

# %Q - Suppress Next Input

In interactive processing, the %Q command is ignored. When issued in batch mode, the %Q command causes the output of maps, or screens produced by INPUT statements, to be suppressed.

SET CONTROL 'Q' causes the next INPUT statement *not* to be processed. This may be used, for example, if at the end of a helproutine the processing is to continue without the user having to press ENTER upon return from the help to the map.
