HISTOGRAM HISTOGRAM

HISTOGRAM

This chapter covers the following topics:

- Function
- Restrictions
- Syntax Description
- Examples

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA |
BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION |
FIND | GET | GET SAME | GET TRANSACTION DATA | LIMIT | PASSW | PERFORM BREAK
PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: Database Access and Update

Function

The HISTOGRAM statement is used to read the values of a database field which is defined as a descriptor, subdescriptor, or a superdescriptor. The values are read directly from the Adabas inverted lists.

The HISTOGRAM statement causes a processing loop to be initiated but does not provide access to any database fields other than the field specified in the HISTOGRAM statement.

See also *HISTOGRAM Statement* (in the *Programming Guide*).

HISTOGRAM Restrictions

Note:

For SQL databases: HISTOGRAM returns the number of rows which have the same value in a specific column.

Restrictions

- This statement cannot be used with XML databases.
- This statement cannot be used with Entire System Server.

Syntax Description

Operand Definition Table:

Operand		Pos Stru		Possible Formats			Referencing Permitted	Dynamic Definition									
operand1	С	S				N	P	I		B *						yes	no
operand2	С	S		A												yes	no
operand3		S		A												yes	no
operand4		S		A		N	P	I	F	В	D	Т	L			no	no

^{*} Format B of operand1 may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Description HISTOGRAM

Syntax Element	Description
operand1 / ALL	Processing Loop Limit:
	You can limit the number of descriptor values to be processed with the HISTOGRAM statement by specifying operand1 - either as a numeric constant (0 - 4294967295) or as a user-defined variable (containing an integer value).
	ALL may optionally be specified to emphasize that all descriptor values are to be processed.
	For this statement, the specified limit has priority over a limit set with a LIMIT statement.
	If a smaller limit is set with the LT parameter (Limit for Processing Loops), the LT limit applies.
	Note: If you wish to process a 4-digit number of descriptor values, specify it with a leading zero (0nnn); because Natural interprets every 4-digit number enclosed in parentheses as a line-number reference to a statement. operand1 is evaluated when the HISTOGRAM loop is entered. If the value of operand1 is modified within the HISTOGRAM loop, this does not affect the number of values read.
MULTI-FETCH-clause	MULTI-FETCH Clause:
	See MULTI-FETCH Clause below.
view-name	View Name:
	As <i>view-name</i> , you specify the name of a view, which is defined either within a DEFINE DATA statement or in a separate global or local data area.
	The view must not contain any other fields apart from the field used in the HISTOGRAM statement (operand4).
	If the field in the view is a periodic-group field or multiple-value field that is defined with an index range, only the first occurrence of that range is filled by the HISTOGRAM statement; all other occurrences are not affected by the execution of the HISTOGRAM statement.
	In reporting mode, <i>view-name</i> is the name of a DDM if no DEFINE DATA LOCAL statement is used.

HISTOGRAM Syntax Description

Syntax Element	Description
PASSWORD=operand2	PASSWORD Clause:
	The PASSWORD clause is used to provide a password (operand2) when retrieving data from an Adabas file which is password-protected. See the statements FIND and PASSW for further information.
SEQUENCE	SEQUENCE Clause:
	This clause can only be used for Adabas and SQL databases.
	With this clause, you can determine whether the records are to be read in ascending sequence or in descending sequence.
	• The default sequence is ascending (which may, but need not, be explicitly specified by using the keyword ASCENDING).
	• If the records are to be read in descending sequence, you specify the keyword DESCENDING.
	• If, instead of determining it in advance, you want to have the option of determining at runtime whether the records are to be read in ascending or descending sequence, you either specify the keyword VARIABLE or DYNAMIC, followed by a variable (operand3). operand3 has to be of format/length A1 and can contain the value A (for "ascending") or D (for "descending").
	O If keyword VARIABLE is used, the reading direction (value of <i>operand3</i>) is evaluated at start of the HISTOGRAM processing loop and remains same until the loop is terminated, regardless if the <i>operand3</i> field is altered in the HISTOGRAM loop or not.
	O If keyword DYNAMIC is used, the reading direction (value of operand3) is evaluated before every record fetch in the HISTOGRAM processing loop and may be changed from record to record. This allows to change the scroll sequence from ascending to descending (and vice versa) at any place in the HISTOGRAM loop.
	Examples of SEQUENCE clause:
	• Example 2 - HISTOGRAM Statement with Records Read in Descending Sequence
	• Example 3 - HISTOGRAM Statement Using Variable Sequence

Syntax Description HISTOGRAM

Syntax Element	Description
operand4	Descriptor:
	As <i>operand4</i> , a descriptor, subdescriptor, superdescriptor or hyperdescriptor may be specified.
	A descriptor contained within a periodic group may be specified with or without an index. If no index is specified, the descriptor will be selected if the value specified is located in any occurrence. If an index is specified, the descriptor will be selected only if the value is located in the occurrence specified by the index. The index specified must be a constant. An index range must not be used.
	For a descriptor which is a multiple-value field an index must not be specified; the descriptor will be selected if the value is located in the record regardless of the position of the value.
STARTING-ENDING-clause	STARTING/ENDING Clause:
	Starting and ending values may be specified using the keywords STARTING and ENDING (or THRU) followed by a constant or a user-defined variable representing the value with which processing is to begin/end.
	For further information, see <i>Specifying Starting/Ending Values</i> below.

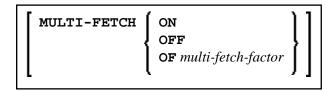

HISTOGRAM Syntax Description

Syntax Element	Description								
WHERE logical-condition	WHERE Clause: The WHERE clause may be used to specify an additional selection criterion (<i>logical-condition</i>) which is evaluated <i>after</i> a value has been read and <i>before</i> any processing is performed on the value (including the AT BREAK evaluation).								
	The descriptor specified in the WHERE clause must be the sa descriptor referenced in the HISTOGRAM statement. No other fields from the selected file are available for processing with HISTOGRAM statement.								
	The syntax for a <i>logical-condition</i> is described in the section <i>Logical Condition Criteria</i> (in the <i>Programming Guide</i>).								
	System Varia	ables							
		ystem variables *ISN, *NUMBER, and re available with the HISTOGRAM statement.							
		d *ISN are only set after the evaluation of the e. They must not be used in the logical condition clause.							
	*NUMBER	The system variable *NUMBER contains the number of database records that contain the last value read.							
		For SQL databases, see *NUMBER for SQL Databases in the System Variables documentation.							
	*ISN	The system variable *ISN contains the number of the occurrence in which the descriptor value last read is contained. *ISN will contain 0 if the descriptor is not contained within a periodic group.							
		*ISN is not available for SQL databases.							
	*COUNTER	The system variable *COUNTER contains a count of the total number of values which have been read (after evaluation of the WHERE clause).							
END-HISTOGRAM	End of HISTOGRAM Statement:								
		erved word END-HISTOGRAM must be used to GRAM statement.							

MULTI-FETCH Clause

Note:

This clause can only be used for Adabas databases.

Note:

[MULTI-FETCH OF multi-fetch-factor] is not evaluated for database types ADA and ADA2. The default processing mode is applied; see profile parameter MFSET. When used in conjunction with database type ADA2, the MULTI-FETCH clause is ignored completely; see *Database Management System Assignments* in the *Configuration Utility* documentation.

For more information, see the section Multi-Fetch Clause (Adabas) in the Programming Guide.

Specifying Starting/Ending Values

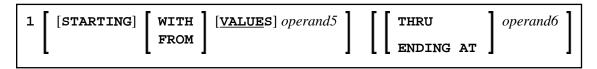

Starting and ending values may be specified using the keywords STARTING and ENDING (or THRU) followed by a constant or a user-defined variable representing the value with which processing is to begin/end.

If a starting value is specified and the value is not present, the next higher value is used as the starting value. If no higher value is present, the HISTOGRAM loop will not be entered.

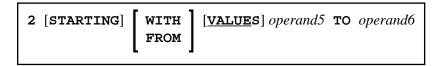

If an ending value is specified, values will be read up to and including the ending value.

Hexadecimal constants may be specified as a starting or ending value for descriptors of format A or B.

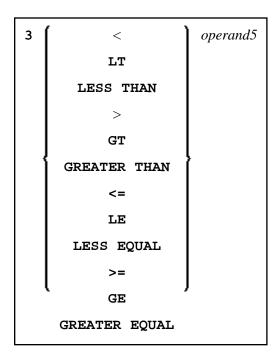

Syntax Option 1:

Syntax Option 2:

Syntax Option 3:

Note:

If the comparators of Diagram 3 are used, the options ENDING AT, THRU and TO may not be used. These comparators are also valid for the READ statement.

Operand Definition Table:

Operand		Pos Stru		Possible Formats		Referencing Permitted	Dynamic Definition									
operand5	С	S		A	U	N	P	I	F	В	D	T	L		yes	no
operand6	С	S		A	U	N	P	I	F	В	D	T	L		yes	no

Syntax Element Description:

Examples HISTOGRAM

Syntax Element	Description					
STARTING	STARTING FROM / ENDING AT Clauses:					
FROM ENDING AT	The STARTING FROM and ENDING AT clauses are used to limit reading to a user-specified range of values.					
	The STARTING FROM clause (= or EQ or EQUAL TO or [STARTING] FROM) determines the starting value for the read operation. If a starting value is specified, reading will begin with the value specified. If the starting value does not exist, the next higher (or lower for a DESCENDING read) value will be returned. If no higher (or lower for DESCENDING) value exists, the HISTOGRAM loop will not be entered.					
	In order to limit the values to an end-value, you may specify an ENDING AT clause with the terms THRU, ENDING AT or TO, that imply an inclusive range. Whenever the descriptor field exceeds the end-value specified, an automatic loop termination is performed. Although the basic functionality of the TO, THRU and ENDING AT keywords looks quite similar, internally they differ in how they work.					
THRU	THRU / ENDING AT Option:					
ENDING AT	If THRU or ENDING AT is used, only the start-value is supplied to the database, but the end-value check is performed by the Natural runtime system, after the value is returned by the database.					
	The THRU and ENDING AT options can be used for all databases which support the HISTOGRAM statements.					
TO	Range:					
	If the keyword TO is used, both the start-value and the end-value are sent to the database and Natural does not perform checks for value ranges. If the end-value is exceeded, the database reacts in the same way as when "end-of-file" is reached and the database loop is exited. Since the complete range checking is done by the database, the lower-value (of the range) is always supplied in the start-value and the higher-value filled into the end-value, regardless wether you are browsing in ASCENDING or in DESCENDING order.					

Examples

- Example 1 HISTOGRAM Statement
- Example 2 HISTOGRAM Statement with Records Read in Descending Sequence
- Example 3 HISTOGRAM Statement Using Variable Sequence

Example 1 - HISTOGRAM Statement

Output of Program HSTEX1S:

CITY	NUMBER OF PERSONS	CNT
MADISON	3	1
MADRID	41	2
MAILLY LE CAMP	1	3
MAMERS	1	4
MANSFIELD	4	5
MARSEILLE	2	6
MATLOCK	1	7
MELBOURNE	2	8

Equivalent reporting-mode example: HSTEX1R.

Example 2 - HISTOGRAM Statement with Records Read in Descending Sequence

Output of Program HSTDSCND:

Page	1				05-01-13	13:41:03
	NAME	NMBR				
77 T NTNT			1			
ZINN			1			
YOT			1			
YNCLAN			1			
YATES			1			

```
YALCIN 1
YACKX-COLTEAU 1
XOLIN 1
WYLLIS 2
WULFRING 1
WRIGHT 1
```

Example 3 - HISTOGRAM Statement Using Variable Sequence

```
** Example 'HSTVSEQ': HISTOGRAM (with VARIABLE SEQUENCE)
*************
DEFINE DATA LOCAL
1 EMPL VIEW OF EMPLOYEES
  2 NAME
1 #DIR
           (A1)
1 #STARTVAL (A20)
END-DEFINE
SET KEY PF3 PF7 PF8
MOVE 'ADKINSON' TO #STARTVAL
HISTOGRAM (9) EMPL FOR NAME FROM #STARTVAL
 WRITE NAME *NUMBER
  IF *COUNTER = 5
   MOVE NAME TO #STARTVAL
  END-IF
END-HISTOGRAM
#DIR := 'A'
REPEAT
 HISTOGRAM EMPL IN VARIABLE #DIR SEQUENCE
           FOR NAME FROM #STARTVAL
   MOVE NAME TO #STARTVAL
    INPUT NO ERASE (IP=OFF AD=O)
         15/01 NAME *NUMBER
         // 'Direction:' #DIR
              'Press PF3 to stop'
              ' PF7 to go step back'
                   PF8 to go step forward'
                   ENTER to continue in that direction'
    IF *PF-KEY = 'PF7' AND #DIR = 'A'
     MOVE 'D' TO #DIR
     ESCAPE BOTTOM
    END-IF
    IF *PF-KEY = 'PF8' AND #DIR = 'D'
     MOVE 'A' TO #DIR
     ESCAPE BOTTOM
    END-IF
    IF *PF-KEY = 'PF3'
     STOP
   END-IF
  END-HISTOGRAM
  IF *COUNTER(0250) = 0
   STOP
 END-IF
END-REPEAT
END
```

Output of Program HSTVSEQ:
