SYSERR

```
SYSERR
```

This command is used to invoke the SYSERR utility.

With the SYSERR utility, you can write your own application-specific messages.

- You can use the SYSERR utility to separate error or information messages from your Natural code and manage them separately.

- As well as unifying messages and defining message ranges for different kinds of messages, you can translate messages into another language and attach a long text to a message.

- You can also use the SYSERR utility to modify the texts of existing Natural system messages, although this is not recommended as modifications will be lost with new Natural releases.

For further information, see *SYSERR Utility* in the *Tools and Utilities* documentation.
