Natural Parameters and System Variables

The following Natural parameters and system variables are evaluated in Natural for Ajax applications and sent to Application Designer:

• DC

The character assigned to the DC parameter is used in the representation of decimal fields in Application Designer.

• DTFORM

This parameter is used for all date fields in Application Designer pages. In your application, the date is shown according to the setting of the DTFORM parameter.

• *CURS-FIELD

Identify the operand that represents the value of the control that has the input focus. When the Natural system function POS is applied to a Natural operand that represents the value of a control, it yields the identifier of that operand.

• *LANGUAGE

Change the language while an application is running. See also Multi Language Management.

See also Support for Special Features.
