

ARIS

SWITCH DATABASE SYSTEM

Version 10.0 - Service Release 3

December 2017

This document applies to ARIS Version 10.0 and to all subsequent releases.

Specifications contained herein are subject to change and these changes will be reported in subsequent release notes or new editions.

Copyright © 2010 - 2017 Software AG, Darmstadt, Germany and/or Software AG USA Inc., Reston, VA, USA, and/or its subsidiaries and/or its affiliates and/or their licensors.

The name Software AG and all Software AG product names are either trademarks or registered trademarks of Software AG and/or Software AG USA Inc. and/or its subsidiaries and/or its affiliates and/or their licensors. Other company and product names mentioned herein may be trademarks of their respective owners.

Detailed information on trademarks and patents owned by Software AG and/or its subsidiaries is located at <http://softwareag.com/licenses> (<http://softwareag.com/licenses>).

Use of this software is subject to adherence to Software AG's licensing conditions and terms. These terms are part of the product documentation, located at <http://softwareag.com/licenses> (<http://softwareag.com/licenses>) and/or in the root installation directory of the licensed product(s).

This software may include portions of third-party products. For third-party copyright notices, license terms, additional rights or restrictions, please refer to "License Texts, Copyright Notices and Disclaimers of Third Party Products". For certain specific third-party license restrictions, please refer to section E of the Legal Notices available under "License Terms and Conditions for Use of Software AG Products / Copyright and Trademark Notices of Software AG Products". These documents are part of the product documentation, located at <http://softwareag.com/licenses> (<http://softwareag.com/licenses>) and/or in the root installation directory of the licensed product(s).

Contents

1	Warning	1
2	Switching from standard installation (PostgreSQL) to Oracle/MSSQL.....	2
3	Switching from Oracle/MSSQL to standard installation (PostgreSQL).....	5
4	Disclaimer	6

1 Warning

When switching to a different DBMS all stored data in the Database Management System (DBMS) is lost.

The following runnables are affected:

- adsadmin
- apg
- abs
- copernicus
- ecp
- octopus
- dashboarding

You are strongly recommend to back up all tenants before you switch the installation to a different DBMS.

2 Switching from standard installation (PostgreSQL) to Oracle/MSSQL

PREPARE THE FUTURE DBMS

Create schemes on the Oracle/Microsoft SQL database management system using the related SQL scripts provided on the ARIS DVD. The following commands refer to ARIS Cloud Controller (ACC) (see **ARIS Cloud Controller (ACC) Command-Line Tool.pdf** document).

Prerequisites

Depending on the database management system to be used, you need:

- An operating Microsoft SQL Server database. If you have not yet installed the Microsoft SQL Server, please follow the instructions in the Microsoft installation program, as well as the documentation provided by the manufacturer.

You have downloaded the latest version of the Microsoft SQL Server JDBC driver, for example, **sqljdbc4-4.0.2206.100.jar** from the Microsoft Download Center to a directory of your choice.

SQL scripts and all additional files. All scripts and files are located on the installation medium (Add-ons\DatabaseScripts\ARIS Server\mssql) or they can be downloaded from the ARIS Download Center (aris.softwareag.com).

You need to know the port number, the database name of the new database instance and also the user name and the password of the application user.

If you are going to use Windows authentication (see: ARIS Server Installation - Windows), download the **sqljdbc_auth.dll** file (<https://www.microsoft.com>). Otherwise select the **SQL Server and Windows authentication mode** (mixed mode) option (Microsoft SQL Console > **Security** tab).

- An operating Oracle database management system. The Oracle database management system is not included in the package. If you have not yet installed the Oracle database management system, please follow the instructions in the Oracle installation program, as well as the documentation provided by the manufacturer.

Ensure that **SQL*PLUS** is available. Therefore an ORACLE client or an ORACL server must be installed on the machine where the scripts are run.

Use of the database character set **AL32UTF8** is mandatory.

You need to know the port number, the database/service name of the new database instance and also the credentials, for example, the user name and the password of the application user.

You have downloaded the latest version of the Oracle JDBC driver, for example, **ojdbc7-12.1.0.1.jar** from the Oracle Web Site to a directory of your choice.

SQL scripts and all additional files. All scripts and files are located on the installation medium (Add-ons\DatabaseScripts\ARIS Server\oracle) or they can be downloaded from the ARIS Download Center (aris.softwareag.com).

Procedure

1. Start the ACC.
2. Stop all runnables. Enter: **stopall**
3. Start the service registry. Enter, for example: **start zoo_m**
4. Deconfigure the modeling database. Enter, for example: **deconfigure postgres_m**
5. Enhance the following runnables with the Oracle/Microsoft SQL Server JDBC driver:
 - abs
 - apg
 - copernicus
 - ecp
 - simulation
 - octopus
 - adsadmin
 - dashboarding

Example (Oracle): **enhance abs_m with commonsClasspath local file "d:/ARIS10.0/server/ojdbc7-12.1.0.1.jar"**

Example (Microsoft SQL Server): **enhance abs_m with commonsClasspath local file "d:/ARIS10.0/server/sqljdbc4-4.0.2206.100.jar"**

6. Register external service:

If you use Oracle, enter:

```
register external service db url="
jdbc:oracle:thin:@<server>:<port>/<sid/service_name>"
driverClassName="oracle.jdbc.OracleDriver" username="<app_user>"
password="<app_user_pwd>" maxIdle=15 maxActive=300 maxWait=10000
removeAbandoned=false removeAbandonedTimeout=600 logAbandoned=false
initialSize=0 testOnBorrow=true validationQuery="select 1 from dual"
defaultAutoCommit=false rollbackOnReturn=true host=<server>
jmxEnabled=true
jdbcInterceptors="com.sag.aris.cip.dbcp.CachedSchemaAssignmentJdbcInterceptor"
```

If you use Microsoft SQL Server, enter:

```
register external service db
url="jdbc:sqlserver://<server>:<port>;DatabaseName=<database>"
driverClassName="com.microsoft.sqlserver.jdbc.SQLServerDriver"
username="<app_user>" password="<app_user_pwd>" maxIdle=15
maxActive=300 maxWait=10000 removeAbandoned=false
removeAbandonedTimeout=600 logAbandoned=true initialSize=0
testOnBorrow=true validationQuery="select 1" defaultAutoCommit=false
rollbackOnReturn=true host=<server> jmxEnabled=true
jdbcInterceptors="com.sag.aris.cip.dbcp.CachedSchemaAssignmentJdbcInterceptor"
```

If you are using Windows authentication, the **integratedSecurity=true** parameter must be added to the URL as well. Additionally, you must perform the following steps:

- a. Open the **ARIS Agent 10.0 Properties** dialog.
 - b. In the **Log on** tab and select **This account**.
 - c. Click **Browse** and specify the name of the domain account to be used.
 - d. Enter the password and click **OK**.
 - e. Restart the service.
 - f. Copy the downloaded **sqljdbc_auth.dll** file (<https://www.microsoft.com>) to <ARIS Server installation directory>\server\jre\bin.
7. Change tenant data for each existing tenants:
- master tenant
- set tenant master data for service db**
com.aris.cip.db.schema=<mastertenant_schema >
- default tenant
- set tenant default data for service db**
com.aris.cip.db.schema=<defaulttenant_schema >
set tenant default data for service db
com.aris.ecp.db.schema=<default_tenant_schema_name>
- custom tenant(s)
- set tenant custom data for service db**
com.aris.cip.db.schema=<customtenant_schema >
set tenant default data for service db
com.aris.ecp.db.schema=<customtenant_schema >
8. Start all runnables. Enter: **startall**

3 Switching from Oracle/MSSQL to standard installation (PostgreSQL)

The following commands refer to ARIS Cloud Controller (ACC) (see **ARIS Cloud Controller (ACC) Command-Line Tool.pdf** document).

Procedure

1. Start the ACC.
2. Stop all runnables. Enter: **stopall**

Start the service registry. Enter, for example: **start zoo_m**

1. Deregister external service:
 - a. Discover the database service ID <service_id>. Enter: **list external services**
 - b. Deregister the external service: **deregister external service <service_id>**.
2. Configure the **postgres** runnable. Enter, for example: **configure postgres_m postgres_m**.
3. Change tenant data for each tenant:

master tenant

set tenant master data for service db com.aris.cip.db.schema=aris_master

default tenant

set tenant default data for service db com.aris.cip.db.schema=aris_default**set tenant default data for service db com.aris.ecp.db.schema=aris_default**

custom tenant(s)

set tenant default data for service db com.aris.cip.db.schema=aris_custom**set tenant default data for service db com.aris.ecp.db.schema=aris_custom**
4. Start all runnables. Enter: **startall**

4 Disclaimer

ARIS products are intended and developed for use by persons. Automated processes, such as the generation of content and the import of objects/artifacts via interfaces, can lead to an outsized amount of data, and their execution may exceed processing capacities and physical limits. For example, processing capacities are exceeded if models and diagrams transcend the size of the modeling area or an extremely high number of processing operations is started simultaneously. Physical limits may be exceeded if the memory available is not sufficient for the execution of operations or the storage of data.

Proper operation of ARIS products requires the availability of a reliable and fast network connection. Networks with insufficient response time will reduce system performance and may cause timeouts.

If ARIS products are used in a virtual environment, sufficient resources must be available there in order to avoid the risk of overbooking.

The system was tested using scenarios that included 100,000 groups (folders), 100,000 users, and 1,000,000 modeling artifacts. It supports a modeling area of 25 square meters.

If projects or repositories are larger than the maximum size allowed, a powerful functionality is available to break them down into smaller, more manageable parts.

Some restrictions may apply when working with process administration, ARIS Administration, ARIS document storage, and ARIS Process Board, and when generating executable processes. Process Governance has been tested and approved for 1000 parallel process instances. However, the number may vary depending on process complexity, e.g., if custom reports are integrated.

ARIS document storage was tested with 40.000 documents. We recommend monitoring the number and overall size of stored documents and archiving some documents if needed.
