CVMIN - Control Variable Modified at Input

This Natural profile parameter determines whether or not an attribute control variable is assigned the status MODIFIED when the setting of the field to which the attribute control variable is attached is overwritten by an *identical* setting. If an attribute control variable has been assigned the status MODIFIED, the MODIFIED option evaluates this as TRUE. This applies regardless of whether the input was entered manually, read from the stack or supplied in batch mode.

Possible settings	ON	If a field setting is overwritten by the same setting, the corresponding control variable will be assigned the status MODIFIED.
	OFF	If a field setting is overwritten by the same setting, the corresponding control variable will not be assigned the status MODIFIED.
Default setting	OFF	
Dynamic specification	yes	
Specification within session	no
