

Search Condition

This chapter covers the following topics:

- Search Condition
- Predicate

Search Condition

A *search-condition* can consist of a simple *predicate* or of multiple *search-conditions* combined with the Boolean operators AND, OR and NOT, and parentheses if required to indicate a desired order of evaluation.

Example

```

DEFINE DATA LOCAL
01 NAME      (A20)
01 AGE       (I2)
END-DEFINE
...
SELECT *
  INTO NAME, AGE
  FROM SQL-PERSONNEL
  WHERE AGE = 32 AND NAME > 'K'
END-SELECT
...

```

Predicate

<i>scalar-expression comparison</i>	{	<i>scalar-expression</i>	}	
		<i>subquery</i>	}	
<i>scalar-expression</i> [NOT] BETWEEN <i>scalar-expression</i> AND <i>scalar-expression</i>				
<i>column-reference</i> [NOT] LIKE	{	<i>atom</i>	}	[ESCAPE <i>atom</i>]
		<i>special-register</i>	}	
<i>column-reference</i> IS [NOT] NULL				
<i>scale-expression</i> [NOT] IN	{	<i>subquery</i>	}	
		({ <i>atom</i> })	
		{ <i>special-register</i> }	, ...	
<i>scalar-expression comparison</i>	{	ALL	}	<i>subquery</i>
		ANY	}	
		SOME	}	
EXISTS <i>subquery</i>				

A *predicate* specifies a condition that can be "true", "false" or "unknown".

In a *search-condition*, a *predicate* can consist of a simple or complex comparison operation or other kinds of conditions.

Example:

```
SELECT NAME, AGE
  INTO VIEW PERS
  FROM SQL-PERSONNEL
 WHERE AGE BETWEEN 20 AND 30
        OR AGE IN ( 32, 34, 36 )
        AND NAME LIKE '%er'
    ...
```

Note:

The percent sign (%) may conflict with Natural terminal commands. If so, you must define a terminal command control character different from %.

The individual predicates are explained in the following topics (for further information on predicates, please refer to the relevant literature). According to the syntax above, they are called as follows:

- Comparison Predicate
- BETWEEN Predicate
- LIKE Predicate
- NULL Predicate
- IN Predicate

- Quantified Predicate
- EXISTS Predicate

Comparison Predicate

A comparison predicate compares two values.

See information on *scalar-expression*.

Comparison

comparison can be any of the following operators:

=	equal to
<	less than
>	greater than
<=	less than or equal to
>=	greater than or equal to
<>	not equal to
¬ =	not equal to
¬ >	not greater than
¬ <	not less than

Subquery

(select-expression)

A *subquery* is a *select-expression* that is nested inside another such expression.

Example:

```

DEFINE DATA LOCAL
1 #NAME      (A20)
1 #PERSNR    (I4)
END-DEFINE
...
SELECT NAME, PERSNR
  INTO #NAME, #PERSNR
  FROM SQL-PERSONNEL
  WHERE PERSNR IN
    ( SELECT PERSNR
      FROM SQL-AUTOMOBILES
      WHERE COLOR = 'black' )
...
END-SELECT

```

For further information, see *Select Expressions*.

BETWEEN Predicate

scalar-expression [NOT] **BETWEEN** *scalar-expression* **AND** *scalar-expression*

A BETWEEN predicate compares a value with a range of values.

See information on *scalar-expression*.

LIKE Predicate

column-reference [NOT] **LIKE** { *atom*
special-register } [**ESCAPE** *atom*]

A LIKE predicate searches for strings that have a certain pattern.

See information on *column-reference*, *atom* and *special-register*.

NULL Predicate

column-reference **IS** [NOT] **NULL**

A NULL predicate tests for null values.

See information on *column-reference*.

IN Predicate

$ \text{scalar-expression} \text{ [NOT] IN } \left\{ \begin{array}{l} \text{subquery} \\ (\left\{ \begin{array}{l} \text{atom} \\ \text{special-register} \end{array} \right\} , \dots) \end{array} \right\} $
--

An IN predicate compares a value with a collection of values.

See information on *scalar-expression*, *atom* and *special-register*.

See information on *subquery*.

Quantified Predicate

$ \text{scalar-expression comparison } \left\{ \begin{array}{l} \text{ALL} \\ \text{ANY} \\ \text{SOME} \end{array} \right\} \text{ subquery} $

A quantified predicate compares a value with a collection of values.

See information on *scalar-expression*, *comparison*, and *subquery*.

EXISTS Predicate

EXISTS <i>subquery</i>

An EXISTS predicate tests for the existence of certain rows.

The EXISTS predicate evaluates to true only if the result of evaluating the *subquery* is not empty; that is, if there exists at least one record (row) in the FROM table of the *subquery* satisfying the search condition of the WHERE clause of this *subquery*.

Example of EXISTS:

```

DEFINE DATA LOCAL
1 #NAME      (A20)
END-DEFINE
...
SELECT NAME
  INTO #NAME
  FROM SQL-PERSONNEL
  WHERE EXISTS
    ( SELECT *
      FROM SQL-EMPLOYEES
      WHERE PERSNR > 1000
    )
  
```

```
        AND NAME < 'L' )  
        ...  
END-SELECT  
...
```

See information on *subquery*.
