## Table of Contents

Preface ..... v
1 Initialisation File ..... 1
2 Environment Variable ..... 3
3 Trace Levels ..... 5

# Preface

The Adabas System Coordinator trace facility is enabled by either adding an entry to the Initialisation File or setting an environment variable.

**Initialisation File**

**Environment Variable**

**Trace Levels**

# 1 Initialisation File

Set the `TRACE` entry in the Initialisation File to the required level. See Initialisation File for further details.

# 2 Environment Variable

Set the CORTRACE environment variable to the required trace level. See your operating system documentation for further details.

**Note:** The TRACE setting in the Initialisation File takes precedence over the CORTRACE environment variable. The CORTRACE environment variable will only be used if the Initialisation File cannot be read or the TRACE setting in the initialisation file is missing, invalid or set to zero. This means that the CORTRACE environment variable has no effect if there is a valid non-zero TRACE setting in the initialisation file.

# 3 Trace Levels

The values for the different types of tracing information are show below. Add the required values together to determine the trace level setting.

| Value | Description |
|---|---|
| 0x00000001 | Error messages |
| 0x00000002 | Information messages |
| 0x00000010 | Control block and buffers supplied by application |
| 0x00000020 | Control block and buffers returned to application |
| 0x00000040 | Control block and buffers supplied to Adabas |
| 0x00000080 | Control block and buffers returned by Adabas |
