Definition of Multi Frame Pages

The definition of multi frame pages is done with the Layout Painter. When you create a new layout, a dialog appears in which you select a template. To create a multi frame page, you have to select the "Multi Frame Page" template. The Layout Painter will open just as usual, but instead of having the PAGE control as the highest control, you now see the control MFPAGE. You can reach a number of controls that are related to multi frame page management.

The following controls are "normal frame controls" (they are described below):

- MFPAGE the top element of multi frame pages.
- MFCISFRAME a frame in which an Application Designer HTML page is loaded.
- MFHTMLFRAME a frame in which a normal HTML page is loaded.
- MFFRAMESET an area that can be subdivided into frames itself.

The following controls are "workplace controls" (they are described in the section *Application Designer Workplace Framework*. The Application Designer workplace is based on these controls.

- MFWPFUNCTIONS
- MFWPACTIVEFUNCTIONS
- MFWPCONTENT

This chapter covers the following topics:

- MFPAGE
- MFCISFRAME
- MFHTMLFRAME
- MFFRAMESET

MFPAGE

The MFPAGE is the top node of every multi frame page. It can be subdivided into frames or framesets.

Basic				
separation	Specifies how the corresponding internally used	Obligatory	rows	
	frameset is subdivided: choose "rows" for subdividing into rows, "cols" for subdividing into columns.		cols	

sizing	Defines the size of the contained sub-frames. If you have three sub-frames to show up inside the page then you might specify "200,200,*" to specify how the height (if SEPARATION is "rows") or the width (if SEPARATION is "cols") is distributed among the frames. You can speficy per frame either a pixel value or a "*".	Obligatory	
comment	Comment without any effect on rendering and behaviour. The comment is shown in the layout editor's tree view.	Optional	
Appearance			
border	Space between frames contained in the frameset that is internally built up.	Optional	1 2 3 int-value
bordercolor	Sets the border color of the frame set.	Optional	#FF0000 #00FF00 #000FF #FFFFFF #808080 #000000
frameborder	Defines if to display a border around the contained frames. Valid values are "true" or "false".	Optional	true false
framespacing	Defines the amount of additional space between the frames. Value is a pixel value.	Optional	1 2 3 int-value
framesetstyle	Style passed to the HTML-frameset definition that is internally generated.	Optional	background-color: #FF0000 color: #0000FF font-weight: bold

MFCISFRAME

The MFCISFRAME represents a frame in which an Application Designer page is shown. The name of the page is passed as a parameter.

Basic			
target	Id of the frame. Must be unique inside the frameset page. Must only contain alphanumeric characters. The id is important! CIS offers certain methods inside the Model-class that allow an adapter to start operations for a certain frame (e.g. openeCIPageInFrame()). As part of the parameters of these methods a target-id is passed. The target-id is exactly the id you specifiy with the TARGET property.	Obligatory	
cisurl	URL of the page to be shown inside. Use /project/page.html as syntax, e.g. "/HTMLBasedGUI/empty.html". Do NOT use only page.html believing that you do not have to specify the project because the multi frame page runs in the same project than the page you want to open - you ALWAYS have to specify the project!	Obligatory	
comment	Comment without any effect on rendering and behaviour. The comment is shown in the layout editor's tree view.	Optional	
Appearance	,	ı	
resizable	Decision if the user is able to resize the frame. This property must be in synch with the definition in the "neighbour frames". If the neighbour frames do not support resizing then it will not be offered to the user as consequence. Valid values are "true" and "false". Default is "true".	Optional	true false
withborder	Boolean value defining if the frame has a border on its own. Default is "false".	Optional	true false
framestyle	Style that is passed to the HTML-FRAME definition that is internally generated.	Optional	background-color: #FF0000 color: #0000FF font-weight: bold

bordercolor	Sets the border color of the frame set.	Optional	#FF0000
			#00FF00
			#0000FF
			#FFFFF
			#808080
			#000000
marginheight	Defines top and bottom margin height. Value is a	Optional	1
	pixel value. Default is "0".		2
			3
			int-value
marginwidth	Defines left and right margin width. Value is a	Optional	1
	pixel value. Default is "0".		2
			3
			int-value
withownborder	Flag that indicates if started pages show an own	Optional	true
	border. Default is false.		false
Unload Behavior	ır		
unloadbehaviour	Reaction that CIS should take if the page inside	Optional	NOTHING
	the frame is closed. Possible values are "NOTHING" for doing nothing and "REMOVESESSION" for removing the session on server side.		REMOVESESSION
	Do not define this property just "by accident" but leave it to the default ("NOTHING").		
	You only switch to "REMOVESESSION" if you want that the server side session is destroyed when leaving the page. This is the case if you have one page that clearly indicates the closing of a session at the point of time when the page is closed.		

Applications can change the page that is shown inside the MFCISFRAME by using the method Adapter.openCISPageInTarget(...).

MFHTMLFRAME

The MFHTMLFRAME represents a frame in which a normal HTML page is shown. This page can be a static HTML page or any URL - e.g. a URL referring to a certain JSP page.

Basic			
target	Id of the frame. Must be unique inside the frameset page. Must only contain alphanumeric characters. The id is important! CIS offers certain methods inside the Model-class that allow an adapter to start operations for a certain frame (e.g. openeCIPageInFrame()). As part of the parameters of these methods a target-id is passed. The target-id is exactly the id you specifiy with the TARGET property.	Obligatory	
url	URL to be opened inside the frame. The URL can be defined relative to the multi frame page or can be defined in an absolute way Example: You can define "/HTMLBasedGUI/workplace/header2.html" - or "http://www.softwareag.com".	Obligatory	
comment	Comment without any effect on rendering and behaviour. The comment is shown in the layout editor's tree view.	Optional	
Appearance			
resizable	Decision if the user is able to resize the frame. This property must be in synch with the definition in the "neighbour frames". If the neighbour frames do not support resizing then it will not be offered to the user as consequence. Valid values are "true" and "false". Default is "true".	Optional	true
withborder	Boolean value defining if the frame has a border on its own. Default is "false".	Optional	true
scrolling	Boolean that indicates whether the frame can be scrolled. Default is true.	Optional	true false
framestyle	Style that is passed to the HTML-FRAME definition that is internally generated.	Optional	background-color: #FF0000 color: #0000FF font-weight: bold

bordercolor	Sets the border color of the frame set.	Optional	#FF0000
			#00FF00
			#0000FF
			#FFFFF
			#808080
			#000000
marginheight	Defines top and bottom margin height. Value is a pixel value. Default is "0".	Optional	1
	value. Default is 0.		2
			3
			int-value
marginwidth	Defines left and right margin width. Value is a pixel value. Default is "0".	Optional	1
	value. Default is 0.		2
			3
			int-value

MFFRAMESET

The MFFRAMESET represents a frame that is internally again divided into frames. The MFFRAMESET definition decides whether to divide into rows or columns, and how to size the inner frames.

Basic				
target	Id of the frame. Must be unique inside the frameset page. Must only contain alphanumeric characters.	Obligatory		
	The id is important! CIS offers certain methods inside the Model-class that allow an adapter to start operations for a certain frame (e.g. openeCIPageInFrame()). As part of the parameters of these methods a target-id is passed. The target-id is exactly the id you specifiy with the TARGET property.			
separation	Specifies how the corresponding internally used frameset is subdivided: choose "rows" for subdividing into rows, "cols" for subdividing into columns.	Obligatory	rows	

sizing	Defines the size of the contained sub-frames. If you have three sub-frames to show up inside the page then you might specify "200,200,*" to specify how the height (if SEPARATION is "rows") or the width (if SEPARATION is "cols") is distributed among the frames. You can speficy per frame either a pixel value or a "*".	Obligatory	
comment	Comment without any effect on rendering and behaviour. The comment is shown in the layout editor's tree view.	Optional	
Appearance			
border	Space between frames contained in the frameset that is internally built up.	Optional	1 2 3 int-value
bordercolor	Sets the border color of the frame set.	Optional	#FF0000 #00FF00 #0000FF #FFFFFF #808080 #000000
frameborder	Defines if to display a border around the contained frames. Valid values are "true" or "false".	Optional	true false
framespacing	Defines the amount of additional space between the frames. Value is a pixel value.	Optional	1 2 3 int-value
framesetstyle	Style passed to the HTML-frameset definition that is internally generated.	Optional	background-color: #FF0000 color: #0000FF font-weight: bold
