DBLOG Utility - Logging Database Calls

The DBLOG utility is used to log Adabas commands, or DL/I and SYNC/ROLB calls, or SQL statements. Logging is useful for tuning an application (controlling the flow of commands accessing the database) and for analyzing error codes that may be returned from the database.

The *DBLOG Utility - Logging Database Calls* documentation is organized in the following parts:

- Executing DBLOG
- DBLOG Menu
- DBLOG Trace Screen
- DBLOG Snapshot Function
- TEST DBLOG Command
