

ARIS 9.8 SR6 OVERVIEW

ARIS 9.8 SR6 feature	Feature description
ARIS Architect / ARIS Designer	
Restrict access to ARIS reports and macros	Not all ARIS users need access to all standard ARIS reports or macros. Users often request functionality and analysis options that fit their role, need and purpose and that they know how to use. That's why you can now set up restrictions per report that limit access to relevant users or user groups.
Test Designer Extension Pack for ARIS Designer	ARIS Test Designer is available as an own extension pack for ARIS Designer.
Import and update pictures via report API	<ul style="list-style-type: none"> • The standard reporting API has been extended to both import/insert pictures into models as well as update pictures in the model • Supports GIF, JPG, PNG and EMF formats, which can be inserted into model types; matrix model is the only exception
System user of database can backup and reorganize their database	<ul style="list-style-type: none"> • The functional administrator role with system user rights for one or several databases can run a backup and reorganize the database without the high-level privilege called "database administration" that grants full access to all databases on the tenant • Segregation of duties and clear role assignment are maintained
Customer experience management method extensions	To better represent and analyze information from customer experience management, two additional connection types are now allowed in the standard model type called "Customer Journey Landscape." You can specify which customer lifecycle stage encompasses which customer journeys. You also can put customer journeys in order and define predecessorship of one customer journey to another.
ARIS for SAP Solutions	
Important note: Support for Solution Manager 7.2	<p>Please note that ARIS will support the new API of SAP® Solution Manager as part of a dedicated service release based on SR5 - which is planned for October 2016. Further it will include a script-based migration for Solution Manager 7.1 projects in ARIS.</p> <p>As this may affect your current project plans, please check regularly on the dedicated article: http://ariscommunity.com/users/josephe-blondaut/2016-08-17-aris-secures-your-sap-investments</p>

ARIS 9.8 SR6 feature	Feature description
ARIS Cloud	
ARIS Mobile/API Access	This capability is now available in ARIS Cloud.
ARIS Connect/ARIS Cloud	
Saving search filter favorites	Easy user access to information for end-users is crucial for the success of a portal. A process manager wants quick access to his or her processes while a new employee wants to find everything that is related to the new job. The search offers access to all this information. Searches can be stored on the client for quick access, to define searches like "what content am I am responsible for?" and to quickly run these search queries again. Moreover, central search queries show up with every end user.
Collaboration permissions (for ARIS items)	Customers have asked for a more advanced means to control the access to collaboration functionality. Now with dedicated collaboration permission, you can control per content item based on ARIS groups with read-access only to collaboration, who can actively collaborate and who can have no collaboration at all.
Collaboration audience - implementation	Customers have asked for a more advanced means to control the access to collaboration functionality. Now with the collaboration audience feature, people can control who will be able to see each activity. The control is done via collaboration groups and UMC groups. Only members of a group can see collaboration content shared with the group.
Matrix model in ARIS Connect	As requested by customers, matrix models can now be viewed in the portal.
Business Model Canvas in ARIS Connect	The Business Model Canvas model type is now available in ARIS Connect Designer and related products.
Show occurrences in the portal	Customers have asked for a way to navigate based on the occurrence-definition-occurrence relation. The portal now offers a standard component in the diagram view that can be used to navigate to other occurrences of a selected item.
Default new table sort by process flow	The portal now provides an advanced support of sorting options that can be set differently per item type (e.g., process, chain). While an X-Y sorting might be the preferred option for a value chain, processes are sorted by process flow. The default behavior can be changed in the XML configuration.
Control access to documents in ARIS Document Storage	You can prevent users from accessing certain parts of the ARIS Document Storage to restrict access to information that may not be relevant to a certain user or user groups. This is done by setting up and managing access rights on document folders.
License Management	You can create pools of licenses that are dedicated to certain business units. This grants exclusive consumption by an assigned user group and allows economies of scale for the license purchasing agents while giving full flexibility for the different license consumers in the company.
CXM factsheet in ARIS Connect	Factsheets are available for Customer Journey Landscapes including for each Customer Journey the attributes Business Driver, Business Driver Impact on Transformation as well as overall Customer Experience.
One report for all controls	You now can fill in several controls in dialogues with just one single report. Until now, one report per each control was necessary resulting in complex design and slower execution. This is a requirement from various customer projects.
Display meta information in portal on methods and objects	Customers have asked to be able to display method information (such as model types and symbol types) in fact sheets—for instance, so that models with the same name are generated automatically. This can now be configured for all fact sheets and the glossary to show meta information in regards to the model method.

ARIS 9.8 SR6 feature	Feature description
ARIS Connect/ARIS Cloud	
Search filtering for models (ARIS Connect Designer)	Advanced search filtering is now available for ARIS Connect Designer for models. Models can be filtered according to model types and attributes. Selecting a search result opens the modeling environment of ARIS Connect.
Search extension of ARIS Document Storage	Advanced search filtering is also available for documents stored in the ARIS Document Storage. You can use these attributes as filters: last changed, creation date and owner.
Search filtering for collaboration	The advanced search filtering is now made available for all ARIS Connect users in regards to collaboration.
Enhancements on table-based modeling	With table-based modeling, lanes of BPMN™ model types can be created via key input and objects can be moved between lanes with key input (F4). Keyboard navigation is also extended.
Start reports in repository view and harmonizing report UIs	In ARIS Connect, you can now start reports from the repository view on one or several selected items, such as database, groups, models and objects. Standard reports are available. You can see the context in which a report was started, such as a dedicated model. Executed reports show the context in which they were started, such as the related process model name "sales order processing".
Change version within ARIS Document Storage	The Microsoft® SharePoint® integration with ARIS Document Storage offers the option to change document versions from the ARIS user interface and refer to it.
ARIS GRC	
Object-specific manager roles	Manager roles in ARIS Risk & Compliance Manager had access to all their respective data either at a cross-client level or client-specific level. For many use cases, it makes sense to also restrict access rights for manager roles to dedicated elements. Object-specific manager roles are now also provided for test cases, surveys, sign-off processes and deficiencies.
Automated data import from ARIS to ARIS Risk & Compliance Manager	Importing master data from ARIS to ARIS Risk & Compliance Manager can now be executed by command without generating an XML file that then has to be imported into ARIS Risk & Compliance Manager.
Script-based reporting using ARIS Report Server	Reports that can be executed in ARIS Risk & Compliance Manager can now be defined in ARIS using ARIS Report Server. No need for XML configuration of reports in ARIS Risk & Compliance Manager. Adaption of reports does no longer needs a new "release" of ARIS Risk & Compliance Manager. The first part of ARIS Risk & Compliance Manager reports is available based on that technical basis.
Automated generation of issues for non-compliant audit steps	Issue management as standard remediation workflow: An audit step owner has to decide if an issue should be generated automatically for a non-compliant-significant audit step.
Risk scoring based on qualitative assessment	Calculating a risk score : In a qualitative risk assessment, based on the values defined for impact types, a risk score is calculated (similar to expected loss on quantitative assessment) to allow ranking of risks.
Improved configuration capabilities for email	Emails sent by ARIS Risk & Compliance Manager can now address external email recipients (people who don't use the product).
Enforceable segregation of duties	ARIS Risk & Compliance Manager can now be configured so a user who has roles with a possible conflict in segregation of duties can no longer execute both roles with the same form. In other words, the reviewer cannot be the same person as owner.
Improved user handling	User handling is improved and now offers: <ul style="list-style-type: none"> • Multiselect for object reactivation • Select objects with "Today" attribute in just one click • "Recommended" attributes (the ones that will become mandatory ones) for a specific status are highlighted / marked

ARIS 9.8 SR6 feature	Feature description
ARIS Process Governance	
Table representation of history (input data, output data)	Until now, for debugging/information purposes, only XML code was shown in the process administration of ARIS Process Governance. You can now see this with a table overview.
Custom buttons for custom workflows in ARIS Connect	Instead of a drop-down selection where customers can choose a specific ARIS Process Governance workflow in ARIS Connect, custom buttons can now be configured to be shown in the portal to start a dedicated ARIS Process Governance workflow.
Visualizing process execution	A diagram now shows the state of the process execution in ARIS Process Governance.
Deactivation of user notifications	User notifications can be deactivated completely via configuration. Thus, a workflow can be run in project environment without configured email server for development and testing purposes.
Time column in delegation history	You'll now find a date/time column in the delegation history dialog on the process board.
One report for all controls	You now can fill in several controls in dialogues with just one single report. Until now, one report per each control was necessary resulting in complex design and slower execution. This is a requirement from various customer projects.
Report support for user-chooser control	You can now to fill in a user-chooser control with a report in order to set the initial selection and the user-group filter dynamically.
Import/export of ARIS Process Governance configuration via process administration	Configurations of ARIS Process Governance can be easily saved for backup purposes and restored for configuration purposes in process administration.
Technical enhancements	The overall technical infrastructure has been improved to meet several customer requests.
Extended ARIS Process Governance service	Saving attribute(s) in ARIS Process Governance now accepts empty values in order to delete maintained attribute values.
Technical improvements	
Performance improvement for queries and spreadsheets	Extensive performance improvements were made to queries and spreadsheets. Query execution is now up to 70% faster. But also update speed in case of template or style changes improved up to 60%.
Fine grained configuration of user management console (UMC) audit logs	ARIS user management allows the complete recording of audit logs that can be filtered at query time only. To avoid large sets of audit data that eventually affect system performance, you can now use form-based configuration option to define which events you really want to log.
Tenant management enhancements	Tenant management bundle is now embedded and included in overall setup for installation and allows updates as well as master tenant backup and restore. This enables a smooth migration of tenants.

ABOUT SOFTWARE AG

The digital transformation is changing enterprise IT landscapes from inflexible application silos to modern software platform-driven IT architectures which deliver the openness, speed and agility needed to enable the digital real-time enterprise. Software AG offers the first end-to-end Digital Business Platform, based on open standards, with integration, process management, in-memory data, adaptive application development, real-time analytics and enterprise architecture management as core building blocks. The modular platform allows users to develop the next generation of application systems to build their digital future, today. With over 45 years of customer-centric innovation, Software AG is ranked as a leader in many innovative and digital technology categories. Learn more at www.SoftwareAG.com.
