DRAGGABLE

Determines whether a dialog element may be dragged by the user.

For bitmap controls with DRAG-MODE set to DM-NONE, this attribute determines whether the end user can use the mouse to drag a bitmap control onto another bitmap control in the same dialog. When dropping the bitmap control by releasing the mouse button, a drag and drop event will occur for the target bitmap control. Whenever a bitmap control is DRAGGABLE, you can also use the INQ-DRAG-DROP action provided with the PROCESS GUI statement to find out where the bitmap control was dropped.

For bitmap controls with DRAG-MODE set to a value other than DM-NONE, this attribute determines whether a drag and drop operation with the bitmap control acting as the drag source is allowed. For more information, please refer to the article Using the Clipboard and Drag and Drop .

For tool bar controls, this attribute determines whether the control is dockable and/or floatable in its own window. The sides of the parent dialog (if any) on which docking is allowed is determined by the DOCKING attribute values for both the tool bar control and the dialog.

Applies to	Bitmap control, tool bar control.
Data Type	BOOLEAN
Default Value	FALSE
Possible Values	TRUE / FALSE
