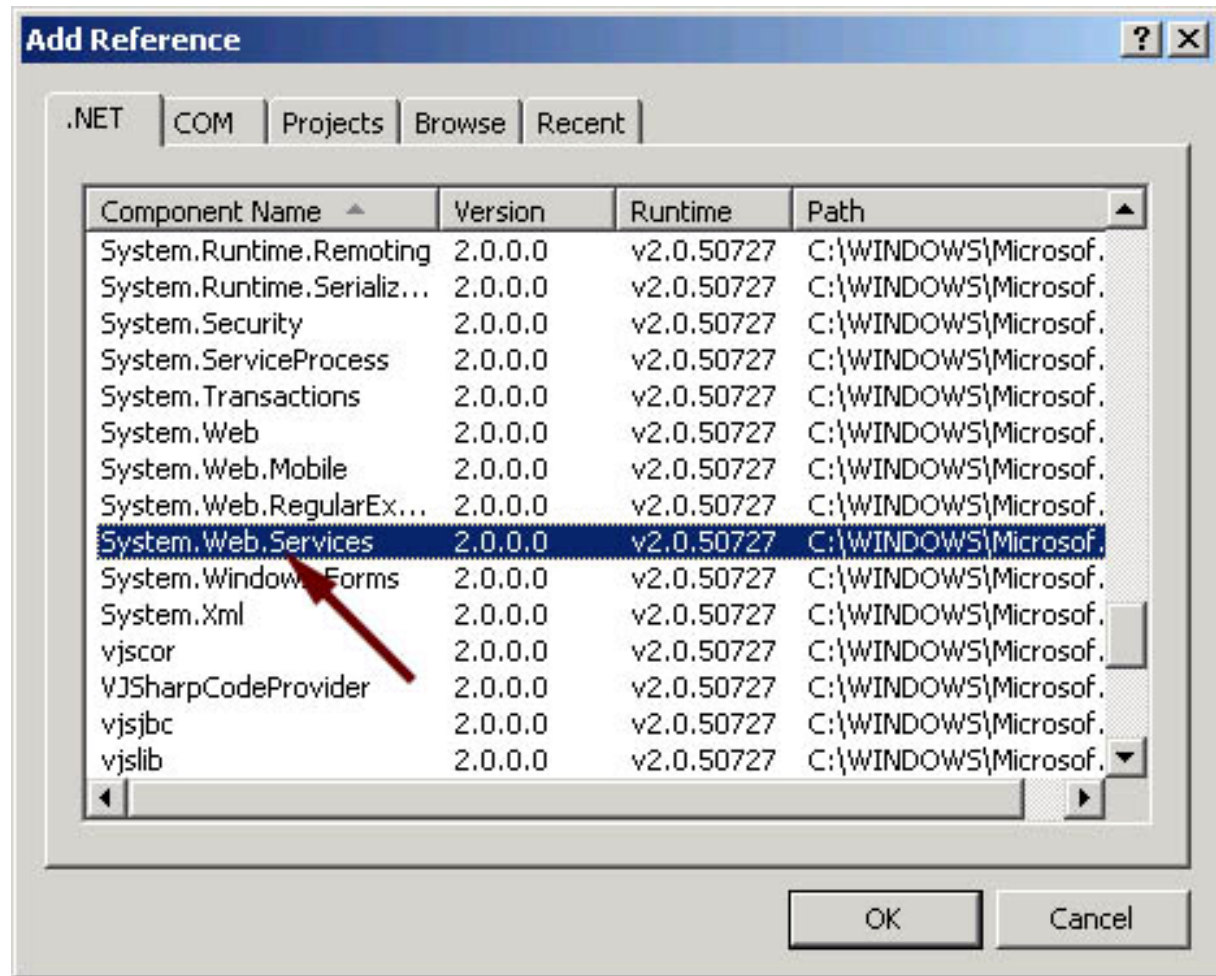

The proxy has been added to the project

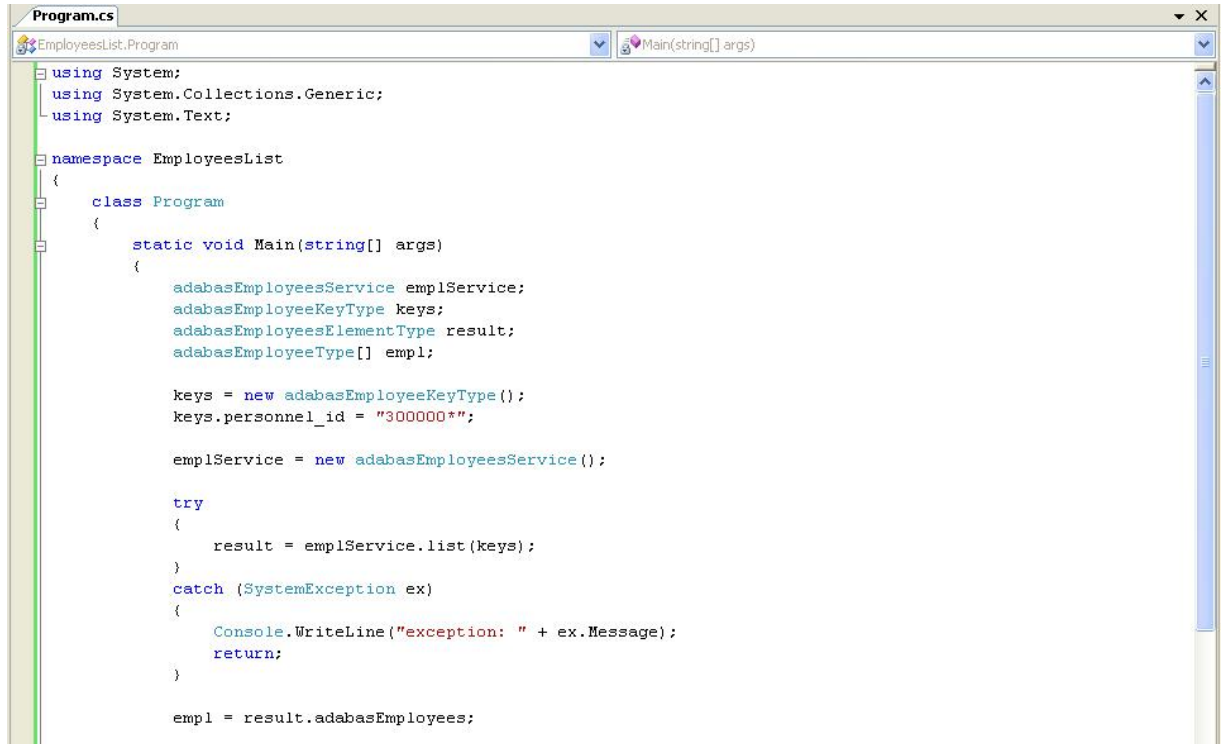

You now need to add a reference to the .NET System.Web.Services component implementing the SOAP interface. In the project explorer, right click on the project name, select **Add Reference**

Scroll down to System.Web.Services, click to select it, click to select it, click **OK** to import the reference

- Remove the generated code from the newly added class entirely, use (paste) the code from [ASGDemo.cs](#) to create your first test program accessing Adabas data via SOA Gateway.

```
Program.cs
EmployeesList.Program
Main(string[] args)

using System;
using System.Collections.Generic;
using System.Text;

namespace EmployeesList
{
    class Program
    {
        static void Main(string[] args)
        {
            adabasEmployeesService emplService;
            adabasEmployeeKeyType keys;
            adabasEmployeesElementType result;
            adabasEmployeeType[] empl;

            keys = new adabasEmployeeKeyType();
            keys.personnel_id = "300000*";

            emplService = new adabasEmployeesService();

            try
            {
                result = emplService.list(keys);
            }
            catch (SystemException ex)
            {
                Console.WriteLine("exception: " + ex.Message);
                return;
            }

            empl = result.adabasEmployees;
        }
    }
}
```

6. Build the application. Right-click on the project name in the project explorer, click **Build**

7. Open a command window, change to the project's build-directory Execute the compiled console application, EmployeesList, the output will look as follows:

```

C:\WINDOWS\system32\cmd.exe
D:\ASGdotnet\EmployeesList\EmployeesList\bin\Debug>EmployeesList
Number of Employees returned: 10
Record [0], Personnel_Id=300000001, Name=Smith, First_Name=Frank
Record [1], Personnel_Id=300000007, Name=Turner, First_Name=John
Record [2], Personnel_Id=300000012, Name=Winterton, First_Name=Robert
Record [3], Personnel_Id=300000014, Name=Singh, First_Name=Mumtaz
Record [4], Personnel_Id=300000037, Name=Tyson, First_Name=Jane
Record [5], Personnel_Id=300000038, Name=Mellor, First_Name=Amanda
Record [6], Personnel_Id=300000042, Name=Oakden, First_Name=Paul
Record [7], Personnel_Id=300000043, Name=Richmond, First_Name=Alan
Record [8], Personnel_Id=300000044, Name=Deakin, First_Name=Denise
Record [9], Personnel_Id=300000045, Name=Garfield, First_Name=James
D:\ASGdotnet\EmployeesList\EmployeesList\bin\Debug>

```

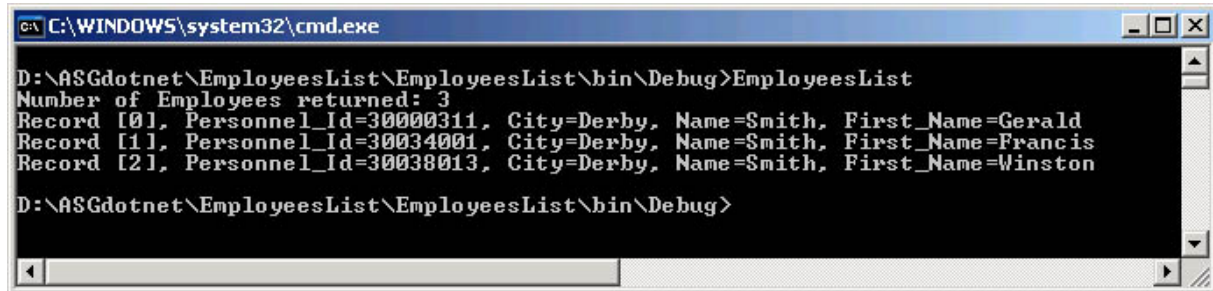

8. This sample selects all "Employees" records with a personnel-id of 4000004n, you may want to experiment varying the key data, this is easily done by modifying the properties passed to the generated classes. E.g. try the following to list all records for "Employees" whose names start "SMI", living in cities with names starting "D".

```

keys.name = "SMI*";
keys.city = "D*";

```

The output will look like this:

```

C:\WINDOWS\system32\cmd.exe
D:\ASGdotnet\EmployeesList\EmployeesList\bin\Debug>EmployeesList
Number of Employees returned: 3
Record [0], Personnel_Id=300000311, City=Derby, Name=Smith, First_Name=Gerald
Record [1], Personnel_Id=30034001, City=Derby, Name=Smith, First_Name=Francis
Record [2], Personnel_Id=30038013, City=Derby, Name=Smith, First_Name=Winston
D:\ASGdotnet\EmployeesList\EmployeesList\bin\Debug>

```

## 6 Accessing Adabas through SoapUI

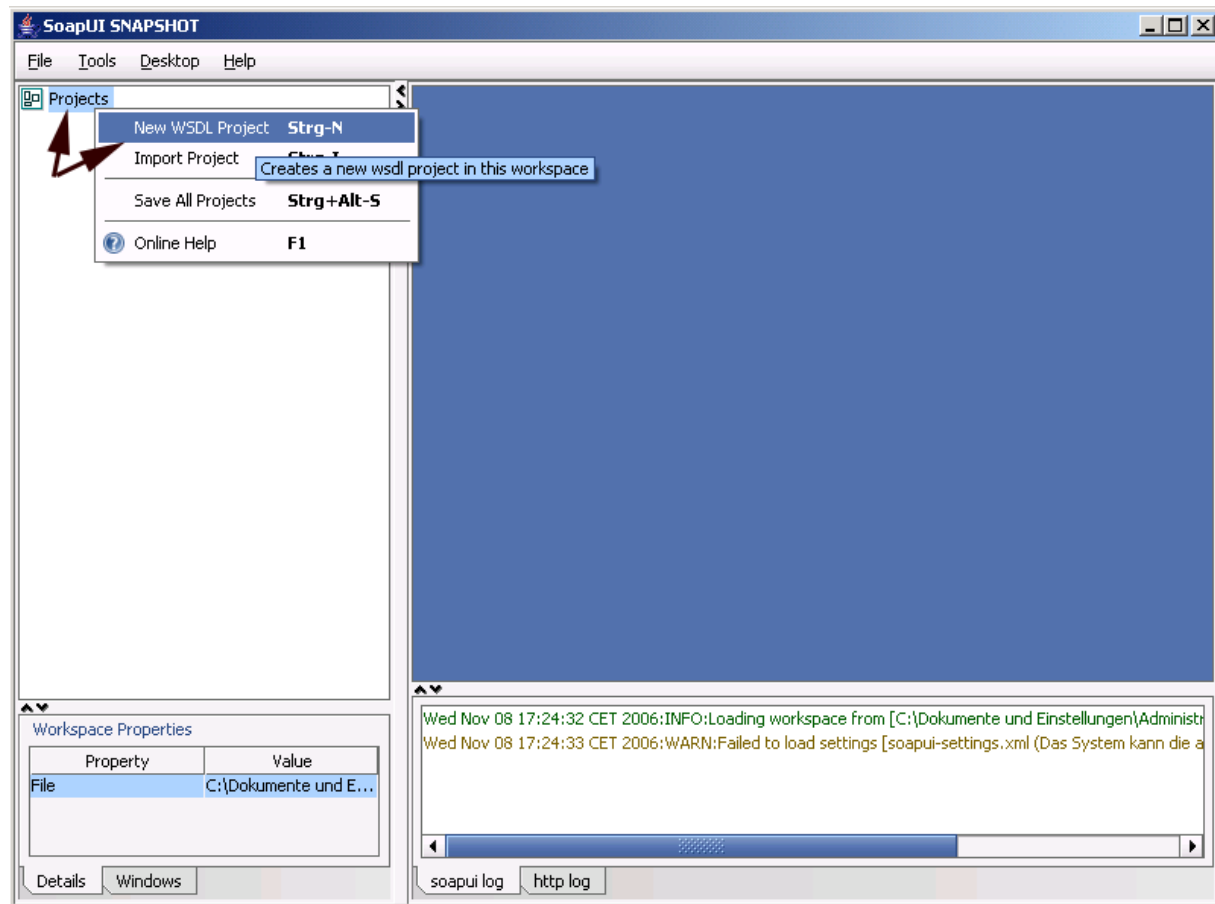

---

This simple scenario demonstrates how to invoke operations on an Adabas DataSource exposed as a "Web service" through SOA Gateway from SoapUI.

soapUI is a (freeware) desktop application for inspecting, invoking, developing and functional / load / compliance testing of web services over HTTP and can be downloaded [here](#).

Additionally, soapUI can be integrated into the Eclipse framework, read [here](#) for more information.

1. When starting soapUI for the very first time an "empty" workspace is generated, right-click on the top-level **Projects** item, select **New WSDL Project** to create your first soapUI project.

You will be prompted for a project name, enter one and click OK:

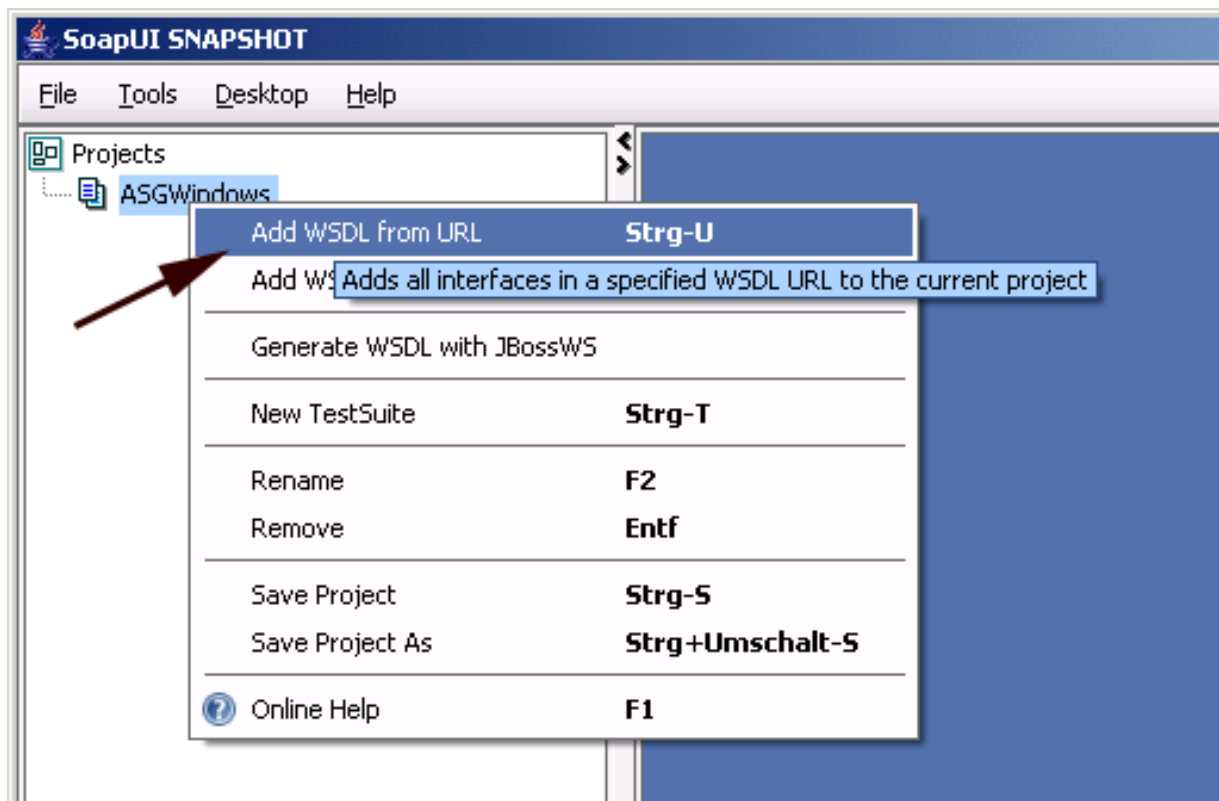

Specify a target location for the project files, click **Save**:

- Now import an SOA Gateway "web service" into the newly created project, right-click the project name, then select **Add WSDL from URL**

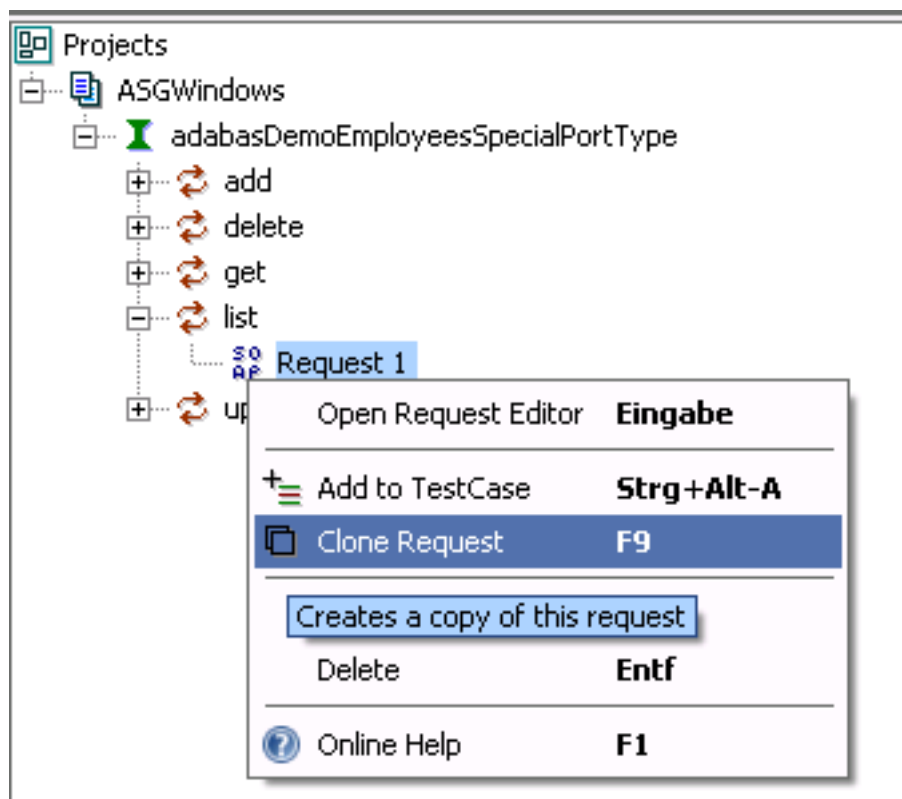

Enter the URI of the adabas\_Employees\_special resource, as in `http://<yourASGserverhost>:<your-ASGserverport>/adabas_Employees_special?WSDL` and click **OK** to import the webservice definitions from the resources / WSDL

You will be asked if default requests for all operations are to be created, click **Yes**.

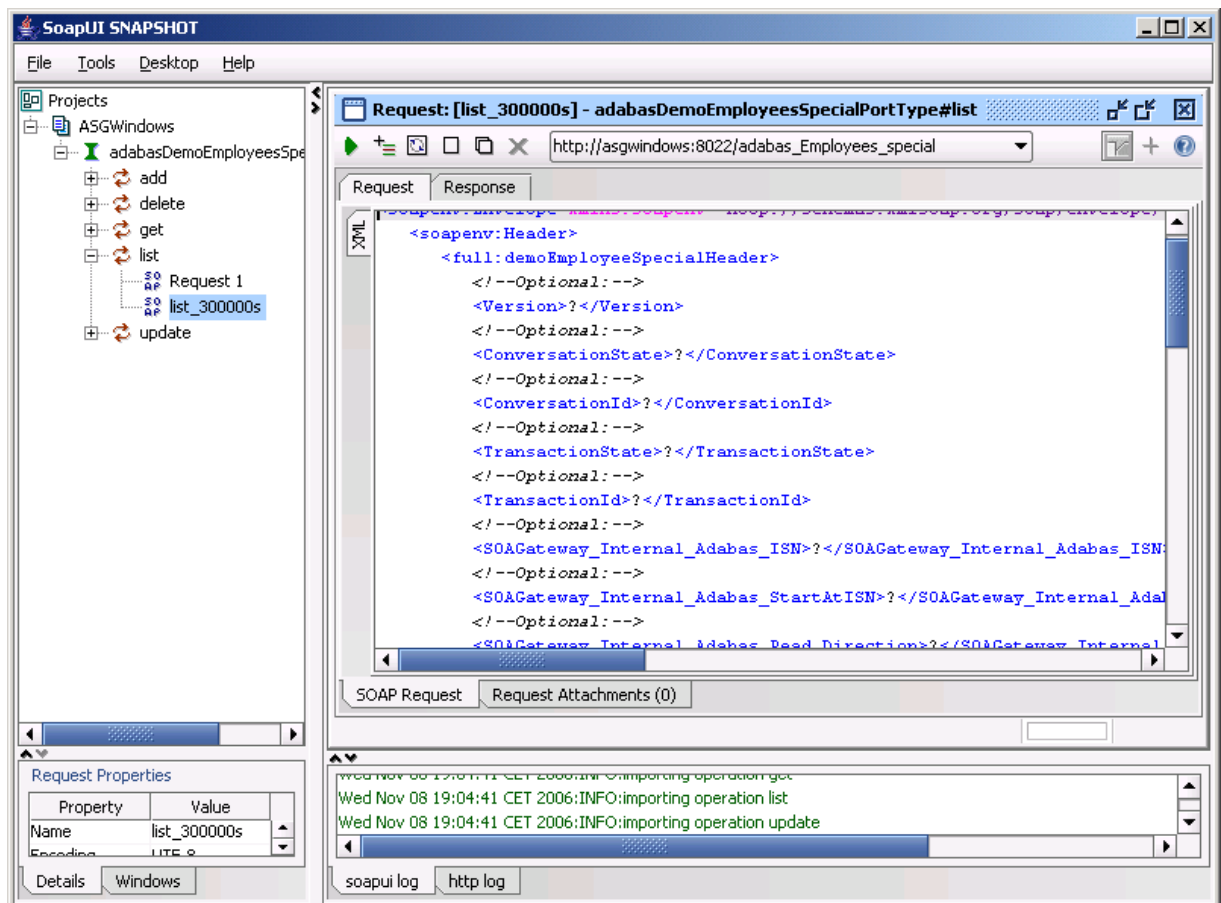

- Default requests have been generated for all SOA Gateway operations for a webservice, unfold the "list" request by clicking the **plus** sign left of it, right-click the created **Request 1**, select **Clone Request**, this allows for unlimited duplication of the original request, which may be desirable when testing various options or "canning" requests.

Assign a name to the cloned request, click **OK**

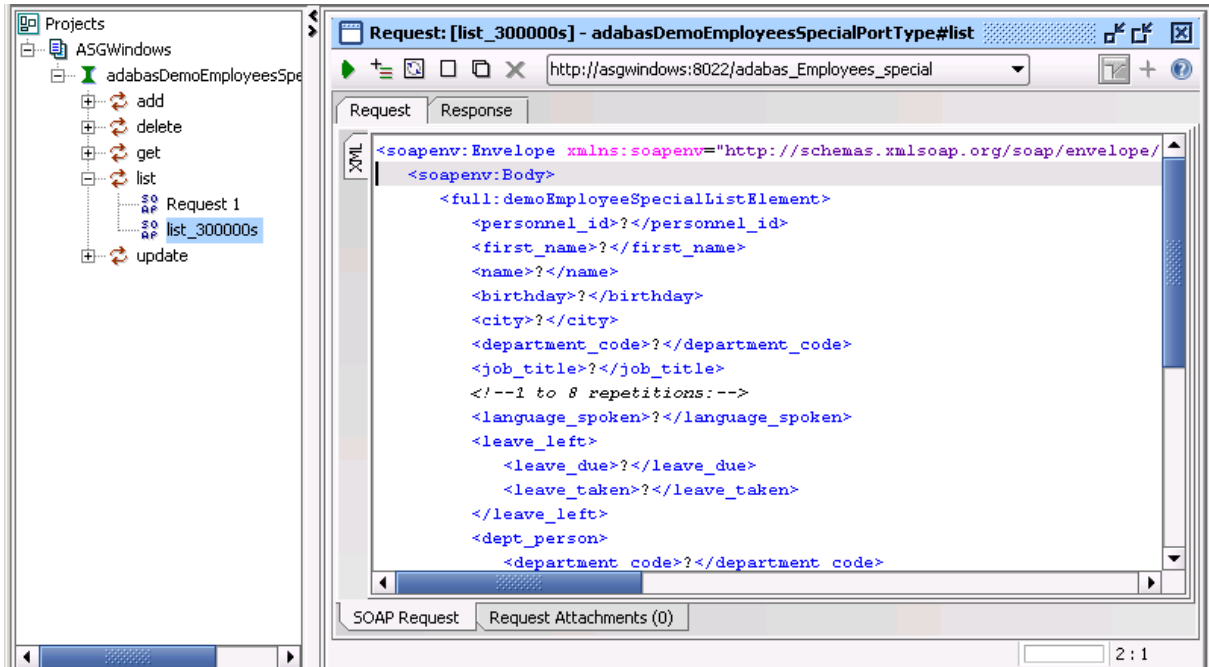

4. soapUI now opens the request document.

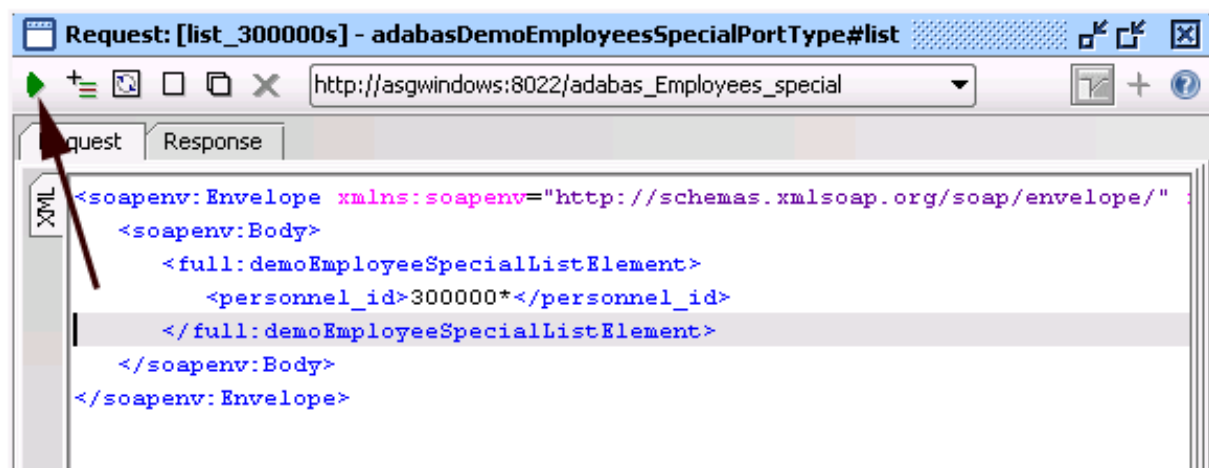

Remove the `soapenv:Header` section, everything from, and including, `<soapenv:Header>` to `</soapenv:Header>`

This leaves you with the soap Body section, which holds all key information:

Remove all key elements but the `personnel_id`, enter 300000\* as the key value, the request should look like this now, then click the **green arrow** to send the request to your SOA Gateway server:

5. The response will look like this - formatted XML

This response shows "simple" as well as repeating fields like MUs (multiple value fields, here: olive arrows), PEs (periodic groups, pink arrows) and MUs within PEs (blue arrows):

Request: [list\_300000s] - adabasDemoEmployeesSpecialPortType#list

http://asgwindows:8022/adabas\_Employees\_special

Request Response

XML

```

<soapenv:Envelope xmlns:full="urn:namespaces:com.risaris/xmiddle/qe/resour
  <soapenv:Body>
    <rsp:adabasDemoEmployeesSpecialElement xmlns:rsp="urn:namespaces:com
      <adabasDemoEmployeesSpecial>

## Preparing for the LOBs (Large OBjects) samples

---

- Loading the LOB file into an OpenSystems database ..... 53
- Loading the LOB file into a Mainframe database ..... 42

While the basic samples use the well-known 'Employees' file delivered with Adabas, the LOBs demo programs require loading of a small Adabas file containing LOB fields.

**Note:** LOB access requires a minimum Adabas version of v6 on OpenSystems platforms, Adabas v8 on mainframe platforms.

## Loading the LOB file into an OpenSystems database

---

These are the steps to load the demo LOB file into an OpenSystems (Windows, \*IX) Adabas database:

- Save **FILE90.FDT** on the target system.
- Save **FILE90.FDU** on the target system, adjust the dbid, file and lobfile parameters according to your needs.
- Set the environment variable FDUFDT, for example on a Linux system: `export FDUFDT=FILE90.FDT`
- Run the command: `adafdu <FILE90.FDU`

The demo 'base' and 'LOB' files are now loaded, which can be verified with the adarep utility:  
`adarep db=<yourdbid>,cont`

The LOB demo file is now ready to be used.

## Loading the LOB file into a Mainframe database

---

The steps to create the LOB demo file in a mainframe Adabas database are as follows:

- Use **this FDT** as input to ADACMP, specifying dummy input (DDEBAND). Sample JCL can be found on the ADAvmr.JOBS library distributed with Adabas.
- Run the ADALOD utility, **these parameters** may serve as template input to the utility. Adjust the file number and size specifications based on your requirements.

**Important:** Note that Adabas space / buffer parameters may need to be increased for LOB access, please consult the Adabas documentation for a description of required changes to your Adabas nucleus parameters.

## 8 Using LOBs (Large OBjects) with soapUi

---

This tutorial shows how to add, delete and get BLOBs using SOA Gateway and Adabas.

SOA Gateway uses the [MTOM](#) specification to send/receive the XML and binary data to/from the required web service. This involves attaching the required binary file(s) to the SOAP message, and then transforming this into a MIME message to send across the wire.

For the purposes of this tutorial, we will use [soapUi](#) to send and receive messages to our web service.

Other web service clients may also be used, such as PHP with the [WSO2 Web Services Framework](#) extension

This tutorial assumes the following

- You have at least soapUi v1.7 installed.
- You are using a version of Adabas which support LOBs
- You have set up a LOB file at FNR 90.

1. Start the Control Center and add a new resource.

Enter the following information

- Name: adabas\_blobs
- DataView : Select 'adabas\_photoblobs', which is one of the sample definitions delivered with SOA Gateway
- DatabaseId: 212 ( or the DBID relevant on your system )
- FileNumber: 90

Publish your changes to the server.

2. Start soapUi, and add the WSDL for the adabas\_blobs service. If you are unfamiliar with soapUi, please run through [this tutorial](#) first

3. You should now have a screen similar to this

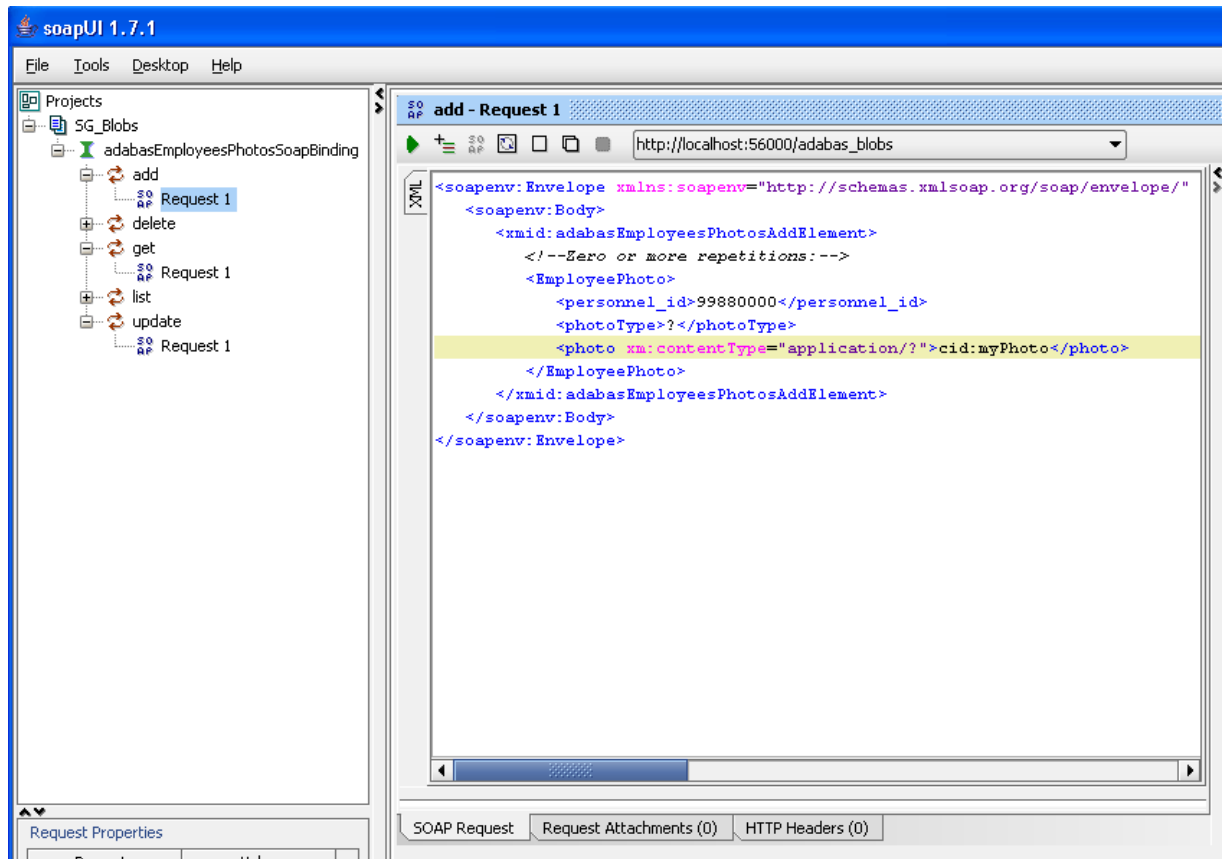

Under **add** double-click **Request 1**

4. Remove the <soapenv:Header> element and all child elements.

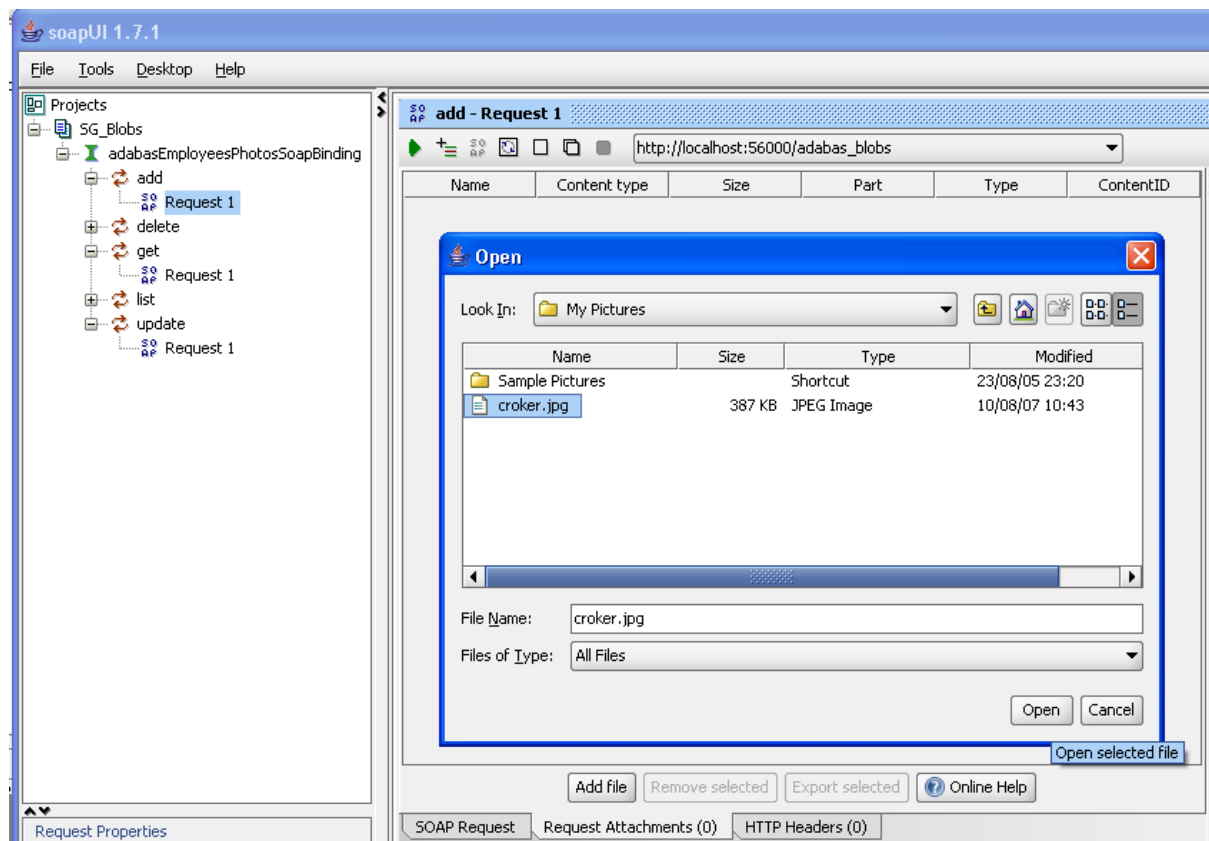

Add the personnel\_id of the record you would like the BLOB to be added

Change the cid:XYZ reference to be something familiar, for example **cid:myPhoto**

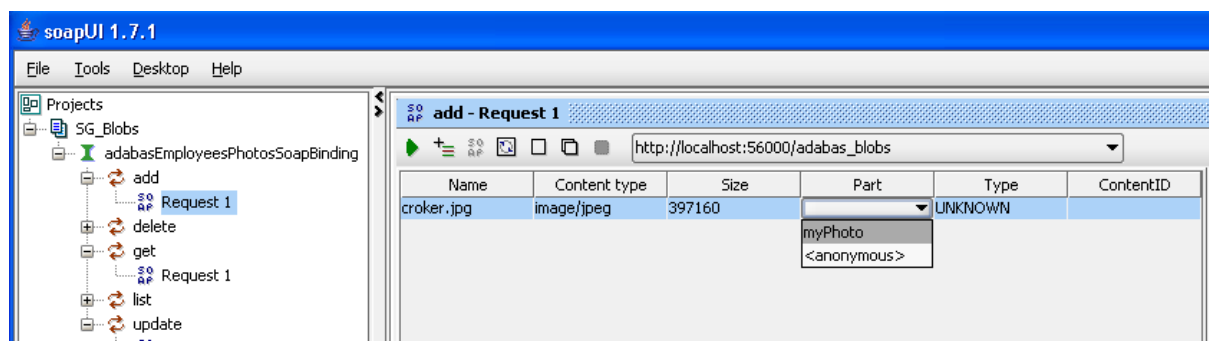

5. Click the **Request Attachments** tab, and click **Add File**

Select the required LOB file and click **Open**

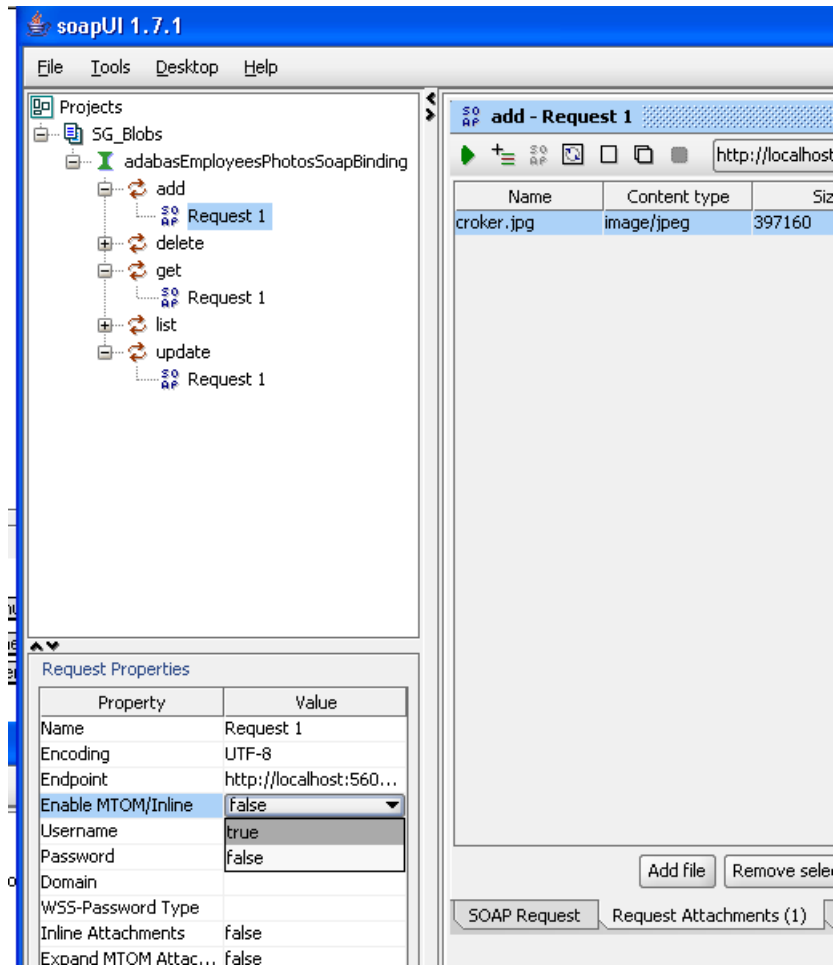

When asked to **Cache Attachment** select **No**

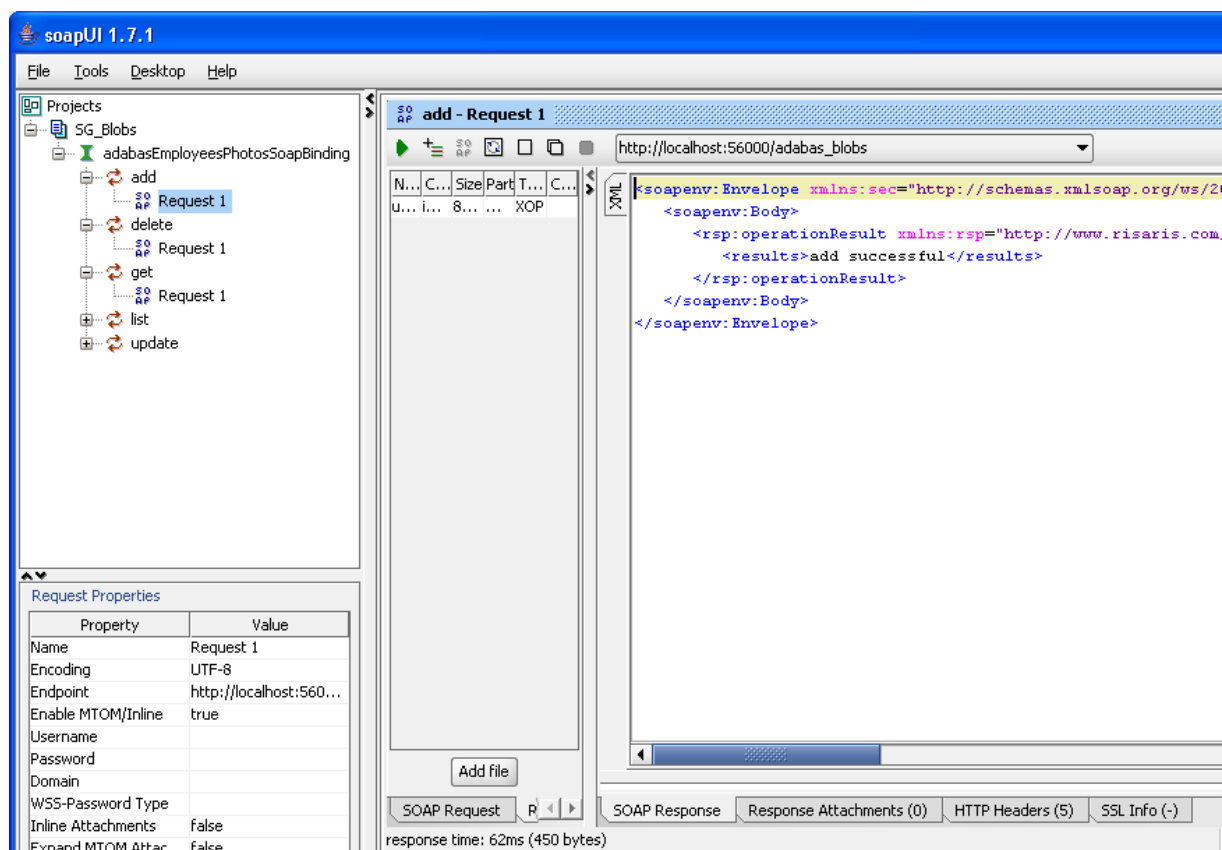

6. Click the **Part** column, and select the CID reference you changed earlier, for example **myPhoto**

7. In the **Request Properties** change **Enable MTOM/Inline** to true

8. Click the green arrow to send the request. The server's response will appear in the right pane

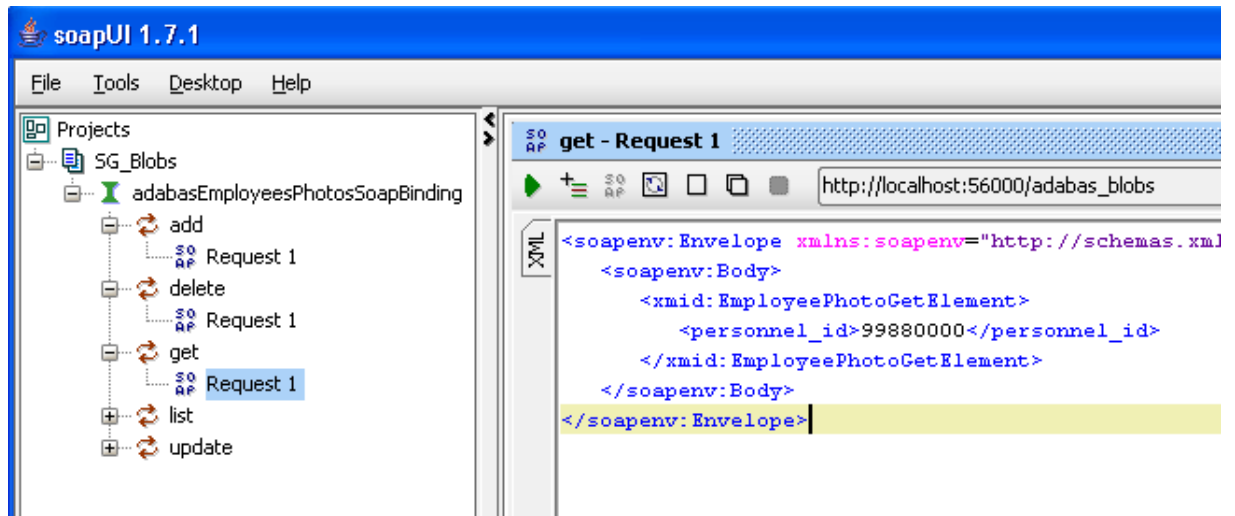

9. Now that the record, including the LOB, has been added to your Adabas file, you will want to retrieve it.

In SOA Gateway LOBs can be retrieved using the **get** request

Under **get**, double-click **Request 1**. Remove the <soapenv:Header> elements as before.

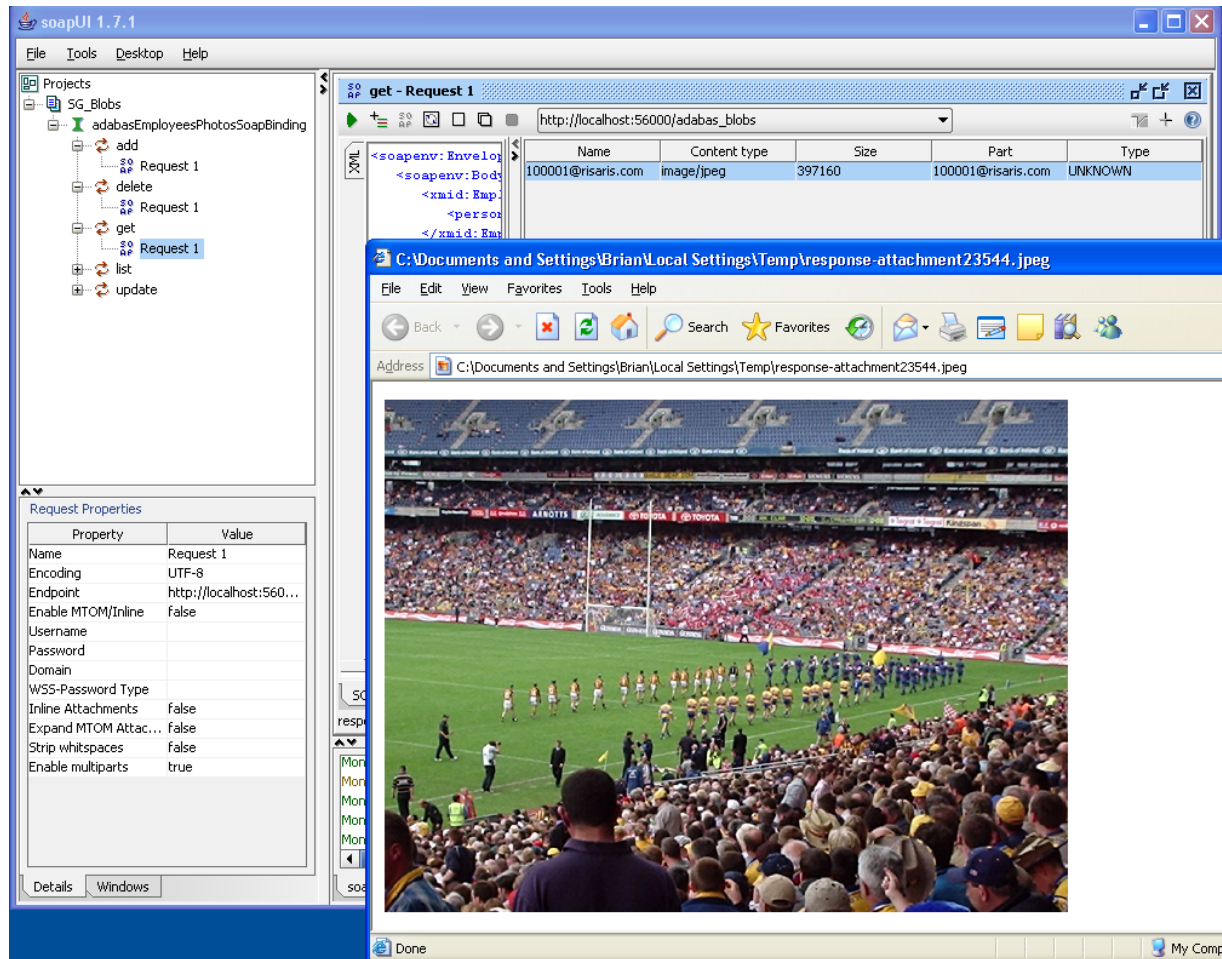

10. Add the personnel\_id of the record that you wish to retrieve, for example 99880000.

11. Click the green arrow, and this record will be retrieved from Adabas.

Select the **Response Attachments** tab, and double-click the attachment.

It should open in a web-browser, or you can save the attachment to disk by selecting **Export selected**

12 You may delete the record, including the LOB, by selecting the delete operation and entering the corresponding personnel\_id.

## 9 Accessing LOBs from PHP

---

LOBs sent as MTOM attachments on a SOAP response from SOA Gateway can be handled by a PHP program. This, however, requires the presence of the [WSO2 Web Services Framework](#)

Provided here are the following sample PHP programs dealing with LOBs access:

- [wsf\\_lobGet](#): Get a record, save the LOB to a file

# 10

## Accessing LOBs using a browser

---

You can also use SOA Gateway to retrieve LOBs from Adabas into a web browser. This can be any browser of your choice, for example IE running on Windows, retrieving LOBs from Adabas running on z/OS.

In the tutorial below, we'll use the popular [Firefox](#) browser and the SOA Gateway running on z/OS.

This tutorial assumes you've already got some LOBs stored in your database. See the previous tutorial to find out how to do this.

1. Start the Control Center and add a new Web Service.

Enter the following information

- Name: adabasTutorial\_blobs
- DataView : Select 'adabas\_photoblobs', which is one of the sample definitions delivered with SOA Gateway
- DatabaseId: 212 ( or the DBID relevant on your system )
- FileNumber: 90

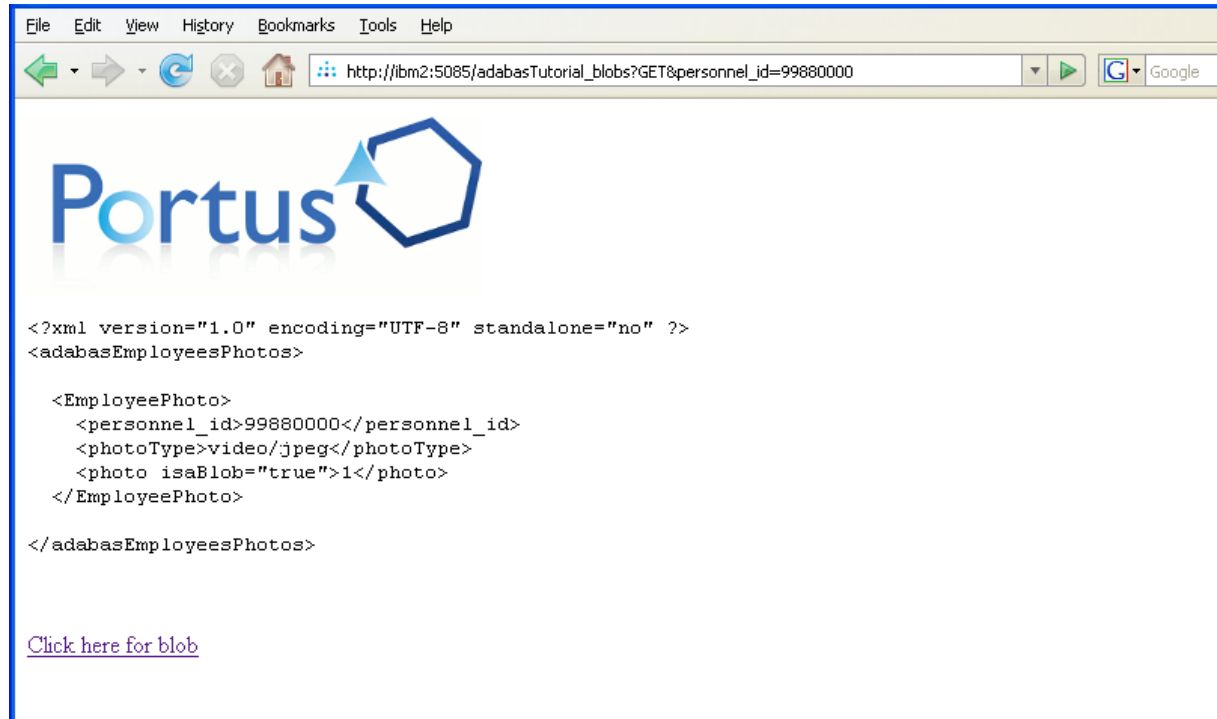

Publish your changes to the server.

2. Start your browser, and enter the following URL

`http://soagate:56000/adabasTutorial_blobs?GET&personnel_id=99880000`

Replacing soagate:56000 with the hostname and port where SOA Gateway is running.

3. If there is a blob associated with this record, the following is returned

4. Click on the link "Click here for blob" to display the LOB file in the browser.

**Note:** The LOB will open automatically in your browser, if it of a MIME type that your browser understands. Commonly used types are PDF, WMV, JPEG, etc. Refer to your browser documentation if you need more information.

5. Here you can see a JPEG file opened up in a new tab in firefox after the LOB link was clicked.

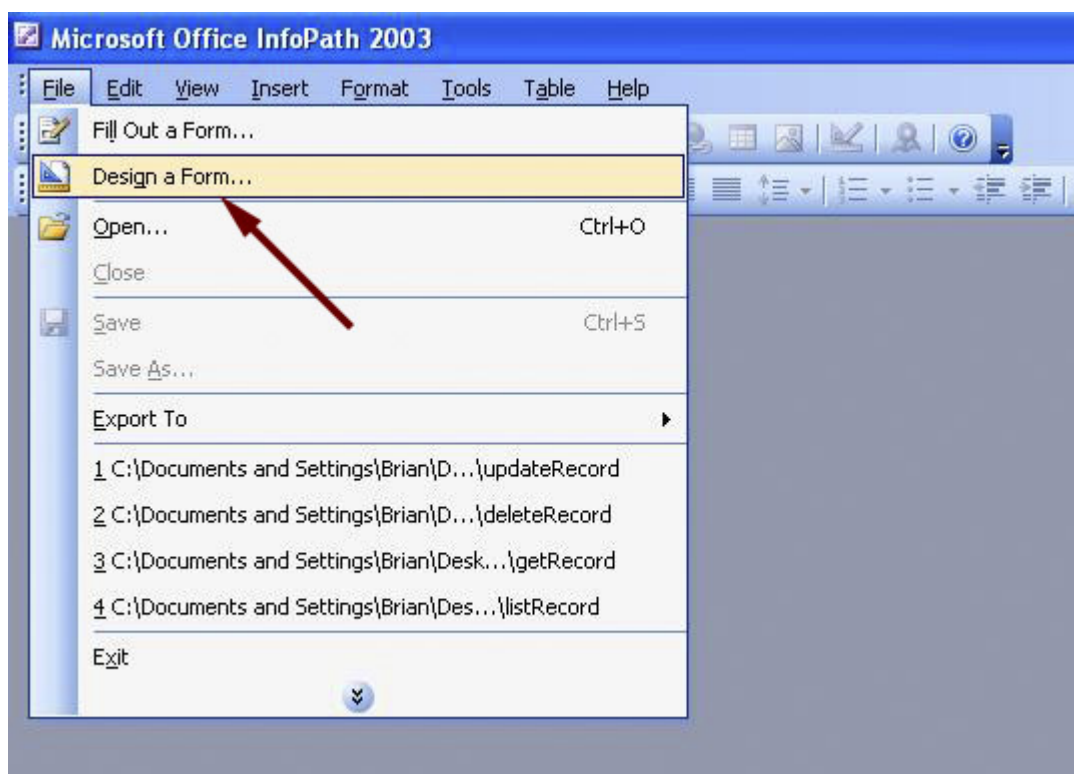

# 11 Accessing Adabas through Microsoft InfoPath

---

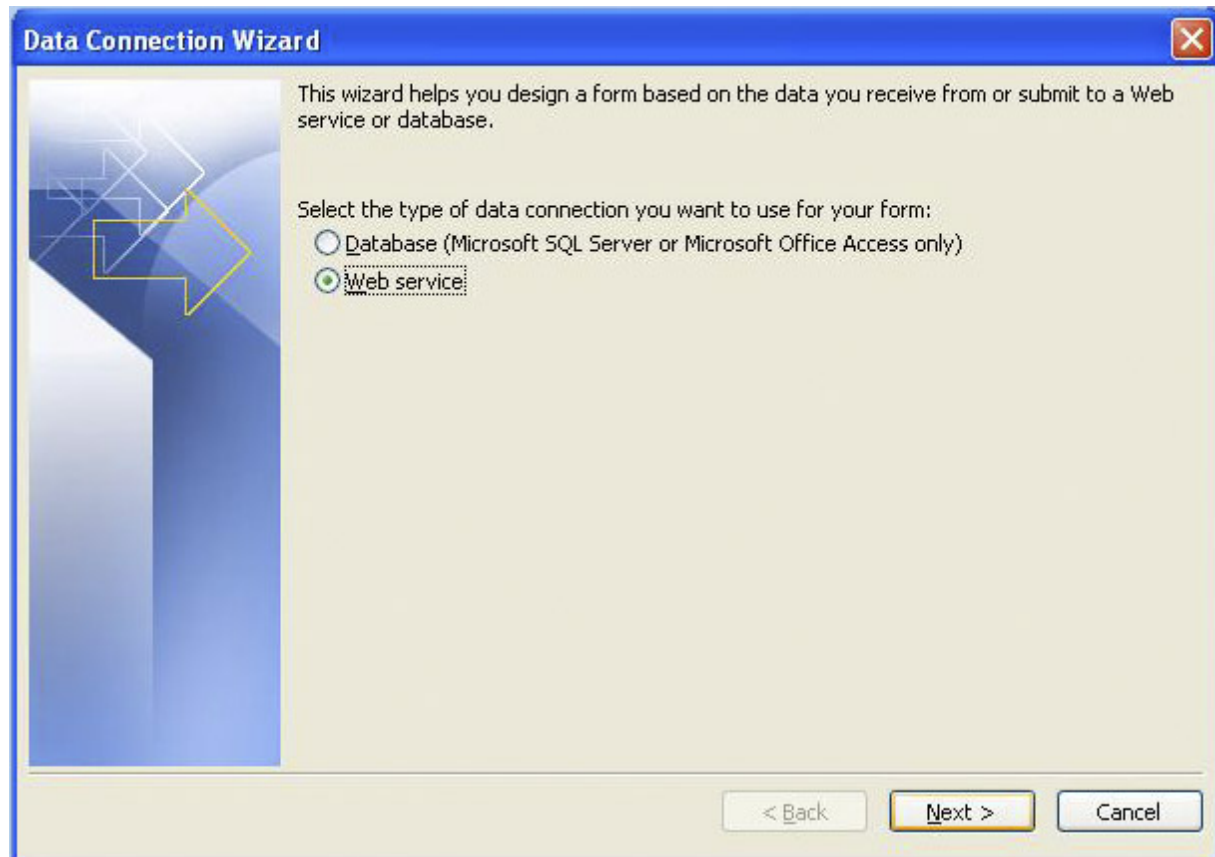

This tutorial demonstrates how to invoke operations on an Adabas DataSource exposed as a "Web service" through SOA Gateway from Microsoft InfoPath.

1. From the InfoPath main menu bar, select **File -> Design a Form**.

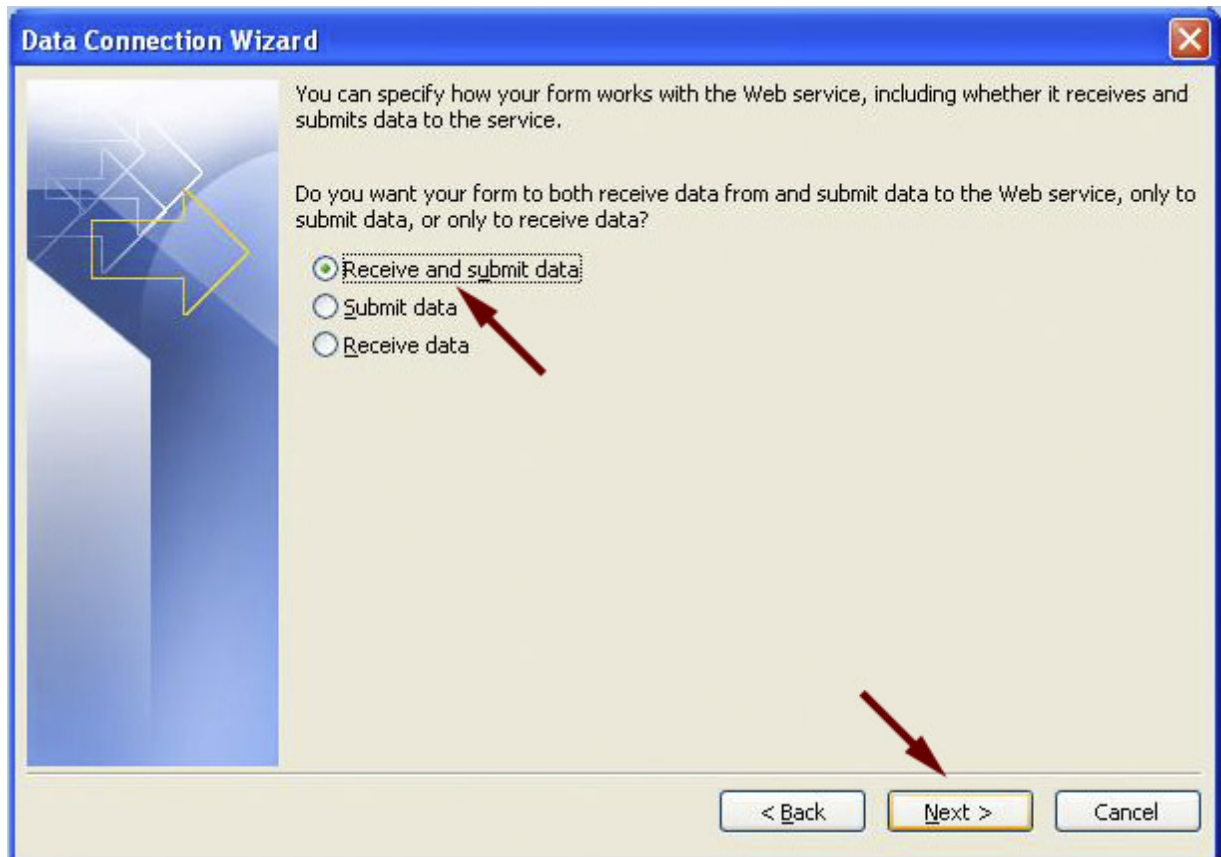

2. A panel will appear on your right hand side - choose **New** from **Data Connection**

This will start a dialog, first select **Web Service**, click **Next**

Select **Receive and submit data**, click **Next**

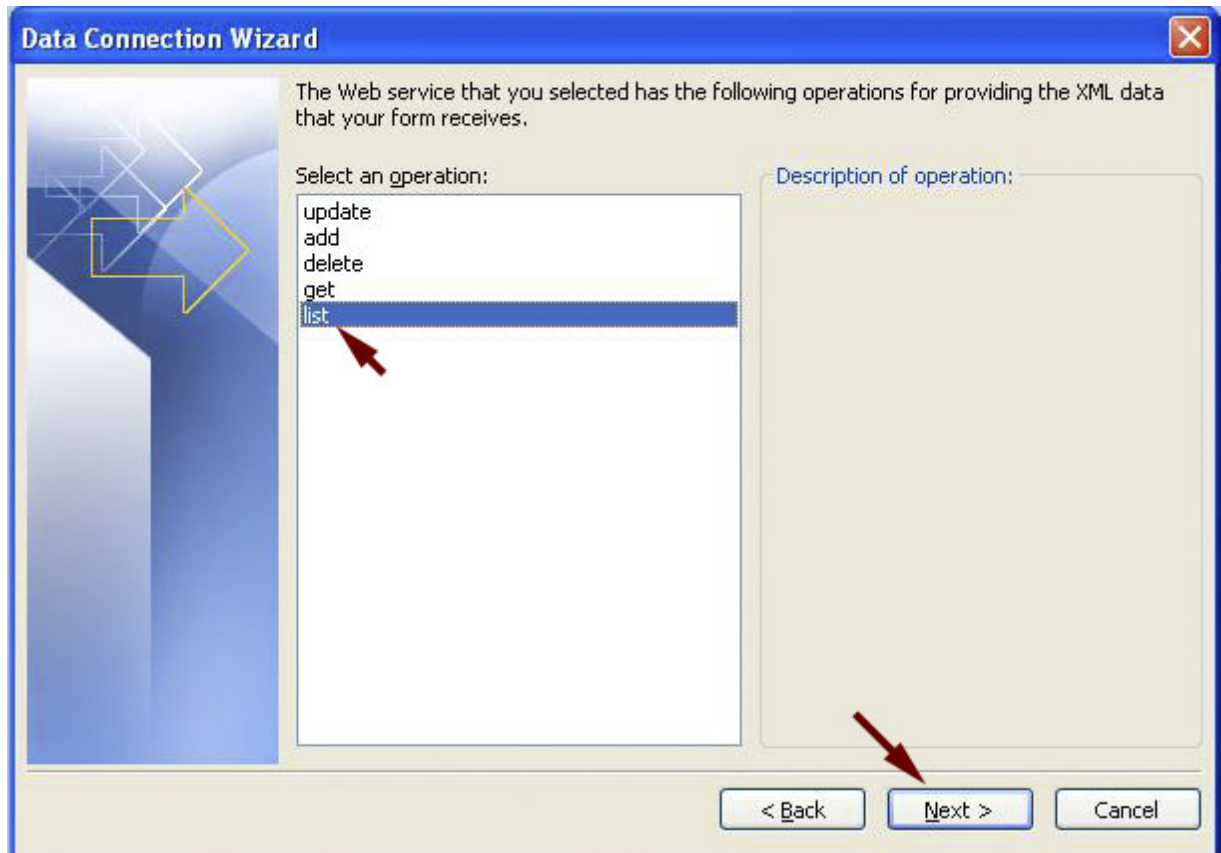

Enter the URL the WSDL for the "Employees" demo file is exposed as: *http://soagate:8885/adabas\_Employees?WSDL*

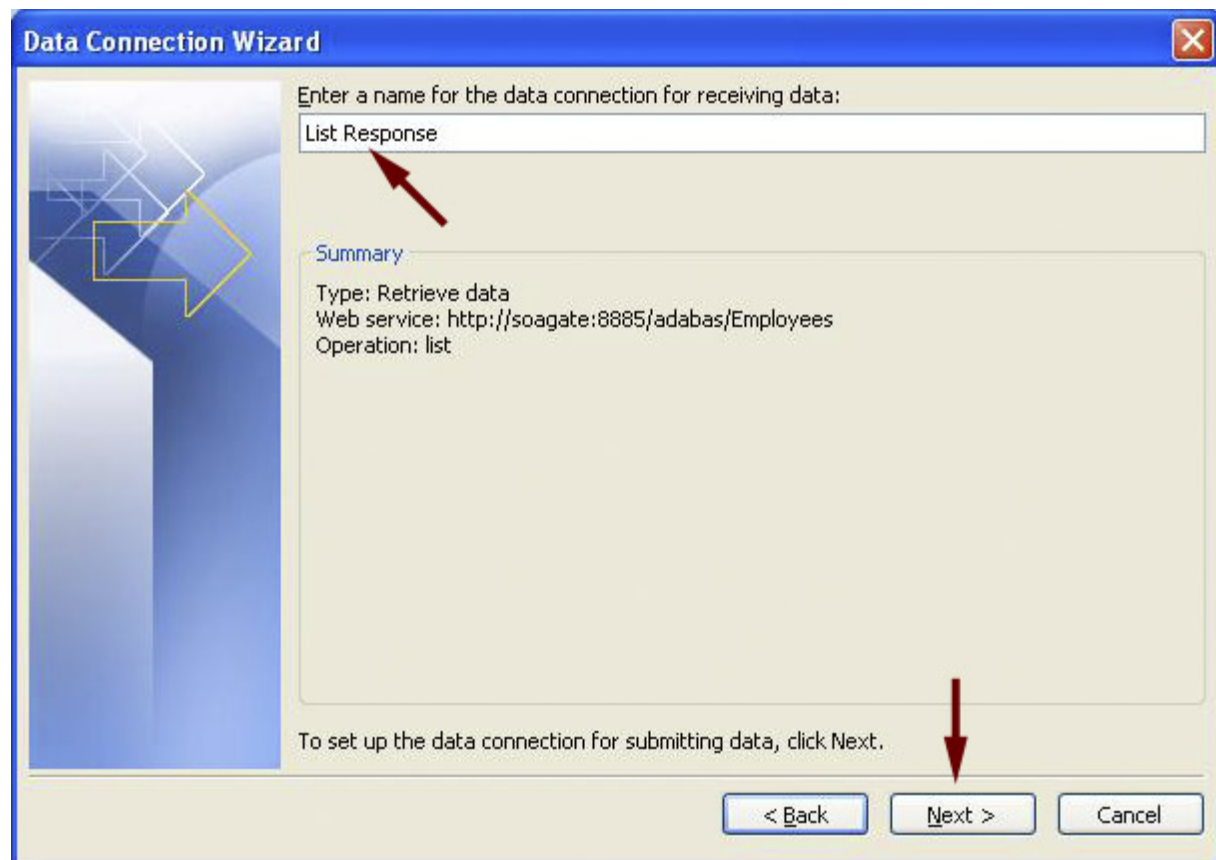

Click **Next**

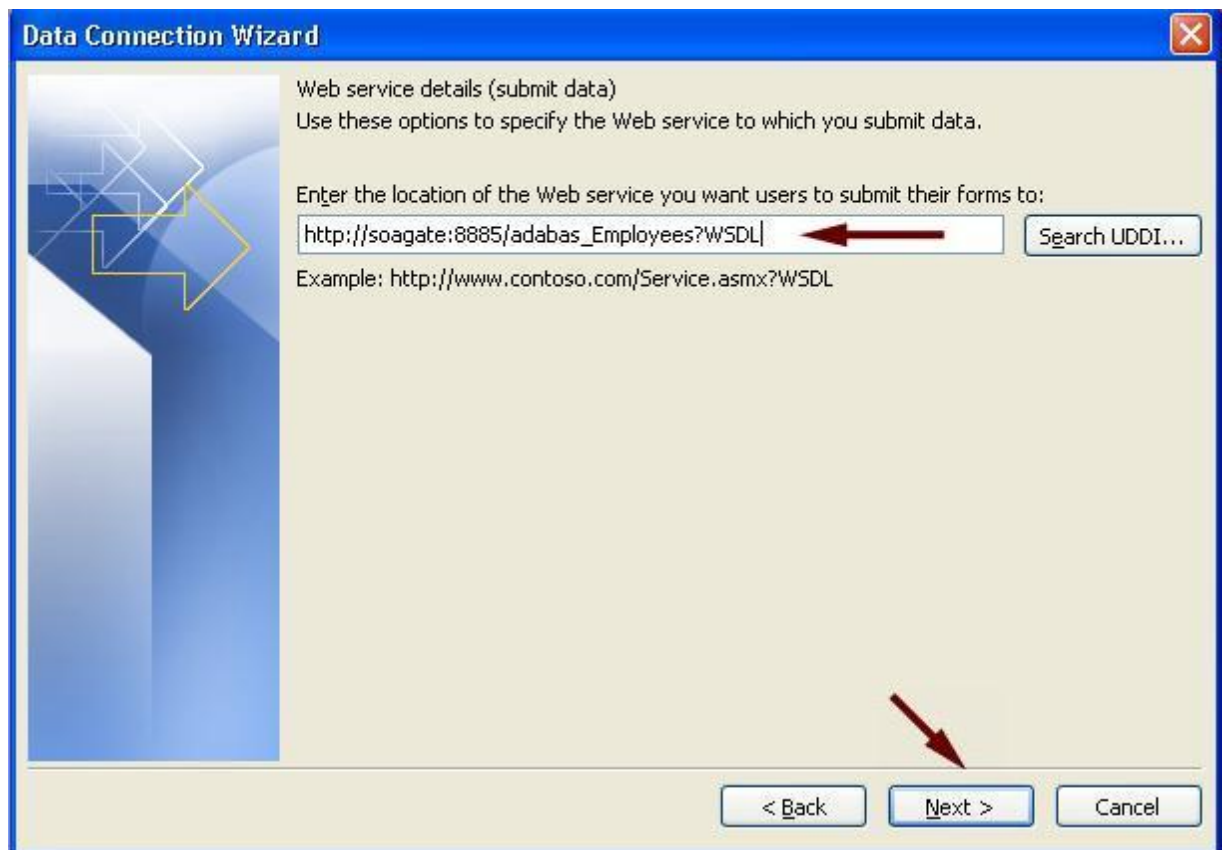

Select the **list** method, click **Next**

Assign a name to the response document, click **Next**

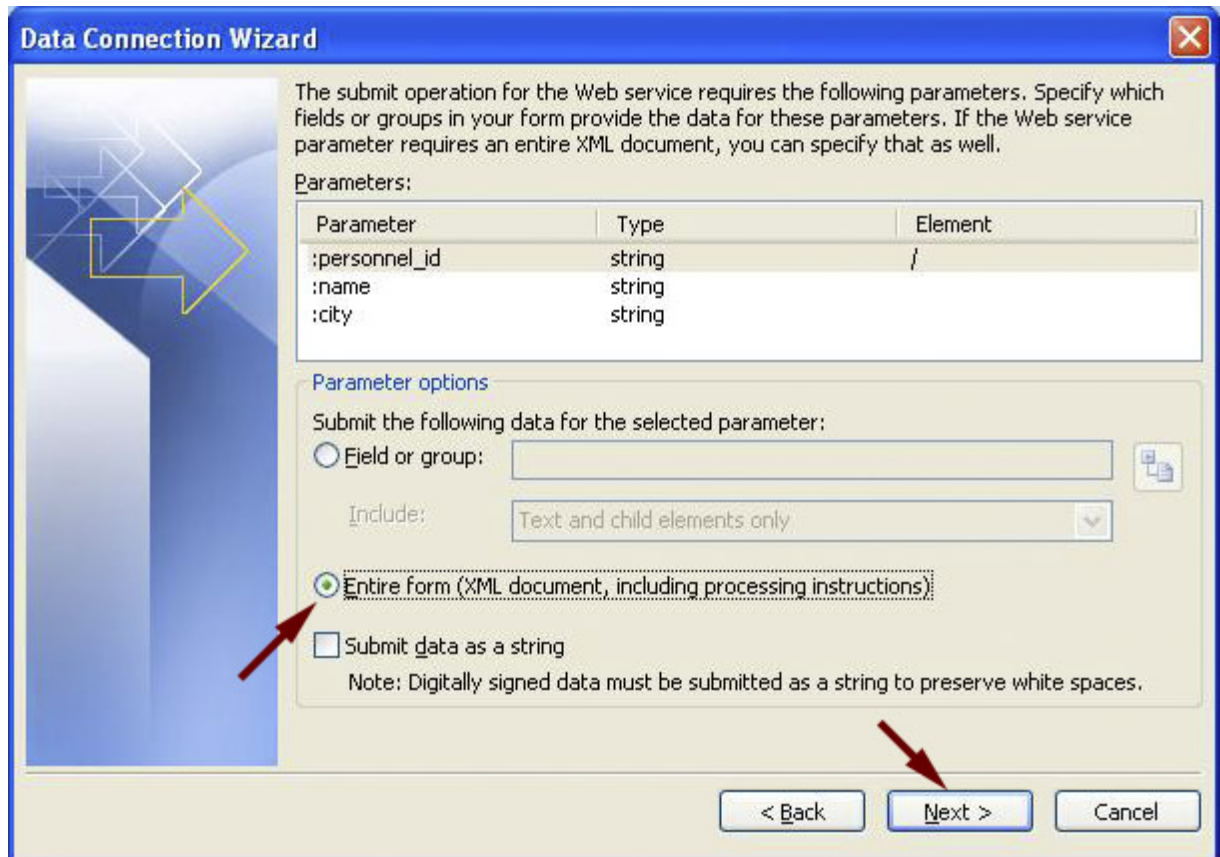

Enter the same URL again, click **Next**

Choose list and click **Next**

Select "Entire form (XML document....", click Next

The submit operation for the Web service requires the following parameters. Specify which fields or groups in your form provide the data for these parameters. If the Web service parameter requires an entire XML document, you can specify that as well.

Parameters:

Parameter	Type	Element
:personnel_id	string	/
:name	string	
:city	string	

Parameter options

Submit the following data for the selected parameter:

☐ Field or group:

Include:

☒ Entire form (XML document, including processing instructions)

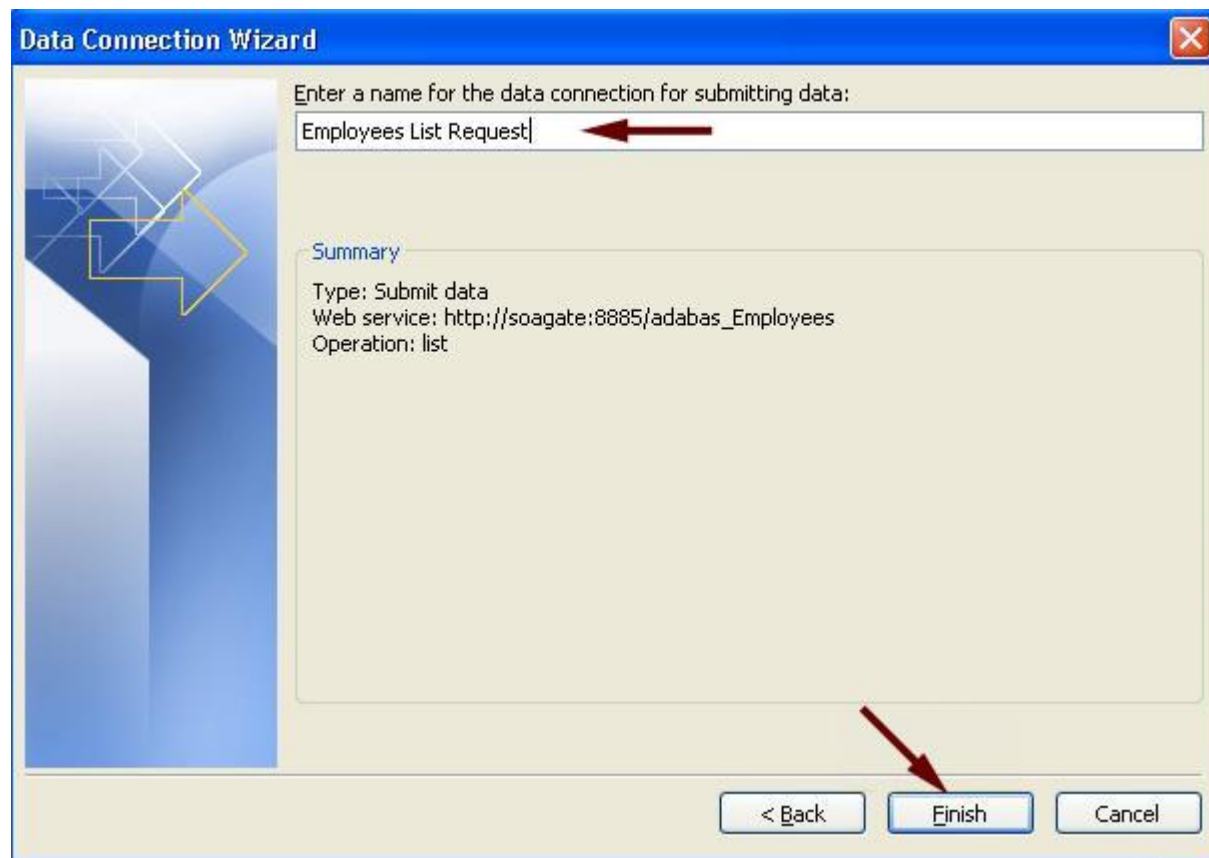

☐ Submit data as a string

Note: Digitally signed data must be submitted as a string to preserve white spaces.

< Back   Next >   Cancel

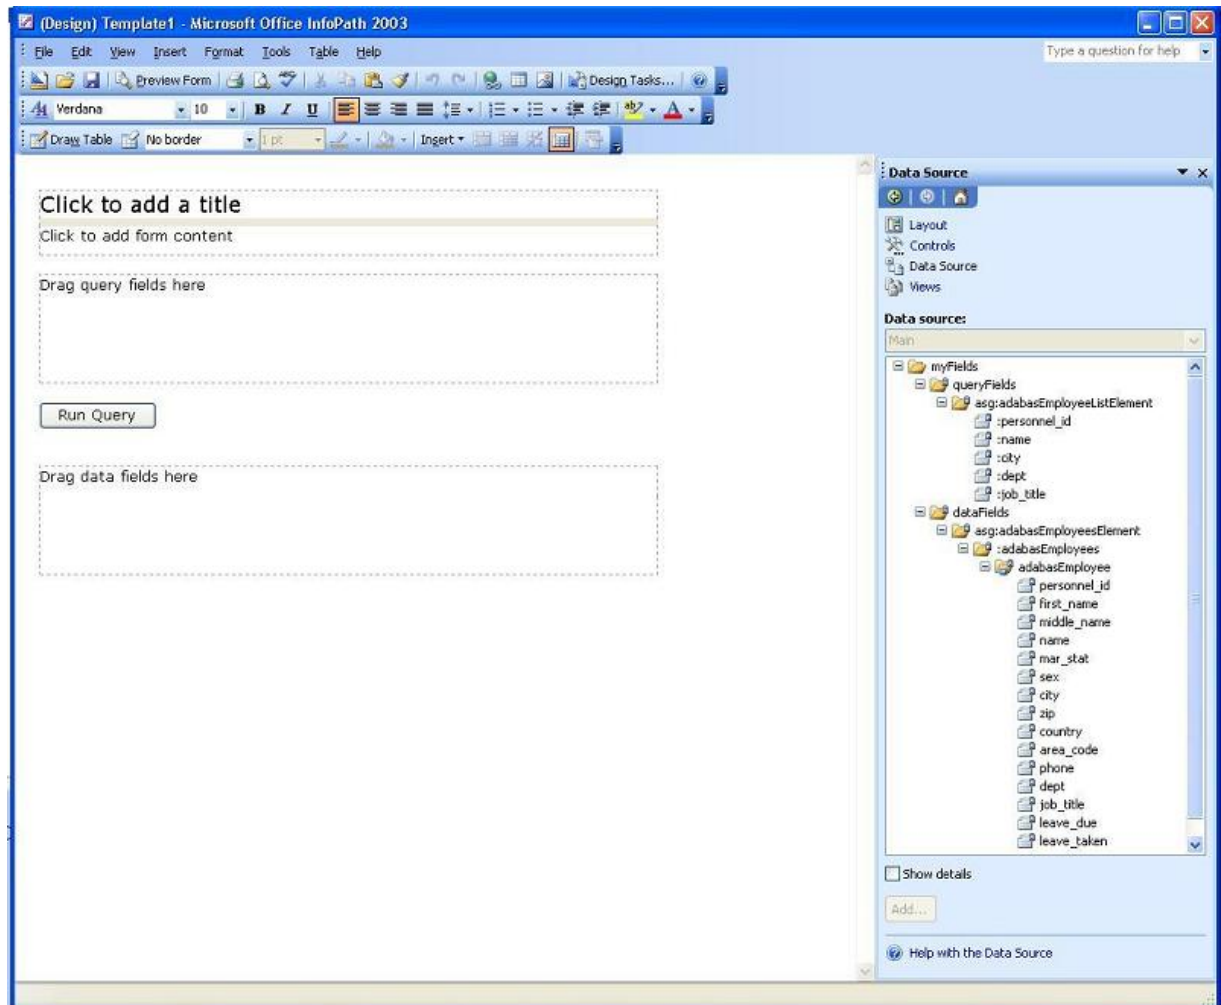

The image shows the 'Data Connection Wizard' dialog box. It has a blue title bar and a sidebar with a large blue arrow pointing right. The main area contains instructions, a table of parameters, and options for submitting data. A red arrow points to the 'Entire form' radio button, and another red arrow points to the 'Next >' button.

Assign a name to the Send Connection, click **Finish**

3. You will now be presented with a form

Do the following:

- Enter a title "List Employees" for example
- Expand the **queryFields**, drag them to the area "Drag query fields here"
- Expand the **dataFields**, right-click on the **adabasEmployee** element. Now drag the adabasEmployee to the area "Drag data fields here", insert it as a **Repeating table**

At this point, it might make sense to resize the table and the fields in the "repeating table"

4. Once you are happy with how your form looks like, select **File -> Preview form -> Default**

**List Employees**

Click to add form content.

Personnel Id:

Name:

City:

Dept:

Job Title:

Section

Section

Personnel Id	First Name	Middle Name	Name	Mar Stat	Sex	City	Zip	Country	Area Code	Phone	Dept	Job Title	Leave Due	Leave Taken
<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>	<input type="text"/>

☒ Repeating Table

- You will be presented with a form, enter 4000004\* in the Personnel Id field and send the request to the server

## List Employees

Personnel Id:

Name:

City:

Dept:

Job Title:

6. Your table will now be populated with the data based on your request:

Personnel Id	First Name	Middle Name	Name	Mar Stat	Sex	City	Zip	Country	Area Code	Phone	Dept	Job Title	Leave Due	Leave Taken

---

# 12

## Using Transactions with soapUI

---

The following tutorial demonstrates how SOA Gateway can be used with Adabas transactions. It is assumed you are already familiar with the following

- soapUi ( see [here](#) )
- Creating SOA Gateway web services from Adabas ( see here )
- Familiar with SOAP Header usage concepts ( see here )

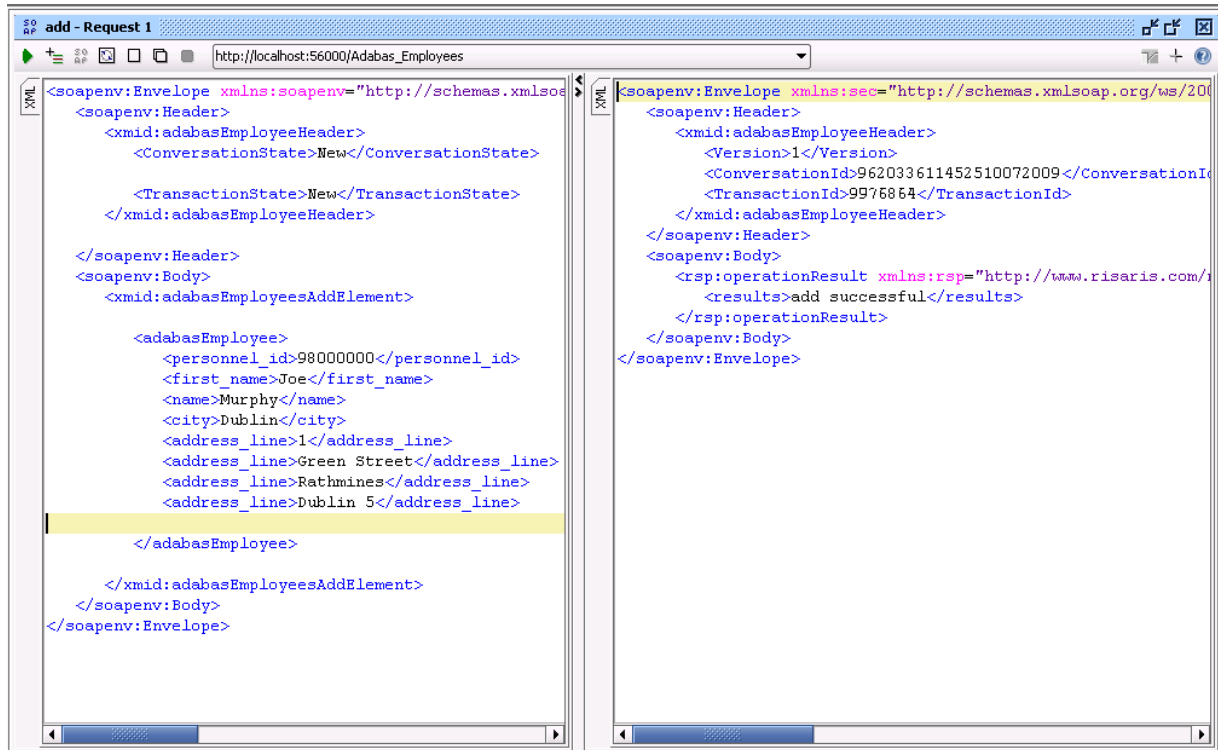

For this tutorial, we will use the Employees demo file (usually file number 11) that comes with Adabas, and the **adabas\_employees\_mini\_view** data view. It is assumed you have already created a web service for your Adabas file.

**Important:** By default, SOA Gateway will time-out and kill existing Conversations after a period of time. This can be configured using the Control Centre, with a maximum value of 3600 (10 minutes). See here for more information.

1. Import the WSDL into soapUi.
2. Choose the request for the add operation, and in the XML set the `ConversationState` to `New` and the `TransactionState` to `New`. Also remove the other Header values. Send the request to SOA Gateway

E.g

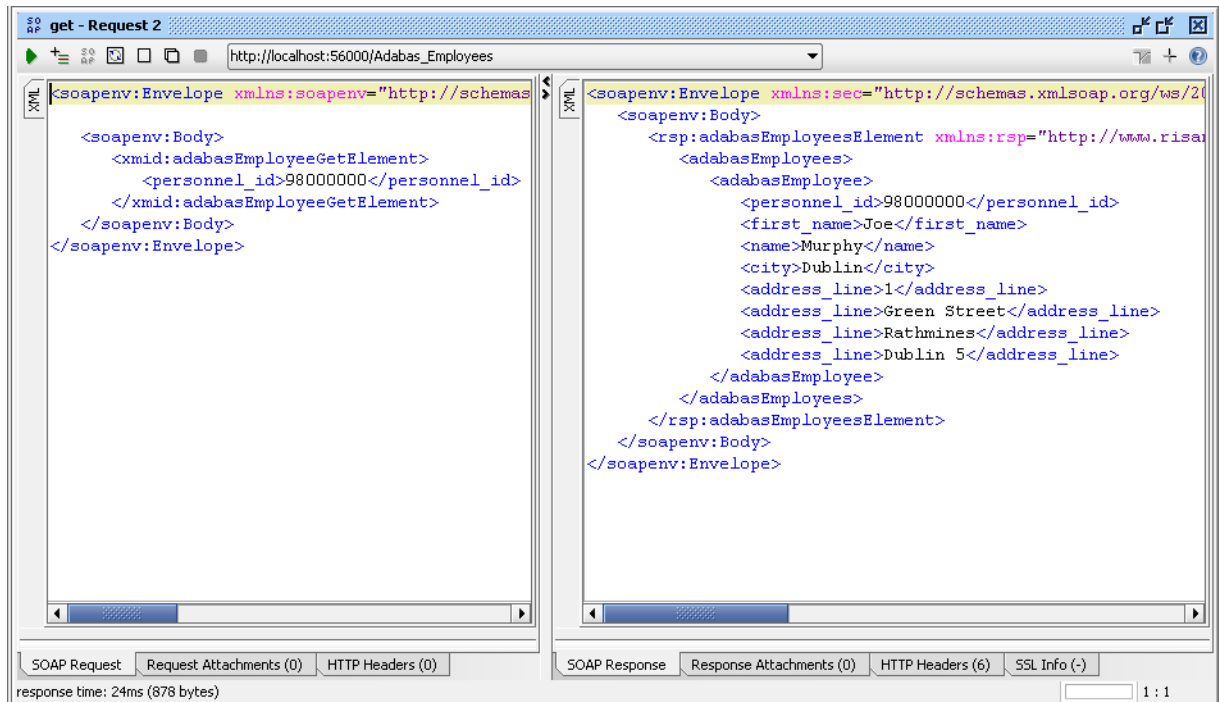

SOA Gateway has now created a new Conversation and a new Transaction for this request. The IDs for each of these are returned.

3. Verify that the record has been added successfully, (but not yet committed).

Choose a get request, remove the soapenv:Header element, and enter the record.

E.g.

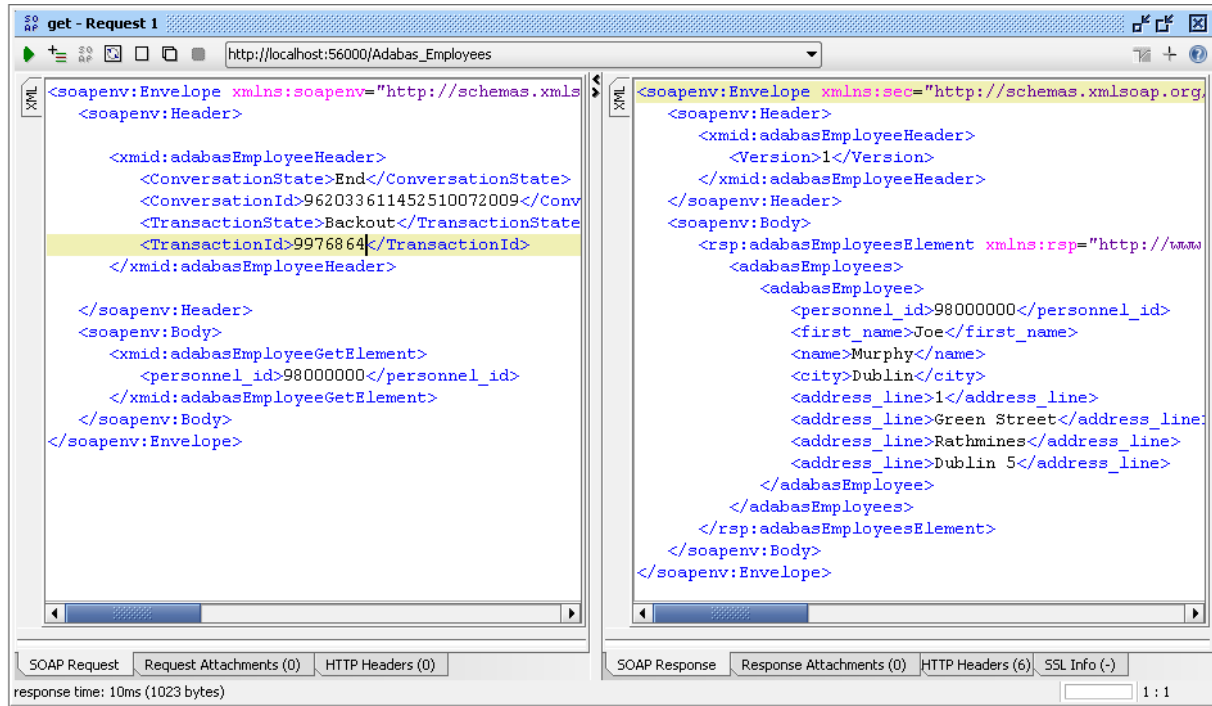

The record has been added, but not yet committed. Because Adabas' isolation level is "Read Uncommitted" (also known as "dirty read"), a request from a non-conversational request will still return the added, but-yet-uncommitted, record.

#### 4. Now backout the transaction.

Choose a get request, and enter the following:

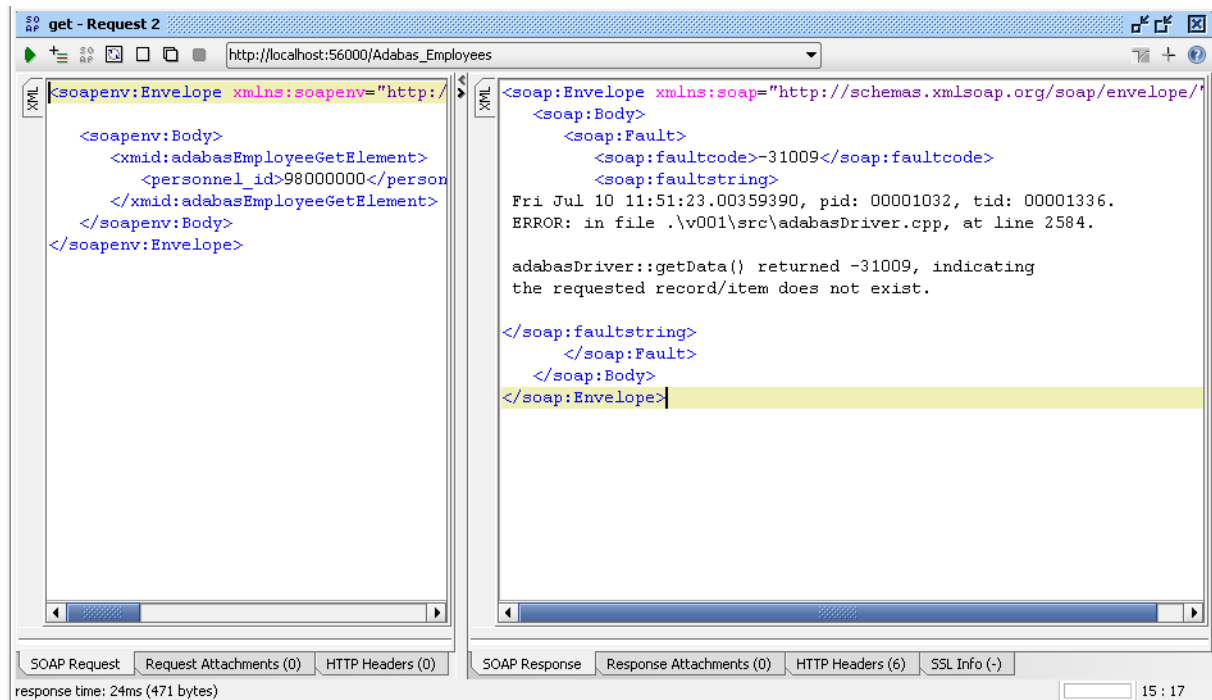

- `ConversationState` to End
- `ConversationID` to the value returned in the add response
- `TransactionState` to Backout
- `TransactionID` to the value returned in the add response

E.g

5. Now, if you re-run the request from Step 3, the item does not exist as the previous add has been backed out.

E.g.

# 13

## SOA Gateway - Configuration Versioning with Eclipse and CVS

### CVS

---

■ Introduction .....	76
■ Requirements .....	76
■ Example Setup .....	76
■ More Information .....	87

## Introduction

---

If Eclipse is used as the management interface to SOA Gateway then versioning of the ASG configuration files can be achieved easily with CVS. Eclipse provides CVS interfaces, so much of the following will be familiar to many users of Eclipse already.

Using CVS can also bring advantages including security, auditing control, redeployment facilitation and metadata management.

## Requirements

---

In order to take advantage of this option, you must have available :

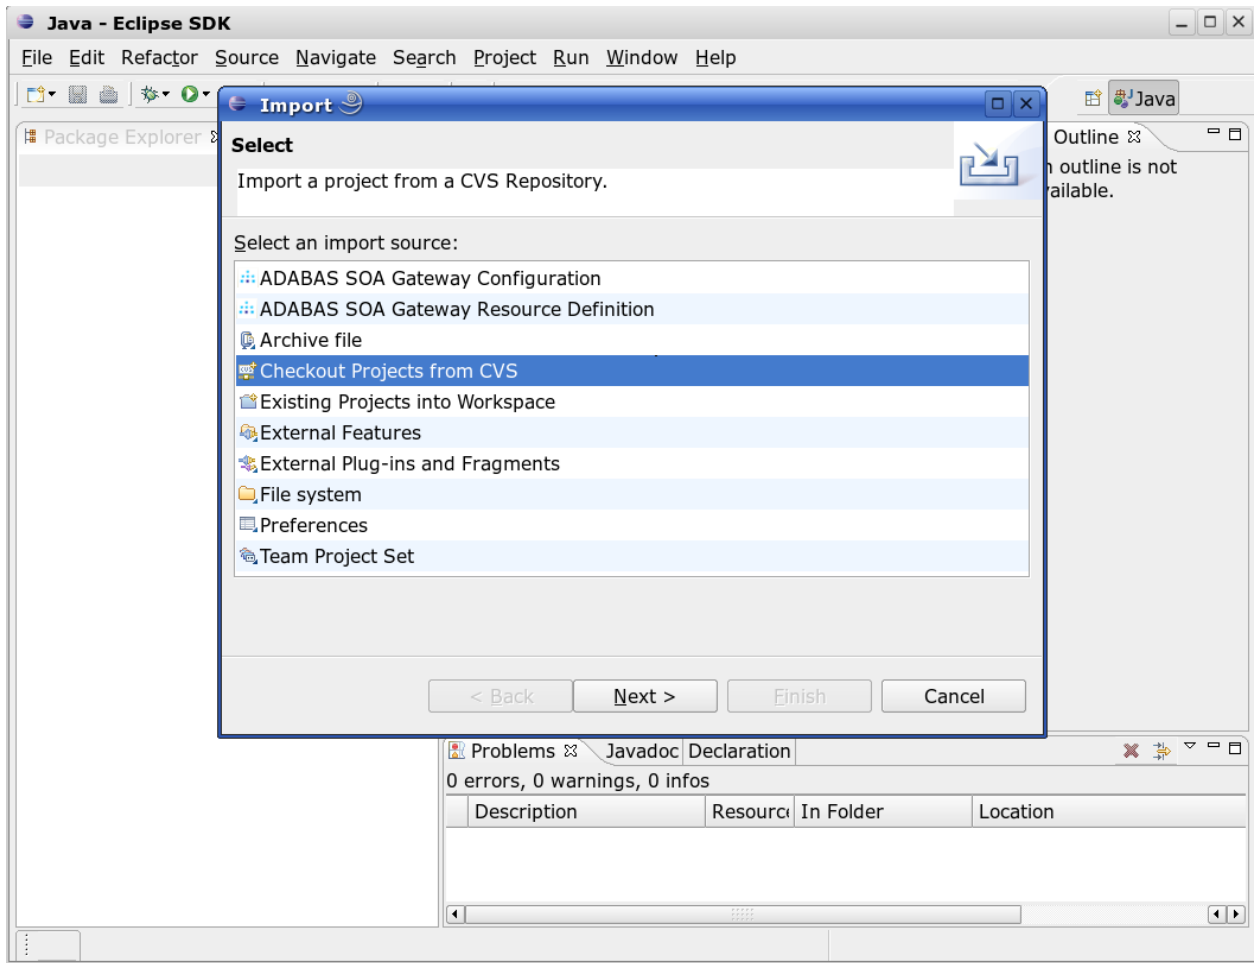

- a server running CVS and to which you have access
- a CVS 'module' where you can add the ASG related files you wish to maintain

## Example Setup

---

- [CVS Server Details](#)
- [CVS Module Selection](#)
- [Selecting a Location in Eclipse](#)
- [Adding Files to CVS](#)
- [Making CVS aware of file changes](#)

Select **File->Import** from the Eclipse Menus and then choose "Checkout Projects from CVS".

## CVS Server Details

Enter the details required for your CVS server.

**Checkout from CVS**

**Enter Repository Location Information**

Define the location and protocol required to connect with an existing CVS repository.

**Location**

Host: cvsserver

Repository path: /home/cvs/repository137

**Authentication**

User: cvsuser

Password: \*\*\*\*\*

**Connection**

Connection type: pserver

☒ Use default port

☐ Use port:

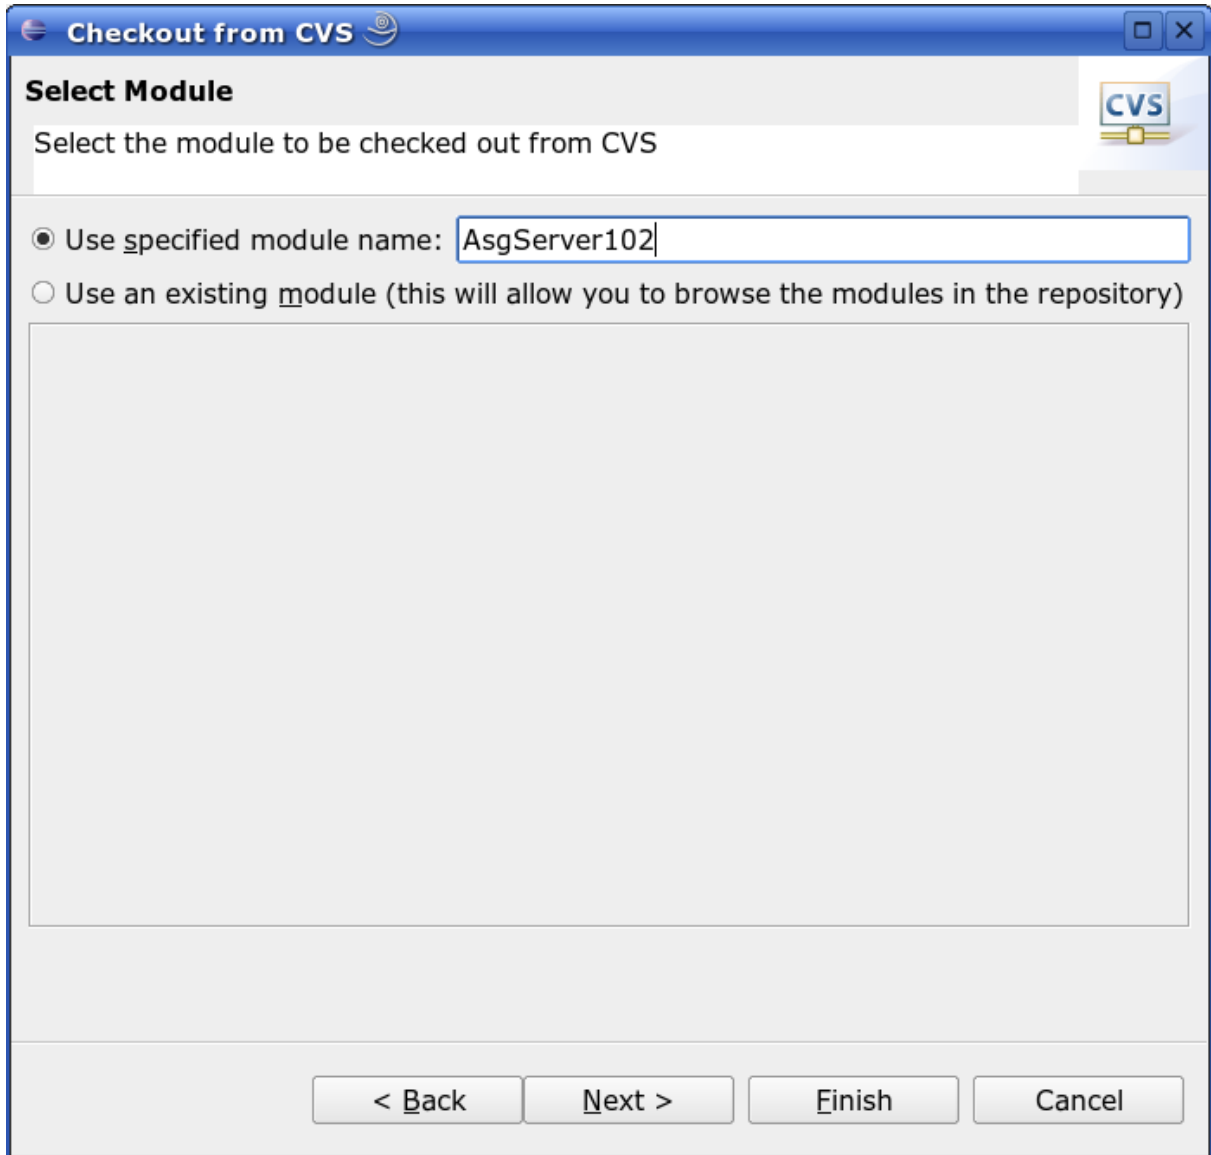

☒ Save password

⚠ Saved passwords are stored on your computer in a file that is difficult, but not impossible, for an intruder to read.

< Back   Next >   Finish   Cancel

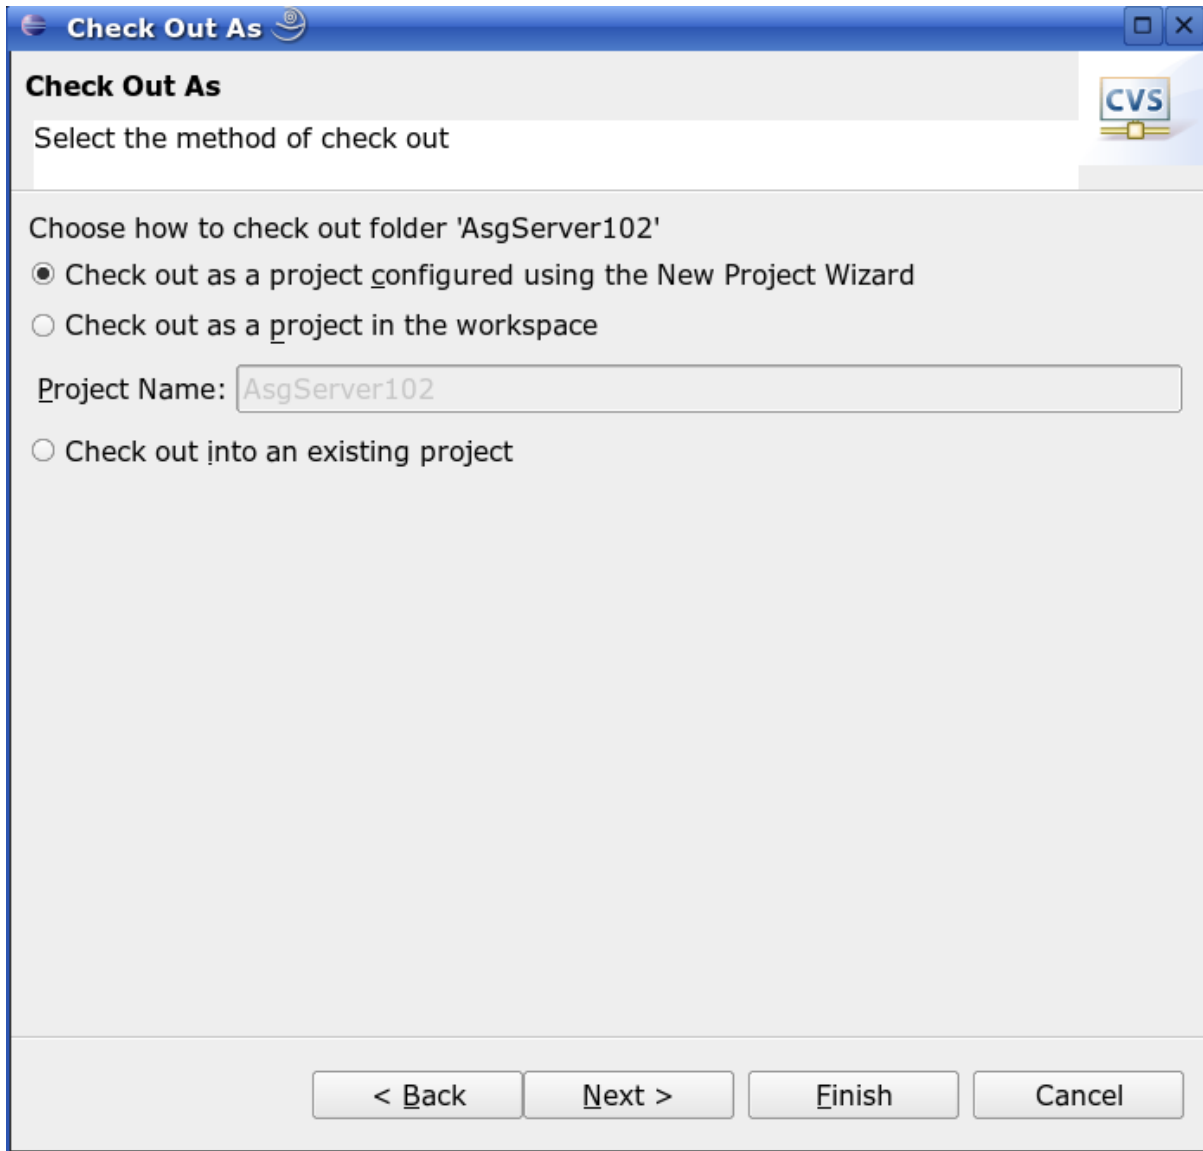

## CVS Module Selection

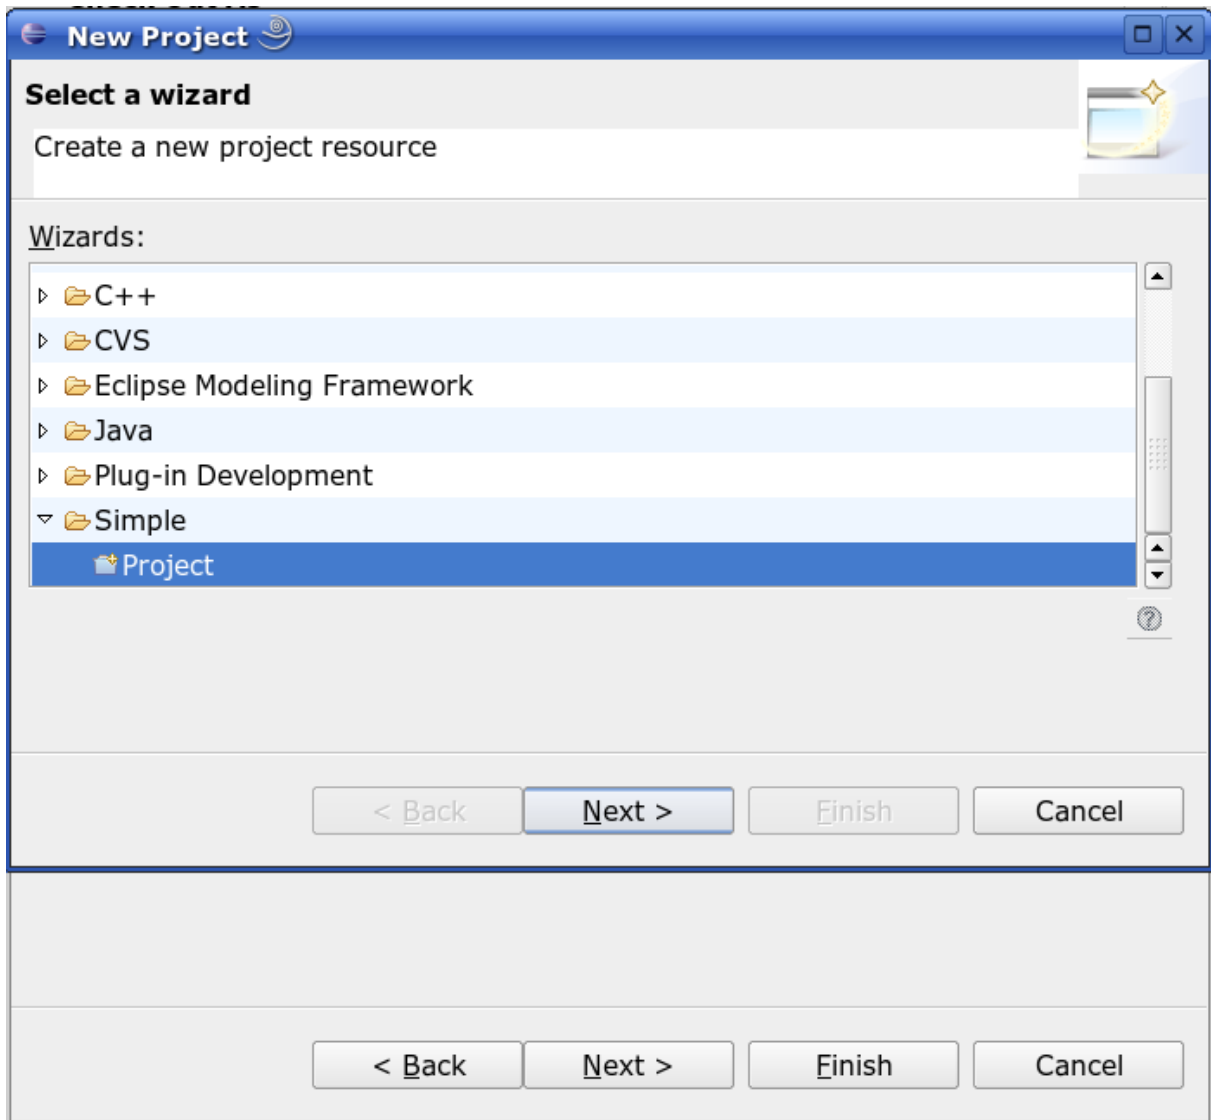

Enter the name of the CVS module where you are to keep your ASG files, or select the module from a list.

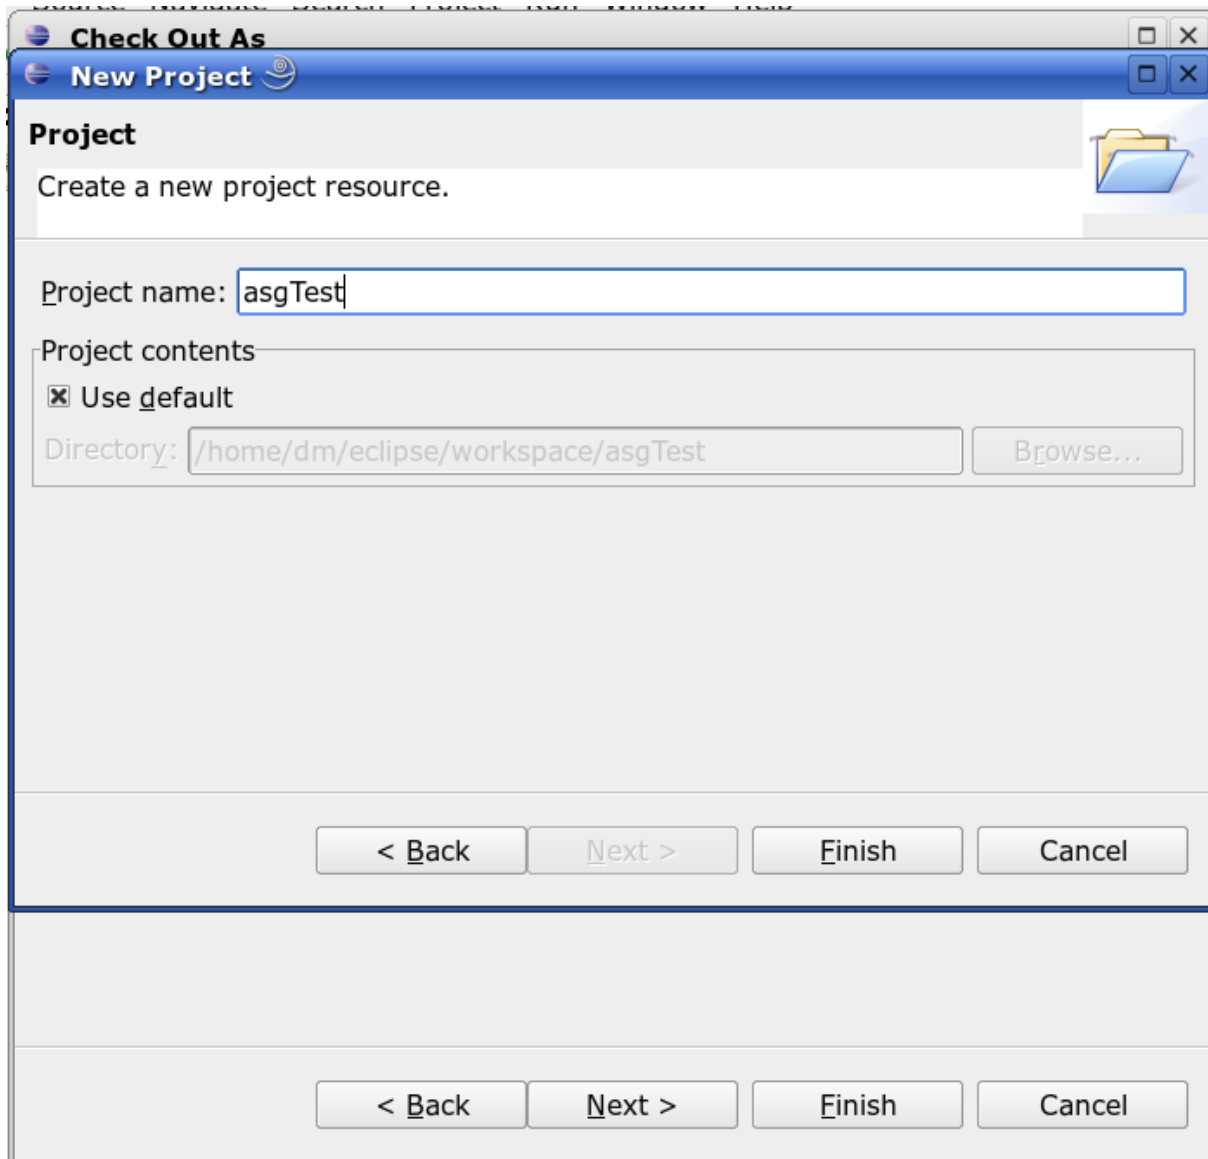

### Selecting a Location in Eclipse

Select where you wish to check out the CVS module to. You may place it in various locations. If you use an existing Eclipse project, the module will appear as a folder within it. This example creates a new Simple Project.

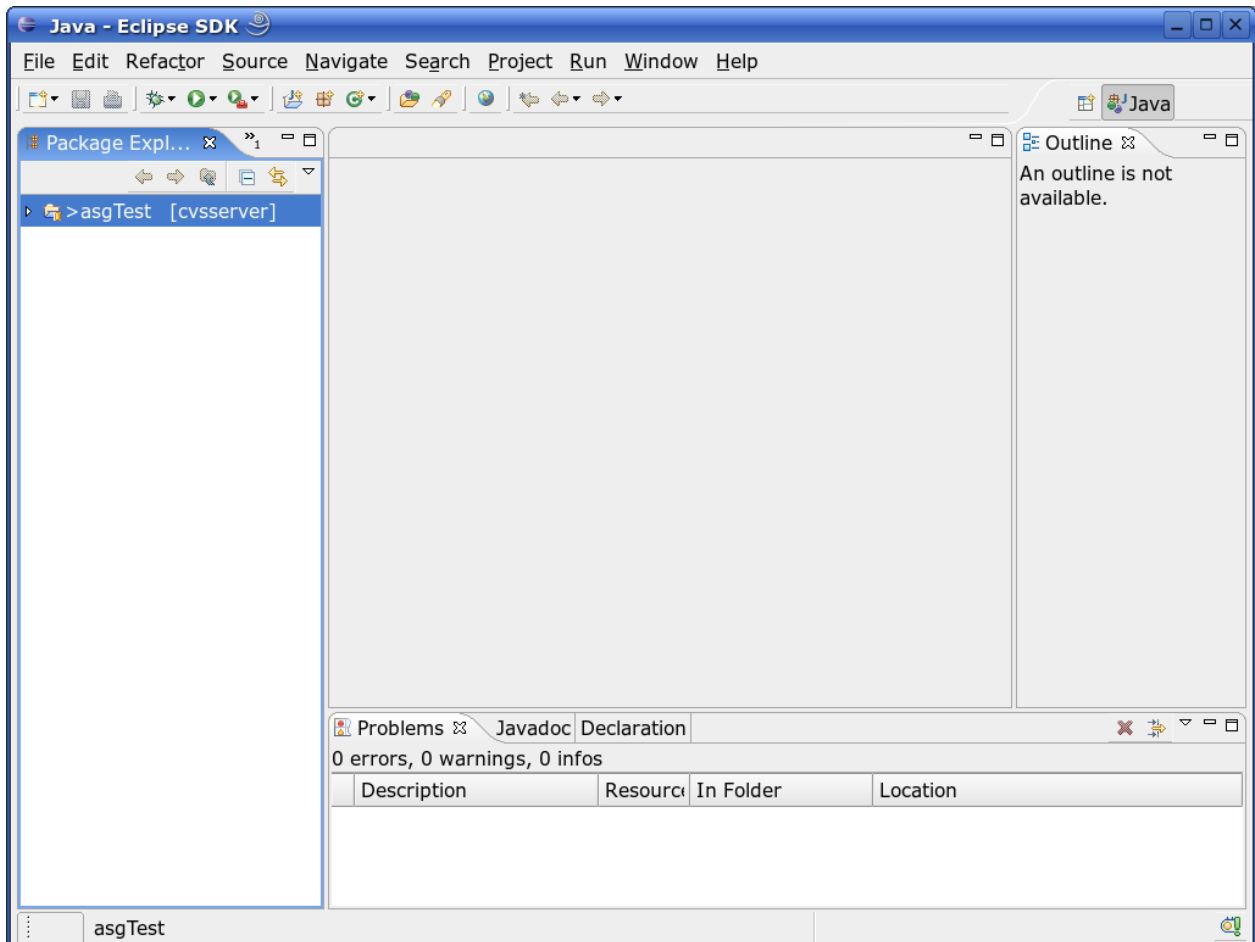

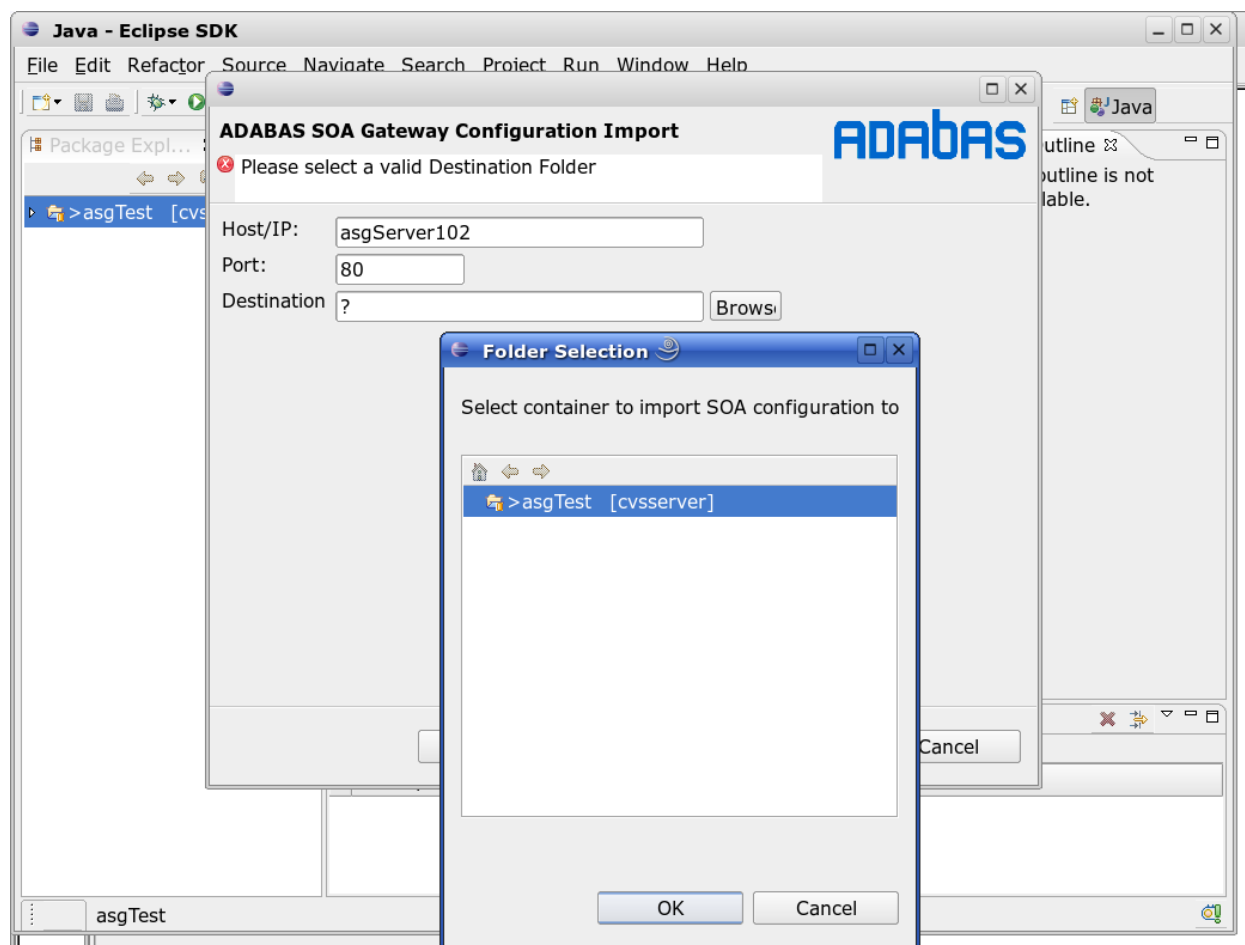

The New Project is now shown in the Eclipse Package Explorer Window, the icon denoting it as a CVS item, and the server name shown at the end.

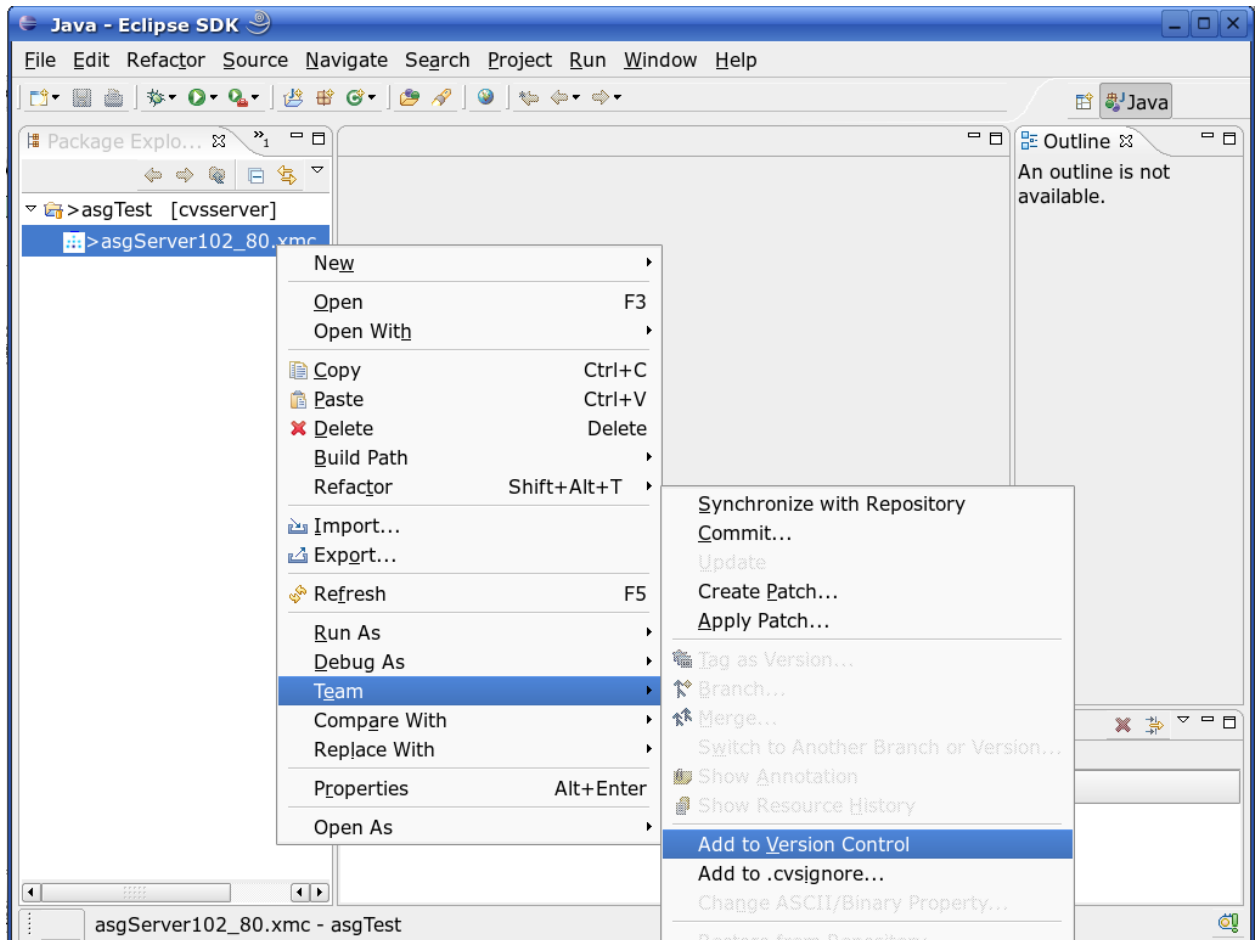

When you import items from ASG, you can now save them in this Project.

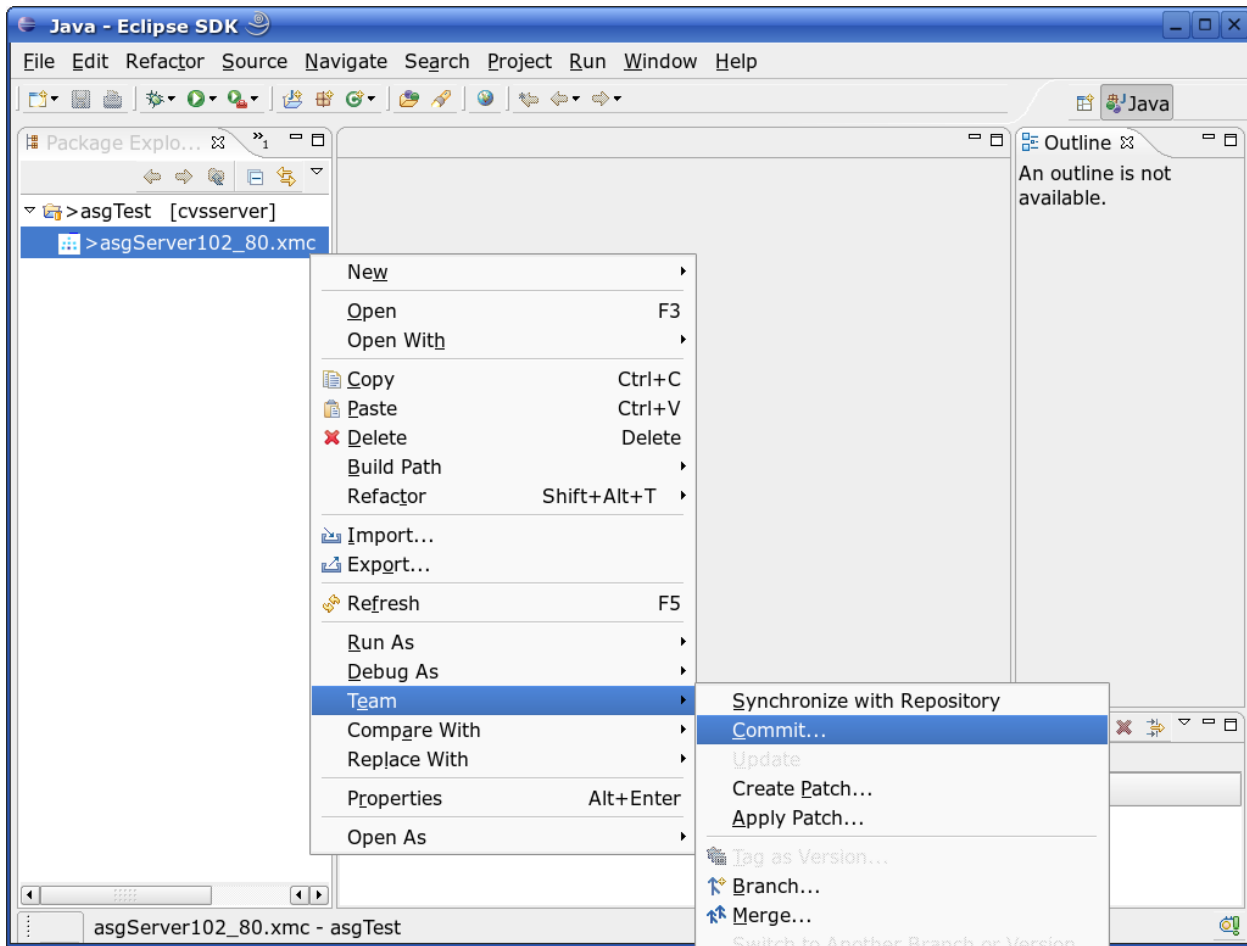

## Adding Files to CVS

Note that your imported files will need to be explicitly added to the CVS repository. Also note that you will have to select the file type when adding it to CVS. This would normally be ASCII TEXT and not the default of Binary.

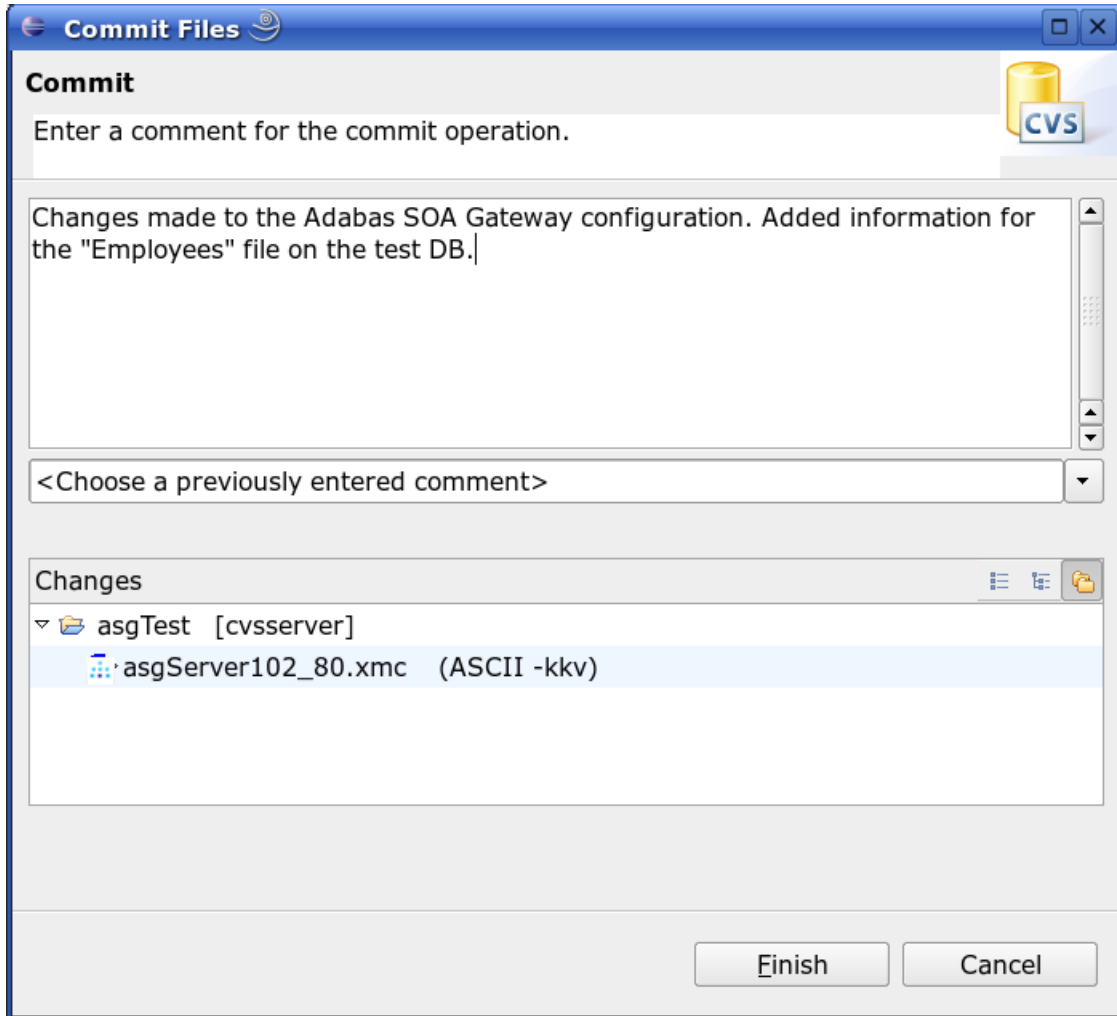

## Making CVS aware of file changes

Every time you make a change to your ASG related files, you should commit those changes to the CVS repository.

A useful comment should be added during the commit describing the change(s) made. Ticket Id's and other related information can be added here also.

That should cover the basics required to use Eclipse in conjunction with CVS so that changes to your ASG configuration files are more controlled. Further information on the use of CVS with Eclipse, and how acquire and set-up a CVS server, can be found at the external sites listed below.

## More Information

More information related to CVS can be found at <http://www.nongnu.org/cvs/>

More information related to CVS use with Eclipse can be found in the Eclipse documentation at <http://www.eclipse.org/>

# 14

## Tut\_02\_List.java

---

```
import SoaG.*;
import SoaG.AdabasEmployeesMiniServiceStub.*;

/*
 * The SOA Gateway LIST method will return all data matching the
 * criteria at once, no matter how large the result set is.
 *
 * So if you need (or want) to retrieve the result set in "chunks"
 * of records, or your request requires complex search syntax,
 * use the SELECT method.
 *
 * Tut_03c_SelectConversational.java provides an example for this.
 */

public class Tut_02_List {

    public static void main(String[] args) {

        try {
            AdabasEmployeesMiniServiceStub stub = new AdabasEmployeesMiniServiceStub();

            AdabasEmployeeKeyType keys = new AdabasEmployeeKeyType();
            keys.setPersonnel_id("50005*");

            AdabasEmployeeListElement listKey = new AdabasEmployeeListElement();
            listKey.setAdabasEmployeeListElement(keys);

            AdabasEmployeesMiniElement result = null;

            result = stub.list(listKey, null, null);

            AdabasEmployeesMiniElementType root = result.getAdabasEmployeesMiniElement();
            AdabasEmployeesMiniType group = root.getAdabasEmployeesMini();
            AdabasEmployeeType elements[] = group.getAdabasEmployee();
        }
    }
}
```

```
System.out.println("Number of record read: " + elements.length);

for (int i = 0; i < elements.length; i++) {
    AdabasEmployeeType r = elements[i];
    System.out.println("Record [" + i + "]"
        + "Personnel Id=" + r.getPersonnel_id() + ", "
        + "Name=" + r.getName() + ", "
        + "First Name=" + r.getFirst_name() + ", "
        + "City=" + r.getCity());
}

} catch (Exception ex) {
    ex.printStackTrace();
}
}
```

# 15

## ex01\_SoaGatewayFirst.php

---

```
<?php

/*
 * This set of examples demonstrate the simplicity in accessing Adabas
 * data as "WebServices" from PHP, based on the "EmployeesMini" view
 * representing a subset ("View") of the Adabas demo file "Employees".
 *
 * This first example outlines the usage of the PHP SoapClient class,
 * which provides the infrastructure for issuing SOAP requests.
 *
 * All examples are based on an Adabas SOA Gateway server running on
 * host "soagate", port 8082, these need to be adjusted to the actual
 * server host/port used at your site.
 */

/*
 * Instantiate the PHP "SoapClient" class
 */
try {
    /*
     * The only required parameter when instantiating "SoapClient" is the URL
     * pointing to the WSDL for the WebService to be accessed.
     */
    $soapclient = new SoapClient("http://localhost:8022/adabas_EmployeesMini?WSDL");
} catch (SoapFault $soapfault) {
    /*
     * In case of a SOAPFault being thrown, this will be caught and the fault
     * information printed. If a SOAPFault occurs outside of a "try/catch"
     * structure, PHP will abend the script with a generic message.
     *
     * Here we print the SOAPFault information in a structured way, the "<pre>"
     * tags are required to format the object nicely.
     */
}
```

```
echo "<pre>";
print_r($soapfault);
echo "</pre>";
return;
}

/*
 * Without any knowledge of, or looking at Adabas definitions, a "WebService ←
programmer"
 * can easily retrieve the signature of any exposed Adabas SOA Gateway Service and
 * code based on it.
 *
 * First we use a method of the SoapClient class to retrieve the functions exposed
 * by the specific "WebService", and print it:
 */

echo "<pre><B>Functions:</B>\n\n";
print_r($soapclient->__getFunctions());

/*
 * The function prototypes shown by the __getFunction() method also depict the ←
required
 * parameters and the return values. Their definitions can be printed as well:
 */
echo ←
"\n\n-----\n\n<B>Type ←
Definitions:</B>\n\n";
print_r($soapclient->__getTypes());
echo "</pre>";

/*
 * Proceed to ex02_SoaGatewayEmpList.php - List and format Employees data
 */

?>
```

# 16

## ex02\_SoaGatewayEmpList.php

---

```
<?php

/*
 * This example demonstrates usage of the "list" function exposed by any
 * Adabas SOA Gateway "WebService" from PHP, retrieving selected records
 * from the Adabas demo file "Employees", and formatting it, in 4 easy steps.
 */

/*
 * Step 1: Instantiate the PHP "SoapClient" class
 */
try {
    $soapclient = new SoapClient("http://localhost:8022/adabas_EmployeesMini?WSDL");
} catch (SoapFault $soapfault) {
    echo "<pre>";
    print_r($soapfault);
    echo "</pre>";
    return;
}

## Usage Governance Tutorials

---

Usage Governance can be reported in 3 ways and written to 3 output types.

- **Using the local file system**
- **Using another SOA Gateway**
- **Using MOM**

# 36

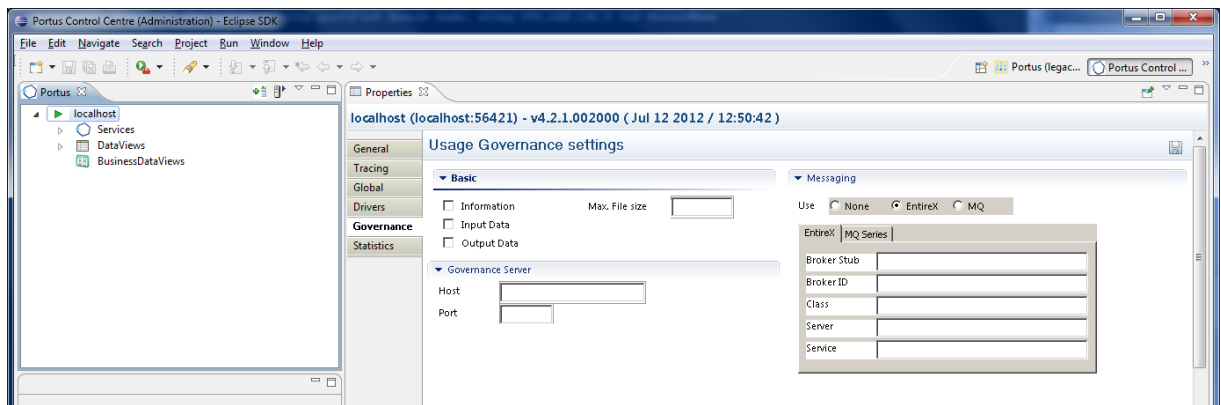

## Using the local file system

---

### Tutorial: Write Usage Governance data to the local file system

1. In the Control Centre select the server for which usage governance data will be generated.
2. Select the Governance tab in the Properties view.

To turn data collection on the Information box must be selected. If required Input Data and Output Data may also be selected.

3. Select the Save button.
4. Stop the server. See here on how to do this.
5. Start the server.
6. Issue a request to SOA Gateway e.g. a get request.
7. Go to SOA Gateway configuration directory.

The default location of SOA Gateway configuration folder is [SERVER\_INST]/Apache22/configuration replacing [SERVER\_INST] with the location in which you have installed SOA Gateway.

8. A file should be present in the format `soag_usage_governance_YYYY_MM_DD_HH_MM_SS_MS.txt`.  
Note that it is not possible to view this file while SOA Gateway is running. Stopping the server will create an XML file with the same name.
9. Open the file to check its contents.
10. There should be 1 entry for the get request plus all the governance data collected as per the options selected in 2.

# 37

## Using another SOA Gateway

---

### Tutorial: Writing Usage Governance data to another SOA Gateway

1. In the Control Centre select the server for which usage governance data will be generated.
2. Select the Governance tab in the Properties view.

To turn data collection on the Information box must be selected. If required Input Data and Output Data may also be selected.

3. The Governance Server section is where we enter the details for another SOA Gateway.
  - Host : the IP address for the server.
  - Port : the port number of the server.
4. Enter these and save.

5. Stop the server. See here on how to do this.
6. Prior to restarting the server the following must be observed:
  - The Governance Server is running i.e. that SOA Gateway with the host and port number entered has been started and is awaiting requests.

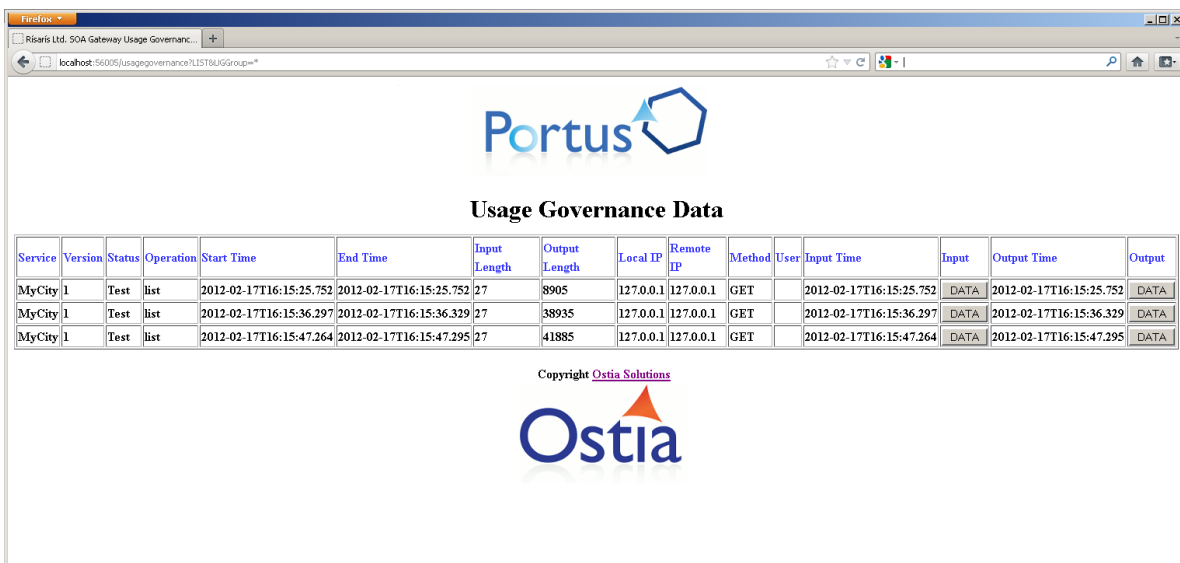

- The governance web service, *usagegovernance*, has been created successfully and is loaded.

If this has not yet been done, following the instructions [here](#) to do this.

7. Start the server. See here on how to do this.
8. On startup an initial connection is made to the governance server to verify its details. If this is unsuccessful an appropriate error will be written to the error log so this should be checked now.

The default location of the Apache error\_log is [SERVER\_INST]/Apache22/logs/error\_log replacing [SERVER\_INST] with the location in which you have installed SOA Gateway.

9. Issue a request to SOA Gateway e.g. a list request.
10. There are a couple of ways to check that the data collection has reached its destination.
  - Query the database table directly..
  - Issue a list request on the usage governance web service e.g.

Service	Version	Status	Operation	Start Time	End Time	Input Length	Output Length	Local IP	Remote IP	Method	User	Input Time	Input	Output Time	Output
MyCity	1	Test	list	2012-02-17T16:15:25.752	2012-02-17T16:15:25.752	27	8905	127.0.0.1	127.0.0.1	GET		2012-02-17T16:15:25.752	DATA	2012-02-17T16:15:25.752	DATA

## 38 Using MOM

---

### **Tutorial: Write Usage Governance data to a MOM system**

Usage Governance data can be written to a WebSphere MQ queue or an Software AG EntireX server.

It is outside the scope of this tutorial to detail exactly how these are set up so it is assumed that the chosen Messaging system is configured correctly.

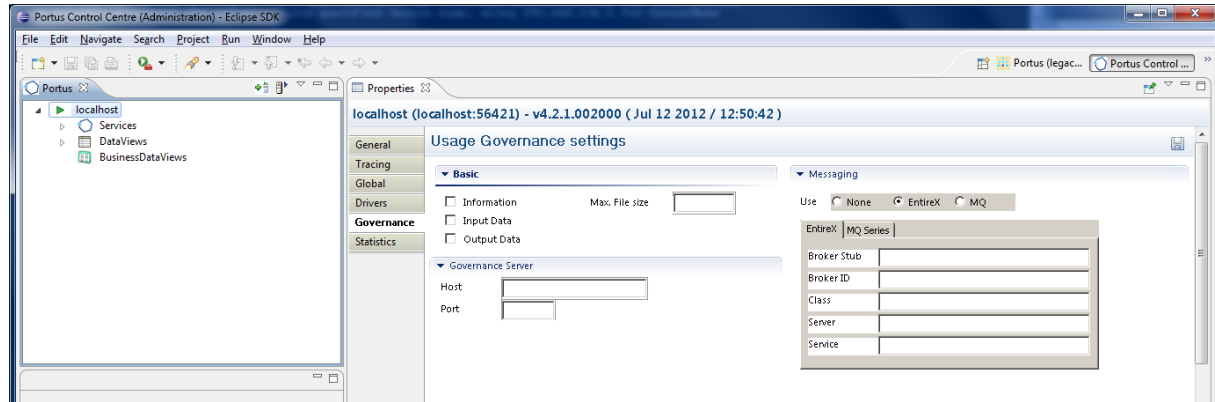

In this tutorial we will be using 2 SOA Gateway servers. One will direct usage governance data collected to a message queue and the other will read from this queue and process the input. The end result is that the target of the usage governance web service will receive an add request complete with the data.

1. In the Control Centre select the server for which usage governance data will be generated.
2. Select the Governance tab in the Properties view.

To turn data collection on the Information box must be selected. If required Input Data and Output Data may also be selected.

3. The Messaging section allows one to enter the details required for None, MQ or EntireX :

Select the radio button of MQ or EntireX and fill in as appropriate for you MOM installation. Note that the queue will be opened for output and later on in this tutorial will be opened as an input queue.

4. Select the Save button.
5. Stop the server. See here on how to do this.
6. Start the server.
7. At this point SOA Gateway should have connected successfully to the manager and opened the output queue specified. Check the error log for any errors at this point.

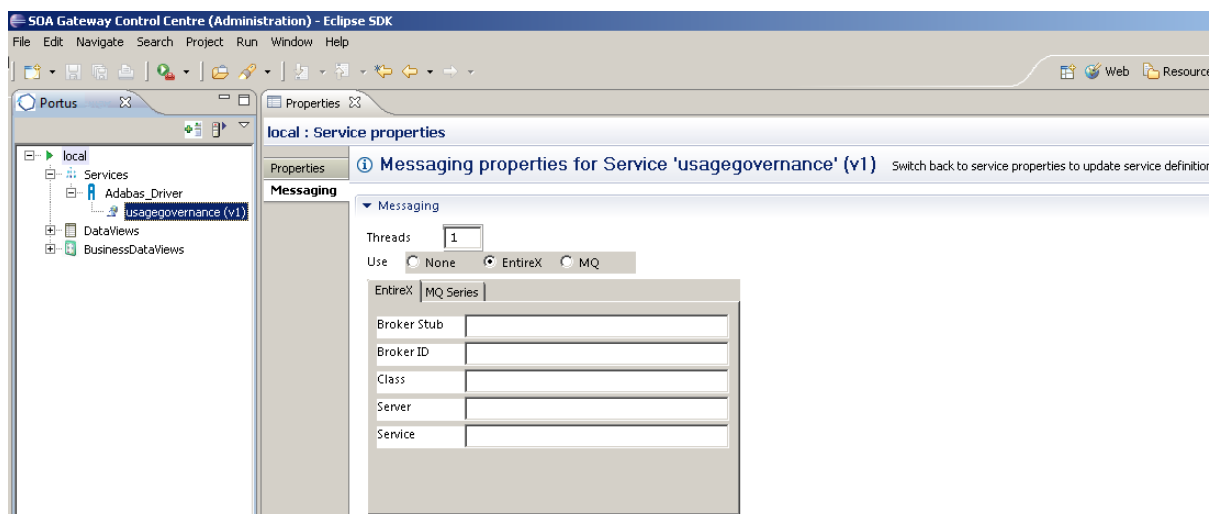

The default location of the Apache error\_log is [SERVER\_INST]/Apache22/logs/error\_log replacing [SERVER\_INST] with the location in which you have installed SOA Gateway.

8. Issue a request to SOA Gateway e.g. a get request
9. An add request, containing usage governance data pertaining to this request, should appear as an entry in the output queue.

Use a search mechanism particular to your messaging system to check that this is the case. Note the syntax of this request is supported by the usage governance web service. If the latter has not yet been created, follow the steps outlined [here](#) to do so.

10. In the Control Centre, select the second SOA Gateway server. Open the Messaging tab in the Properties view for the usage governance web service:

11. Fill in the details for the messaging system you are using. Clearly, for MQ, the Input Q value has to be the value specified for Queue in step 3. For EntireX the details entered here should match those from 3.

**Note:** The Broker Stub value will depend on the system from which EntireX is being called i.e. broker32.dll for Windows, broker.so for Linux etc.

12. As per the hint, switch back to Service properties and select the Save button when complete.
13. SOA Gateway will now make contact with the appropriate messaging system. Check the error log for messages.

The default location of the Apache error\_log is [SERVER\_INST]/Apache22/logs/error\_log replacing [SERVER\_INST] with the location in which you have installed SOA Gateway.

14. As soon as successful connections have been made, the input queue/service will be read and the message(s) processed.

There are a couple of ways to check the status of this.

- Query the database table directly..
- Issue a list request on the usage governance web service.
- Check the Output Q (MQ) or the EntireX server for responses to the add request to the usage governance web service.

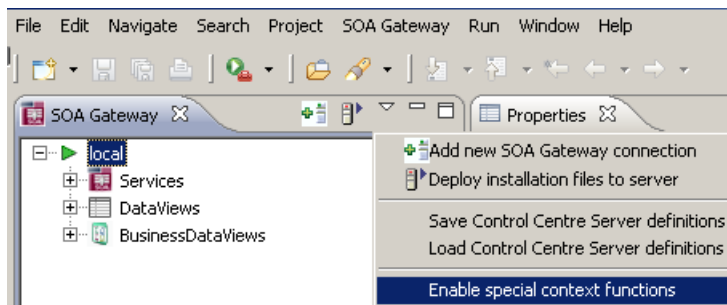

# 39

## Create the usage governance web service

---

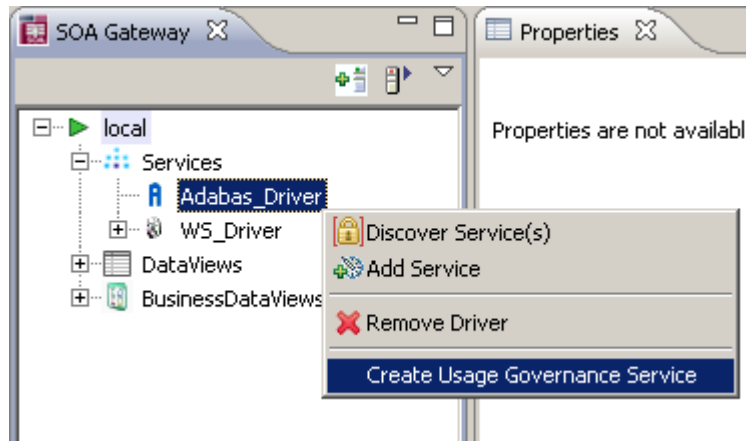

The usage governance web service is a bespoke service which is mandatory if usage governance data is being collected on a separate SOA Gateway. Here are the steps required to create it.

1. In the Control Centre select the server on which usage governance data will be stored.
2. Click on the View Menu icon and select the **Enable special context functions** entry.

3. Under Services select the driver which will support the new service. If one has not yet been created add one now. See [here](#) for details on this.

Right click on the driver entry and select the **Create Usage Governance Service** item.

4. Fill in the details appropriate to your installation.

Select the *Create database table now* check box.

Select Create.

5. The web service is now created and its properties displayed .

# 40

## SOAP over EntireX Tutorial

---

### Tutorial: Send SOAP requests to EntireX

SOA Gateway and EntireX can be used together to enable sending SOAP requests to an EntireX service and to receive a response from a service. These request are asynchronous so it means that multiple requests can be sent from the client even though SOA Gateway may not be running. These requests are held until SOA Gateway reads and processes them. Likewise the responses are retained until such time that a client may request them.

Here is a top level view on the steps involved.

- For a particular web service specify the Broker details required.
- The resultant WSDL for the web service can be read by a client which will enable it to generate the appropriate SOAP request to send to the service.
- The resultant WSDL for the web service can be read by a client which will enable it to generate the appropriate SOAP request to read from the service.

### Details

This tutorial will make use of Java wrapper/stub classes to access a SOA Gateway Service.

Java wrapper/stub classes are generated using the [Apache Axis2](#) feature [WSDL2Java](#).

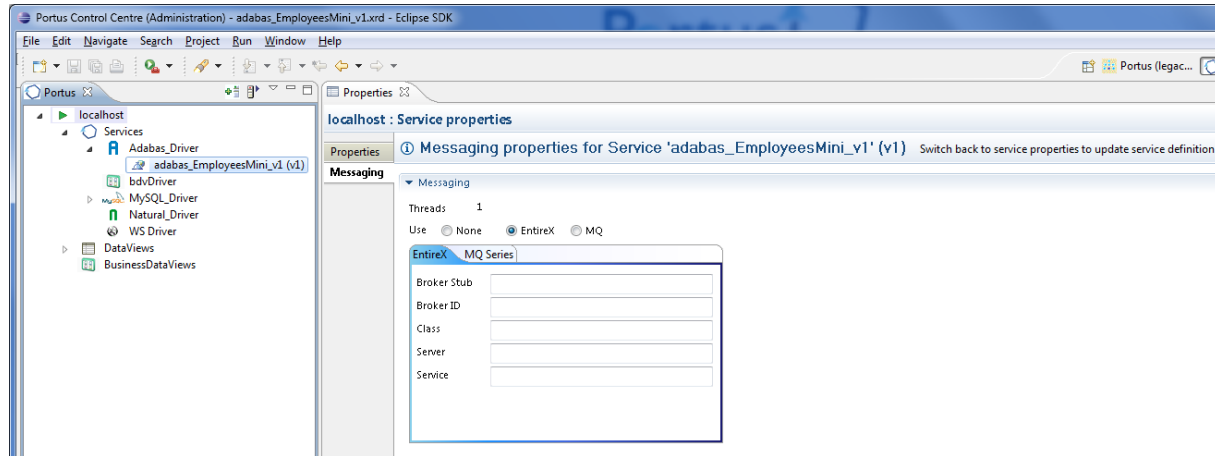

If you do not have it already, download and install the latest Axis2 kit.

The web service which we will be using is that described by the "adabas\_EmployeesMini" DataView supplied with SOA Gateway.

1. Select the adabas\_EmployeesMini web service and open the Messaging tab. Select the EntireX radio button and tab. Fill in the details appropriate to your installation.

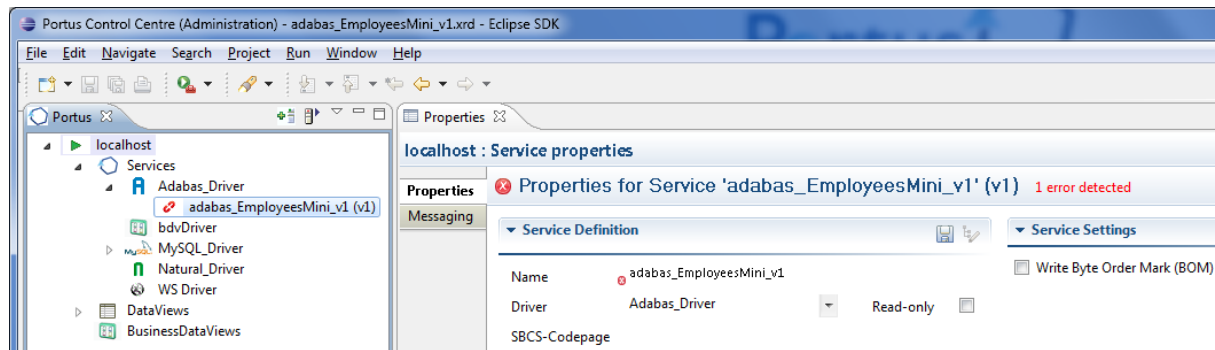

**Note:** The Broker Stub value will depend on the system from which EntireX is being called i.e. broker32.dll for Windows, broker.so for Linux etc.

2. As per the hint, switch back to service properties and select the Save button when complete.
3. SOA Gateway will now make contact with the EntireX Broker. If an error occurs it will be highlighted as shown below.

Check the error\_log to find the cause. The default location of the Apache error\_log is [SERVER\_INST]/Apache22/logs/error\_log replacing [SERVER\_INST] with the location in which you have installed SOA Gateway. Please correct and try again.

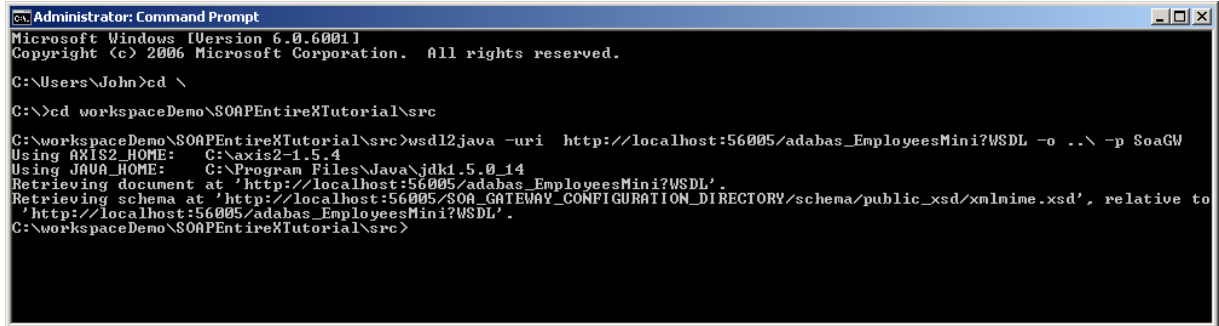

If successful then carry on to next step.

4. Switch to the Java perspective (Window -> Open Perspective -> Other... -> Java (default). For more information on this aspect of Eclipse see Getting started with Eclipse.
5. Create a new Java-project naming it "SOAPEntireXTutorial".
6. Right-click the "SOAPEntireXTutorial" project folder, select "Build Path", then "Add External Archives.."
7. Add all .jar files from the axis2 "lib" directory to the project's Build-Path.
8. Right-click the "SOAPEntireXTutorial" project folder, select "Build Path", then "Add External Archives.."
9. Add the entirex.jar files from your EntireX installation e.g. ...\\SoftwareAG\\EntireX\\classes

10. Open a command prompt (aka "DOS box"), change to the "SOAPEntireXTutorial\src" directory and run the following command:

```
wSDL2java -uri http://<yourserver>:<yourport>/adabas_EmployeesMini?WSDL -o ..\ -p SoaGW
```

```
Administrator: Command Prompt

C:\>cd workspaceDemo\SOAPEntireXTutorial\src

C:\workspaceDemo\SOAPEntireXTutorial\src>wSDL2java -uri http://localhost:56005/adabas_EmployeesMini?WSDL -o ..\ -p SoaGW
Using AXIS2_HOME: C:\axis2-1.5.4
Using JAVA_HOME: C:\Program Files\Java\jdk1.5.0_14
Retrieving document at 'http://localhost:56005/adabas_EmployeesMini?WSDL'.
Retrieving schema at 'http://localhost:56005/soa_gateway_configuration_directory/schema/public_xsd/xmlmime.xsd', relative to
'http://localhost:56005/adabas_EmployeesMini?WSDL'.
C:\workspaceDemo\SOAPEntireXTutorial\src>
```

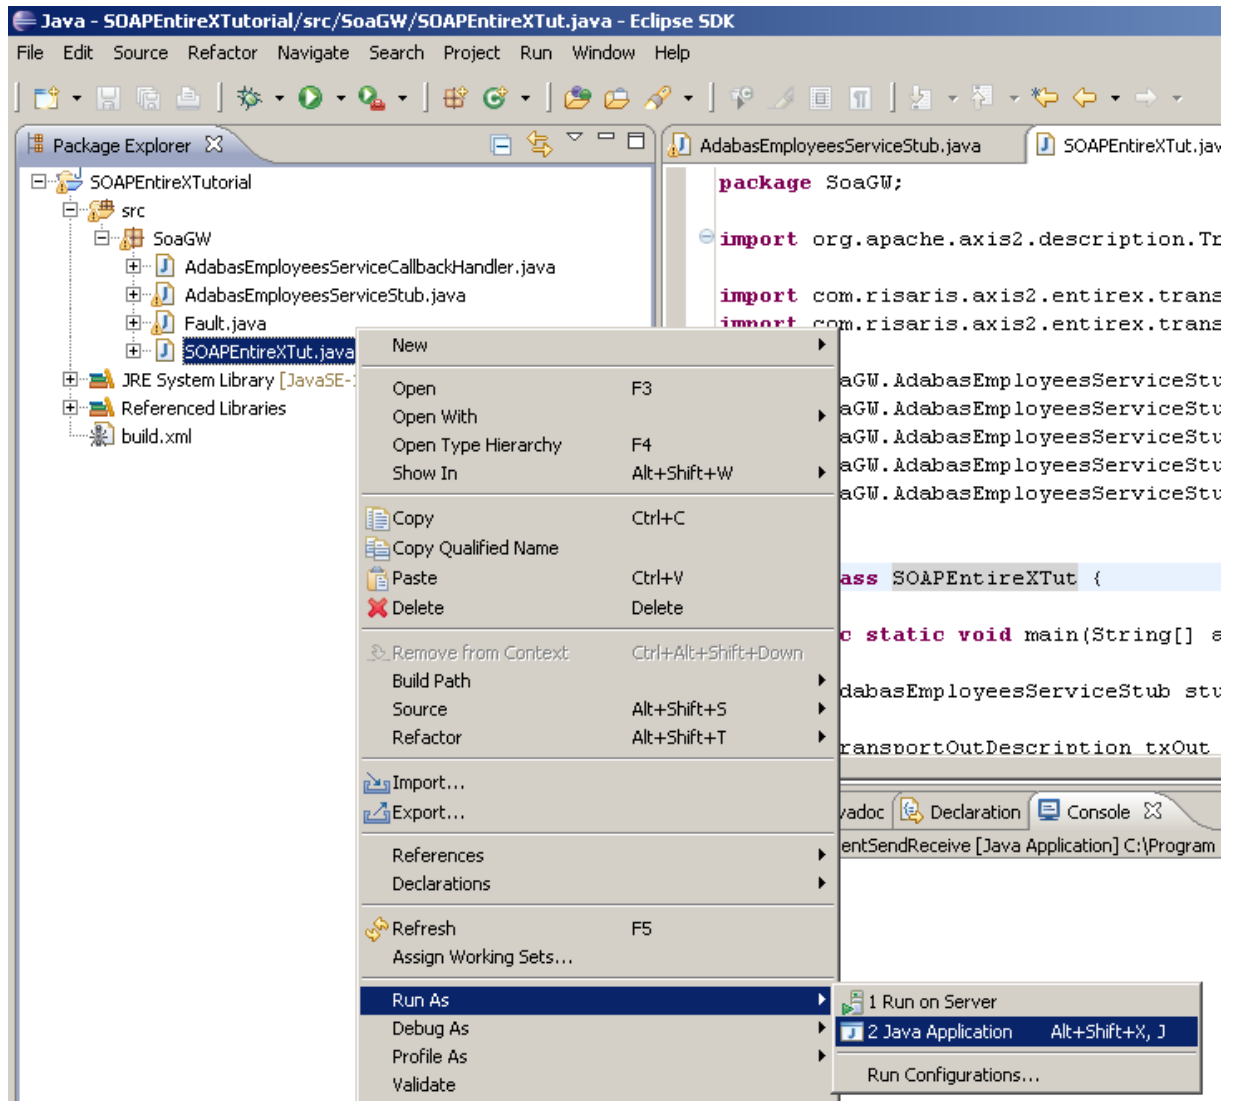

11. The following items are generated from the SOA Gateway WSDL:
- A "Stub" class implementing all types and operations ( ports / bindings ).
  - A CallbackHandler - a stub class (not used in this tutorial) providing hooks for client-side extensions to the generated result- and error handlers.
  - A Fault class.
12. Get file SOAPEntireXTut.java and, when prompted, save in the ..\SOAPEntireXTutorial\src\SoaGW directory. Right-click on SOAPEntireXTutorial and select Refresh(F5). SOAPEntireXTut.java should appear in the explorer window.
13. Get file exxTransports-0.1.jar and, when prompted, save it in a local directory.
14. Right-click on SOAPEntireXTutorial and select Build Path -> Add External Archives...

Navigate to where exxTransports-0.1.jar was saved and select Open to add it the project.

15. Right-click on the file and select Run As -> Java Application:

16. The output appears in the "Console" window:
