

SYSPSW - Adabas Password for Natural System Files

This Natural profile parameter only applies to Adabas databases.

It provides a default Adabas password for access to Natural system files (FNAT, FUSER, FDIC, FSEC, FSPOOL) which have been password-protected.

Possible settings	8 characters	<p>If a Natural system file is password-protected, a password which permits updates to the file must be specified.</p> <p>The password specified with the SYSPSW parameter applies to all Natural system files for which no individual passwords are specified.</p> <p>If the OPRB parameter is specified, the SYSPSW password is used for the initial Adabas open call and must permit access and/or update to all the files specified in OPRB as required.</p>
	blanks	<p>If the Natural system files are not password-protected, set SYSPSW to blanks.</p>
Default setting	blanks	
Dynamic specification	yes	<p>If you specify SYSPSW dynamically in conjunction with any of the individual system file parameters FNAT, FUSER, FDIC, FSEC and FSPOOL, you must specify SYSPSW <i>before</i> any individual system file parameter.</p>
Specification within session	no	

Anmerkung:

Passwords for individual system files can be specified with the profile parameters FNAT, FUSER, FDIC, FSEC and FSPOOL.
