

# BPLIST - Name of Preload List for Natural Buffer Pool

This Natural profile parameter specifies the name of a preload list to be used for the Natural buffer pool.

<b>Possible settings</b>	1-8 characters, or blank	Name of a preload list to be used for the Natural buffer pool.  If BPLIST= ' ' (blank) is set, no preload list is used.
<b>Default setting</b>	blank	
<b>Dynamic specification</b>	yes	This parameter can only be specified dynamically.
<b>Specification within session</b>	no	

For general information, see *Natural Buffer Pool* in the *Operations* documentation.

The parameter corresponds to the LIST specification of the BPI profile parameter or the NTBPI macro.

It only applies to the primary Natural buffer pool (TYPE=NAT, SEQ=0). If there is a primary buffer pool with SEQ=0 in NATPARM, only the LIST setting of this buffer pool is updated. Internally, the BPLIST specification is converted into an equivalent BPI specification.

## Example:

BPLIST=LIST3 is converted into: BPI=(TYPE=NAT,SEQ=0,LIST=LIST3)
