YD - Year Differential

This Natural profile parameter can be used to adjust the current machine date (as read by using the internal machine time) by adding/subtracting a number of years to/from it. This may be useful for countries that use different calendars.

Possible settings	-499 to 499	The parameter is specified as YD=+*nnn* or YD=-*nnn* where *nnn* is the number of years. If the profile parameter MAXYEAR is set to 9999, the upper value limit is +7999.
Default setting	0	
Dynamic specification	yes	
Specification within session	no	

Notes:

1. If the current year is a leap year, but the year resulting from the YD setting is not, the 1st March will be used instead of the 29th February.
2. The year resulting from the sum of the profile parameters TD, DD and YD must be in the range of 1583 through 2699. If the profile parameter MAXYEAR is set to 9999, the upper year limit is 9999.
