Example Programs for System Variables 1008

1 Statements

This documentation describes the Natural programming language statements. It is organized under the following headings:

	Syntax Symbols and Operand Definition Tables	Information on the symbols that are used within the diagrams that describe the syntax of Natural statements and on operand definition tables.
	Statements Grouped by Functions	Provides an overview of the Natural statements ordered by functional groups.
	Statements in Alphabetical Order	Descriptions of the statements (except SQL statements) in alphabetical order.
	Natural SQL Statements	Describes specific statements that can be used in Natural programs to maintain data contained in an SQL database.
	Referenced Example Programs	Contains additional example programs that are referenced in the Natural statements and system variables reference documentation.

See also the *Programming Guide* for statement usage related topics such as: *User-Defined Variables* | Dynamic and Large Variables/Fields, *Introduction*, *Usage* | *User-Defined Constants* | *Report Specification* | *Text Notation* | *User Comments* | *Rules for Arithmetic Assignment* | *Logical Condition Criteria* | *User-Defined Functions*

2 Syntax Symbols and Operand Definition Tables

- Syntax Symbols 4
- Operand Definition Table 5

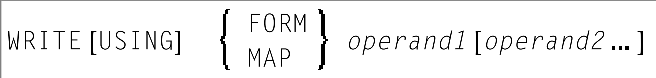
Syntax Symbols

The following symbols are used within the diagrams that describe the syntax of Natural statements:

Syntax Symbol	Description
ABCDEF	Upper-case letters indicate that the term is either a Natural keyword or a Natural reserved word that must be entered exactly as specified.
ABCDEF	If an optional term in upper-case letters is completely underlined (not a hyperlink!), this indicates that the term is the default value. If you omit the term, the underlined value applies.
ABCDEF	If a term in upper-case letters is partially underlined (not a hyperlink!), this indicates that the underlined portion is an acceptable abbreviation of the term.
abcdef	Letters in italics are used to represent variable information. You must supply a valid value when specifying this term. **Note:** In place of *statement* or *statements*, you must supply one or several suitable statements, depending on the situation. If you do not want to supply a specific statement, you may insert the IGNORE statement.
[ ]	Elements contained within square brackets are optional. If the square brackets contain several lines stacked one above the other, each line is an optional alternative. You may choose at most one of the alternatives.
{ }	If the braces contain several lines stacked one above the other, each line is an alternative. You must choose exactly one of the alternatives.
|	The vertical bar separates alternatives.
...	A term preceding an ellipsis may optionally be repeated. A number after the ellipsis indicates how many times the term may be repeated. If the term preceding the ellipsis is an expression enclosed in square brackets or braces, the ellipsis applies to the entire bracketed expression.
,...	A term preceding a comma-ellipsis may optionally be repeated; if it is repeated, the repetitions must be separated by commas. A number after the comma-ellipsis indicates how many times the term may be repeated. If the term preceding the comma-ellipsis is an expression enclosed in square brackets or braces, the comma-ellipsis applies to the entire bracketed expression.
:...	A term preceding a colon-ellipsis may optionally be repeated; if it is repeated, the repetitions must be separated by colons. A number after the colon-ellipsis indicates how many times the term may be repeated. If the term preceding the colon-ellipsis is an expression enclosed in square brackets or braces, the colon-ellipsis applies to the entire bracketed expression.

Syntax Symbol	Description
Other symbols (except [ ] { } | ... ,... :...)	All other symbols except those defined in this table must be entered exactly as specified. *Exception*: The SQL scalar concatenation operator is represented by two vertical bars that must be entered literally as they appear in the syntax definition.

Example:



- WRITE, USING, MAP and FORM are Natural keywords which you must enter as specified.
- *operand1* and *operand2* are user-supplied variables for which you specify the names of the objects you wish to deal with.
- The braces indicate that you must choose whether to specify either FORM or MAP; however, you must specify one of the two.
- The square brackets indicate that USING and *operand2* are optional elements which you can, but need not, specify.
- The ellipsis indicates that you may specify *operand2* several times.

Operand Definition Table

Whenever one or more operands appear in the syntax of a Natural statement, the following table is provided:

Operand	Possible Structure						Possible Formats														Referencing Permitted	Dynamic Definition
operand1	C	S	A	G	N/M	E	A	U	N	P	I	F	B	D	T	L	C		O		yes/no	yes/no

This table provides the following information on each operand:

Possible Structure

Indicates the structure which the operand may take:

<table>
<tr><td>C</td><td colspan="2">Constant.</td></tr>
<tr><td>S</td><td colspan="2">Single occurrence (scalar; that is, a field/variable which is neither an array nor a group).</td></tr>
<tr><td>A</td><td colspan="2">Array.</td></tr>
<tr><td>G</td><td colspan="2">Group.</td></tr>
<tr><td rowspan="3">N/M</td><td colspan="2">Natural system variable:</td></tr>
<tr><td>N</td><td>All system variables can be used.</td></tr>
<tr><td>M</td><td>Only modifiable system variables can be used. For information on wether the content of a system variable is modifiable or not, see the Natural System Variables documentation.</td></tr>
<tr><td>E</td><td colspan="2">Arithmetic expressions.</td></tr>
</table>

Possible Formats

Indicates the format which the operand may take:

A	Alphanumeric (ASCII code page)
U	Alphanumeric (Unicode)
N	Numeric unpacked
P	Packed numeric
I	Integer
F	Floating point
B	Binary
D	Date
T	Time
L	Logical
C	Attribute control
O	`HANDLE OF OBJECT`

Referencing Permitted

Indicates whether the operand may be referenced or not, using a statement label or the source code line number.

Dynamic Definition

Indicates whether the field may be dynamically defined within the body of the program. This is possible in reporting mode only.

3 Statements Grouped by Functions

- Database Access and Update ... 10
- Arithmetic and Data Movement Operations ... 11
- Loop Execution ... 12
- Creation of Output Reports ... 12
- Screen Generation for Interactive Processing ... 13
- Processing of Logical Conditions ... 13
- Invoking Programs and Routines ... 14
- User-Defined Functions ... 14
- Program and Session Termination ... 15
- Control of Work Files / PC Files ... 15
- Component Based Programming ... 15
- Memory Management Control for Dynamic Variables or X-Arrays ... 16
- Natural Remote Procedure Call ... 16
- Internet and XML ... 16
- Miscellaneous ... 16
- Reporting Mode Statements ... 17

This chapter provides an overview of the statements grouped by their functions.

Notes:

1. Certain statements can be used both in structured mode and in reporting mode, while others can be used in reporting mode only. See *Natural Programming Modes* in the *Programming Guide*.
2. The statements DLOGOFF, DLOGON, SHOW, IMPORT and EXPORT are only available when Entire DB is installed. For a description, see the *Entire DB* documentation.

Database Access and Update

Natural DML Statements

The following Natural Data Manipulation Language (DML) statements are used to access and manipulate information contained in a database.

READ	Reads a database file in physical or logical sequence of records.
FIND	Selects records from a database file based on user-specified criteria.
HISTOGRAM	Reads the values of a database field.
GET	Reads a record with a given ISN (internal sequence number) or RNO (record number).
GET SAME	Re-reads the record currently being processed.
ACCEPT/REJECT	Accepts/reject records based on user-specified criteria.
PASSW	Provides password for access to a password-protected file.
LIMIT	Limits the number of executions of a READ, FIND or HISTOGRAM processing loop.
STORE	Adds a new record to the database.
UPDATE	Updates a record in the database.
DELETE	Deletes a record from the database.
END TRANSACTION	Indicates the end of a logical transaction.
BACKOUT TRANSACTION	Backs out a partially completed logical transaction.
GET TRANSACTION DATA	Reads transaction data stored with a previous END TRANSACTION statement.
RETRY	Attempts to re-read a record which is in hold status for another user.
AT START OF DATA	Specifies statements to be performed when the first of a set of records is processed in a processing loop.
AT END OF DATA	Specifies statements to be performed after the last of a set of records has been processed in a processing loop.
AT BREAK	Specifies statements to be performed when the value of a control field changes (break processing).

BEFORE BREAK PROCESSING	Specifies statements to be performed before performing break processing.
PERFORM BREAK PROCESSING	Immediately invokes break processing.

Natural SQL Statements

In addition to the Natural DML Statements, Natural also provides SQL statements for use in Natural programs so that SQL can be used directly.

The following SQL Statements are available:

CALLDBPROC	Invokes a stored procedure of the SQL database system to which Natural is connected.
COMMIT	Indicates the end of a logical transaction and releases all data locked during the transaction. All data modifications are committed and made permanent.
DELETE	Deletes either rows in a table without using a cursor (**"searched"** DELETE) or rows in a table to which a cursor is positioned (**"positioned"** DELETE).
INSERT	Adds one or more new rows to a table.
PROCESS SQL	Issues SQL statements to the underlying database.
READ RESULT SET	Reads a result set which was created by a stored procedure that was invoked by a previous CALLDBPROC statement.
ROLLBACK	Undoes all database modifications made since the beginning of the last recovery unit.
SELECT	Supports both the **cursor-oriented selection** that is used to retrieve an arbitrary number of rows and the **non-cursor selection** (singleton SELECT) that retrieves at most one single row.
UPDATE	Performs an update operation on either rows in a table without using a cursor (**"searched"** UPDATE) or columns in a row to which a cursor is positioned (**"positioned"** UPDATE).

Arithmetic and Data Movement Operations

The following statements are used for arithmetic and data movement operations:

COMPUTE	Performs arithmetic operations or assigns values to fields.
ADD	Adds two or more operands.
SUBTRACT	Subtracts one or more operands from another operand.
MULTIPLY	Multiplies two or more operands.
DIVIDE	Divides one operand into another.
EXAMINE TRANSLATE	Translates the characters contained in a field into upper-case or lower-case, or into other characters.
MOVE	Moves the value of an operand to one or more fields.

MOVE ALL	Moves multiple occurrences of a value to another field.
COMPRESS	Concatenates the value of two or more fields into a single field.
SEPARATE	Separates the content of a field into two or more fields.
EXAMINE	Scans a field for a specific value and replaces it, and/or counts how often it occurs.
RESET	Sets the value of a field to zero (if numeric) or blank (if alphanumeric), or to its initial value.

Loop Execution

The following statements are related to the execution of processing loops:

ESCAPE	Stops the execution of a processing loop.
FOR	Initiates a processing loop and controls the number of times the loop is to be processed.
REPEAT	Initiates a processing loop (and terminates it based on a specified condition).
SORT	Sorts records.

Creation of Output Reports

The following statements are used for the creation of output reports:

FORMAT	Specifies output parameter settings.
DISPLAY	Specifies fields to be output in column form.
WRITE / PRINT	Specifies fields to be output in non-column form.
WRITE TITLE	Specifies text to be output at the top of each page of a report.
WRITE TRAILER	Specifies text to be output at the bottom of each page of a report.
AT TOP OF PAGE	Specifies processing to be performed when a new output page is started.
AT END OF PAGE	Specifies processing to be performed when the end of an output page is reached.
SKIP	Generates one or more blank lines in a report.
EJECT	Causes a page advance without titles or headings.
NEWPAGE	Causes a page advance with titles and headings.
SUSPEND IDENTICAL SUPPRESS	Suspends identical suppression for a single record.
DEFINE PRINTER	Allocates a report to a logical output destination.
CLOSE PRINTER	Closes a printer.

Screen Generation for Interactive Processing

The following statements are used to create data screens (maps) for the purpose of interactive processing of data:

INPUT	Creates a formatted screen (map) for data display/ entry.
REINPUT	Re-executes an INPUT statement (if invalid data were entered in response to the previous INPUT statement).
DEFINE WINDOW	Specifies the size, position and attributes of a window.
SET WINDOW	Activates and de-activates a window.
PROCESS PAGE	Creates a data mapping to a web rich GUI screen.
PROCESS PAGE USING	Performs rich GUI I/O processing using an adapter object generated from a page layout.
PROCESS PAGE UPDATE	Re-executes a PROCESS PAGE statement.
PROCESS PAGE MODAL	Initiates a processing block and controls the lifetime of a rich GUI window.

Processing of Logical Conditions

The following statements are used to control the execution of statements based on conditions detected during the execution of a Natural program:

IF	Performs statements depending on a logical condition.
IF SELECTION	Verifies that in a sequence of alphanumeric fields one and only one contains a value.
DECIDE FOR	Performs statements depending on logical conditions.
DECIDE ON	Performs statements depending on the contents of a variable.

Invoking Programs and Routines

The following statements are used in conjunction with the execution of programs and routines:

CALL	Invokes a non-Natural program from a Natural program.
CALLNAT	Invokes a Natural subprogram.
CALL FILE	Invokes a non-Natural program to read a record from a non-Adabas file.
CALL LOOP	Generates a processing loop containing a call to a non-Natural program.
DEFINE SUBROUTINE	Defines a Natural subroutine.
ESCAPE	Stops the execution of a routine.
FETCH	Invokes a Natural program.
PERFORM	Invokes a Natural subroutine.
PROCESS COMMAND	Invokes a command processor.
RUN	Compiles and executes a source program.

User-Defined Functions

The following Natural statements are used to create user-defined functions:

DEFINE FUNCTION	Creates new user-defined functions which may be called instead of operands in the Natural statements. Functions can be defined inside the object type Function only.
DEFINE PROTOTYPE	Specifies a signature according to a certain function call.
Function Call	Used to call user-defined functions which are defined inside special objects of type function. Also used to call Natural functions.

Program and Session Termination

The following Natural statements are used to terminate the execution of an application or to terminate the Natural session.

STOP	Terminates the execution of an application.
TERMINATE	Terminates the Natural session.

Control of Work Files / PC Files

The following Natural statements are used to read/write data to a physical sequential (non-Adabas) work file:

WRITE WORK FILE	Writes data to a work file.
DOWNLOAD PC FILE	Enables transfer data from a mainframe, UNIX or OpenVMS platform to the PC.
READ WORK FILE	Reads data from a work file.
UPLOAD PC FILE	Enables transfer data from a PC to a mainframe, UNIX or OpenVMS platform.
CLOSE WORK FILE	Closes a work file.
CLOSE PC FILE	Closes a specific PC work file.
DEFINE WORK FILE	Assigns a file name to a work file.

Component Based Programming

The following Natural statements are used in conjunction with component based programming:

DEFINE CLASS	Specifies a class from within a Natural class module.
CREATE OBJECT	Creates an object (also known as an instance) of a given class.
SEND METHOD	Invokes a method of an object.
INTERFACE	Defines an interface (a collection of methods and properties) for a certain feature of a class.
METHOD	Assigns a subprogram as the implementation of a method, outside an interface definition.
PROPERTY	Assigns an object data variable as the implementation to a property, outside an interface definition.

Memory Management Control for Dynamic Variables or X-Arrays

EXPAND	Expands the allocated memory of dynamic variables to a given size or expands the number of occurrences of X-arrays.
REDUCE	Reduces the size of a dynamic variable or the number of occurrences of X-arrays.
RESIZE	Adjusts the size of a dynamic variableor the number of occurrences of X-arrays.

Natural Remote Procedure Call

OPEN CONVERSATION	Allows the RPC Client to open a conversation and specify the remote subprograms to be included in the conversation.
CLOSE CONVERSATION	Allows the client to close conversations. You can close the current conversation, another open conversation, or all open conversations.
DEFINE DATA CONTEXT	Defines variables known as context variables, which are meant to be available to multiple remote subprograms within one conversation, without having to explicitly pass the variables as parameters with the corresponding CALLNAT statements.

See also the section *Natural Statements Involved* in the *Natural Remote Procedure Call* documentation.

Internet and XML

PARSE	Allows you to parse XML documents from a Natural program.
REQUEST DOCUMENT	Allows you to access an external system.

Miscellaneous

DEFINE DATA	Defines the data elements which are to be used in a Natural program or routine.
END	Indicates the end of the source code of a Natural program or routine.
INCLUDE	Incorporates Natural copycode at compilation.
ON ERROR	Intercepts runtime errors which would otherwise result in a Natural error message, followed by the termination of the Natural program.
RELEASE	Deletes the contents of the Natural stack; releases sets of ISN sets retained via a FIND statement; releases Natural global variables.

SET CONTROL	Performs a Natural terminal command from within a Natural program.
SET KEY	Assigns functions to terminal keys.
SET GLOBALS	Sets values for session parameters.
SET TIME	Establishes a point-in-time reference for a *TIMD system variable.
STACK	Places data and/or commands into the Natural stack.

Reporting Mode Statements

The following statements are for reporting mode only:

CLOSE LOOP	Closes a processing loop.
DO/DOEND	Specify a group of statements to be executed based on a logical condition.
OBTAIN	Causes on or more fields to be read from a file.
REDEFINE	Redefines a field.

The following statements can be used both in structured mode and in reporting mode, however, the statement structure and, with some of them, the functionality is different:

AT START OF DATA	Specifies statements to be performed when the first of a set of records is processed in a processing loop.
AT END OF DATA	Specifies statements to be performed after the last of a set of records has been processed in a processing loop.
AT BREAK	Specifies statements to be performed when the value of a control field changes (break processing).
AT TOP OF PAGE	Specifies processing to be performed when a new output page is started.
AT END OF PAGE	Specifies processing to be performed when the end of an output page is reached.
BEFORE BREAK PROCESSING	Specifies statements to be performed before performing break processing.
CALL LOOP	Generates a processing loop containing a call to a non-Natural program.
CALL FILE	Invokes a non-Natural program to read a record from a non-Adabas file.
COMPUTE	Performs arithmetic operations or assigns values to fields.
DEFINE SUBROUTINE	Defines a Natural subroutine.
ESCAPE	Stops the execution of a processing loop.
FIND	Selects records from a database file based on user-specified criteria.
GET SAME	Re-reads the record currently being processed.
HISTOGRAM	Reads the values of a database field.
IF	Performs statements depending on a logical condition.

IF SELECTION	Verifies that in a sequence of alphanumeric fields one and only one contains a value.
ON ERROR	Intercepts runtime errors which would otherwise result in a Natural error message, followed by the termination of the Natural program.
READ	Reads a database file in physical or logical sequence of records.
READ WORK FILE	Reads data from a work file.
REPEAT	Initiates a processing loop (and terminates it based on a specified condition).
SORT	Sorts records.
STORE	Adds a new record to the database.
UPDATE	Updates a record in the database.
UPLOAD PC FILE	Enables transfer data from a PC to a mainframe, UNIX or OpenVMS platform.

4 ACCEPT/REJECT

- Function 20
- Syntax Description 20
- Processing of Multiple ACCEPT/REJECT Statements 21
- Limit Notation 21
- Examples 22

```
{ ACCEPT } [IF] logical-condition
{ REJECT }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | HISTOGRAM | GET | GET SAME | GET TRANSACTION DATA | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The statements ACCEPT and REJECT are used for accepting/rejecting a record based on user-specified logical criterion. The ACCEPT/REJECT statement may be used in conjunction with statements which read data records in a processing loop (FIND, READ, HISTOGRAM, CALL FILE, SORT or READ WORK FILE). The criterion is evaluated *after* the record has been selected/read.

Whenever an ACCEPT/REJECT statement is encountered for processing, it will internally refer to the innermost currently active processing loop initiated with one of the above mentioned statements.

When ACCEPT/REJECT statements are placed in a subroutine, in case of a record reject, the subroutine(s) entered in the processing loop will automatically be terminated and processing will continue with the next record of the innermost currently active processing loop.

Syntax Description

Syntax Element	Description
IF	**IF Clause:** An IF clause may be used with an ACCEPT or REJECT statement to specify logical condition criteria in addition to that specified when the record was selected/read with a FIND, READ, or HISTOGRAM statement. The logical condition criteria are evaluated after the record has been read and after record processing has started.
logical-condition	**Logical Condition Criterion:** The basic criterion is a relational expression. Multiple relational expressions may be combined with logical operators (AND, OR) to form complex criteria. Arithmetic expressions may also be used to form a relational expression.

Syntax Element	Description
	The fields used to specify the logical criterion may be database fields or user-defined variables. For additional information on logical conditions, see *Logical Condition Criteria* in the *Programming Guide*. **Note:** When ACCEPT/REJECT is used with a HISTOGRAM statement, only the database field specified in the HISTOGRAM statement may be used as a logical criterion.

Processing of Multiple ACCEPT/REJECT Statements

Normally, only one ACCEPT or REJECT statement is required in a single processing loop. If more than one ACCEPT/REJECT is specified *consecutively*, the following conditions apply:

- If consecutive ACCEPT and REJECT statements are contained in the same processing loop, they are processed in the specified order.
- If an ACCEPT condition is satisfied, the record will be accepted and consecutive ACCEPT/REJECT statements will be ignored.
- If a REJECT condition is satisfied, the record will be rejected and consecutive ACCEPT/REJECT statements will be ignored.
- If the processing continues to the last ACCEPT/REJECT statement, the last statement will determine whether the record is accepted or rejected.

If other statements are interleaved between multiple ACCEPT/REJECT statements, each ACCEPT/REJECT will be handled independently.

Limit Notation

If a LIMIT statement or other limit notation has been specified for a processing loop containing an ACCEPT or REJECT statement, each record processed is counted against the limit regardless of whether or not the record is accepted or rejected.

Examples

- Example 1 - ACCEPT
- Example 2 - ACCEPT / REJECT

Example 1 - ACCEPT

```
** Example 'ACREX1': ACCEPT
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 SEX
  2 MAR-STAT
END-DEFINE
*
LIMIT 50
READ EMPLOY-VIEW
  ACCEPT IF SEX='M' AND MAR-STAT = 'S'
  WRITE  NOTITLE '=' NAME '=' SEX 5X '=' MAR-STAT
END-READ
END
```

Output of Program ACREX1:

```
NAME: MORENO                S E X: M     MARITAL STATUS: S
NAME: VAUZELLE              S E X: M     MARITAL STATUS: S
NAME: BAILLET               S E X: M     MARITAL STATUS: S
NAME: HEURTEBISE            S E X: M     MARITAL STATUS: S
NAME: LION                  S E X: M     MARITAL STATUS: S
NAME: DEZELUS               S E X: M     MARITAL STATUS: S
NAME: BOYER                 S E X: M     MARITAL STATUS: S
NAME: BROUSSE               S E X: M     MARITAL STATUS: S
NAME: DROMARD               S E X: M     MARITAL STATUS: S
NAME: DUC                   S E X: M     MARITAL STATUS: S
NAME: BEGUERIE              S E X: M     MARITAL STATUS: S
NAME: FOREST                S E X: M     MARITAL STATUS: S
NAME: GEORGES               S E X: M     MARITAL STATUS: S
```

Example 2 - ACCEPT / REJECT

```
** Example 'ACREX2': ACCEPT/REJECT
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 SALARY    (1)
*
1 #PROC-COUNT (N8) INIT <0>
END-DEFINE
*
EMP. FIND EMPLOY-VIEW WITH NAME = 'JACKSON'
  WRITE NOTITLE *COUNTER NAME FIRST-NAME 'SALARY:' SALARY(1)
  /*
  ACCEPT IF SALARY (1) LT 50000
  WRITE *COUNTER 'ACCEPTED FOR FURTHER PROCESSING'
  /*
  REJECT IF SALARY (1) GT 30000
  WRITE *COUNTER 'NOT REJECTED'
  /*
  ADD 1 TO #PROC-COUNT
END-FIND
*
SKIP 2
WRITE NOTITLE 'TOTAL PERSONS FOUND ' *NUMBER (EMP.) /
              'TOTAL PERSONS SELECTED' #PROC-COUNT
END
```

Output of Program ACREX2:

```
          1 JACKSON              CLAUDE               SALARY:      33000
          1 ACCEPTED FOR FURTHER PROCESSING
          2 JACKSON              FORTUNA              SALARY:      36000
          2 ACCEPTED FOR FURTHER PROCESSING
          3 JACKSON              CHARLIE              SALARY:      23000
          3 ACCEPTED FOR FURTHER PROCESSING
          3 NOT REJECTED

TOTAL PERSONS FOUND            3
TOTAL PERSONS SELECTED         1
```

5 ADD

- Function 26
- Syntax 1 - ADD Statement without GIVING Clause 26
- Syntax 2 - ADD Statement with GIVING Clause 27
- Example 29

Related Statements: COMPRESS | COMPUTE | DIVIDE | EXAMINE | MOVE | MOVE ALL | MULTIPLY | RESET | SEPARATE | SUBTRACT

Belongs to Function Group: ***Arithmetic and Data Movement Operations***

Function

The ADD statement is used to add two or more operands.

This statements has two different syntax structures.

Notes:

1. At the time the ADD statement is executed, each operand used in the arithmetic operation must contain a valid value.
2. For additions involving arrays, see also the section *Arithmetic Operations with Arrays*.
3. As for the formats of the operands, see also the section *Performance Considerations for Mixed Formats*.

Syntax 1 - ADD Statement without GIVING Clause

```
ADD [ROUNDED] operand1... TO operand2
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Operand Definition Table (Syntax 1):

Operand	Possible Structure						Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A		N				N	P	I	F		D	T					yes	no
operand2		S	A		M				N	P	I	F		D	T					yes	yes

Syntax Element Description:

Syntax Element	Description:
operand1	**Operand(s):** *operand1* is a summand
ROUNDED	**ROUNDED Option:** If the keyword ROUNDED is used, the result will be rounded. For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.
TO *operand2*	**Summand and Result of Summation:** *operand2* is *included* in the addition as a summand, and it receives the result of the operation.

Example:

The statement

```
ADD #A(*) TO #B(*)  is equivalent to  COMPUTE #B(*) := #A(*) + #B(*)
ADD #S    TO #R     is equivalent to  COMPUTE #R    := #S + #R
ADD #S #T TO #R     is equivalent to  COMPUTE #R    := #S + #T + #R
ADD #A(*) TO #R     is equivalent to  COMPUTE #R    := #A(*) + #R
```

Syntax 2 - ADD Statement with GIVING Clause

```
ADD [ROUNDED] operand1... GIVING operand2
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Operand Definition Table (Syntax 2):

Operand	Possible Structure						Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S	A		N				N	P	I	F		D	T				yes	no
operand2		S	A		M		A	U	N	P	I	F	B*	D	T				yes	yes

* Format B of *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description:
operand1	**Operands:** *operand1* is a summand.
ROUNDED	**ROUNDED Option:** If the keyword ROUNDED is used, the result will be rounded. For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.
GIVING *operand2*	**Result of Summation:** *operand2* is only used to receive the result of the operation. It is *not included* in the addition. **Note:** If *operand2* is defined with alphanumeric format, the result will be converted to alphanumeric.

Note: If Syntax 2 is used, the following applies: Only the (*operand1*) field(s) left of the keyword GIVING are the terms of the addition, the field right of the keyword GIVING (*operand2*) is just used to receive the result value. If just a single (*operand1*) field is supplied, the ADD operation turns into an assignment.

Example:

The statement

```
ADD #S       GIVING #R  is equivalent to  COMPUTE #R := #S
ADD #S #T    GIVING #R  is equivalent to  COMPUTE #R := #S + #T
ADD #A(*) 0  GIVING #R  is equivalent to  COMPUTE #R := #A(*) + 0
  which is a legal operation, due to the rules defined in  Arithmetic Operations
with Arrays
ADD #A(*)    GIVING #R  is equivalent to  COMPUTE #R := #A(*)
  which is an illegal operation, due to the rules defined in  Assignment Operations
with Arrays
```

Example

```
** Example 'ADDEX1': ADD
************************************************************************
DEFINE DATA LOCAL
1 #A      (P2)
1 #B      (P1.1)
1 #C      (P1)
1 #DATE   (D)
1 #ARRAY1 (P5/1:4,1:4) INIT (2,*) <5>
1 #ARRAY2 (P5/1:4,1:4) INIT (4,*) <10>
END-DEFINE
*
ADD +5 -2 -1 GIVING #A
WRITE NOTITLE 'ADD +5 -2 -1 GIVING #A' 15X '=' #A
*
ADD .231 3.6 GIVING #B
WRITE       / 'ADD .231 3.6 GIVING #B' 15X '=' #B
*
ADD ROUNDED 2.9 3.8 GIVING #C
WRITE       / 'ADD ROUNDED 2.9 3.8 GIVING #C' 8X '=' #C
*
MOVE *DATX TO #DATE
ADD 7 TO #DATE
WRITE       / 'CURRENT DATE:'     *DATX (DF=L) 13X
              'CURRENT DATE + 7:' #DATE (DF=L)
*
WRITE       / '#ARRAY1 AND #ARRAY2 BEFORE ADDITION'
            / '=' #ARRAY1 (2,*) '=' #ARRAY2 (4,*)
ADD #ARRAY1 (2,*) TO #ARRAY2 (4,*)
WRITE       / '#ARRAY1 AND #ARRAY2 AFTER ADDITION'
            / '=' #ARRAY1 (2,*) '=' #ARRAY2 (4,*)
*
END
```

Output of Program ADDEX1:

```
ADD +5 -2 -1 GIVING #A              #A:   2

ADD .231 3.6 GIVING #B              #B:  3.8

ADD ROUNDED 2.9 3.8 GIVING #C       #C:  7

CURRENT DATE: 2005-01-10            CURRENT DATE + 7: 2005-01-17

#ARRAY1 AND #ARRAY2 BEFORE ADDITION
#ARRAY1:      5      5      5      5 #ARRAY2:     10     10     10     10
```

```
#ARRAY1 AND #ARRAY2 AFTER ADDITION
#ARRAY1:       5       5       5       5 #ARRAY2:      15      15      15      15
```

6 ASSIGN

See the statement `COMPUTE`.

7 AT BREAK

- Function 34
- Syntax Description 35
- Multiple Break Levels 36
- Examples 37

Structured Mode Syntax

```
[AT] BREAK [(r)] [OF] operand1 [/n/]
  statement ...
END-BREAK
```

Reporting Mode Syntax

```
[AT] BREAK [(r)] [OF] operand1 [/n/]
           { statement              }
           { DO statement... DOEND  }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The AT BREAK statement is used to cause the execution of one or more statements whenever a change in value of a **control field** occurs. It is used in conjunction with automatic break processing and is available with the following statements: FIND, READ, HISTOGRAM, SORT, READ WORK FILE.

The automatic break processing works as follows: Immediately after a record was read by the processing loop, the control field is checked. If a value change is detected in comparison to the previous record, the statements included in the AT BREAK statement block are executed. This does not apply to the very first record in the processing loop. In addition, when the processing loop is terminated (as reading of records is complete or due to an ESCAPE BOTTOM statement), a final execution of the statements in the AT BREAK statement block is triggered.

For further information, see *Automatic Break Processing* in the *Programming Guide*.

An AT BREAK statement block is only executed if the object which contains the statement is active at the time when the break condition occurs.

It is possible to initiate a new processing loop within an AT BREAK condition. This loop must also be closed within the same AT BREAK condition.

This statement is non-procedural (that is, its execution depends on an event, not on where in a program it is located).

Natural system functions may be used in conjunction with an `AT BREAK` statement, see *Natural System Functions for Use in Processing Loops* in the *System Functions* documentation and *Example of System Functions with AT BREAK Statement* in the *Programming Guide*.

For further information, see also the section *AT BREAK Statement* in the *Programming Guide*. It covers topics such as:

- *Control Break Based on a Database Field*
- *Control Break Based on a User-Defined Variable*

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S				A	U	N	P	I	F	B	D	T	L				yes	no

Syntax Element Description:

Syntax Element	Description

(*r*)	**Reference Notation:**
	By default, the final `AT BREAK` condition (for loop termination) is always related to the outermost active processing loop initiated with a `FIND`, `READ`, `READ WORK FILE`, `HISTOGRAM` or `SORT` statement.
	
	With the notation (*r*) you can relate the final break condition of an `AT BREAK` statement to another specific currently open processing loop (that is, the loop in which the `AT BREAK` statement is located or any outer loop).
	
	Example:
	
	`...`
	`READ ...`
	`  FIND ...`
	`    FIND ...`
	`      AT BREAK ...`
	`        FIND ...`
	`        END-FIND`
	`      END-BREAK`
	`    END-FIND`
	`  END-FIND`
	`END-READ`
	`...`

Syntax Element	Description
	In this example, the final AT BREAK condition is related to the READ loop initiated in line 0120. It would be possible to have it related to one of the FIND loops initiated in line 0130 and 0140, but not to the one initiated in line 0160. If (r) is specified for a break hierarchy, it must be specified with the first AT BREAK statement and applies also to all AT BREAK statements which follow.
operand1	**Control Field:** The field used as the break control field is usually a database field. If a user-defined variable is used, it must be initialized prior to the evaluation of automatic break processing (see BEFORE BREAK PROCESSING statement). A specific occurrence of an array can also be used as a control field.
/n/	**Notation /*n*/:** The notation /n/ may be used to indicate that only the first *n* positions (counting from left to right) of the control field are to be checked for a change in value. This notation can only be used with operands of **format** A, B, N or P. A control break occurs when the value of the control field changes, or when all records in the processing loop for which the AT BREAK statement applies have been processed.
statement	**Statement(s) to be Executed at Break Condition:** In place of *statement*, you must supply one or several suitable statements, depending on the situation. For an example of a statement, see ***Examples*** below.
END-BREAK	**End of AT BREAK Statement:** The Natural reserved word END-BREAK must be used to end the AT BREAK statement.

Multiple Break Levels

Multiple AT BREAK statements may be specified within a processing loop within the same program module. If multiple BREAK statements are specified for the same processing loop, they form a hierarchy of break levels independent of whether they are specified consecutively or interspersed within other statements. The first AT BREAK statement represents the lowest control break level, and each additional AT BREAK statement represents the next higher control break level.

Every processing loop in a loop hierarchy may have its own break hierarchy attached.

Example:

<table>
<tr><th>Structured Mode:</th><th>Reporting Mode:</th></tr>
<tr><td>

```
FIND ...
   AT BREAK
   ...
   END-BREAK
   AT BREAK
   ...
   END-BREAK
   AT BREAK
   ...
   END-BREAK
END-FIND
...
```

</td><td>

```
FIND ...
   AT BREAK
      DO
      ...
      DOEND
   AT BREAK
      DO
      ...
      DOEND
...
```

</td></tr>
</table>

A change in the value of a control field in a break level causes break processing to be activated for that break level and all lower break levels, regardless of the values of the control fields for the lower break levels.

For easier program maintenance, it is recommended to specify multiple breaks consecutively.

See also ***Example 3*** below and the section *Multiple Control Break Levels* in the *Programming Guide*.

Examples

This section covers the following topics:

- Example 1 - AT BREAK
- Example 2 - AT BREAK Using /n/ Notation
- Example 3 - AT BREAK with Multiple Break Levels

For further examples of `AT BREAK`, see *Natural System Functions for Use in Processing Loops*, Examples ATBEX3 and ATBEX4.

Example 1 - AT BREAK

```
** Example 'ATBEX1S': AT BREAK (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 COUNTRY
  2 NAME
END-DEFINE
*
LIMIT 10
READ EMPLOY-VIEW BY CITY
AT BREAK OF CITY
    SKIP 1
  END-BREAK
  DISPLAY NOTITLE CITY (IS=ON) COUNTRY (IS=ON) NAME
END-READ
*
END
```

Output of Program ATBEX1S:

```
        CITY         COUNTRY         NAME
-------------------- ------- --------------------

AIKEN                USA     SENKO

AIX EN OTHE          F       GODEFROY

AJACCIO                      CANALE

ALBERTSLUND          DK      PLOUG

ALBUQUERQUE          USA     HAMMOND
                             ROLLING
                             FREEMAN
                             LINCOLN

ALFRETON             UK      GOLDBERG

ALICANTE             E       GOMEZ
```

Equivalent reporting-mode example: **ATBEX1R**.

Example 2 - AT BREAK Using /n/ Notation

```
** Example 'ATBEX2': AT BREAK (with /n/ notation)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 DEPT
  2 NAME
END-DEFINE
*
LIMIT 10
READ EMPLOY-VIEW BY DEPT STARTING FROM 'A'
AT BREAK OF DEPT /4/
    SKIP 1
  END-BREAK
  DISPLAY NOTITLE DEPT NAME
END-READ
*
END
```

Output of Program ATBEX2:

```
DEPARTMENT         NAME
   CODE
---------- --------------------

ADMA01     JENSEN
ADMA01     PETERSEN
ADMA01     MORTENSEN
ADMA01     MADSEN
ADMA01     BUHL
ADMA02     HERMANSEN
ADMA02     PLOUG
ADMA02     HANSEN

COMP01     HEURTEBISE
COMP01     TANCHOU
```

Example 3 - AT BREAK with Multiple Break Levels

```
** Example 'ATBEX5S': AT BREAK (multiple break levels) (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 DEPT
  2 NAME
  2 LEAVE-DUE
1 #LEAVE-DUE-L (N4)
END-DEFINE
```

```
*
LIMIT 5
FIND EMPLOY-VIEW WITH CITY = 'PHILADELPHIA' OR = 'PITTSBURGH'
                 SORTED BY CITY DEPT
  MOVE LEAVE-DUE TO #LEAVE-DUE-L
  DISPLAY CITY (IS=ON) DEPT (IS=ON) NAME #LEAVE-DUE-L
  /*
 AT BREAK OF DEPT
    WRITE NOTITLE /
          T*DEPT OLD(DEPT) T*#LEAVE-DUE-L SUM(#LEAVE-DUE-L) /
  END-BREAK
  AT BREAK OF CITY
    WRITE NOTITLE
          T*CITY OLD(CITY) T*#LEAVE-DUE-L SUM(#LEAVE-DUE-L) //
  END-BREAK
END-FIND
*
END
```

Output of Program ATBEX5:

```
        CITY         DEPARTMENT         NAME         #LEAVE-DUE-L
                        CODE
-------------------- ---------- -------------------- ------------

PHILADELPHIA         MGMT30     WOLF-TERROINE           11
                                MACKARNESS              27

                     MGMT30                             38

                     TECH10     BUSH                    39
                                NETTLEFOLDS             24

                     TECH10                             63

PHILADELPHIA                                           101

PITTSBURGH           MGMT10     FLETCHER                34

                     MGMT10                             34

PITTSBURGH                                              34
```

Equivalent reporting-mode example: ATBEX5R.

8 AT END OF DATA

- Function 42
- Restrictions 43
- Syntax Description 43
- Example 44

Structured Mode Syntax

```
[AT]END [OF] DATA [(r)]
  statement ...
END-ENDDATA
```

Reporting Mode Syntax

```
[AT]END [OF] DATA [(r)]
{    statement              }
{    DO statement ... DOEND }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The AT END OF DATA statement is used to specify processing to be performed when all records selected for a database processing loop have been processed.

This section covers the following topics:

- Processing
- Values of Database Fields
- Positioning
- System Functions

See also *AT START/END OF DATA Statements* in the *Programming Guide*.

Processing

This statement is non-procedural, that is, its execution depends on an event, not on where in a program it is located.

Values of Database Fields

When the `AT END OF DATA` condition for the processing loop occurs, all database fields contain the data from the last record processed.

Positioning

This statement must be specified within the same program module which contains the loop creating statement.

System Functions

Natural system functions may be used in conjunction with an `AT END OF DATA` statement as described in *Using System Functions in Processing Loops* in the *System Functions* documentation.

Restrictions

- This statement can only be used in a processing loop that has been initiated with one of the following statements: `FIND`, `READ`, `READ WORK FILE`, `HISTOGRAM` or `SORT`.
- It may be used only once per processing loop.
- It is *not* evaluated if the processing loop referenced for `END OF DATA` processing is not entered.

Syntax Description

Syntax Element	Description
`(r)`	**Reference to a Specific Processing Loop:** An `AT END OF DATA` statement may be related to a specific active processing loop by using the notation `(r)`. If this notation is not used, the `AT END OF DATA` statement will be related to the outermost active database processing loop.
`END-ENDDATA`	**End of AT END OF DATA Statement:** The Natural reserved word `END-ENDDATA` must be used to end the `AT END OF DATA` statement.

Example

```
** Example 'AEDEX1S': AT END OF DATA
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 FIRST-NAME
  2 SALARY    (1)
  2 CURR-CODE (1)
END-DEFINE
*
LIMIT 5
EMP. FIND EMPLOY-VIEW WITH CITY = 'STUTTGART'
  IF NO RECORDS FOUND
    ENTER
  END-NOREC
  DISPLAY PERSONNEL-ID NAME FIRST-NAME
          SALARY (1) CURR-CODE (1)
  /*
   AT END OF DATA
    IF *COUNTER (EMP.) = 0
      WRITE 'NO RECORDS FOUND'
      ESCAPE BOTTOM
    END-IF
    WRITE NOTITLE / 'SALARY STATISTICS:'
                  / 7X 'MAXIMUM:' MAX(SALARY(1))  CURR-CODE (1)
                  / 7X 'MINIMUM:' MIN(SALARY(1))  CURR-CODE (1)
                  / 7X 'AVERAGE:' AVER(SALARY(1)) CURR-CODE (1)
    END-ENDDATA
  /*
END-FIND
*
END
```

See also *Natural System Functions for Use in Processing Loops* in the *System Functions* documentation.

Output of Program AEDEX1S:

```
PERSONNEL         NAME                FIRST-NAME         ANNUAL   CURRENCY
   ID                                                    SALARY     CODE
--------- -------------------- -------------------- ---------- --------

11100328  BERGHAUS             ROSE                      70800 DM
11100329  BARTHEL              PETER                     42000 DM
11300313  AECKERLE             SUSANNE                   55200 DM

```

```
SALARY STATISTICS:
       MAXIMUM:      70800 DM
       MINIMUM:      42000 DM
       AVERAGE:      55680 DM
```

Equivalent reporting-mode example: **AEDEX1R**.

9 AT END OF PAGE

- Function 48
- Syntax Description 50
- Example 50

Structured Mode Syntax

```
[AT] END [OF] PAGE [(rep)]
  statement ...
END-ENDPAGE
```

Reporting Mode Syntax

```
[AT] END [OF] PAGE [(rep)]
{        statement                 }
{        DO statement ... DOEND    }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The AT END OF PAGE statement is used to specify processing that is to be performed when an end-of-page condition is detected (see session parameter PS in the *Parameter Reference*). An end-of-page condition may also occur as a result of a SKIP or NEWPAGE statement, but not as a result of an EJECT or INPUT statement.

See also the following sections in the *Programming Guide*:

- *Controlling Data Output*
- *Report Specification - (rep) Notation*
- *Layout of an Output Page*
- *AT END OF PAGE Statement*

Processing

An AT END OF PAGE statement block is only executed if the object which contains the statement block is active at the time when the end-of-page condition occurs.

An AT END OF PAGE statement must not be placed within an inline subroutine.

This statement is non-procedural, that is, its execution depends on an event, not on where in a program it is located.

Logical Page Size

The end-of-page check is performed after the processing of a DISPLAY or WRITE statement is completed. Therefore, if a DISPLAY or WRITE statement produces multiple lines of output, overflow of the physical page may occur before an end-of-page condition is detected.

A logical page size (session parameter PS) which is less than the physical page size must be specified to ensure that information printed by an AT END OF PAGE statement appears on the same physical page as the title.

Last-Page Handling

Within a main program, an end-of-page condition is activated when the execution of the main program terminates via ESCAPE, STOP or END.

Within a subroutine, an end-of-page condition is not activated when the execution of the subroutine terminates via ESCAPE-ROUTINE, RETURN or END-SUBROUTINE.

System Functions

Natural system functions may be used in conjunction with an AT END OF PAGE statement as described in the section *Using System Functions in Processing Loops* in the *System Functions* documentation.

If a system function is to be used within an AT END OF PAGE statement block, the GIVE SYSTEM FUNCTIONS clause must be specified in the corresponding DISPLAY statement.

INPUT Statement with AT END OF PAGE

If an `INPUT` statement is specified within an `AT END OF PAGE` statement block, no new page operation is performed. The page size (session parameter `PS`) must be reduced to a value that allows the lines created by the `INPUT` statement to appear on the same physical page.

See also:

- *Split Screen Feature* of `INPUT` Statement
- *Example 2 - AT END OF PAGE with INPUT Statement*

Syntax Description

Syntax Element	Description
(*rep*)	**Report Specification:** The notation `(rep)` may be used to specify the identification of the report for which the `AT END OF PAGE` statement is applicable. A value in the range `0 - 31` or a logical name which has been assigned using the `DEFINE PRINTER` statement may be specified. If `(rep)` is not specified, the `AT END OF PAGE` statement will apply to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* in the *Programming Guide*.
`END-ENDPAGE`	**End of AT END OF PAGE Statement:** The Natural reserved word `END-ENDPAGE` must be used to end the `AT END OF PAGE` statement.

Example

- Example 1 - AT END OF PAGE

- Example 2 - AT END OF PAGE with INPUT Statement

Example 1 - AT END OF PAGE

```
** Example 'AEPEX1S': AT END OF PAGE (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID

10 AT START OF DATA

- Function ... 56
- Syntax Description ... 57
- Example ... 57

Structured Mode Syntax

```
[AT] START [OF] DATA [(r)]
  statement ...
END-START
```

Reporting Mode Syntax

```
[AT] START [OF] DATA  [(r)]
{        statement                }
{        DO statement...  DOEND   }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The statement AT START OF DATA is used to perform processing immediately after the first of a set of records is read for a processing loop that has been initiated by one of the following statements: READ, FIND, HISTOGRAM, SORT or READ WORK FILE.

See also *AT START/END OF DATA Statements* in the *Programming Guide*.

Processing

If the loop-initiating statement contains a WHERE clause, the at-start-of-data condition will be true when the first record is read which meets both the basic search and the WHERE criteria.

This statement is non-procedural, that is, its execution depends on an event, not on where in a program it is located.

Value of Database Fields

All database fields contain the values of the record which caused the at-start-of-data condition to be true (that is, the first record of the set of records to be processed).

Positioning

This statement must be positioned *within* a processing loop, and it may be used only once per processing loop.

Syntax Description

Syntax Element	Description
(*r*)	**Reference to a Specific Processing Loop:** An `AT START OF DATA` statement may be related to a specific outer active processing loop by using the notation `(r)`. If this notation is not used, the statement is related to the outermost active processing loop.
`END-START`	**End of AT START OF DATA Statement:** The Natural reserved word `END-START` must be used to end the `AT START OF DATA` statement.

Example

```
** Example 'ASDEX1S': AT START OF DATA (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 CITY
*
1 #CNTL (A1)  INIT <' '>
1 #CITY (A20) INIT <' '>
END-DEFINE
*
REPEAT
  INPUT 'ENTER VALUE FOR CITY'  #CITY
  IF #CITY = ' ' OR = 'END'
    STOP
  END-IF
  FIND EMPLOY-VIEW WITH CITY = #CITY
    IF NO RECORDS FOUND
      WRITE NOTITLE NOHDR 'NO RECORDS FOUND'
```

```
      ESCAPE BOTTOM
    END-NOREC
    /*
   AT START OF DATA
      INPUT (AD=O) 'RECORDS FOUND' *NUMBER //
                   'ENTER ''D'' TO DISPLAY RECORDS' #CNTL (AD=A)
      IF #CNTL NE 'D'
        ESCAPE BOTTOM
      END-IF
    END-START
    /*
    DISPLAY NAME FIRST-NAME
  END-FIND
END-REPEAT
END
```

Output of Program ASDEX1S:

```
ENTER VALUE FOR CITY PARIS
```

After entering and confirming name of city:

```
RECORDS FOUND        26

ENTER 'D' TO DISPLAY RECORDS D
```

Records displayed:

```
        NAME              FIRST-NAME
-------------------- --------------------

11 AT TOP OF PAGE

- Function 62
- Restriction 63
- Syntax Description 63
- Example 64

Structured Mode Syntax

```
[AT] TOP [OF] PAGE [(rep)]
  statement ...
END-TOPPAGE
```

Reporting Mode Syntax

```
[AT] TOP [OF] PAGE [(rep)]
        { statement                  }
        { DO statement ... DOEND     }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The statement AT TOP OF PAGE is used to specify processing which is to be performed when a new page is started.

See also the following sections in the *Programming Guide*:

- *Controlling Data Output*
- *Report Specification - (rep) Notation*
- *Layout of an Output Page*
- *AT TOP OF PAGE Statement*

Processing

A new page is started when the internal line counter exceeds the page size set with the session parameter PS (page size for Natural reports), or when a NEWPAGE statement is executed. Either of these events cause a top-of-page condition to be true. An EJECT statement causes a new page to be started but does not cause a top-of-page condition.

An AT TOP OF PAGE statement block is only executed when the object which contains the statement is active at the time when the top-of-page condition occurs.

Any output created as a result of AT TOP OF PAGE processing will appear following the title line with an intervening blank line.

This statement is non-procedural, that is, its execution depends on an event, not on where in a program it is located.

Restriction

An AT TOP OF PAGE statement must not be placed within an inline subroutine.

Syntax Description

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the AT TOP OF PAGE statement is applicable. A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified. If (*rep*) is not specified, the AT TOP OF PAGE statement applies to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* in the *Programming Guide*.
END-TOPPAGE	**End of AT TOP OF PAGE Statement:** The Natural reserved word END-TOPPAGE must be used to end the AT TOP OF PAGE statement.

Example

```
** Example 'ATPEX1S': AT TOP OF PAGE (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 CITY
  2 DEPT

Equivalent reporting-mode example: **ATPEX1R**.

12 BACKOUT TRANSACTION

- Function 68
- Restriction 69
- Database-Specific Considerations 69
- Example 69

```
BACKOUT [TRANSACTION]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The BACKOUT TRANSACTION statement is used to back out all database updates performed during the current logical transaction. This statement also releases all records held during the transaction.

The statement is executed only if a database transaction under control of Natural has taken place. For which databases the statement is executed depends on the setting of the profile parameter ET (execution of END/BACKOUT TRANSACTION statements):

- If ET=OFF, the statement is executed only for the database affected by the transaction.
- If ET=ON, the statement is executed for all databases that have been referenced since the last execution of a BACKOUT TRANSACTION or END TRANSACTION statement.

Backout Transaction Issued by Natural

If the user interrupts the current Natural operation with a terminal command (command %% or CLEAR key), Natural issues a BACKOUT TRANSACTION statement.

See also the terminal command %% in the *Terminal Commands* documentation.

Additional Information

For additional information on the use of the transaction backout feature, see the sections *Database Update - Transaction Processing* and *Backing Out a Transaction* in the *Programming Guide*.

Restriction

This statement is not available with Entire System Server.

Database-Specific Considerations

SQL Databases	As most SQL databases close all cursors when a logical unit of work ends, a BACKOUT TRANSACTION statement must not be placed within a database modification loop; instead, it has to be placed after such a loop.
XML Databases	A BACKOUT TRANSACTION statement must not be placed within a database modification loop; instead, it has to be placed after such a loop.

Example

```
** Example 'BOTEX1': BACKOUT TRANSACTION
**
** CAUTION: Executing this example will modify the database records!
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME

  VALUE 'NO'
    BACKOUT TRANSACTION
  NONE
    REINPUT 'PLEASE ENTER YES OR NO'
END-DECIDE
*
END
```

Output of Program BOTEX1:

```
DEPARTMENT TO BE UPDATED: MGMT30
```

Result for department `MGMT30`:

```
NAME:        POREE
LEAVE DUE:   45
LEAVE TAKEN: 31
```

Confirmation query:

```
UPDATE TO BE PERFORMED  YES/NO: NO
```

13 BEFORE BREAK PROCESSING

- Function 72
- Restrictions 73
- Syntax Description 73
- Example 74

Structured Mode Syntax

```
BEFORE [BREAK] [PROCESSING]
  statement ...
END-BEFORE
```

Reporting Mode Syntax

```
[BEFORE [BREAK] [PROCESSING]
{         statement                }
{         DO statement ... DOEND   }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The BEFORE BREAK PROCESSING statement may be used in conjunction with automatic break processing to perform processing:

- before the value of the break control field is checked;
- before the statements specified with an AT BREAK statement are executed;
- before Natural system functions are evaluated.

This statement is most often used to initialize or compute values of user-defined variables which are to be used in break processing (see AT BREAK statement).

This statement is non-procedural (that is, its execution depends on an event, not on where in a program it is located).

See also the following sections in the *Programming Guide*:

- *Control Breaks*
- *BEFORE BREAK PROCESSING Statement*
- *Example of BEFORE BREAK PROCESSING Statement*

Restrictions

- The BEFORE BREAK PROCESSING statement may only be used with a processing loop that has been initiated with one of the following statements:
  - FIND
  - READ
  - HISTOGRAM
  - SORT
  - READ WORK FILE

  It may be placed anywhere within the processing loop and is always related to the processing loop in which it is contained. Only one BEFORE BREAK PROCESSING statement may be specified per processing loop.
- The BEFORE BREAK PROCESSING statement must not be used in conjunction with the statement PERFORM BREAK PROCESSING.

Syntax Description

Syntax Element	Description
statement...	**Statement(s) for Break Processing:** In place of *statement*, you must supply one or several suitable statements, depending on the situation. For an example of a statement, see ***Example*** below. If no break processing is to be performed (that is, no AT BREAK statement is specified for the processing loop), any statements specified with a BEFORE BREAK PROCESSING statement will *not* be executed.
END-BEFORE	**End of BEFORE BREAK PROCESSING Statement:** In structured mode, the Natural reserved word END-BEFORE must be used to end the BEFORE BREAK PROCESSING statement.

Example

```
** Example 'BBPEX1': BEFORE BREAK PROCESSING
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 NAME
  2 SALARY (1)
  2 BONUS  (1,1)
*
1 #INCOME  (P11)
END-DEFINE
*
LIMIT 7
READ EMPLOY-VIEW BY CITY = 'L'
  /*
 BEFORE BREAK PROCESSING
    COMPUTE #INCOME = SALARY (1) + BONUS (1,1)
  END-BEFORE
  /*
  AT BREAK OF CITY
    WRITE NOTITLE  'AVERAGE INCOME FOR' OLD (CITY) 20X AVER(#INCOME) /
  END-BREAK
  /*
  DISPLAY CITY 'NAME' NAME 'SALARY' SALARY (1) 'BONUS' BONUS (1,1)
END-READ
END
```

Output of Program BBPEX1:

```
        CITY                 NAME             SALARY     BONUS
-------------------- -------------------- ---------- ----------

LA BASSEE            HULOT                    165000      70000
AVERAGE INCOME FOR LA BASSEE                                   235000

LA CHAPELLE ST LUC   GUILLARD                 124100      23000
LA CHAPELLE ST LUC   BERGE                    198500      50000
LA CHAPELLE ST LUC   POLETTE                  124090      23000
LA CHAPELLE ST LUC   DELAUNEY                 115000      23000
LA CHAPELLE ST LUC   SCHECK                   125600      23000
LA CHAPELLE ST LUC   KREEBS                   184550      50000
AVERAGE INCOME FOR LA CHAPELLE ST LUC                          177306
```

14 CALL

- Function 76
- Syntax Description 76
- Return Code 77
- User Exits 77
- INTERFACE4 82

`CALL [INTERFACE4] operand1 [USING] [operand2] ... 128`

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `CALL FILE` | `CALL LOOP` | `CALLNAT` | `DEFINE SUBROUTINE` | `ESCAPE` | `FETCH` | `PERFORM`

Belongs to Function Group: ***Invoking Programs and Routines***

Function

The `CALL` statement is used to call an external program or function written in another standard programming language from a Natural program and then return to the next statement after the `CALL` statement.

The called program or function may be written in any programming language which supports a standard `CALL` interface. Multiple `CALL` statements to one or more external program or functions may be specified.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no
operand2	C	S	A	G		A	U	N	P	I	F	B	D	T	L	C	G		yes	yes

Syntax Element Description:

Syntax Element	Description
`INTERFACE4`	**Interface Usage:** The optional keyword `INTERFACE4` specifies the type of the interface that is used for the call of the external program. See the section ***INTERFACE4*** below.
operand1	**Name of Called Function:** The name of the function to be called (*operand1*) can be specified as a constant or - if different functions are to be called dependent on program logic - as an alphanumeric variable of length 1 to 8. A function name must be placed left-justified in the variable.

Syntax Element	Description
[USING] *operand2*	**Parameters to be Passed:** The CALL statement may contain up to 128 parameters (*operand2*). One address is passed in the parameter list for each parameter field specified. If a group name is used, the group is converted to individual fields; that is, if a user wishes to specify the beginning address of a group, the first field of the group must be specified. **Note:** If an application-independent variable (AIV) or context variable is passed as a parameter to a user exit, the following restriction applies: if the user exit invokes a Natural subprogram which creates a new AIV or context variable, the parameter is invalid after the return from the subprogram. This is true regardless of whether the new AIV/context variable is created by the subprogram itself or by another object invoked directly or indirectly by the subprogram.

Return Code

The condition code of any called function may be obtained by using the Natural system function RET (Return Code Function).

Example:

```
...
RESET #RETURN(B4)
CALL 'PROG1'
IF RET ('PROG1') > #RETURN
  WRITE 'ERROR OCCURRED IN PROGRAM1'
END-IF
...
```

User Exits

User exits are needed to make external functions available and to access operating-system interfaces that are not available to Natural.

The user exits can be placed either in a shared library and thus linked dynamically, or in a library that is linked statically to the Natural nucleus.

If they are placed in shared libraries, it is not necessary to relink Natural whenever a user exit is modified. This makes the development and testing of user exits a lot easier. This feature is available under all operating systems that support shared libraries. Under all operating systems, it is possible

to place user exits in a library that is linked to the Natural nucleus; that is, to statically link the user exits with the Natural prelinked object *natraw.o*.

A user exit is added to Natural in three steps:

1. A jump table has to be created that allows Natural to associate the name of a function invoked by a `CALL` statement with the address of the function.
2. The functions that were put into the jump table must be written.
3. In the case of a dynamic link, the shared library that contains the user exits has to be rebuilt. In the case of a static link, the jump table and the external functions must be linked together with the prelinked Natural nucleus, to produce an executable Natural nucleus that supports the external functions.

The following topics are covered below:

- Step 1 - Defining the Jump Table
- Step 2 - Writing the External Functions
- Step 3 - Compiling and Linking
- How to Build a Shared Library
- Using the Shared Library
- How to Generate a Static Nucleus
- Example Programs

Step 1 - Defining the Jump Table

A sample of a jump table - *jumptab.c* - can be found in the directory:

$NATDIR/$NATVERS/samples/sysexuex

Step 2 - Writing the External Functions

Each function has three parameters and returns a long integer. A function prototype should be as follows:

```
NATFCT myadd  (nparm, parmptr, parmdec)

WORD  nparm;
BYTE  **parmptr;
FINFO  *parmdec;
```

nparm	16 bit unsigned short value, containing the total number of transferred operands (operand2).
parmptr	Array of pointers, pointing to the transferred operands.
parmdec	Array of field information for each transferred operand.

The data type FINFO is defined as follows:

```
typedef struct {
  unsigned char     TypeVar;      /* type of variable                          */
  unsigned char     pb2;          /* if type == ('D', 'N', 'P' or 'T') ==>  */
                                  /*    total num of digits                    */
                                  /* else                                      */
  union {                         /*    unused                                 */
    unsigned char   pb[2];        /* if type == ('D', 'N', 'P' or 'T') ==>  */
    unsigned short  lfield;       /*    pb[0] = #dig before.dec.point          */
  } flen;                         /*    pb[1] = #dig  after.dec.point          */
                                  /* else                                      */
                                  /*    lfield = length of field               */
} FINFO;
```

Next, the module containing the external functions must be written. A sample function - *mycadd.c* - can be found in the directory:

$NATDIR/$NATVERS/samples/sysexuex

Step 3 - Compiling and Linking

The file *natuser.h*, which is included by the sample program, is delivered with Natural. It contains declarations for the data types BYTE, WORD and the FINFO structure, that is, the description of the internal representation of each passed parameter.

- In the case of dynamically linked user exits, the shared library containing the user exits has to be rebuilt.
- In the case of statically linked user exits, the Natural nucleus has to be relinked.

For these purposes, it is strongly recommended to use the sample makefiles supplied by Software AG, as they already contain the necessary compiler and linker parameters. The sample makefiles can be found in the directory:

$NATDIR/$NATVERS/samples/sysexuex

For further information, see the following sections and the explanations in the makefiles themselves.

How to Build a Shared Library

1. From the example directory, which is contained in *$NATDIR/$NATVERS/samples/sysexuex*, copy the following files into your work directory:
   - *Makedyn*
   - *jumptab.c*
   - *ncuxinit.c*
2. Copy the C source files which contain your user exits into the same work directory.
3. Edit the file *jumptab.c* to include the names and function pointers for your user exits. To do so, you add in Section 2 the external declarations of your user exits, and in Section 3 you add the name/function-pointer pairs for your user exits. You might consider cutting and pasting the appropriate sections from your pre-2.2 version of *jumptab.c*.
4. Edit the makefile as follows:
   - Specify the names of the object files containing the user exits in the following line:

     ```
     USEROBJS =
     ```

   - Specify the name of the resulting shared library in the following line:

     ```
     USERLIB =
     ```

   - If you need to include private header files, specify the directories containing them in the following line:

     ```
     INCDIR =
     ```

5. To remove all unneeded files, issue the command:

   ```
   make -f Makedyn clean
   ```

6. To compile and link your shared library, issue the command:

   ```
   make -f Makedyn lib
   ```

Using the Shared Library

Set the environment variable `NATUSER` to the libraries you want to use. For example:

```
setenv NATUSER $NATDIR/$NATVERS/bin/library-name
```

You must specify a full qualified path name for the shared library.

You can specify more than one path if you delimit them with a colon (:) similar to the UNIX `PATH` variable.

Note: The libraries are searched in the order in which they are specified in `NATUSER`. This means that if two libraries contain a function of the same name, Natural always calls the function in the library which is specified first in `NATUSER`.

Example:

See the sample user exit function in *$NATDIR/$NATVERS/samples/sysexuex*.

How to Generate a Static Nucleus

1. From the example directory, which is contained in *$NATDIR/$NATVERS/samples/sysexuex*, copy the following files into your work directory:
   - *Makefile*
   - *jumptab.c*
2. Copy the C source files which contain your user exits into the same work directory.
3. Edit the file *jumptab.c* to include the names and function pointers for your user exits. To do so, you add in Section 2 the external declarations of your user exits, and in Section 3 you add the name/function-pointer pairs for your user exits. You might consider cutting and pasting the appropriate sections from your pre-2.2 version of *jumptab.c*.
4. Edit the makefile as follows:
   - Specify the names of the object files containing the user exits in the following line:

     ```
     USEROBJS =
     ```

- If you need to include private header files, specify the directories containing them in the following line:

```
INCDIR =
```

5. Issue the command `make` to get information about further processing options.

Example:

See the sample user exit function in *$NATDIR/$NATVERS/samples/sysexuex*.

Example Programs

After successful compilation and linking, the external programs can be invoked from a Natural program. Corresponding Natural example programs are provided in the library `SYSEXUEX`.

INTERFACE4

The keyword `INTERFACE4` specifies the type of the interface that is used for the call of the external program. This keyword is optional. If this keyword is specified, the interface, which is defined as `INTERFACE4`, is used for the call of the external program.

The following table lists the differences between the `CALL` statement used with `INTERFACE4` and the one used without `INTERFACE4`:

	CALL statement without keyword INTERFACE4	CALL statement with keyword INTERFACE4
Number of parameters possible	128	32767
Maximum data size of one parameter	65535	1 GB
Retrieve array information	no	yes
Support of large and dynamic operands	no	yes
Parameter access via API	no	yes

The following topics are covered below:

- INTERFACE4 - External 3GL Program Interface
- Operand Structure for INTERFACE4
- INTERFACE4 - Parameter Access

- Exported Functions

INTERFACE4 - External 3GL Program Interface

The interface of the external 3GL program is defined as follows, when `INTERFACE4` is specified with the Natural `CALL` statement:

```
NATFCT functionname (numparm, parmhandle, traditional)
```

`USR_WORD`	`numparm;`	16 bit unsigned short value, containing the total number of transferred operands (*operand2*).
`void`	`*parmhandle;`	Pointer to the parameter passing structure.
`void`	`*traditional;`	Check for interface type (if it is not a `NULL` pointer it is the traditional `CALL` interface).

Operand Structure for INTERFACE4

The operand structure of `INTERFACE4` is named `parameter_description` and is defined as follows. The structure is delivered with the header file *natuser.h*.

`struct parameter_description`			
`void *`	`address`	Address of the parameter data, not aligned, `realloc()` and `free()` are not allowed.	
`int`	`format`	Field data format: `NCXR_TYPE_ALPHA`, etc. (*natuser.h*).	
`int`	`length`	Length (before decimal point, if applicable).	
`int`	`precision`	Length after decimal point (if applicable).	
`int`	`byte_length`	Length of field in bytes int dimension number of dimensions (`0` to `IF4_MAX_DIM`).	
`int`	`dimensions`	Number of dimensions (`0` to `IF4_MAX_DIM`).	
`int`	`length_all`	Total data length of array in bytes.	
`int`	`flags`	Several flag bits combined by bitwise `OR` operation, meaning:	
		`IF4_FLG_PROTECTED`:	The parameter is write protected.
		`IF4_FLG_DYNAMIC`:	The parameter is a dynamic variable.
		`IF4_FLG_NOT_CONTIGUOUS`:	The array elements are not contiguous (have spaces between them).
		`IF4_FLG_AIV`:	The parameter is an application-independent variable.
		`IF4_FLG_DYNVAR`:	The parameter is a dynamic variable.

		`IF4_FLG_XARRAY`:	The parameter is an X-array.
		`IF4_FLG_LBVAR_0`:	The lower bound of dimension 0 is variable.
		`IF4_FLG_UBVAR_0`:	The upper bound of dimension 0 is variable.
		`IF4_FLG_LBVAR_1`:	The lower bound of dimension 1 is variable.
		`IF4_FLG_UBVAR_1`:	The upper bound of dimension 1 is variable.
		`IF4_FLG_LBVAR_2`:	The lower bound of dimension 2 is variable.
		`IF4_FLG_UBVAR_2`:	The upper bound of dimension 2 is variable.
`int`	`occurrences[IF4_MAX_DIM]`	Array occurrences in each dimension.	
`int`	`indexfactors[IF4_MAX_DIM]`	Array indexfactors for each dimension.	
`void *`	`dynp`	Reserved for internal use.	
`void *`	`pops`	Reserved for internal use.	

The address element is null for arrays of dynamic variables and for X-arrays. In these cases, the array data cannot be accessed as a whole, but must be accessed through the parameter access functions described below.

For arrays with fixed bounds of variables with fixed length, the array contents can be accessed directly using the address element. In these cases the address of an array element (i,j,k) is computed as follows (especially if the array elements are not contiguous):

```
elementaddress = address + i * indexfactors[0] + j * indexfactors[1] + k *
indexfactors[2]
```

If the array has less than 3 dimensions, leave out the last terms.

INTERFACE4 - Parameter Access

A set of functions is available to be used for the access of the parameters. The process flow is as follows:

- The 3GL program is called via the `CALL` statement with the `INTERFACE4` option, and the parameters are passed to the 3GL program as described above.
- The 3GL program can now use the exported functions of Natural, to retrieve either the parameter data itself, or information about the parameter, such as format, length, array information, etc.
- The **exported functions** can also be used to pass back parameter data.

There are also functions to create and initialize a new parameter set in order to call arbitrary subprograms from a 3GL program. With this technique a parameter access is guaranteed to avoid

memory overwrites done by the 3GL program. (Natural's data is safe: memory overwrites within the 3GL program's data are still possible).

Exported Functions

The following topics are covered below:

- Get Parameter Information
- Get Parameter Data
- Write Back Operand Data
- Create, Initialize and Delete a Parameter Set
- Create Parameter Set
- Delete Parameter Set
- Initialize a Scalar of a Static Data Type
- Initialize an Array of a Static Data Type
- Initialize a Scalar of a Dynamic Data Type
- Initialize an Array of a Dynamic Data Type
- Resize an X-array Parameter

Get Parameter Information

This function is used by the 3GL program to receive all necessary information from any parameter. This information is returned in the `struct parameter_description`, which is documented **above**.

Prototype:

```
int ncxr_get_parm_info ( int parmnum, void *parmhandle, struct parameter_description
*descr );
```

Parameter Description:

<table>
<tr><td>parmnum</td><td colspan="2">Ordinal number of the parameter. This identifies the parameter of the passed parameter list. Range: 0 ... numparm-1.</td></tr>
<tr><td>parmhandle</td><td colspan="2">Pointer to the internal parameter structure</td></tr>
<tr><td>descr</td><td colspan="2">Address of a struct parameter_description</td></tr>
<tr><td rowspan="5">return</td><td>Return Value:</td><td>Information:</td></tr>
<tr><td>0</td><td>OK</td></tr>
<tr><td>-1</td><td>Illegal parameter number.</td></tr>
<tr><td>-2</td><td>Internal error.</td></tr>
<tr><td>-7</td><td>Interface version conflict.</td></tr>
</table>

Get Parameter Data

This function is used by the 3GL program to get the data from any parameter.

Natural identifies the parameter by the given parameter number and writes the parameter data to the given buffer address with the given buffer size.

If the parameter data is longer than the given buffer size, Natural will truncate the data to the given length. The external 3GL program can make use of the function `ncxr_get_parm_info`, to request the length of the parameter data.

There are two functions to get parameter data: `ncxr_get_parm` gets the whole parameter (even if the parameter is an array), whereas `ncxr_get_parm_array` gets the specified array element.

If no memory of the indicated size is allocated for "buffer" by the 3GL program (dynamically or statically), results of the operation are unpredictable. Natural will only check for a null pointer.

If data gets truncated for variables of the type I2/I4/F4/F8 (buffer length not equal to the total parameter length), the results depend on the machine type (little endian/big endian). In some applications, the user exit must be programmed to use no static data to make recursion possible.

Prototypes:

```
int ncxr_get_parm( int parmnum, void *parmhandle, int buffer_length, void *buffer )

int ncxr_get_parm_array( int parmnum, void *parmhandle, int buffer_length, void
*buffer, int *indexes )
```

This function is identical to `ncxr_get_parm`, except that the indexes for each dimension can be specified. The indexes for unused dimensions should be specified as `0`.

Parameter Description:

parmnum	Ordinal number of the parameter. This identifies the parameter of the passed parameter list. Range: `0 ... numparm-1`.	
parmhandle	Pointer to the internal parameter structure	
buffer_length	Length of the buffer, where the requested data has to be written to	
buffer	Address of buffer, where the requested data has to be written to. This buffer should be aligned to allow easy access to I2/I4/F4/F8 variables.	
indexes	Array with index information	
return	Return Value:	Information:
	< 0	Error during retrieval of the information:
	-1	Illegal parameter number.
	-2	Internal error.

	-3	Data has been truncated.
	-4	Data is not an array.
	-7	Interface version conflict.
	-100	Index for dimension 0 is out of range.
	-101	Index for dimension 1 is out of range.
	-102	Index for dimension 2 is out of range.
	0	Successful operation.
	> 0	Successful operation, but the data was only this number of bytes long (buffer was longer than the data).

Write Back Operand Data

These functions are used by the 3GL program to write back the data to any parameter. Natural identifies the parameter by the given parameter number and writes the parameter data from the given buffer address with the given buffer size to the parameter data. If the parameter data is shorter than the given buffer size, the data will be truncated to the parameters data length, that is, the rest of the buffer will be ignored. If the parameter data is longer than the given buffer size, the data will be copied only to the given buffer length, the rest of the parameter stays untouched. This applies to arrays in the same way. For dynamic variables as parameters, the parameter is resized to the given buffer length.

If data gets truncated for variables of the type I2/I4/F4/F8 (buffer length not equal to the total parameter length), the results depend on the machine type (little endian/big endian). In some applications, the user exit must be programmed to use no static data to make recursion possible.

Prototypes:

```
int ncxr_put_parm        ( int parmnum, void *parmhandle,
                             int buffer_length, void *buffer );
int ncxr_put_parm_array  ( int parmnum, void *parmhandle,
                            int buffer_length, void *buffer,
                           int *indexes );
```

Parameter Description:

parmnum	Ordinal number of the parameter. This identifies the parameter of the passed parameter list. Range: 0 ... numparm-1.	
parmhandle	Pointer to the internal parameter structure.	
buffer_length	Length of the data to be copied back to the address of buffer, where the data comes from.	
indexes	Index information	
return	Return Value:	Information:
	< 0	Error during copying of the information:

	-1	Illegal parameter number.
	-2	Internal error.
	-3	Too much data has been given. The copy back was done with parameter length.
	-4	Parameter is not an array.
	-5	Parameter is protected (constant or AD=0).
	-6	Dynamic variable could not be resized due to an "out of memory" condition.
	-7	Interface version conflict.
	-13	The given buffer includes an incomplete Unicode character.
	-100	Index for dimension 0 is out of range.
	-101	Index for dimension 1 is out of range.
	-102	Index for dimension 2 is out of range.
	0	Successful operation.
	> 0	Successful operation., but the parameter was this number of bytes long (length of parameter greater than given length).

Create, Initialize and Delete a Parameter Set

If a 3GL program wants to call a Natural subprogram, it needs to build a parameter set that corresponds to the parameters the subprogram expects. The function ncxr_create_parm is used to create a set of parameters to be passed with a call to ncxr_if_callnat. The set of parameters created is represented by an opaque parameter handle, like the parameter set that is passed to the 3GL program with the CALL INTERFACE4 statement. Thus, the newly created parameter set can be manipulated with functions ncxr_put_parm* and ncxr_get_parm* as described above.

The newly created parameter set is not yet initialized after having called the function ncxr_create_parm. An individual parameter is initialized to a specific data type by a set of ncxr_parm_init* functions described below. The functions ncxr_put_parm* and ncxr_get_parm* are then used to access the contents of each individual parameter. After the caller has finished with the parameter set, they must delete the parameter handle. Thus, a typical sequence in creating and using a set of parameters for a subprogram to be called through ncxr_if4_callnat will be:

```
ncxr_create_parm
ncxr_init_ parm*
ncxr_init_ parm*
...
ncxr_put_ parm*
ncxr_put_ parm*
...
ncxr_get_parm_info*
ncxr_get_parm_info*
...
```

```
ncxr_if4_callnat
...
ncxr_get_parm_info*
ncxr_get_parm_info*
...
ncxr_get_ parm*
ncxr_get_ parm*
...
ncxr_delete_parm
```

Create Parameter Set

The function `ncxr_create_parm` is used to create a set of parameters to be passed with a call to `ncxr_if_callnat`.

Prototype:

```
int ncxr_create_parm( int parmnum, void** pparmhandle )
```

Parameter Description:

<table>
<tr><td>parmnum</td><td colspan="2">Number of parameters to be created.</td></tr>
<tr><td>pparmhandle</td><td colspan="2">Pointer to the created parameter handle.</td></tr>
<tr><td rowspan="6">return</td><td>Return Value:</td><td>Information:</td></tr>
<tr><td>< 0</td><td>Error:</td></tr>
<tr><td>-1</td><td>Illegal parameter count.</td></tr>
<tr><td>-2</td><td>Internal error.</td></tr>
<tr><td>-6</td><td>Out of memory condition.</td></tr>
<tr><td>0</td><td>Successful operation.</td></tr>
</table>

Delete Parameter Set

The function `ncxr_delete_parm` is used to delete a set of parameters that was created with `ncxr_create_parm`.

Prototype:

```
int ncxr_delete_parm( void* parmhandle )
```

Parameter Description:

parmhandle	Pointer to the parameter handle to be deleted.	
return	Return Value:	Information:
	< 0	Error:
	-2	Internal error.
	0	Successful operation.

Initialize a Scalar of a Static Data Type

Prototype:

```
int ncxr_init_parm_s( int parmnum, void *parmhandle,
    char format, int length, int precision, int flags );
```

Parameter Description:

parmnum	Ordinal number of the parameter. This identifies the parameter in the passed parameter list. Range: 0 ... numparm-1.	
parmhandle	Pointer to the parameter handle.	
format	Format of the parameter.	
length	Length of the parameter.	
precision	Precision of the parameter.	
flags	IF4_FLG_PROTECTED	
return	Return Value:	Information:
	< 0	Error:
	-1	Invalid parameter number.
	-2	Internal error.
	-6	Out of memory condition.
	-8	Invalid format.
	-9	Invalid length or precision.
	0	Successful operation.

Initialize an Array of a Static Data Type

Prototype:

```
int ncxr_init_parm_sa( int parmnum, void *parmhandle,
    char format, int length, int precision,
    int dim, int *occ, int flags );
```

Parameter Description:

<table>
<tr><td>parmnum</td><td colspan="2">Ordinal number of the parameter. This identifies the parameter in the passed parameter list.
Range: 0 ... numparm-1.</td></tr>
<tr><td>parmhandle</td><td colspan="2">Pointer to the parameter handle.</td></tr>
<tr><td>format</td><td colspan="2">Format of the parameter.</td></tr>
<tr><td>length</td><td colspan="2">Length of the parameter.</td></tr>
<tr><td>precision</td><td colspan="2">Precision of the parameter.</td></tr>
<tr><td>dim</td><td colspan="2">Dimension of the array.</td></tr>
<tr><td>occ</td><td colspan="2">Number of occurrences per dimension.</td></tr>
<tr><td>flags</td><td colspan="2">A combination of the flags

IF4_FLG_PROTECTED
IF4_FLG_LBVAR_0
IF4_FLG_UBVAR_0
IF4_FLG_LBVAR_1
IF4_FLG_UBVAR_1
IF4_FLG_LBVAR_2
IF4_FLG_UBVAR_2</td></tr>
<tr><td rowspan="10">return</td><td>Return Value:</td><td>Information:</td></tr>
<tr><td>< 0</td><td>Error:</td></tr>
<tr><td>-1</td><td>Invalid parameter number.</td></tr>
<tr><td>-2</td><td>Internal error.</td></tr>
<tr><td>-6</td><td>Out of memory condition.</td></tr>
<tr><td>-8</td><td>Invalid format.</td></tr>
<tr><td>-9</td><td>Invalid length or precision.</td></tr>
<tr><td>-10</td><td>Invalid dimension count.</td></tr>
<tr><td>-11</td><td>Invalid combination of variable bounds.</td></tr>
<tr><td>0</td><td>Successful operation.</td></tr>
</table>

Initialize a Scalar of a Dynamic Data Type

Prototype:

```
int ncxr_init_parm_d( int parmnum, void *parmhandle,
    char format, int flags );
```

Parameter Description:

parmnum	Ordinal number of the parameter. This identifies the parameter in the passed parameter list. Range: 0 ... numparm-1.	
parmhandle	Pointer to the parameter handle.	
format	Format of the parameter.	
flags	IF4_FLG_PROTECTED	
return	Return Value:	Information:
	< 0	Error:
	-1	Invalid parameter number.
	-2	Internal error.
	-6	Out of memory condition.
	-8	Invalid format.
	0	Successful operation.

Initialize an Array of a Dynamic Data Type

Prototype:

```
int ncxr_init_parm_da( int parmnum, void *parmhandle,
    char format, int dim, int *occ, int flags );
```

Parameter Description:

parmnum	Ordinal number of the parameter. This identifies the parameter in the passed parameter list. Range: 0 ... numparm-1.
parmhandle	Pointer to the parameter handle.
format	Format of the parameter.
dim	Dimension of the array.
occ	Number of occurrences per dimension.
flags	A combination of the flags IF4_FLG_PROTECTED IF4_FLG_LBVAR_0 IF4_FLG_UBVAR_0

	IF4_FLG_LBVAR_1 IF4_FLG_UBVAR_1 IF4_FLG_LBVAR_2 IF4_FLG_UBVAR_2

return	Return Value:	Information:
	< 0	Error:
	-1	Invalid parameter number.
	-2	Internal error.
	-6	Out of memory condition.
	-8	Invalid format.
	-10	Invalid dimension count.
	-11	Invalid combination of variable bounds.
	0	Successful operation.

Resize an X-array Parameter

Prototype:

```
int ncxr_resize_parm_array( int parmnum, void *parmhandle, int *occ );
```

Parameter Description:

parmnum	Ordinal number of the parameter. This identifies the parameter in the passed parameter list. Range: 0 ... numparm-1.	
parmhandle	Pointer to the parameter handle.	
occ	New number of occurrences per dimension.	
return	Return Value:	Information:
	< 0	Error:
	-1	Invalid parameter number.
	-2	Internal error.
	-6	Out of memory condition.
	-12	Operand is not resizable (in one of the specified dimensions).
	0	Successful operation.

All function prototypes are declared in the file natuser.h.

15 CALL FILE

- Function ... 96
- Restriction ... 96
- Syntax Description ... 97
- Example ... 98

Structured Mode Syntax

```
CALL FILE 'program-name' operand1 operand2
  statement ...
END-FILE
```

Reporting Mode Syntax

```
CALL FILE 'program-name' operand1 operand2
  statement ...
[LOOP]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CALL | CALL LOOP | CALLNAT | DEFINE SUBROUTINE | ESCAPE | FETCH | PERFORM

Belongs to Function Group: ***Invoking Programs and Routines***

Function

The CALL FILE statement is used to call a non-Natural program which reads a record from a non-Adabas file and returns the record to the Natural program for processing.

Restriction

The statements AT BREAK, AT START OF DATA and AT END OF DATA must not be used within a CALL FILE processing loop.

Syntax Description

Operand Definition Table:

Operand	Possible Structure				Possible Formats	Referencing Permitted	Dynamic Definition
operand1		S	A		A U N P I F B D T L C	yes	yes
operand2		S	A	G	A U N P I F B D T L C	yes	yes

Syntax Element Description:

Syntax Element	Description
'*program-name*'	**Program to be Called:** The name of the non-Natural program to be called.
operand1	**Control Field:** *operand1* is used to provide control information.
operand2	**Record Area:** *operand2* defines the record area. The format of the record to be read can be described using field definitions (or FILLER *n*X) entries following the name of the first field in the record. The fields used to define the record format must not have been previously defined in the Natural program. This ensures that fields are allocated in the contiguous storage by Natural.
statement ...	**Processing Loop:** The CALL FILE statement initiates a processing loop which must be terminated with an ESCAPE or STOP statement. More than one ESCAPE statement may be specified to escape from a CALL FILE loop based on different conditions.
END-FILE	**End of CALL FILE Statement:** An END-FILE statement must be used to close the processing loop.

Example

Calling Program:

```
** Example 'CFIEX1': CALL FILE
************************************************************************
DEFINE DATA LOCAL
1 #CONTROL (A3)
1 #RECORD
  2 #A     (A10)
  2 #B     (N3.2)
  2 #FILL1 (A3)
  2 #C     (P3.1)
END-DEFINE
*
CALL FILE 'USER1' #CONTROL #RECORD
  IF #CONTROL = 'END'
    ESCAPE BOTTOM
  END-IF
END-FILE
/*****************************
/* ... PROCESS RECORD ...
/*****************************
END
```

The byte layout of the record passed by the called program to the Natural program in the above example is as follows:

```
CONTROL #A       #B    FILLER  #C
(A3)   (A10)   (N3.2)  3X   (P3.1)

XXX XXXXXXXXXX XXXXX   XXX   XXX
```

Called COBOL Program:

```
ID DIVISION.
PROGRAM-ID. USER1.
ENVIRONMENT DIVISION.
INPUT-OUTPUT SECTION.
FILE-CONTROL.
     SELECT USRFILE ASSIGN UT-S-FILEUSR.
DATA DIVISION.
FILE SECTION.
FD   USRFILE RECORDING F LABEL RECORD OMITTED
     DATA RECORD DATA-IN.
01   DATA-IN         PIC X(80).
LINKAGE SECTION.
01   CONTROL-FIELD   PIC XXX.
```

```
01   RECORD-IN       PIC X(21).
PROCEDURE DIVISION USING CONTROL-FIELD RECORD-IN.
BEGIN.
     GO TO FILE-OPEN.
FILE-OPEN.
     OPEN INPUT USRFILE
     MOVE SPACES TO CONTROL-FIELD.
     ALTER BEGIN TO PROCEED TO FILE-READ.
FILE-READ.
     READ USRFILE INTO RECORD-IN
          AT END
          MOVE 'END' TO CONTROL-FIELD
          CLOSE USRFILE
          ALTER BEGIN TO PROCEED TO FILE-OPEN.
     GOBACK.
```

16 CALL LOOP

- Function 102
- Restriction 102
- Syntax Description 103
- Example 103

Structured Mode Syntax

```
CALL LOOP  operand1  [operand2] ...40
  statement ...
END-LOOP
```

Reporting Mode Syntax

```
CALL LOOP operand1 [operand2] ...40
  statement ...
[LOOP]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CALL | CALL FILE | CALLNAT | DEFINE SUBROUTINE | ESCAPE | FETCH | PERFORM

Belongs to Function Group: ***Invoking Programs and Routines***

Function

The CALL LOOP statement is used to generate a processing loop that contains a call to a non-Natural program.

Unlike the CALL statement, the CALL LOOP statement results in a processing loop which is used to repeatedly call the non-Natural program. See the CALL statement for a detailed description of the CALL processing.

Restriction

The statements AT BREAK, AT START OF DATA and AT END OF DATA must not be used within a CALL LOOP processing loop.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no
operand2	C	S	A	G		A	U	N	P	I	F	B	D	T	L	C			yes	yes

Syntax Element Description:

Syntax Element	Description
operand1	**Program to be Called:** The name of the non-Natural program to be called can be specified as a constant or - if different programs are to be called dependent on program logic - as an alphanumeric variable of length 1 to 8. A program name must be placed left-justified in the variable.
operand2	**Parameters:** The `CALL LOOP` statement can have a maximum of 40 parameters. The parameter list is constructed as described for the `CALL` statement. Fields used in the parameter list may be initially defined in the `CALL LOOP` statement itself or may have been previously defined.
statement ...	**Processing Loop:** The `CALL LOOP` statement initiates a processing loop which must be terminated with an `ESCAPE` statement.
`END-LOOP`	**End of CALL LOOP Statement:** The Natural reserved word `END-LOOP` must be used to close the processing loop.

Example

```
DEFINE DATA LOCAL
1 PARAMETER1 (A10)
END-DEFINE
CALL LOOP 'ABC' PARAMETER1
  IF PARAMETER1 = 'END'
     ESCAPE BOTTOM
  END-IF
END-LOOP
END
```

17 CALLNAT

- Function ... 106
- Syntax Description ... 107
- Parameter Transfer with Dynamic Variables ... 109
- Examples ... 110

```
CALLNAT operand1 [ [USING] { operand2 [ (AD= { M | O | A } ) ] | nX } ... ]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CALL | CALL FILE | CALL LOOP | DEFINE SUBROUTINE | ESCAPE | FETCH | PERFORM

Belongs to Function Group: ***Invoking Programs and Routines***

Function

The CALLNAT statement is used to invoke a Natural subprogram for execution. (A Natural subprogram can only be invoked via a CALLNAT statement; it cannot be executed by itself.)

When the CALLNAT statement is executed, the execution of the invoking object (that is, the object containing the CALLNAT statement) will be suspended and the invoked subprogram will be executed. The execution of the subprogram continues until either its END statement is reached or processing of the subprogram is stopped by an ESCAPE ROUTINE statement being executed. In either case, processing of the invoking object will then continue with the statement following the CALLNAT statement.

Notes:

1. A subprogram can in turn invoke other subprograms.
2. A subprogram has no access to the global data area used by the invoking object. If a subprogram in turn invokes a subroutine or helproutine, it can establish its own global data area to be shared with the subroutine/helproutine.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no
operand2	C	S	A	G		A	U	N	P	I	F	B	D	T	L	C	G	O	yes	yes

Syntax Element Description:

Syntax Element	Description
operand1	**Subprogram to be Invoked:** As *operand1*, you specify the name of the subprogram to be invoked. The name may be specified either as a constant of 1 to 8 characters, or - if different subprograms are to be called dependent on program logic - as an alphanumeric variable of length 1 to 8. The subprogram name may contain an ampersand (&); at execution time, this character will be replaced by the one-character code corresponding to the current value of the system variable *LANGUAGE. This makes it possible, for example, to invoke different subprograms for the processing of input, depending on the language in which input is provided.
operand2	**Parameters:** If parameters are passed to the subprogram, the structure of the parameter list must be defined in a DEFINE DATA PARAMETER statement. The parameters specified with the CALLNAT statement are the only data available to the subprogram from the invoking object. By default, the parameters are passed *by reference*, that is, the data are transferred via address parameters, the parameter values themselves are not moved. However, it is also possible to pass parameters *by value*, that is, pass the actual parameter values. To do so, you define these fields in the DEFINE DATA PARAMETER statement of the subprogram with the option BY VALUE or BY VALUE RESULT (see *parameter-data-definition* in the description of the DEFINE DATA statement). ■ If parameters are passed *by reference*, the following applies: The sequence, format and length of the parameters in the invoking object must match exactly the sequence, format and length of the DEFINE DATA PARAMETER structure in the invoked subprogram. The names of the variables in the invoking object and the invoked subprogram may be different. ■ If parameters are passed *by value*, the following applies: The sequence of the parameters in the invoking object must match exactly the sequence in the DEFINE DATA PARAMETER structure of the invoked subprogram. Formats and lengths of the variables in the invoking object and the subprogram may be different; however, they have to be data transfer compatible; see the corresponding table in the section *Rules for Arithmetic Assignments*, *Data Transfer* in

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td></td><td colspan="2">

the *Programming Guide*. The names of the variables in the invoking object and the subprogram may be different. If parameter values that have been modified in the subprogram are to be passed back to the invoking object, you have to define these fields with BY VALUE RESULT. When BY VALUE is specified without RESULT, it is not possible to pass modified parameter values back to the invoking object (regardless of the AD specification; see also below).

Note: With BY VALUE, an internal copy of the parameter values is created. The subprogram accesses this copy and can modify it, but this will not affect the original parameter values in the invoking object. With BY VALUE RESULT, an internal copy is likewise created, however, after termination of the subprogram, the original parameter values are overwritten by the (modified) values of the copy.

For both ways of passing parameters, the following applies:

If a group is specified as *operand2*, the individual fields contained in that group are passed to the subprogram; that is, for each of these fields a corresponding field must be defined in the subprogram's parameter data area.

In the parameter data area of the invoked subprogram, a redefinition of groups is only permitted within a REDEFINE block.

If an array is passed, its number of dimensions and occurrences in the subprogram's parameter data area must be the same as in the CALLNAT parameter list.

Note: If multiple occurrences of an array that is defined as part of an indexed group are passed with the CALLNAT statement, the corresponding fields in the subprogram's parameter data area must not be redefined, as this would lead to the wrong addresses being passed.

When the option PCHECK of the COMPOPT command is set to ON, the compiler will check the number, format, length and array index bounds of the parameters that are specified in a CALLNAT statement. Also, the OPTIONAL feature of the DEFINE DATA PARAMETER statement is considered in the parameter check.

</td></tr>
<tr><td rowspan="5">AD=</td><td colspan="2">

</td></tr>
<tr><td>AD=O</td><td>

Non-modifiable, see session parameter AD=O.

Note: Internally, AD=O is processed in the same way as BY VALUE (see *parameter-data-definition* in the description of the DEFINE DATA statement).

</td></tr>
<tr><td>AD=M</td><td>

Modifiable, see session parameter AD=M.

This is the default setting.

</td></tr>
<tr><td>AD=A</td><td>Input only, see session parameter AD=A.</td></tr>
<tr><td colspan="2">If *operand2* is a constant, AD cannot be explicitly specified. For constants AD=O always applies.</td></tr>
</table>

Syntax Element	Description
*n*X	**Parameters to be Skipped:** With the notation *n*X you can specify that the next *n* parameters are to be skipped (for example, 1X to skip the next parameter, or 3X to skip the next three parameters); this means that for the next *n* parameters no values are passed to the subprogram. The possible range of values for *n* is 1 - 4096. A parameter that is to be skipped must be defined with the keyword OPTIONAL in the subprogram's DEFINE DATA PARAMETER statement. OPTIONAL means that a value can - but need not - be passed from the invoking object to such a parameter.

Parameter Transfer with Dynamic Variables

Dynamic variables may be passed as parameters to a called program object (CALLNAT, PERFORM). A call by reference is possible because the value space of a dynamic variable is contiguous. A call by value causes an assignment with the variable definition of the caller as the source operand and the parameter definition as the destination operand. In addition, a call by value result causes the movement to change to the opposite direction. When using a call-by-reference, both definitions must be DYNAMIC. If only one of them is DYNAMIC, a runtime error is raised. In case of a call by value (result) all combinations are possible.

The following table illustrates the valid combinations of statically and dynamically defined variables of the caller, and statically and dynamically defined parameters concerning the parameter transfer.

Call By Reference

operand2 of caller	Parameter definition	
	Static	Dynamic
Static	yes	no
Dynamic	no	yes

The formats of the dynamic variables A or B must match.

Call by Value (Result)

operand2 of caller	Parameter definition	
	Static	Dynamic
Static	yes	yes
Dynamic	yes	yes

Note: When using static/dynamic or dynamic/static definitions, a value truncation may occur according to the data transfer rules of the appropriate assignments.

Examples

- Example 1
- Example 2

Example 1

Calling Program:

```
** Example 'CNTEX1': CALLNAT
************************************************************************
DEFINE DATA LOCAL
1 #FIELD1 (N6)
1 #FIELD2 (A20)
1 #FIELD3 (A10)
END-DEFINE
*
CALLNAT 'CNTEX1N' #FIELD1 (AD=M) #FIELD2 (AD=O) #FIELD3 'P4 TEXT'
*
WRITE '=' #FIELD1 '=' #FIELD2 '=' #FIELD3
*
END
```

Called Subprogram CNTEX1N:

```
** Example 'CNTEX1N': CALLNAT  (called by CNTEX1)
************************************************************************
DEFINE DATA PARAMETER
1 #FIELDA (N6)
1 #FIELDB (A20)
1 #FIELDC (A10)
1 #FIELDD (A7)
END-DEFINE
*
*
```

```
#FIELDA := 4711
*
#FIELDB := 'HALLO'
*
#FIELDC := 'ABC'
*
WRITE '=' #FIELDA '=' #FIELDB '=' #FIELDC '=' #FIELDD
*
END
```

Example 2

Calling Program:

```
** Example 'CNTEX2': CALLNAT
************************************************************************
DEFINE DATA LOCAL
1 #ARRAY1  (N4/1:10,1:10)
1 #NUM     (N2)
END-DEFINE
*
*
CALLNAT 'CNTEX2N' #ARRAY1 (2:5,*)
*
FOR #NUM 1 TO 10
  WRITE #NUM #ARRAY1(#NUM,1:10)
END-FOR
*
END
```

Called Subprogram CNTEX2N:

```
** Example 'CNTEX2N': CALLNAT  (called by CNTEX2)
************************************************************************
DEFINE DATA
PARAMETER
1 #ARRAY (N4/1:4,1:10)
LOCAL
1 I      (I2)
END-DEFINE
*
*
FOR I 1 10
  #ARRAY(1,I) := I
  #ARRAY(2,I) := 100 + I
  #ARRAY(3,I) := 200 + I
  #ARRAY(4,I) := 300 + I
END-FOR
*
END
```

18 CLOSE CONVERSATION

- Function 114
- Syntax Description 114
- Further Information and Examples 115

```
                    { {operand1} ... }
CLOSE CONVERSATION  { *CONVID        }
                    { ALL            }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `DEFINE DATA CONTEXT` | `OPEN CONVERSATION`

Belongs to Function Group: ***Natural Remote Procedure Call***

Function

The statement `CLOSE CONVERSATION` is used in conjunction with the Natural Remote Procedure Call (RPC). It allows the client to close conversations. You can close the current conversation, another open conversation, or all open conversations.

Note: A logon to another library does not automatically close conversations.

Syntax Description

Operand Definition Table:

Operand	Possible Structure			Possible Formats	Referencing Permitted	Dynamic Definition
operand1		S	A	I	yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Identifier of Conversation to be Closed:** To close a specific open conversation, specify its ID as *operand1*. *operand1* must be a variable of format/length I4.
`*CONVID`	**Closing the Current Conversation:** To close the current conversation, specify `*CONVID`. The ID of the current conversation is determined by the value of the system variable `*CONVID`.
`ALL`	**Closing All Open Conversations:** To close all open conversations, specify `ALL`.

Further Information and Examples

See the following sections in the *Natural Remote Procedure Call (RPC)* documentation:

- *Natural RPC Operation in Conversational Mode*
- *Using a Conversational RPC*

19 CLOSE PC FILE

- Function 118
- Syntax Description 118
- Example 118

```
CLOSE { PC   } [FILE] work-file-number
      { WORK }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: DOWNLOAD PC FILE | UPLOAD PC FILE

Belongs to Function Group: *Control of Work Files / PC Files*

Function

The statement CLOSE PC FILE is used to close a specific PC work file. It allows you to explicitly specify in a program that a PC work file is to be closed.

A work file is also closed automatically when command mode is reached.

See also the Natural Connection and Entire Connection documentation.

Syntax Description

Syntax Element	Description
work-file-number	The *work-file-number* is the number of the PC work file to be closed. This number must correspond to one of the work file numbers for the PC as defined to Natural.

Example

The following program demonstrates the use of the CLOSE PC FILE statement.

```
** Example 'PCCLEX1': CLOSE PC FILE
**
** NOTE: Example requires that Natural Connection is installed.
************************************************************************
DEFINE DATA LOCAL
01 W-DAT   (A40)
01 REC-NUM (N3)
01 I       (P3)
END-DEFINE
*
REPEAT
```

```
UPLOAD PC FILE 7 ONCE W-DAT                /* Data upload
  AT END OF FILE
    ESCAPE BOTTOM
  END-ENDFILE
  INPUT 'Processing file' W-DAT (AD=O)
    /   'Enter record number to display' REC-NUM
  IF REC-NUM = 0
    STOP
  END-IF
  FOR I = 1 TO REC-NUM
    UPLOAD PC FILE 7 ONCE W-DAT
    AT END OF FILE
      WRITE 'Max. record number reached, last record is'
      ESCAPE BOTTOM
    END-ENDFILE
  END-FOR
  I := I - 1
  WRITE 'Record' I ':' W-DAT
CLOSE PC FILE 7                            /* Close PC file 7
END-REPEAT
END
```

Output of Program PCCLEX1:

When you run the program, a window appears in which you specify the name of the PC file from which the data is to be uploaded. The data is then uploaded from the PC. At the end of each loop, the PC file is closed.

20 CLOSE PRINTER

- Function 122
- Syntax Description 122
- Example 123

```
CLOSE PRINTER  { (logical-printer-name) }
               { (printer-number)       }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The CLOSE PRINTER statement is used to close a specific printer. With this statement, you explicitly specify in a program that a printer is to be closed.

A printer is also closed automatically in one of the following cases:

- when a DEFINE PRINTER statement in which the same printer is defined again is executed;
- when command mode is reached.

Syntax Description

Syntax Element	Description
logical-printer-name	**Logical Printer Name:** With the *logical-printer-name* you specify which printer is to be closed. The name is the same as in the corresponding DEFINE PRINTER statement in which you defined the printer. Naming conventions for the *logical-printer-name* are the same as for user-defined variables, see *Naming Conventions for User-Defined Variables* in *Using Natural*.
printer-number	**Printer Number:** Alternatively to the *logical-printer-name*, you may define the *printer-number* to specify which printer is to be closed. The *printer-number* may be a number in the range from 0 - 31. This is the number also to be used in a DISPLAY / WRITE or DEFINE PRINTER statement. Printer number 0 indicates the hardcopy printer.

Example

```
** Example 'CLPEX1': CLOSE PRINTER
************************************************************************
DEFINE DATA LOCAL
1 EMP-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 FIRST-NAME
  2 BIRTH
*
1 #I-NAME (A20)
END-DEFINE
*
DEFINE PRINTER (PRT01=1)
*
REPEAT
  INPUT 'SELECT PERSON' #I-NAME
  IF #I-NAME = ' '
    STOP
  END-IF
  FIND EMP-VIEW WITH NAME = #I-NAME
    WRITE (PRT01) 'NAME         :' NAME ',' FIRST-NAME
           /      'PERSONNEL-ID :' PERSONNEL-ID
           /      'BIRTH        :' BIRTH (EM=YYYY-MM-DD)
  END-FIND
  /*
  CLOSE PRINTER (PRT01)
  /*
END-REPEAT
END
```

21 CLOSE WORK FILE

- Function 126
- Syntax Description 126
- Example 126

```
CLOSE WORK [FILE] work-file-number
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `DEFINE WORK FILE` | `READ WORK FILE` | `WRITE WORK FILE`

Belongs to Function Group: ***Control of Work Files / PC Files***

Function

The statement `CLOSE WORK FILE` is used to close a specific work file. It allows you to explicitly specify in a program that a work file is to be closed.

A work file is closed automatically:

- When command mode is reached.
- When an end-of-file condition occurs during the execution of a `READ WORK FILE` statement.
- Before a `DEFINE WORK FILE` statement is executed which assigns another file to the work file number concerned.

Syntax Description

Syntax Element	Description
work-file-number	The number of the work file (as defined to Natural) to be closed.

Example

```
** Example 'CWFEX1': CLOSE WORK FILE
************************************************************************
DEFINE DATA LOCAL
1 W-DAT   (A20)
1 REC-NUM (N3)
1 I       (P3)
END-DEFINE
*
REPEAT
  READ WORK FILE 1 ONCE W-DAT  /* READ MASTER RECORD
  /*
  AT END OF FILE
    ESCAPE BOTTOM
```

```
  END-ENDFILE
  INPUT 'PROCESSING FILE' W-DAT (AD=O)
      / 'ENTER RECORDNUMBER TO DISPLAY' REC-NUM
  IF REC-NUM = 0
    STOP
  END-IF
    FOR I = 1 TO REC-NUM
    /*
    READ WORK FILE 1 ONCE W-DAT
    /*
    AT END OF FILE
      WRITE 'RECORD-NUMBER TOO HIGH, LAST RECORD IS'
      ESCAPE BOTTOM
    END-ENDFILE
  END-FOR
  I := I - 1
  WRITE 'RECORD' I ':' W-DAT
  /*
  CLOSE WORK FILE 1
  /*
END-REPEAT
END
```

22 COMPRESS

- Function 130
- Syntax Description 130
- Processing 134
- Examples 134

```
COMPRESS [NUMERIC] [FULL]

{ operand1 [(parameter)]                                             }
{ SUBSTRING (operand1,operand3,operand4) [(parameter)]               } ...

INTO      {            operand2                              }
          {            SUBSTRING                             }
                       (operand2,operand5,operand6)

          [ LEAVING SPACE                                    ]
          [ LEAVING NO [SPACE]                               ]
          [ WITH [ALL] [DELIMITERS] [operand7]               ]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ASSIGN | COMPUTE | EXAMINE | MOVE | MOVE ALL | SEPARATE

Belongs to Function Group: ***Arithmetic and Data Movement Operations***

Function

The COMPRESS statement is used to transfer (combine) the contents of one or more operands into a single field.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A	G	N	A	U	N	P	I	F	B	D	T			G	O	yes	no
operand2		S				A	U					B							yes	yes
operand3	C	S						N	P	I		B*							yes	no
operand4	C	S						N	P	I		B*							yes	no
operand5	C	S						N	P	I		B*							yes	no
operand6	C	S						N	P	I		B*							yes	no
operand7	C	S				A	U					B							yes	no

* Format B of *operand3*, *operand4*, *operand5* and *operand6* may be used only with a length of less than or equal to 4.

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>NUMERIC</td><td>Handling of Sign Characters:

This option determines how sign characters and decimal characters are to be handled:

Without NUMERIC, decimal points and signs in numeric source values are suppressed before the values are transferred. For example:

<code>COMPRESS -123 1.23 INTO #TARGET WITH DELIMITER '*'
Content of #TARGET is: 123*123</code>

With NUMERIC, decimal points and signs in numeric source values are also transferred to the target field.

For floating point source values, decimal points and signs are transferred, regardless of whether NUMERIC has been specified or not.

Example 1:

<code>COMPRESS NUMERIC -123 1.23 INTO #TARGET WITH DELIMITER '*'
Content of #TARGET is: -123*1.23</code>

Example 2:

<code>COMPRESS NUMERIC 'ABC' -0056.00 -0056.10 -0056.01 INTO #TARGET WITH
DELIMITER '*'
Content of #TARGET is: ABC*-56*-56.1*-56.01</code>

Example 3:

<code>COMPRESS NUMERIC FULL 'ABC' -0056.00 -0056.10 -0056.01 INTO #TARGET WITH
DELIMITER '*'
Content of #TARGET is: ABC*-0056.00*-0056.10*-0056.01</code></td></tr>
<tr><td>FULL</td><td>Handling of Source Field Values:

Without FULL, the following are removed from the source fields before the values are transferred:

■ leading zeros before the decimal point for fields of format N, P or I
■ trailing zeros after the decimal point for fields of format N or P
■ trailing blanks for fields of format A
■ and leading binary zeros for fields of format B</td></tr>
</table>

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>For a numeric source field containing all zeros, one zero will be transferred. For example:
<pre>COMPRESS 'ABC ' 001 INTO #TARGET WITH DELIMITER '*'
Content of #TARGET is: ABC*1</pre>With <code>FULL</code>, the values of the source fields in their actual lengths will be transferred to the target field. In other words:
leading zeros before the decimal point for fields of format N, P or I
trailing zeros after the decimal point for fields of format N or P
and trailing blanks for fields of format A
leading binary zeros for fields of format B
are displayed as entered. For example:
<pre>COMPRESS FULL 'ABC ' 001 INTO #TARGET WITH DELIMITER '*'
Content of #TARGET is: ABC *001</pre></td></tr>
<tr><td>operand1</td><td>Source Fields:
As operand1, you specify the fields whose contents are to be transferred.
Note: If operand1 is not of format A or B, its content is converted into alphanumeric representation before it is transferred. If necessary, the alphanumeric representation is truncated.
If operand1 is a time variable (format T), only the time component of the variable content is transferred, but not the date component.</td></tr>
<tr><td>operand2</td><td>Target Field:
As operand2, you specify the field which is to receive the values of the source fields.
If the target field is of format U (Unicode) and if a source field of format B is involved, the length of the sending binary field must be even.</td></tr>
<tr><td>LEAVING SPACE</td><td>Values in Target Field Separated by a Blank:
If you use the <code>COMPRESS</code> statement without any further options, or if you specify <code>LEAVING SPACE</code> (which also applies by default), the values in the target field will be separated from one another by a blank.</td></tr>
<tr><td>LEAVING NO SPACE</td><td>Values in Target Field Not Separated:
If you specify <code>LEAVING NO SPACE</code>, the values in the target field will not be separated from one another by a blank or any other character.</td></tr>
<tr><td>parameter</td><td>Print Mode/Date Format Parameters:
As parameter, you can specify the session parameter <code>PM</code> or the session parameter <code>DF</code>:</td></tr>
</table>

Syntax Element	Description	

	PM=I	In order to support languages whose writing direction is from right to left, you can specify PM=I so as to transfer the value of *operand1* in inverse (right-to-left) direction to *operand2*. For example, as a result of the following statements, the content of #B would be ZYXABC:
		
		`MOVE 'XYZ' TO #A`
		`COMPRESS #A (PM=I) 'ABC' INTO #B`
		`LEAVING NO SPACE`
		
		Any trailing blanks in *operand1* will be removed (except if FULL is specified), then the value is reversed character by character and transferred to *operand2*.

	DF	If *operand1* is a date variable, you can specify the session parameter DF as *parameter* for this variable.
SUBSTRING (*operand1*, *operand3*, *operand4*)	**SUBSTRING Option:** If *operand1* is of alphanumeric (A), Unicode (U) or binary (B) format, you can use the SUBSTRING option to transfer only a certain part of a source field. After the field name (*operand1*) you specify first the starting position (*operand3*) and then the length (*operand4*) of the field portion to be transferred.	
INTO SUBSTRING (*operand2*, *operand5*, *operand6*)	**INTO Clause:** Also, you can use the SUBSTRING option in the INTO clause to transfer source values into a certain part of the target field. In both cases, the use of the SUBSTRING option in a COMPRESS statement corresponds to that in a MOVE statement. See the MOVE statement for details on the SUBSTRING option.	
WITH DELIMITERS	**Input Delimiter Character:** If you wish the values in the target field to be separated from one another by a specific character, you use the DELIMITERS option. If you specify WITH DELIMITERS without *operand7*, the values will be separated by the input delimiter character as defined with the session parameter ID.	
WITH DELIMITERS *operand7*	**Specific Delimiter Character:** If you specify WITH DELIMITERS *operand7*, the values will be separated by the character specified with *operand7*. *operand7* must be a single character. If *operand7* is a variable, it must be of format/length (A1) or (B1). If the target field is of format A or B, the format/length of the delimiter has to be (A1), (B1) or (U1). If the target field is of format U (Unicode), the format/length of the delimiter has to be (A1), (B2) or (U1).	

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>WITH ALL</td><td>Handling of Delimiters:

Without ALL, a delimiter is placed in the target field only between values actually transferred. For example:

<code>COMPRESS 'A' ' ' 'C' ' ' INTO #TARGET WITH DELIMITERS '*'</code>
<code>Content of #TARGET is: A*C</code>

With ALL, a delimiter is also placed in the target field for each blank value that is not actually transferred. This means that the number of delimiters in the target field corresponds to the number of source fields minus 1. This may be useful, for example, if the content of the target field is to be separated again with a subsequent SEPARATE statement. For example:

<code>COMPRESS 'A' ' ' 'C' ' ' INTO #TARGET WITH ALL DELIMITERS '*'</code>
<code>Content of #TARGET is: A**C*</code></td></tr>
</table>

Processing

A destination field of format B is handled like a destination field of format A.

The COMPRESS operation terminates when either all operands have been processed or the target field (*operand2*) is filled.

If the target field contains more positions than all operands combined, all remaining positions of *operand2* will be filled with blanks. If the target field is shorter, the value will be truncated.

If *operand2* is a dynamic variable, the COMPRESS operation terminates when all source operands have been processed. No truncation will be performed. The length of *operand2* after the COMPRESS operation will correspond to the combined length of the source operands. The current length of a dynamic variable can be ascertained by using the system variable *LENGTH.

Examples

This section covers the following topics:

- Example 1 - Compress
- Example 2 - Compress Leaving No Space

- Example 3 - Compress with Delimiter

Example 1 - Compress

```
** Example 'CMPEX1': COMPRESS
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 MIDDLE-I
*
1 #COMPRESSED-NAME (A20)
END-DEFINE
*
LIMIT 4
READ EMPLOY-VIEW BY NAME
  COMPRESS FIRST-NAME MIDDLE-I NAME INTO #COMPRESSED-NAME
  DISPLAY NOTITLE
          FIRST-NAME MIDDLE-I NAME 5X #COMPRESSED-NAME
END-READ
*
END
```

Output of Program CMPEX1:

```
     FIRST-NAME      MIDDLE-I         NAME              #COMPRESSED-NAME
-------------------- -------- --------------------     --------------------

KEPA                          ABELLAN                  KEPA ABELLAN
ROBERT               W        ACHIESON                 ROBERT W ACHIESON
SIMONE                        ADAM                     SIMONE ADAM
JEFF                 H        ADKINSON                 JEFF H ADKINSON
```

Example 2 - Compress Leaving No Space

```
** Example 'CMPEX2': COMPRESS (with LEAVING NO SPACE)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 CURR-CODE (1)
  2 SALARY    (1)
*
1 #CCSALARY   (A20)
END-DEFINE
*
LIMIT 4
READ EMPL-VIEW BY NAME
```

```
  COMPRESS CURR-CODE (1) SALARY (1) INTO #CCSALARY
           LEAVING NO SPACE
  DISPLAY NOTITLE
          NAME CURR-CODE (1) SALARY (1) 5X #CCSALARY
END-READ
*
END
```

Output of Program CMPEX2:

```
        NAME          CURRENCY   ANNUAL            #CCSALARY
                        CODE     SALARY
-------------------- -------- ----------     --------------------

ABELLAN              PTA         1450000     PTA1450000
ACHIESON             UKL           11300     UKL11300
ADAM                 FRA          159980     FRA159980
ADKINSON             USD           34500     USD34500
```

Example 3 - Compress with Delimiter

```
** Example 'CMPEX3': COMPRESS (with delimiter)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 CURR-CODE (1)
  2 SALARY    (1)
*
1 #CCSALARY   (A20)
END-DEFINE
*
LIMIT 4
READ EMPL-VIEW BY NAME
  COMPRESS CURR-CODE (1) SALARY (1) INTO #CCSALARY
           WITH DELIMITER '*'
  DISPLAY NOTITLE NAME CURR-CODE (1) SALARY (1) 5X #CCSALARY
END-READ
*
END
```

Output of Program CMPEX3:

```
        NAME         CURRENCY   ANNUAL            #CCSALARY
                       CODE     SALARY
-------------------- -------- ----------     --------------------

ABELLAN              PTA         1450000     PTA*1450000
ACHIESON             UKL           11300     UKL*11300
ADAM                 FRA          159980     FRA*159980
ADKINSON             USD           34500     USD*34500
```

23 COMPUTE

- Function 140
- Syntax Description 142
- Result Precision of a Division 144
- SUBSTRING Option 144
- Examples 144

Structured Mode Syntax

```
[ {COMPUTE} [ROUNDED] {operand1 [:]= } ... {arithmetic-expression} ]
[ {ASSIGN }                                {operand2             } ]
[                                                                  ]
[ {operand1 := } ... {arithmetic-expression}                       ]
[                    {operand2             }                       ]
```

Reporting Mode Syntax

```
[ {COMPUTE} ] [ROUNDED] {operand1 [:]= } ... {arithmetic-expression}
[ {ASSIGN } ]                                {operand2             }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ADD | COMPRESS | DIVIDE | EXAMINE | MOVE | MOVE ALL | MULTIPLY | RESET | SEPARATE | SUBTRACT

Belongs to Function Group: ***Arithmetic and Data Movement Operations***

Function

The COMPUTE statement is used to perform an arithmetic or assignment operation.

A COMPUTE statement with multiple target operands (*operand1*) is identical to the corresponding individual COMPUTE statements if the source operand (*operand2*) is not an arithmetic expression.

```
#TARGET1 := #TARGET2 := #SOURCE
```

is identical to

```
#TARGET1 := #SOURCE
#TARGET2 := #SOURCE
```

Example:

```
DEFINE DATA LOCAL
1 #ARRAY(I4/1:3) INIT <3,0,9>
1 #INDEX(I4)
1 #RESULT(I4)
END-DEFINE
*
#INDEX := 1
*
#INDEX :=       /* #INDEX is 3
#RESULT :=      /* #RESULT is 9
#ARRAY(#INDEX)
*
#INDEX := 2
*
#INDEX  :=      /* #INDEX is 0
#ARRAY(3) :=    /* returns run time error NAT1316
#ARRAY(#INDEX)
END
```

If the source operand is an arithmetic expression, the expression is evaluated and its result is stored in a temporary variable. Then the temporary variable is assigned to the target operands.

```
#TARGET1 := #TARGET2 := #SOURCE1 + 1
is identical to
#TEMP := #SOURCE1 + 1
#TARGET1 := #TEMP
#TARGET2 := #TEMP
```

Example:

```
DEFINE DATA LOCAL
1 #ARRAY(I4/1:3) INIT <2, 0, 9>
1 #INDEX(I4)
1 #RESULT(I4)
END-DEFINE
*
#INDEX := 1
*
#INDEX :=   /* #INDEX is 3
#RESULT :=   /* #RESULT is 3
#ARRAY(#INDEX) + 1
*
#INDEX := 2
*
#INDEX  :=  /* #INDEX is 0
#ARRAY(3) :=   /* returns run time error NAT1316
#ARRAY(#INDEX)
END
```

For further information, see *Rules for Arithmetic Assignment* in the *Programming Guide* and particularly the following sections:

- *Arithmetic Operations with Arrays*
- *Data Transfer* (for information on data transfer compatibility and the rules for data transfer)

Syntax Description

Operand Definition Table:

Operand	Possible Structure						Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A		M		A	U	N	P	I	F	B	D	T	L	C	G	O	yes	yes
operand2	C	S	A		N	E	A	U	N	P	I	F	B	D	T	L	C	G	O	yes	no

Syntax Element Description:

Syntax Element	Description
COMPUTE | ASSIGN [:]=	**Usage of Keywords:** This statement may be issued in short form by omitting the statement keyword COMPUTE (or ASSIGN). In structured mode, when the statement keyword COMPUTE (or ASSIGN) is omitted, the equal sign (=) must be preceded by a colon (:). However, when the ROUNDED option is used, the statement keyword COMPUTE (or ASSIGN) must be specified.
ROUNDED	**ROUNDED Option:** If you specify the keyword ROUNDED, the value will be rounded before it is assigned to *operand1*. For information on rounding, see *Rules for Arithmetic Assignments*, *Field Truncation and Field Rounding* in the *Programming Guide*.
operand1	**Result Field:** *operand1* will contain the result of the arithmetic/assignment operation. For the precision of the result, see *Precision of Results for Arithmetic Operations* in the *Programming Guide*. If *operand1* is a database field, the field in the database is not updated.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>If operand1 is a dynamic variable, it is filled with exactly the data and length of operand2 or the length of the result of the arithmetic-operation, including trailing blanks. The current length of a dynamic variable can be obtained by using the system variable *LENGTH.

For general information on dynamic variables, see Using Dynamic and Large Variables.</td></tr>
<tr><td>arithmetic-expression</td><td>Arithmetic Expression:

An arithmetic expression consists of one or more constants, database fields, and user-defined variables.

Natural mathematical functions (described in the System Functions documentation) may also be used as arithmetic operands.

Operands used in an arithmetic expression must be defined with format N, P, I, F, D, or T.

As for the formats of the operands, see also Performance Considerations for Mixed Formats in the Programming Guide.

The following connecting operators may be used:
<table>
<tr><th>Operator:</th><th>Symbol:</th></tr>
<tr><td>Parentheses</td><td>( )</td></tr>
<tr><td>Exponentiation</td><td>**</td></tr>
<tr><td>Multiplication</td><td>*</td></tr>
<tr><td>Division</td><td>/</td></tr>
<tr><td>Addition</td><td>+</td></tr>
<tr><td>Subtraction</td><td>-</td></tr>
</table>
Each operator should be preceded and followed by at least one blank so as to avoid any conflict with a variable name that contains any of the above characters.

The processing order of arithmetic operations is:

1. Parentheses
2. Exponentiation
3. Multiplication/division (left to right as detected)
4. Addition/subtraction (left to right as detected)</td></tr>
<tr><td>operand2</td><td>Source Field:

operand2 is the source field. If operand1 is of format C, operand2 may also be specified as an attribute constant.

See User-Defined Constants in the Programming Guide.</td></tr>
</table>

Result Precision of a Division

The precision (number of decimal positions) of the result of a division in a COMPUTE statement is determined by the precision of either the first operand (dividend) or the first result field, whichever is greater.

For a division of integer operands, however, the following applies: For a division of two integer constants, the precision of the result is determined by the precision of the first result field; however, if at least one of the two integer operands is a variable, the result is also of integer format (that is, without decimal positions, regardless of the precision of the result field).

SUBSTRING Option

If the operands are of alphanumeric, Unicode or binary format, you may use the SUBSTRING option in the same manner as described for the MOVE statement to assign a part of *operand2* to *operand1*.

Examples

- Example 1 - ASSIGN Statement
- Example 2 - COMPUTE Statement

Example 1 - ASSIGN Statement

```
** Example 'ASGEX1S': ASSIGN (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 #A (N3)
1 #B (A6)
1 #C (N0.3)
1 #D (N0.5)
1 #E (N1.3)
1 #F (N5)
1 #G (A25)
1 #H (A3/1:3)
END-DEFINE
*
ASSIGN #A = 5                           WRITE NOTITLE '=' #A
ASSIGN #B = 'ABC'                       WRITE '=' #B
ASSIGN #C = .45                         WRITE '=' #C
ASSIGN #D = #E = -0.12345               WRITE '=' #D / '=' #E
ASSIGN ROUNDED #F = 199.999             WRITE '=' #F
#G     := 'HELLO'                       WRITE '=' #G
```

```
#H (1) := 'UVW'
#H (3) := 'XYZ'                         WRITE '=' #H (1:3)
*
END
```

Output of Program ASGEX1S:

```
#A:    5
#B: ABC
#C:  .450
#D: -.12345
#E: -0.123
#F:    200
#G: HELLO
#H: UVW     XYZ
```

Equivalent reporting-mode example: **ASGEX1R**.

Example 2 - COMPUTE Statement

```
** Example 'CPTEX1': COMPUTE
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 SALARY    (1:2)
*
1 #A          (P4)
1 #B          (N3.4)
1 #C          (N3.4)
1 #CUM-SALARY (P10)
1 #I          (P2)
END-DEFINE
*
COMPUTE #A = 3 * 2 + 4 / 2 - 1
WRITE NOTITLE 'COMPUTE #A = 3 * 2 + 4 / 2 - 1' 10X '=' #A
*
COMPUTE ROUNDED #B = 3 -4 / 2 * .89
WRITE 'COMPUTE ROUNDED #B = 3 -4 / 2 * .89' 5X '=' #B
*
COMPUTE #C = SQRT (#B)
WRITE 'COMPUTE #C = SQRT (#B)' 18X '=' #C
*
LIMIT 1
READ EMPLOY-VIEW BY PERSONNEL-ID STARTING FROM '20017000'
  WRITE / 'CURRENT SALARY: '  4X SALARY (1)
        / 'PREVIOUS SALARY:'  4X SALARY (2)
  FOR #I = 1 TO 2
    COMPUTE #CUM-SALARY = #CUM-SALARY + SALARY (#I)
  END-FOR
  WRITE 'CUMULATIVE SALARY:' #CUM-SALARY
```

```
END-READ
*
END
```

Output of Program CPTEX1:

```
COMPUTE #A = 3 * 2 + 4 / 2 - 1          #A:      7
COMPUTE ROUNDED #B = 3 -4 / 2 * .89     #B:    1.2200
COMPUTE #C = SQRT (#B)                  #C:    1.1045

CURRENT SALARY:          34000
PREVIOUS SALARY:         32300
CUMULATIVE SALARY:       66300
```

24 CREATE OBJECT

- Function 148
- Syntax Description 148

```
CREATE OBJECT operand1 OF [CLASS] operand2
  [GIVING operand4]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `DEFINE CLASS` | `INTERFACE` | `METHOD` | `PROPERTY` | `SEND METHOD`

Belongs to Function Group: ***Component Based Programming***

Function

The `CREATE OBJECT` statement is used to create an instance of a class.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S																O	no	no
operand2	C	S				A													yes	no
operand4		S			N					I									yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Object Handle:** *operand1* must be defined as an object handle (`HANDLE OF OBJECT`). The object handle is filled when the object is successfully created. When not successfully returned, *operand1* contains the value `NULL-HANDLE`.
`OF CLASS` *operand2*	**Class-Name:** *operand2* is the name of the class of which the object is to be created. For classes that are not registered as DCOM classes, it must contain the class name defined in the `DEFINE CLASS` statement. For classes that are registered as DCOM classes, it must contain either the `ProgID` of the class or the class GUID. For Natural classes that are registered as DCOM classes, the `ProgID` corresponds to the class name specified in the `DEFINE CLASS` statement.

Syntax Element	Description

	.
	
	`CREATE OBJECT #O1 OF CLASS "Employee" or`
	`CREATE OBJECT #O1 OF CLASS "653BCFE0-84DA-11D0-BEB3-10005A66D231"`

`GIVING` *`operand4`*	**GIVING Clause:** If this clause is specified, *`operand4`* contains either the Natural message number if an error occurred, or zero on success. If this clause is not specified, Natural run time error processing is triggered if an error occurs.

25 DECIDE FOR

- Function 152
- Syntax Description 152
- Examples 153

```
DECIDE FOR      { FIRST }      CONDITION
                { EVERY }
 {WHEN  logical-condition  statement ...} ...
 [WHEN ANY  statement ...]
 [WHEN ALL  statement ...]
 WHEN NONE  statement ...
END-DECIDE
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: DECIDE ON | IF | IF SELECTION | ON ERROR

Belongs to Function Group: ***Processing of Logical Conditions***

Function

The DECIDE FOR statement is used to decide for one or more actions depending on multiple conditions (cases).

Note: If *no* action is to be performed under a certain condition, you must specify the statement IGNORE in the corresponding clause of the DECIDE FOR statement.

Syntax Description

Syntax Element	Description
FIRST CONDITION	**Processing of First Condition Only:** Only the first true condition is to be processed. See also ***Example 1***.
EVERY CONDITION	**Processing of Every Condition:** Every true condition is to be processed. See also ***Example 2***.
WHEN *logical-condition* *statement*	**Logical Condition(s) to be Processed:** With this clause, you specify the logical condition(s) to be processed. See the section *Logical Condition Criteria* in the *Programming Guide*.
WHEN ANY *statement*	**WHEN ANY Clause:**

Syntax Element	Description
	With WHEN ANY, you can specify the **statement(s)** to be executed when any of the logical conditions are true.
WHEN ALL *statement*	**WHEN ALL Clause:** With WHEN ALL, you can specify the **statement (s)** to be executed when all logical conditions are true. This clause is applicable only if EVERY has been specified.
WHEN NONE *statement*	**WHEN NONE Clause:** With WHEN NONE, you specify the statement(s) to be executed when none of the logical conditions are true.
END-DECIDE	**End of DECIDE FOR Statement:** The Natural reserved word END-DECIDE must be used to end the DECIDE FOR statement.

Examples

- Example 1 - DECIDE FOR with FIRST Option
- Example 2 - DECIDE FOR with EVERY Option

Example 1 - DECIDE FOR with FIRST Option

```
** Example 'DECEX1': DECIDE FOR (with FIRST option)
************************************************************************
DEFINE DATA LOCAL
1 #FUNCTION (A1)
1 #PARM     (A1)
END-DEFINE
*
INPUT #FUNCTION #PARM
*
DECIDE FOR FIRST CONDITION
  WHEN #FUNCTION = 'A' AND #PARM = 'X'
    WRITE 'Function A with parameter X selected.'
  WHEN #FUNCTION = 'B' AND #PARM = 'X'
    WRITE 'Function B with parameter X selected.'
  WHEN #FUNCTION = 'C' THRU 'D'
    WRITE 'Function C or D selected.'
  WHEN NONE
    REINPUT 'Please enter a valid function.'
            MARK *#FUNCTION
END-DECIDE
```

```
*
END
```

Output of Program DECEX1:

```
#FUNCTION A #PARM Y
```

After pressing ENTER:

```
PLEASE ENTER A VALID FUNCTION
#FUNCTION A #PARM Y
```

Example 2 - DECIDE FOR with EVERY Option

```
** Example 'DECEX2': DECIDE FOR (with EVERY option)
************************************************************************
DEFINE DATA LOCAL
1 #FIELD1 (N5.4)
END-DEFINE
*
INPUT #FIELD1
*
DECIDE FOR EVERY CONDITION
  WHEN #FIELD1 >= 0
    WRITE '#FIELD1 is positive or zero.'
  WHEN #FIELD1 <= 0
    WRITE '#FIELD1 is negative or zero.'
  WHEN FRAC(#FIELD1) = 0
    WRITE '#FIELD1 has no decimal digits.'
  WHEN ANY
    WRITE 'Any of the above conditions is true.'
  WHEN ALL
    WRITE '#FIELD1 is zero.'
  WHEN NONE
    IGNORE
END-DECIDE
*
END
```

Output of Program DECEX2:

```
#FIELD1 42
```

After pressing ENTER:

```
Page      1                                                    05-01-11  14:56:26

#FIELD1 is positive or zero.
#FIELD1 has no decimal digits.
Any of the above conditions is true.
```

26 DECIDE ON

- Function 158
- Syntax Description 159
- Examples 161

```
DECIDE ON
  { FIRST  } [VALUES] [OF]
    EVERY
                 { operand1                                      }
                   SUBSTRING (operand3,operand5,operand6)
  { VALUES       { operand2                                      }
                   SUBSTRING (operand4,operand7,operand8)
               [[,{ operand2                                     }] ...
                   SUBSTRING (operand4,operand7,operand8)
               [: { operand2                                     } ]]   statement ...}
                   SUBSTRING (operand4,operand7,operand8)
  [ANY [VALUES]  statement ...]
  [ALL [VALUES]  statement ...]
  NONE [VALUES] statement ...
END-DECIDE
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: DECIDE FOR | IF | IF SELECTION | ON ERROR

Belongs to Function Group: ***Processing of Logical Conditions***

Function

The DECIDE ON statement is used to specify multiple actions to be performed depending on the value (or values) contained in a variable.

Note: If *no* action is to be performed under a certain condition, you must specify the statement IGNORE in the corresponding clause of the DECIDE ON statement.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A		N	A	U	N	P	I	F	B	D	T	L		G	O	yes	no
operand2	C	S	A			A	U	N	P	I	F	B	D	T	L		G	O	yes	no
operand3		S	A			A	U					B							yes	no
operand4	C	S	A			A	U					B							yes	no
operand5	C	S						N	P	I		B *							yes	no
operand6	C	S						N	P	I		B *							yes	no
operand7	C	S						N	P	I		B *							yes	no
operand8	C	S						N	P	I		B *							yes	no

* Format B of *operand5*, *operand6*, *operand7* and *operand8* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
FIRST/EVERY	**Processing of Values:** With one of these keywords, you indicate whether only the first or every value that is found is to be processed.
operand1	**Selection Field:** As *operand1* or *operand2* you specify the name of the field whose content is to be checked.
VALUES *operand2* [[,*operand2*] ... [:*operand2*]*statement* ...	**VALUES Clause:** With this clause, you specify the value (*operand2*) of the selection field, as well as the *statement(s)* which are to be executed if the field contains that value. You can specify one value, multiple values, or a range of values optionally preceded by one or more values. Multiple values must be separated from one another either by the input delimiter character (as specified with the session parameter ID) or by a comma. A comma must not be used for this purpose, however, if the comma is defined as decimal character (with the session parameter DC).

Syntax Element	Description
	For a range of values, you specify the starting value and ending value of the range, separated from each other by a colon.
SUBSTRING (*operand3*,*operand5*,*operand6*)	**SUBSTRING Option:** Without the SUBSTRING option, the whole content of a field is checked. The SUBSTRING option allows you to check only a certain part of an alphanumeric, Unicode or binary field. After the field name (*operand3*), you specify first the starting position (*operand5*) and then the length (*operand6*) of the field portion to be checked.
SUBSTRING (*operand4*,*operand7*,*operand8*)	**SUBSTRING Option:** After the field name (*operand4*), you specify first the starting position (*operand7*) and then the length (*operand8*) of the field portion to be checked.
ANY *statement*	**ANY Clause:** With ANY, you specify the *statement(s)* which are to be executed if any of the values in the VALUES clause are found. These statements are to be executed in addition to the statement specified in the VALUES clause.
ALL *statement*	**ALL Clause:** With ALL, you specify the *statement(s)* which are to be executed if all of the values in the VALUES clause are found. These statements are to be executed in addition to the statement specified in the VALUES clause. The ALL clause applies only if the keyword EVERY is specified.
NONE *statement*	**NONE Clause:** With NONE, you specify the *statement(s)* which are to be executed if none of the specified values are found.
END-DECIDE	**End of DECIDE ON Statement:** The Natural reserved word END-DECIDE must be used to end the DECIDE ON statement.

Examples

- Example 1 - DECIDE ON with FIRST Option
- Example 2 - DECIDE ON with EVERY Option

Example 1 - DECIDE ON with FIRST Option

```
** Example 'DECEX3': DECIDE ON (with FIRST option)
************************************************************************
*
SET KEY ALL
INPUT 'Enter any PF key' /
      'and check result' /
*
DECIDE ON FIRST VALUE OF *PF-KEY
  VALUE 'PF1'
    WRITE 'PF1 key entered.'
  VALUE 'PF2'
    WRITE 'PF2 key entered.'
  ANY VALUE
    WRITE 'PF1 or PF2 key entered.'
  NONE VALUE
    WRITE 'Neither PF1 nor PF2 key entered.'
END-DECIDE
*
END
```

Output of Program DECEX3:

```
 Enter any PF key
 and check result
```

Output after pressing PF1:

```
Page      1                                                  05-01-11  15:08:50

PF1 key entered.
PF1 or PF2 key entered.
```

Example 2 - DECIDE ON with EVERY Option

```
** Example 'DECEX4': DECIDE ON (with EVERY option)
************************************************************************
DEFINE DATA LOCAL
1 #FIELD (N1)
END-DEFINE
*
INPUT 'Enter any value between 1 and 9:' #FIELD (SG=OFF)
*
DECIDE ON EVERY VALUE OF #FIELD
  VALUE 1 : 4
    WRITE 'Content of #FIELD is 1-4'
  VALUE 2 : 5
    WRITE 'Content of #FIELD is 2-5'
  ANY VALUE
    WRITE 'Content of #FIELD is 1-5'
  ALL VALUE
    WRITE 'Content of #FIELD is 2-4'
  NONE VALUE
    WRITE 'Content of #FIELD is not 1-5'
    END-DECIDE
*
END
```

Output of Program DECEX4:

```
ENTER ANY VALUE BETWEEN 1 AND 9: 4
```

After entering and confirming 4**:**

```
Page      1                                                05-01-11  15:11:45

Content of #FIELD is 1-4
Content of #FIELD is 2-5
Content of #FIELD is 1-5
Content of #FIELD is 2-4
```

27 DEFINE CLASS

- Function 164
- Syntax Description 164

```
DEFINE CLASS class-name
[ OBJECT    { USING { local-data-area      } } ] ...
            {       { parameter-data-area  } }
            { data-definition ...            }
[ LOCAL     { USING { local-data-area      } } ] ...
            {       { parameter-data-area  } }
            { data-definition                }
[ INTERFACE USING copycode ] ...
[ INTERFACE                ]
[PROPERTY ] ...
[METHOD ] ...
END-CLASS
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CREATE OBJECT | INTERFACE | METHOD | PROPERTY | SEND METHOD

Belongs to Function Group: ***Component Based Programming***

Function

The DEFINE CLASS statement is used to specify a class from within a Natural class module. A Natural class module consists of one DEFINE CLASS statement followed by an END statement.

Syntax Description

Syntax Element	Description
class-name	**Class Name:** This is the name that is used by clients to create objects of this class. The name can be up to a maximum of 32 characters long. The name may contain periods: this can be used to construct class names such as *company-name.application-name.class-name* Each part between the periods (...) must conform to the *Naming Conventions for User-Defined Variables*. If the class is planned to be used by clients written in different programming languages, the class name should be chosen in a way that it does not conflict with the naming conventions that apply in these languages.

Syntax Element	Description
OBJECT	**OBJECT Clause:** This clause is used to define the object data. The syntax of the OBJECT clause is the same as for the LOCAL clause of the DEFINE DATA statement. For further information, see the description of the LOCAL clause of the DEFINE DATA statement.
LOCAL	**LOCAL Clause:** This clause is only used to include globally unique IDs (GUIDs) in the class definition. GUIDs need only be defined if a class is to be registered with DCOM. GUIDs are mostly defined in a local data area. The syntax of the LOCAL clause is the same as for the LOCAL clause of the DEFINE DATA statement. For further information, see the description of the LOCAL clause of the DEFINE DATA statement.
ID	**ID Clause:** This clause is used to assign a globally unique ID to the class. The class GUID is the name of a GUID defined in the data area that is included by the LOCAL clause. The class GUID is a (named) alphanumeric constant. A GUID must be assigned to a class if it is to be registered with DCOM.
INTERFACE USING	**INTERFACE Clause:** This clause is used to include copycode that contains INTERFACE statements.
copycode	**Copycode:** The copycode used by the INTERFACE USING clause may contain one or more INTERFACE statements.
PROPERTY	**PROPERTY Statement:** The PROPERTY statement is used to assign an object data variable operand as the implementation to a property, outside an interface definition.
METHOD	**METHOD Statement:** The METHOD statement is used to assign a subprogram as the implementation to a method, outside an interface definition.
END-CLASS	**End of DEFINE CLASS Statement:** The Natural reserved word END-CLASS must be used to end the DEFINE CLASS statement.

28 DEFINE DATA

General Syntax

```
DEFINE DATA
 [GLOBAL USING global-data-area [WITH block[.block] ...]]
[    PARAMETER    { USING parameter-data-area                          } ] ...
                  { parameter-data-definition...                      }
[    OBJECT       { USING { local-data-area     }                      } ] ...
                  {       { parameter-data-area }                      }
                  { data-definition...                                 }
[    LOCAL        { USING { local-data-area     }                      } ] ...
                  {       { parameter-data-area }                      }
                  { data-definition...                                 }
 [INDEPENDENT AIV-data-definition ...]
[    CONTEXT      { USING { local-data-area     }                      } ]
                  {       { parameter-data-area }                      }
                  { context-data-definition ...                        }
END-DEFINE
```

The DEFINE DATA statement offers a number of clauses to declare data definitions for use within a Natural program, either by referencing predefined data definitions contained in a local data area (LDA), global data area (GDA) or paramater data area (PDA), or by writing in-line definitions.

The documentation for the `DEFINE DATA` statement is divided into the following sections:

- **Syntax Overview**
- **DEFINE DATA - General**

Specific Data Definitions:

- **Defining Local Data**
- **Defining Global Data**
- **Defining Parameter Data**
- **Defining Application-Independent Variables**
- **Defining Context Variables for Natural RPC**
- **Defining NaturalX Objects**

Clauses and Options:

- **Variable Definition**
- **View Definition**
- **Redefinition**
- **Handle Definition**
- **Array Dimension Definition**
- **Initial-Value Definition**
- **Initial/Constant Values for an Array**
- **EM, HD, PD Parameters for Field/Variable**

Examples:

- **Examples of DEFINE DATA Statement Usage**

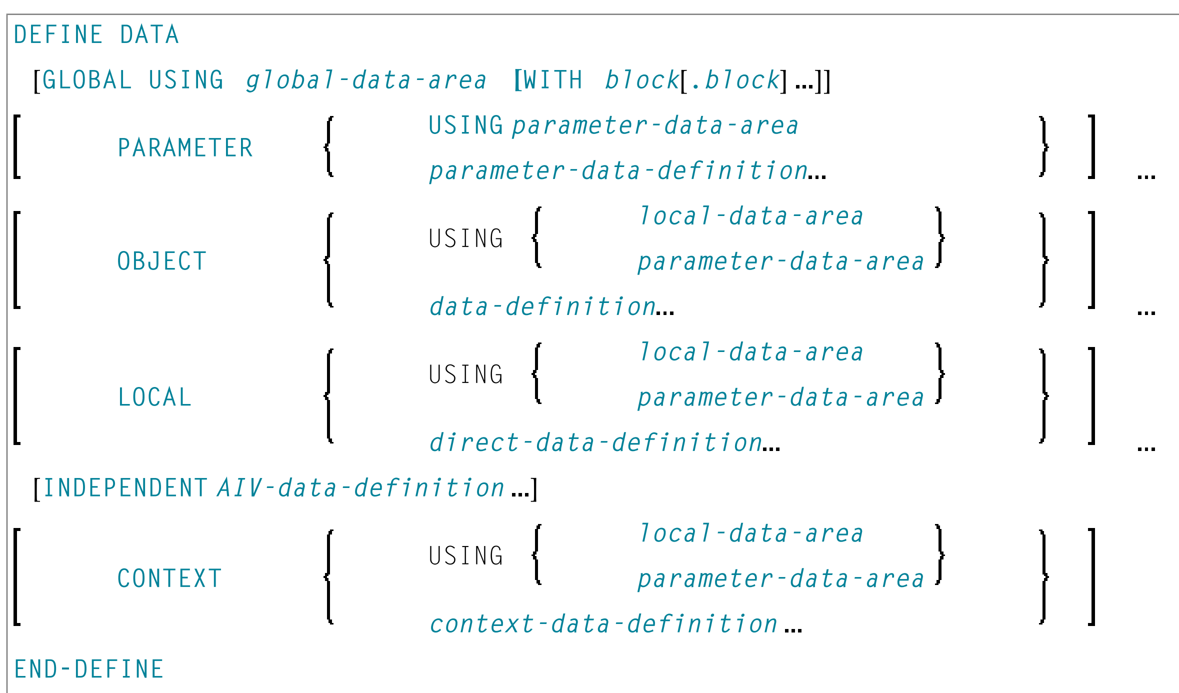
29 Syntax Overview

- General Syntax 170
- Basic Syntax Elements 170

This chapter contains a complete summary of the syntax boxes used in the DEFINE DATA statement descriptions.

It provides information about the way the keywords, clauses, parameters, options and other syntax elements are to be arranged and combined in the program statement lines.

General Syntax



```
DEFINE DATA
 [GLOBAL USING global-data-area [WITH block[.block] ...]]
[ PARAMETER { USING parameter-data-area
              parameter-data-definition... } ] ...
[ OBJECT    { USING { local-data-area
                      parameter-data-area }
              data-definition... } ] ...
[ LOCAL     { USING { local-data-area
                      parameter-data-area }
              direct-data-definition... } ] ...
 [INDEPENDENT AIV-data-definition ...]
[ CONTEXT   { USING { local-data-area
                      parameter-data-area }
              context-data-definition ... } ]
END-DEFINE
```

Basic Syntax Elements

The following topics are covered below:

- data-definition
- parameter-data-definition
- parameter-handle-definition
- variable-definition
- view-definition
- redefinition
- init-definition
- array-definition
- array-init-definition
- emhdpm

- AIV-data-definition
- context-data-definition

data-definition

```
         { group-name [(array-definition)]      }
         { variable-definition                  }
{ level  { view-definition                      } }
         { redefinition                         }
         { handle-definition                    }
```

For more information, see ***Defining Local Data*** or ***Defining NaturalX Objects***.

parameter-data-definition

```
        { group-name [(array-definition)]
        { redefinition
        {                   (format-length[/array-definition])                                  [BY VALUE
{ level {                 {   {  A  }                                                   }
        { variable-name   {  ( {  U  }  [(array-definition)] )      DYNAMIC                 }  [RESULT]]
        {                     {  B  }                                                          [OPTIONAL]
        { parameter-handle-definition [BY VALUE [RESULT]] [OPTIONAL]                                     }
```

For more information, see ***Defining Parameter Data***.

parameter-handle-definition

```
handle-name [(array-definition)] HANDLE OF OBJECT
```

For more information, see ***Parameter Handle Data Definition***.

variable-definition

```
{ <scalar-definition> }
{ <array-definition>  }
```

<*scalar-definition*>

```
                 ( (format-length)                  ) [ { CONSTANT }                 ]
variable-name    {                                  } [ {          }  init-definition ] [emhdpm]
                 ( ( { A } )  DYNAMIC               ) [ { INIT     }                 ]
                 (   { U }                          )
                 (   { B }                          )
```

<*array-definition*>

```
                 ( (format-length/ array-definition)                    ) [ { CONSTANT }                        ]
variable-name    {                                                      } [ {          }  array-init-definition ] [emhdpm]
                 ( ( { A } /array-definition )  DYNAMIC                 ) [ { INIT     }                        ]
                 (   { U }                                              )
                 (   { B }                                              )
```

For more information, see ***Variable Definition***.

view-definition

```
view-name      [        ( ddm-field [ { ([format-length][/array-definition])                     } [emhdpm] ] ]
VIEW [OF]      [ level  {           [ { ( { A }  [/array-definition] )     DYNAMIC               }          ] } ] ...
ddm-name       [        (           [ {   { U }                                                  }          ] ]
               [        (                 { B }                                                             ] ]
               [        ( redefinition                                                                      ] ]
```

For more information, see ***View Definition***.

redefinition

```
                                 ( rgroup                                           )
REDEFINE field-name   {  level   { rfield (format-length [/array-definition])       }  } ...
                                 ( FILLER nX                                        )
```

For more information, see ***Redefinition***.

init-definition

```
<constant>
<system-variable>
FULL LENGTH <character-s>
LENGTH n <character-s>
```

For more information, see *Initial/Constant Values for Array*.

array-definition

```
{bound[:bound]},...3
```

For more information, see *Array Dimension Definition*.

array-init-definition

```
{ [[ ( { ALL | index[:index] | V },...3 ) ]] { { FULL LENGTH | LENGTH n } <character-s,...>
                                               < { constant | system-variable,... } > } } ...
```

For more information, see *Initial/Constant Values for an Array*.

emhdpm

```
([EM=value] [HD='text'] [PM=value])
```

For more information, see *EM, HD, PM Parameters for Field/Variable*.

AIV-data-definition

```
level { variable-definition
        redefinition
        handle-definition }
```

For more information, see *Defining Application-Independent Variables*.

context-data-definition

```
       ┌ variable-definition ┐
level  ┤ redefinition        ├
       └ handle-definition   ┘
```

For more information, see ***Defining Context Variables for Natural RPC***

30 DEFINE DATA - General

- Function 176
- Rules 176
- Programming Modes 176
- Further Information 177

Function

The `DEFINE DATA` statement offers a number of clauses to declare data definitions for use within a Natural program, either by referencing predefined data definitions contained in a local data area (LDA), global data area (GDA) or paramater data area (PDA), or by writing in-line definitions.

Rules

- When a `DEFINE DATA` statement is used, it must be the first statement of the program/routine.
- An "empty" `DEFINE DATA` statement is not allowed; in other words, at least one clause (`LOCAL`, `GLOBAL`, `PARAMETER`, `INDEPENDENT`, `CONTEXT` or `OBJECT`) must be specified and at least one field must be defined.
- You may specify more than one clause; in this case, the clauses must be specified in the order shown in the syntax diagrams.
- The Natural reserved word `END-DEFINE` must be used to end the `DEFINE DATA` statement.

Programming Modes

The `DEFINE DATA` statement is available in structured mode and in reporting mode. Differences are marked accordingly in the `DEFINE DATA` statement description.

Generally, the following applies:

- Structured Mode
- Reporting Mode

Structured Mode

All variables to be used, except **application-independent variables** (AIVs), must be defined in the `DEFINE DATA` statement; they must not be defined elsewhere in the program. If a `DEFINE DATA INDEPENDENT` statement is used, AIVs must not be defined elsewhere in the program.

Reporting Mode

The `DEFINE DATA` statement is not mandatory since variables may be defined in the body of the program. However, if a `DEFINE DATA LOCAL` statement is used in reporting mode, variables, except application-independent variables (AIVs), must not be defined elsewhere in the program; and if a `DEFINE DATA INDEPENDENT` statement is used, **application-independent variables** (AIVs) must not be defined elsewhere in the program.

Further Information

For further information on the `DEFINE DATA` statement, see the following sections in the *Programming Guide*:

- *Use and Structure of DEFINE DATA Statement*
- *Use of Data Areas*

31 Defining Local Data

- Function 180
- Restriction 180
- Syntax Description 180

General syntax of DEFINE DATA LOCAL:

```
[ LOCAL { USING { local-data-area        }              } ] ...
        {       { parameter-data-area    }              }
        { direct-data-definition ...                    }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The DEFINE DATA LOCAL statement is used to define the data elements that are to be used exclusively by a single Natural module in an application. These elements or fields can be defined in different ways:

- either within the DEFINE DATA LOCAL statement itself, using the *direct-data-definition* syntax (see ***Direct Data Definition***)
- or outside the program in a separate LDA (*Local Data Area*) or PDA (*Parameter Data Area*), with the DEFINE DATA LOCAL USING statement referencing that data area.

Restriction

The LDA and the objects which reference it must be contained in the same library (or in a steplib).

Syntax Description

Syntax Element	Description
local-data-area	**LDA Name:** Specify the name of the local data area (LDA) to be referenced. An LDA is created using the *Data Area Editor*. It contains predefined data elements which can be included in the DEFINE DATA LOCAL statement.

Syntax Element	Description

	You may reference more than one data area; in that case you have to repeat the reserved words LOCAL and USING, for example:
	
	`DEFINE DATA LOCAL`
	`  LOCAL USING DATX_L`
	`  LOCAL USING DATX_P`
	
	`  ...`
	`END-DEFINE ;`
	
	For further information, see also *Defining Fields in a Separate Data Area* and *Local Data Area, Example 2* in the *Programming Guide*.

parameter-data-area	**PDA Name:** Specify the name of a parameter data area (PDA). **Note:** A data area referenced with DEFINE DATA LOCAL may also be a parameter data area (PDA). By using a PDA as an LDA you can avoid the extra effort of creating an LDA that has the same structure as the PDA. A PDA is created using the *Data Area Editor*. For further information, see *Parameter Data Area* in the *Programming Guide*.
direct-data-definition	**Direct Data Definition:** For information on how to define elements or fields within the statement itself, that is, without using an LDA or PDA, see the section ***Direct Data Definition*** below.
END-DEFINE	**End of DEFINE DATA Statement:** The Natural reserved word END-DEFINE must be used to end the DEFINE DATA statement.

Direct Data Definition

Local data can be defined directly within a program or routine. For direct data definition, the following syntax applies:

```
        group-name [(array-definition)]
        variable-definition
  level view-definition
        redefinition
        handle-definition
```

For further information, see

- *Example 1 - DEFINE DATA LOCAL* (Direct Data Definition)
- *Defining Fields within a DEFINE DATA Statement* in the *Programming Guide*
- *Local Data Area, Example 1* in the *Programming Guide*

Syntax Element Description for Direct Data Definition:

Syntax Element	Description
level	**Level Number:** Level number is a 1- or 2-digit number in the range from 01 to 99 (the leading zero is optional) used in conjunction with field grouping. Fields assigned a level number of 02 or greater are considered to be a part of the immediately preceding group which has been assigned a lower level number. The definition of a group enables reference to a series of fields (may also be only 1 field) by using the group name. With certain statements (`CALL`, `CALLNAT`, `RESET`, `WRITE`, etc.), you may specify the group name as a shortcut to reference the fields contained in the group. A group may consist of other groups. When assigning the level numbers for a group, no level numbers may be skipped. A view-definition must always be defined at Level 1.
group-name	**Group Name:** The name of a group. The name must adhere to the rules for defining a Natural variable name. See also the following sections: ■ *Naming Conventions for User-Defined Variables* in *Using Natural*. ■ *Qualifying Data Structures* in the *Programming Guide*.
array-definition	**Array Dimension Definition:** With an *array-definition*, you define the lower and upper bounds of dimensions in an array-definition. See *Array Dimension Definition*.
variable-definition	**Variable Definition:** A *variable-definition* is used to define a single field/variable that may be single-valued (scalar) or multi-valued (array). See *Variable Definition*.
view-definition	**View Definition:**

Syntax Element	Description
	A *view-definition* is used to define a view as derived from a data definition module (DDM). See ***View Definition***.
redefinition	**Redefinition:** A *redefinition* may be used to redefine a group, a view, a DDM field or a single field/variable (that is a scalar or an array). See ***Redefinition***.
handle-definition	**Handle Definition:** A handle identifies a dialog element in code and is stored in handle variables. See ***Handle Definition***.

32 Defining Global Data

- Function 186
- Syntax Description 186

General syntax of DEFINE DATA GLOBAL:

```
DEFINE DATA
  GLOBAL USING global-data-area [WITH block[.block...]]
END-DEFINE
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The DEFINE DATA GLOBAL statement is used to define data elements using a GDA (see Global Data Area).

Syntax Description

Syntax Element	Description
USING *global-data-area*	**GDA Name:** Specify the name of a global data area (GDA) to be referenced. A GDA is created using the *Data Area Editor*. It contains predefined data elements which can be included in the DEFINE DATA LOCAL statement. In contrast to an LDA, the data elements defined in a GDA can be referenced by more than one programming object. For further information, see Global Data Area in the *Programming Guide*.
WITH *block*	**Data Blocks:** To save data storage space, you can create a global data area with data blocks. Data blocks can overlay one another during program execution, thereby saving storage space. The maximum number of block levels is 8 (including the master block). For further information, see *Data Blocks* in the *Programming Guide*.
.*block*	**Block(s) to be Used:** A single or multiple .*block* notations specify the block(s) which are used in the program.
END-DEFINE	**End of DEFINE DATA Statement:** The Natural reserved word END-DEFINE must be used to end the DEFINE DATA statement.

33 Defining Parameter Data

- Function 188
- Restrictions 188
- Syntax Description 188

General syntax of DEFINE DATA PARAMETER:

```
[ PARAMETER { USING parameter-data-area           } ] ...
            { parameter-data-definition...         }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The DEFINE DATA PARAMETER statement is used to define the data elements that are to be used as incoming parameters in a Natural subprogram, external subroutine, helproutine or function. These parameters can be defined within the statement itself (see ***Parameter Data Definition*** below); or they can be defined outside the program in a **parameter data area** (PDA), with the statement referencing that data area.

Restrictions

- Parameter data elements must not be assigned initial or constant values, and they must not have edit mask (EM), header (HD) or print mode (PM) definitions; see also ***EM, HD, PM Parameters for Field/Variable***.
- The parameter data area and the objects which reference it must be contained in the same library (or in a steplib).

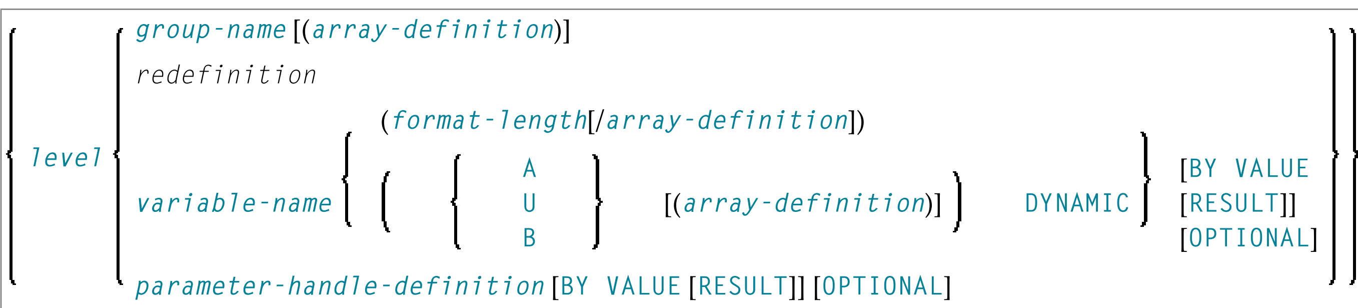
Syntax Description

Syntax Element	Description
USING *parameter-data-area*	**PDA Name:** The name of the *parameter-data-area* that contains data elements which are used as parameters in a subprogram, external subroutine or dialog.
parameter-data-definition	**Direct Parameter Data Definition:** Instead of defining a parameter data area, parameter data can also be defined directly within a program or routine. See ***Direct Parameter Data Definition*** below.
END-DEFINE	**End of DEFINE DATA Statement:**

Syntax Element	Description
	The Natural reserved word END-DEFINE must be used to end the DEFINE DATA statement.

Direct Parameter Data Definition

For direct parameter data definition, the following syntax applies:



Syntax Element Description:

Syntax Element	Description
level	**Level Number:** Level number is a 1- or 2-digit number in the range from 01 to 99 (the leading zero is optional) used in conjunction with field grouping. Fields assigned a level number of 02 or greater are considered to be a part of the immediately preceding group which has been assigned a lower level number. The definition of a group enables reference to a series of fields (may also be only 1 field) by using the group name. With certain statements (CALL, CALLNAT, RESET, WRITE, etc.), you may specify the group name as a shortcut to reference the fields contained in the group. A group may consist of other groups. When assigning the level numbers for a group, no level numbers may be skipped.
group-name	**Group Name:** The name of a group. The name must adhere to the rules for defining a Natural variable name. See also the following sections: ■ *Naming Conventions for User-Defined Variables* in *Using Natural*. ■ *Qualifying Data Structures* in the *Programming Guide*.
array-definition	**Array Dimension Definition:**

Syntax Element	Description
	With an *array-definition*, you define the lower and upper bounds of dimensions in an array-definition. For further information, see ***Array Dimension Definition*** and ***Variable Arrays in a Parameter Data Area***.
redefinition	**Redefinition:** A *redefinition* may be used to redefine a group or a single field/variable (that is a scalar or an array). See ***Redefinition***. **Note:** In a *parameter-data-definition*, a redefinition of groups is only permitted within a REDEFINE block.
variable-name	**Variable Name:** The name to be assigned to the variable. Rules for Natural variable names apply. For information on naming conventions for user-defined variables. For further information, see *Naming Conventions for User-Defined Variables* in *Using Natural*.
format-length	**Format/Length Definition:** The format and length of the field. For information on format/length definition of user-defined variables. For further information, see *Format and Length of User-Defined Variables* in the *Programming Guide*.
A, U or B	**Data Type:** Alphanumeric (A), Unicode (U) or binary (B) for dynamic variable.
DYNAMIC	**DYNAMIC Option:** A parameter may be defined as DYNAMIC. For further information on processing dynamic variables, see *Introduction to Dynamic Variables and Fields* in the *Programming Guide*.
	Call Mode: Depending on whether call-by-reference, call-by-value or call-by-value-result is used, the appropriate transfer mechanism is applicable. For further information, see the CALLNAT statement.
(without BY VALUE)	**Call-by-Reference:** Call-by-reference is active by default when you omit the BY VALUE keywords. In this case, a parameter is passed to a subprogram/subroutine by reference (that is, via its address); therefore a field specified as parameter in a CALLNAT/PERFORM statement must have the same format/length as the corresponding field in the invoked subprogram/subroutine.

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td rowspan="3">BY VALUE</td><td colspan="2">Call-by-Value:

When you specify BY VALUE, a parameter is passed to a subprogram/subroutine by value; that is, the actual parameter value (instead of its address) is passed. Consequently, the field in the subprogram/subroutine need not have the same format/length as the CALLNAT/PERFORM parameter. The formats/lengths must only be data transfer compatible. For data transfer compatibility, the Rules for Arithmetic Assignment and Data Transfer apply (see Programming Guide).

BY VALUE allows you, for example, to increase the length of a field in a subprogram/subroutine (if this should become necessary due to an enhancement of the subprogram/subroutine) without having to adjust any of the objects that invoke the subprogram/subroutine.</td></tr>
<tr><td colspan="2">Example of BY VALUE:</td></tr>
<tr><td>* Program
DEFINE DATA LOCAL
1 #FIELDA (P5)
...
END-DEFINE
...
CALLNAT 'SUBR01' #FIELDA
...</td><td>* Subroutine SUBR01
DEFINE DATA PARAMETER
1 #FIELDB (P9) BY VALUE
END-DEFINE
...</td></tr>
<tr><td>BY VALUE RESULT</td><td colspan="2">Call-by-Value-Result:

While BY VALUE applies to a parameter passed to a subprogram/subroutine, BY VALUE RESULT causes the parameter to be passed by value in both directions; that is, the actual parameter value is passed from the invoking object to the subprogram/subroutine and, on return to the invoking object, the actual parameter value is passed from the subprogram/subroutine back to the invoking object.

With BY VALUE RESULT, the formats/lengths of the fields concerned must be data transfer compatible in both directions.</td></tr>
<tr><td>OPTIONAL</td><td colspan="2">Optional Parameters:

For a parameter defined without OPTIONAL (default), a value must be passed from the invoking object.

For a parameter defined with OPTIONAL, a value can, but need not be passed from the invoking object to this parameter.

In the invoking object, the notation nX is used to indicate parameters which are skipped, that is, for which no values are passed.

With the SPECIFIED option you can find out at run time whether an optional parameter has been defined or not.</td></tr>
<tr><td>parameter-handle-definition</td><td colspan="2">Parameter Handle Definition:</td></tr>
</table>

Syntax Element	Description
	See the section ***Parameter Handle Definition*** below.

Parameter Handle Definition

Syntax of *parameter-handle-definition*:

```
handle-name [(array-definition)] HANDLE OF OBJECT
```

Syntax Element Description:

Syntax Element	Description
handle-name	**Handle Name:** The name to be assigned to the handle; the naming conventions for user-defined variables apply. For further information, see *Naming Conventions for User-Defined Variables* in *Using Natural*.
HANDLE OF OBJECT	**Handle of Object:** Is used in conjunction with NaturalX as described in the section *NaturalX* of the *Programming Guide*.
array-definition	**Array Dimension Definition:** With an *array-definition*, you define the lower and upper bounds of dimensions in an array-definition. For further information, sse ***Array Dimension Definition***.

34 Defining Application-Independent Variables

- Function 194
- Syntax Description 194

General syntax of DEFINE DATA INDEPENDENT:

```
DEFINE DATA
  INDEPENDENT AIV-data-definition...
END-DEFINE
```

For an explanation of the symbols used in the syntax diagrams, see ***Syntax Symbols***.

Function

The DEFINE DATA INDEPENDENT statement is used to define application-independent variables (AIVs).

An application-independent variable is referenced by its name, and its content is shared by all programming objects executed within one application that refer to that name. The variable is allocated by the first executed programming object that references this variable and is deallocated by the LOGON command or a RELEASE VARIABLES statement.

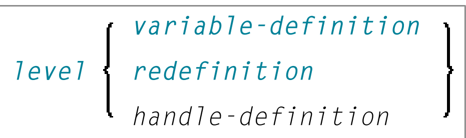
The optional INIT clause is evaluated in each executed programming object that contains this clause (not only in the programming object that allocates the variable).

Note: In an RPC server, application-independent variables (AIVs) are not deallocated implicitly, but stay active across RPC requests, because different clients may have access to the same variables on the RPC server. This means they must be deallocated explicitly using the RELEASE VARIABLES statement. See *Application-Independent Variables* in the *Natural Remote Procedure Call* documentation.

Syntax Description

Syntax Element	Description
INDEPENDENT *AIV-data-definition*	**AIV Data Definition:** The DEFINE DATA INDEPENDENT statement can be used to define a single or multiple application-independent variables (AIVs). For each AIV, the syntax shown in ***AIV Data Definition*** applies.
END-DEFINE	**End of DEFINE DATA Statement:** The Natural reserved word END-DEFINE must be used to end the DEFINE DATA statement.

AIV Data Definition



Syntax Element Description:

Syntax Element	Description
level	**Level Number:** An application-independent variable must be defined at Level 01. Other levels are only used in a redefinition.
variable-definition	**Variable Definition** A *variable definition* is used to define a single field/variable that may be single-valued (scalar) or multi-valued (array). For further information, see ***Variable Definition***. **Note:** The name of an application-independent variable must start with a plus (+) character.
redefinition	**Redefinition:** With a *redefinition*, you can partition an application-independent variable into one or more subfields. For further information, see ***Redefinition***. The subfields resulting from the redefinition must not be application-independent variables; that is, their name must not start with a plus sign (+). These fields are treated as local variables.
handle-definition	**Handle Definition:** A handle identifies a dialog element in code and is stored in handle variables. For further information, see ***Handle Definition***.

Note: The first character of the name must be a plus (+). Rules for Natural variable names apply, see *Naming Conventions for User-Defined Variables* in *Using Natural*.

35 Defining Context Variables for Natural RPC

- Function 198
- Restrictions 199
- Syntax Description 199

General syntax of DEFINE DATA CONTEXT:

```
[          { USING     { local-data-area      }   } ]
[ CONTEXT  {           { parameter-data-area  }   } ] ...
[          {                                      } ]
[          { context-data-definition ...          } ]
```

For an explanation of the symbols used in the syntax diagrams, see ***Syntax Symbols***.

Belongs to Function Group: ***Natural Remote Procedure Call***

Function

The DEFINE DATA CONTEXT statement is used in conjunction with the Natural Remote Procedure Call (RPC). It is used to define variables known as context variables, which are meant to be available to multiple remote subprograms within one conversation, without having to explicitly pass the variables as parameters with the corresponding CALLNAT statements.

A context variable is referenced by its name, and its content is shared by all programming objects executed in one conversation that refer to that name. The variable is allocated by the first executed programming object that contains the definition of the variable and is deallocated when the conversation ends.

Context variables can also be used in a non-conversational CALLNAT. In this case, the context variables only exist during a single invocation of this CALLNAT but the variables can be shared with all its callees.

A context variable is not shared with subprograms that are called within the conversation. If such a subprogram or one of its callees references a context variable, a separate storage area is allocated for this variable.

The optional INIT clause is evaluated in each executed programming object that contains this clause (not only in the programming object that allocates the variable). This is different to the way the INIT works for global variables.

For further information, see *Defining a Conversation Context* in the *Natural Remote Procedure Call* documentation.

Restrictions

A context variable must be defined at Level 01. Other levels are only used in a redefinition.

Syntax Description

Syntax Element	Description

USING *local-data-area*	**LDA Name:**
	
	A local data area (LDA) contains data elements which are to be used in a single Natural module. You may reference more than one data area; in that case you have to repeat the reserved words CONTEXT and USING, for example:
	
	`DEFINE DATA`
	`  CONTEXT USING DATX_L`
	`  CONTEXT USING DATX_P`
	
	`  ...`
	`END-DEFINE ;`
	
	For further information, see *Defining Fields in a Separate Data Area* in the *Programming Guide*.

USING *parameter-data-area*	**PDA Name:** A parameter data area contains data elements which are used as parameters in a subprogram, external subroutine or dialog.
context-data-definition	**Context Data Definition:** Context data can be defined directly within a program or routine. For direct data definition, the syntax shown **below** applies.
END-DEFINE	**End of DEFINE DATA Statement:** The Natural reserved word END-DEFINE must be used to end the DEFINE DATA statement.

Context Data Definition

Context data can be defined directly within a program or routine. For direct data definition, the following syntax applies:

```
level { variable-definition }
      { redefinition        }
      { handle-definition   }
```

For further information, see *Defining Fields within a DEFINE DATA Statement* in the *Programming Guide*.

Syntax Element	Description
level	**Level Number:** An application-independent variable must be defined at Level 01. Other levels are only used in a redefinition.
variable-definition	**Variable Definition:** A *variable-definition* is used to define a single field/variable that may be single-valued (scalar) or multi-valued (array). For further information, see ***Variable Definition***. **Note:** The CONSTANT clause must not be used in this context
redefinition	**Redefinition:** A *redefinition* may be used to redefine a group, a view, a DDM field or a single field/variable (that is a scalar or an array). For further information, see ***Redefinition***.
handle-definition	**Handle Definition:** A handle identifies a dialog element in code and is stored in handle variables. For further information, see ***Handle Definition***.

Note: The fields resulting from the redefinition are not considered a context variable. These fields are treated as local variables.

36 Defining NaturalX Objects

- Function 202
- Syntax Description 202

General syntax of DEFINE DATA OBJECT:

```
[ OBJECT { USING { local-data-area     } } ] ...
         {       { parameter-data-area } }
         { data-definition...            }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The DEFINE DATA OBJECT statement is used in a subprogram or class in conjunction with NaturalX. For further information, refer to the section *NaturalX* in the *Programming Guide*.

Syntax Description

Syntax Element	Description

USING *local-data-area*	**LDA Name:**
	
	A local data area (LDA) contains data elements which are to be used in a single Natural module. You may reference more than one data area; in that case you have to repeat the reserved words OBJECT and USING, for example:
	
	`DEFINE DATA`
	`  OBJECT USING DATX_L`
	`  OBJECT USING DATX_P`
	
	`  ...`
	`END-DEFINE ;`
	
	For further information, see also *Defining Fields in a Separate Data Area* in the *Programming Guide*.

USING *parameter-data-area*	**PDA Name:** A data area defined with DEFINE DATA OBJECT may be a parameter data area (PDA). By using a PDA as an object data area you can avoid the extra effort of creating an object data area that has the same structure as the PDA.
data-definition	**Direct Data Definition:** Data can also be defined directly using the syntax shown in ***Direct Data Definition***.
END-DEFINE	**End of DEFINE DATA Statement:**

Syntax Element	Description
	The Natural reserved word `END-DEFINE` must be used to end the `DEFINE DATA` statement.

Direct Data Definition

Data can also be defined directly using the following syntax:

```
{ level { group-name [(array-definition)]  } }
        { variable-definition              }
        { view-definition                  }
        { redefinition                     }
        { handle-definition                }
```

For further information, see *Defining Fields within a DEFINE DATA Statement* in the *Programming Guide*.

Syntax Element	Description
level	**Level Number:** Level number is a 1- or 2-digit number in the range from 01 to 99 (the leading zero is optional) used in conjunction with field grouping. Fields assigned a level number of 02 or greater are considered to be a part of the immediately preceding group which has been assigned a lower level number. The definition of a group enables reference to a series of fields (may also be only 1 field) by using the group name. With certain statements (`CALL`, `CALLNAT`, `RESET`, `WRITE`, etc.), you may specify the group name as a shortcut to reference the fields contained in the group. A group may consist of other groups. When assigning the level numbers for a group, no level numbers may be skipped. A view-definition must always be defined at Level 1.
group-name	**Group Name:** The name of a group. The name must adhere to the rules for defining a Natural variable name. See also the following sections: ■ *Naming Conventions for User-Defined Variables* in *Using Natural*. ■ *Qualifying Data Structures* in the *Programming Guide*.
array-definition	**Array Dimension Definition:**

Syntax Element	Description
	With an *array-definition*, you define the lower and upper bounds of dimensions in an array-definition. For further information, see ***Array Dimension Definition***.
variable-definition	**Variable Definition:** A *variable-definition* is used to define a single field/variable that may be single-valued (scalar) or multi-valued (array). For further information, see ***Variable Definition***.
view-definition	**View Definition:** A *view-definition* is used to define a view as derived from a data definition module (DDM). For further information, see ***View Definition***.
redefinition	**Redefinition:** A *redefinition* may be used to redefine a group, a view, a DDM field or a single field/variable (that is a scalar or an array). For further information, see ***Redefinition***.
handle-definition	**Handle Definition:** A handle identifies a dialog element in code and is stored in handle variables. For further information, see ***Handle Definition***.

37 Variable Definition

- Function 206
- Syntax Description 206

The *variable-definition* option is used with DEFINE DATA LOCAL, DEFINE DATA INDEPENDENT, DEFINE DATA CONTEXT and DEFINE DATA OBJECT.

In the *variable-definition* option, you may specify either a *scalar-definition* or an *array-definition*:

```
{ <scalar-definition> }
{ <array-definition>  }
```

<scalar-definition>

```
              { (format-length)               }
variable-name {                               } [ { CONSTANT } init-definition ] [emhdpm]
              { ( { A } )   DYNAMIC           }   { INIT     }
              {   { U }                       }
              {   { B }                       }
```

<array-definition>

```
              { (format-length/ array-definition)                  } [ { CONSTANT }                      ]
variable-name {                                                    } [ { INIT     } array-init-definition ] [emhdpm]
              { ( { A } /array-definition )   DYNAMIC              }
              {   { U }                                            }
              {   { B }                                            }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

A *variable-definition* is used to define a single field/variable that may be single-valued (scalar) or multi-valued (array).

Syntax Description

Syntax Element	Description
variable-name	**Variable Name:** The name to be assigned to the variable. Rules for Natural variable names apply. With DEFINE DATA INDEPENDENT, the variable name must begin with a plus character (+).

Syntax Element	Description
	For information on naming conventions for user-defined variables, see *Naming Conventions for User-Defined Variables* in *Using Natural*.
format-length	**Format/Length Definition:** For information on format/length definition of user-defined variables, see *Format and Length of User-Defined Variables* in the *Programming Guide*.
A, U or B	**Data Type:** Alphanumeric (A), Unicode (U) or binary (B) for dynamic variables.
array-definition	**Array Dimension Definition:** With an *array-definition*, you define the lower and upper bounds of dimensions in an array-definition. For further information, see ***Array Dimension Definition***.
DYNAMIC	**DYNAMIC Option:** A field may be defined as DYNAMIC. For more information on processing dynamic variables, see *Introduction to Dynamic Variables and Fields*.
CONSTANT	**CONSTANT Option:** The variable/array is to be treated as a named constant. The constant value(s) assigned will be used each time the variable/array is referenced. The value(s) assigned cannot be modified during program execution. See also *Defining Fields*, *User-Defined Constants*, *Defining Named Constants* in the *Programming Guide*. **Note:** For reasons of internal handling, it is not allowed to mix variable definitions and constant definitions within one group definition; that is, a group may contain either variables only or constants only. The CONSTANT clause must not be used with DEFINE DATA INDEPENDENT and DEFINE DATA CONTEXT. The CONST clause cannot be used with X-arrays.
INIT	**INIT Option:** The variable/array is to be assigned an initial value. This value will also be used when this variable/array is referenced in a RESET INITIAL statement. If no INIT specification is supplied, a field will be initialized with a default initial value depending on its format (see table ***Default Initial Values*** below). For further information, see *Defining Fields*, *Initial Values* in the *Programming Guide*. **Note:** With DEFINE DATA INDEPENDENT and DEFINE DATA CONTEXT, the INIT clause is evaluated in each executed programming object that contains

Syntax Element	Description
	this clause (not only in the programming object that allocates the variable). This is different to the way the `INIT` works for global variables. The `INIT` clause cannot be used with X-arrays.
init-definition	**Initial-Value Definition:** With the *init-definition* option, you define the initial/constant values for a variable. See ***Initial-Value Definition***.
array-init-definition	**Initial/Constant Values for an Array:** With an *array-init-definition*, you define the initial/constant values for an array. For further information, see ***Initial/Constant Values for an Array***.
emhdpm	**EM, HD, PM Parameters for Field/Variable:** With this option, additional parameters to be in effect for a field/variable may be defined. For further information, see ***EM, HD, PM Parameters for Field/Variable***.

Default Initial Values

The following table shows the default initial values that are provided with the various formats:

Format	Default Initial Value
B, F, I, N, P	`0`
A, U	(blank)
L	`FALSE`
D	`D' '`
T	`T'00:00:00'`
C	(`AD=D`)
Object Handle	`NULL-HANDLE`

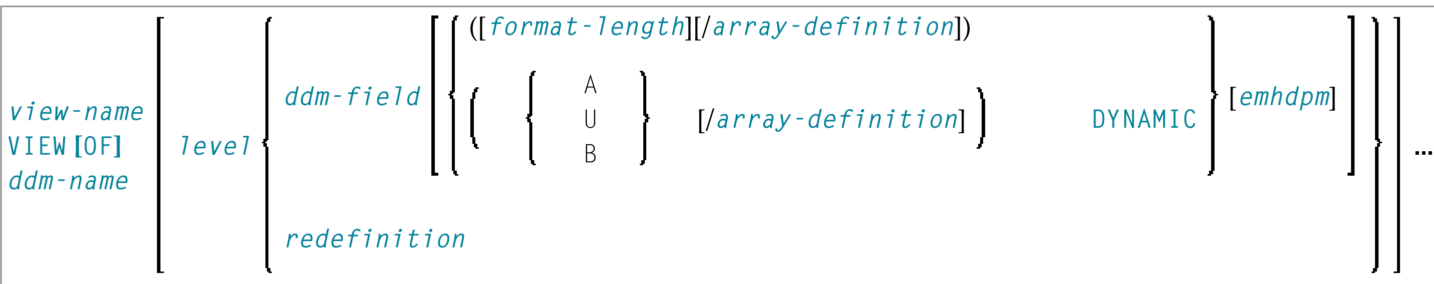
Fields declared as `DYNAMIC` do not have any initial value because their field length is zero by default.

38 View Definition

- Function 210
- Syntax Description 210

The *view-definition* option is used with DEFINE DATA LOCAL and DEFINE DATA OBJECT.

The *view-definition* option has the following syntax:



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

A *view-definition* is used to define a data view as derived from a data definition module (DDM).

Note: In a parameter data area, *view-definition* is not permitted.

For further information, see *Accessing Data in an Adabas Database* in the *Programming Guide* and particularly the following topics:

- *Data Definition Modules - DDMs*
- *Database Arrays*
- *Datenbank-View definieren*

Syntax Description

Syntax Element	Description
view-name	**View Name:** The name to be assigned to the view. Rules for Natural variable names apply; see *Naming Conventions for User-Defined Variables* in *Using Natural*.
VIEW [OF] *ddm-name*	**DDM Name:** The name of the data definition module (DDM) from which the view is to be taken.
level	**Level Number:**

Syntax Element	Description
	Level number is a 1- or 2-digit number in the range from 01 to 99 (the leading zero is optional) used in conjunction with field grouping. Fields assigned a level number of 02 or greater are considered to be a part of the immediately preceding group which has been assigned a lower level number. The definition of a group enables reference to a series of fields (may also be only one field) by using the group name. With certain statements (`CALL`, `CALLNAT`, `RESET`, `WRITE`, etc.), you may specify the group name as a shortcut to reference the fields contained in the group. A group may consist of other groups. When assigning the level numbers for a group, no level numbers may be skipped.
ddm-field	**DDM Field Name:** The name of a field to be taken from the DDM. When you define a view for a `HISTOGRAM` statement, the view must contain only the descriptor for which `HISTOGRAM` is to be executed.
redefinition	**Redefinition:** A *redefinition* may be used to redefine a group, a view, a DDM field or a single field/variable (that is a scalar or an array). For further information, see ***Redefinition***.
format-length	**Format/Length Definition:** Format and length of the field. If omitted, these are taken from the DDM. In structured mode, the definition of format and length (if supplied) must be the same as those in the DDM. In reporting mode, the definition of format and length (if supplied) must be type-compatible with those in the DDM.
`A`, `U` or `B`	**Data Type:** Alphanumeric (A), Unicode (U) or binary (B) for dynamic variables. **Note:** 1. For Adabas on mainframe computers, format U is available for LA fields (length <= 16381 bytes), but not for LB fields (length: <= 1 GB). 2. Format B is not available with Adabas.
array-definition	**Array Definition:** Depending on the programming mode used, arrays (periodic-group fields, multiple-value fields) may have to contain information about their occurrences. For further information, see ***Array Definition in a View*** below.

Syntax Element	Description
emhdpm	**EM, HD, PM Parameters for Field/Variable:** With this option, additional parameters to be in effect for a field/variable may be defined. See ***EM, HD, PM Parameters for Field/Variable***.
DYNAMIC	**DYNAMIC Option:** Defines a view field as DYNAMIC. For further information on processing dynamic variables, see *Introduction to Dynamic Variables and Fields* in the *Programming Guide*.

Array Definition in a View

Depending on the programming mode used, arrays (periodic-group fields, multiple-value fields) may have to contain information about their occurrences.

- Structured Mode
- Reporting Mode

Structured Mode

If a field is used in a view that represents an array, the following applies:

- An index value must be specified for MU/PE fields
- When no format/length specification is supplied, the values are taken from the DDM.
- When a format/length specification is supplied, it must be the same as in the DDM.

Database-Specific Considerations in Structured Mode:

Adabas:	If MU/PE fields (defined in a DDM) are to be used inside a view, these fields must include an array index specification. For an MU field or ordinary PE field, you specify a one-dimensional index range, e.g. (1:10). For an MU field inside a PE group, you specify a two-dimensional index range, e.g. (1:10,1:5).		
Tamino:	**DDM definition**	**allowed**	**not allowed**
	A(*:X2)	A(*:Y2) Y2=<X2 A(Y1:Y2) Y2>Y1 Y2=<X2 A(Z:Z+Y) Y>=0	A(*:*) A(Y1:*)

	`A(X1:*)`	`A(Y1:*) Y1>=X1`
		`A(Y1:Y2) Y2>=X1, Y1>=X1`
		`A(Z:Z+Y) Y>=0`
			`A(*:*)`
			`A(*:Y2)`

	`A(X1:X2)`	`A(Y1:Y2) Y2<Y1`
		`A(Z:Z+Y) 0=<Y>=X2-X1+1`
			`A(*:*)`
			`A(Y1:*)`
			`A(*:Y2)`

Examples for Structured Mode:

```
DEFINE DATA LOCAL
1 EMP1 VIEW OF EMPLOYEES
  2 NAME(A20)
  2 ADDRESS-LINE(A20 / 1:2)

1 EMP2 VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE(1:2)

1 EMP3 VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE(2)

1 #K (I4)
1 EMP4 VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE(#K:#K+1)
END-DEFINE
END
```

Reporting Mode

In this mode, the same rules are valid as for structured mode, however, there are two exceptions:

- An index value needs not be supplied. In this case, the index range for the missing dimensions is set to (1:1).
- The format/length specification may differ from the specification in the DDM. Then the definition of format and length must be type-compatible with those in the DDM.

Examples:

```
DEFINE DATA LOCAL
1 EMP1 VIEW OF EMPLOYEES
  2 NAME(A30)
  2 ADDRESS-LINE(A35 / 5:10)

1 EMP2 VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE(A40)        /* ADDRESS LINE (1:1) IS ASSUMED

1 EMP3 VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE             /* ADDRESS LINE (1:1) IS ASSUMED

1 #K (I4)
1 EMP4 VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE(#K:#K+1)
END-DEFINE
END
```

39 Redefinition

- Function 216
- Restrictions 216
- Syntax Description 217

The `redefinition` option is used with `DEFINE DATA LOCAL`, `DEFINE DATA PARAMETER`, `DEFINE DATA INDEPENDENT`, `DEFINE DATA CONTEXT` and `DEFINE DATA OBJECT`.

The `redefinition` option has the following syntax:

```
REDEFINE field-name { level { rgroup                                         } } ...
                            { rfield (format-length [/array-definition])   }
                            { FILLER nX                                     }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

A `redefinition` may be used to redefine a group, a view, a DDM field or a single field/variable (that is a scalar or an array).

Notes:

1. A `redefinition` of a view or a DDM field is not applicable to a `parameter-data-definition`.
2. Unicode fields should not be redefined as alphanumeric (A) or numeric (N) fields.

See also *Redefining Fields* in the *Programming Guide*.

Restrictions

- Handles, X-arrays and dynamic variables cannot be redefined and cannot be contained in a redefinition clause.
- A group that contains a handle, X-array or a dynamic variable can only be redefined up to - but not including or beyond - the element in question.

Syntax Description

Syntax Element	Description
field-name	**Name of Field to be Redefined:** The name of the group, view, DDM field or single field that is being redefined.
level	**Level Number of Field being Redefined:** Level number is a 1- or 2-digit number in the range from 01 to 99 (the leading zero is optional) used in conjunction with field grouping. Fields assigned a level number of 02 or greater are considered to be a part of the immediately preceding group which has been assigned a lower level number.
rgroup	**Name of Resulting Group:** The name of the group resulting from the redefinition. **Note:** In a *redefinition* within a *view-definition*, the name of *rgroup* must be different from any field name in the underlying DDM.
rfield	**Name of Name of Resulting** The name of the field resulting from the redefinition. **Note:** In a *redefinition* within a *view-definition*, the name of *rfield* must be different from any field name in the underlying DDM.
format-length	**Format/Length of Name of Resulting** The format and length of the resulting field (*rfield*).
array-definition	**Array Dimension Definition:** With an *array-definition*, you define the lower and upper bounds of dimensions in an array-definition. For further information, see ***Array Dimension Definition***.
FILLER *n*X	**Filler Byte Definition:** With this notation, you define *n* filler bytes - that is, segments which are not to be used - in the field that is being redefined. The definition of trailing filler bytes is optional.

Examples of REDEFINE Usage

Example 1:

```
   DEFINE DATA LOCAL
     01 #VAR1 (A15)
     01 #VAR2
        02 #VAR2A (N4.1)
INIT <0>
        02 #VAR2B (P6.2)
INIT <0>
     01 REDEFINE #VAR2
        02 #VAR2RD (A10)
   END-DEFINE
   ...
```

Example 2:

```
   DEFINE DATA LOCAL
   01 MYVIEW VIEW OF STAFF
      02 NAME
      02 BIRTH
      02 REDEFINE BIRTH
        03 BIRTH-YEAR  (N4)

         03 BIRTH-MONTH (N2)
         03 BIRTH-DAY   (N2)
   END-DEFINE
   ...
```

Example 3:

```
   DEFINE DATA LOCAL

   1 #FIELD (A12)
   1 REDEFINE #FIELD
     2 #RFIELD1 (A2)
     2 FILLER 2X
     2 #RFIELD2 (A2)
     2 FILLER 4X
     2 #RFIELD3 (A2)
   END-DEFINE
   ...
```

40 Handle Definition

- Function 220
- Syntax Description 220

The *handle-definition* is used with DEFINE DATA LOCAL, DEFINE DATA OBJECT, DEFINE DATA PARAMETER, DEFINE DATA INDEPENDENT and DEFINE DATA CONTEXT.

The *handle-definition* has the following syntax:

```
            { HANDLE OF  [        { CONSTANT }                    ] }
            { OBJECT     [        { INIT     } init-definition   ] }
handle-name {                                                         }
            { (array-definition) { OBJECT }    [[{ CONSTANT }                          ]] }
            { HANDLE OF                        [[{ INIT     } array-init-definition   ]] }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

A handle identifies a dialog element in code and is stored in handle variables. For further information, see *NaturalX* in the *Programming Guide*.

The HANDLE definition in the DEFINE DATA statement is generated automatically on the creation of a dialog element or dialog.

After having defined a handle, you can use the handle-name in any statement to query, set or modify attribute values for the defined dialog-element-type.

Examples of handle-definition:

```
1 #SAVEAS-MENUITEM HANDLE OF MENUITEM
1 #OK-BUTTON (1:10) HANDLE OF PUSHBUTTON
```

Syntax Description

Syntax Element	Description
handle-name	**Handle Name:** The name to be assigned to the handle; the naming conventions for user-defined variables apply. For further information, see *Naming Conventions for User-Defined Variables* in *Using Natural*.
HANDLE OF OBJECT	**Handle of Object:**

Syntax Element	Description
	Used in conjunction with NaturalX. For further information, see *NaturalX* in the *Programming Guide*.
`CONSTANT`	**CONSTANT Option:** The variable/array is to be treated as a named constant. The constant value(s) assigned will be used each time the variable/array is referenced. The value(s) assigned cannot be modified during program execution. **Note:** 1. For reasons of internal handling, it is not allowed to mix variable definitions and constant definitions within one group definition; that is, a group may contain either variables only or constants only. 2. The `CONSTANT` option must not be used with `DEFINE DATA INDEPENDENT` and `DEFINE DATA CONTEXT`.
`INIT`	**INIT Option:** The variable/array is to be assigned an initial value. This value will also be used when this variable/array is referenced in a `RESET INITIAL` statement. **Note:** With `DEFINE DATA INDEPENDENT` and `DEFINE DATA CONTEXT`, the `INIT` clause is evaluated in each executed programming object that contains this clause (not only in the programming object that allocates the variable). This is different to the way the `INIT` works for global variables.
init-definition	**Initial-Value Definition:** With the *init-definition* option, you define the initial/constant values for a variable. See ***Initial-Value Definition***.
array-definition	**Array Dimension Definition:** With an *array-definition*, you define the lower and upper bounds of dimensions in an array-definition. See ***Array Dimension Definition***.
array-init-definition	**Array Initial Value:** The array is to be assigned an initial value. This value will also be used when this array is referenced in a `RESET INITIAL` statement.

41 Array Dimension Definition

- Function 224
- Syntax Description 224

The `array-dimension-definition` is used in the statement `DEFINE DATA OBJECT` and in the *`variable-definition`* option of `DEFINE DATA LOCAL`, `DEFINE DATA INDEPENDENT`, `DEFINE DATA CONTEXT`, `DEFINE DATA OBJECT`.It is also used in the `DEFINE FUNCTION` statement.

The `array-dimension-definition` has the following syntax:

{*bound*[:*bound*]},... 3

Function

With an `array-dimension-definition`, you define the lower and upper bound of a dimension in an array-definition.

You can define up to 3 dimensions for an array.

See also *Arrays* in the *Programming Guide*.

Syntax Description

Syntax Element	Description
bound	**Lower/Upper Bound:** A bound can be one of the following: ■ a numeric integer constant; ■ a previously defined named constant; ■ (for database arrays) a previously defined user-defined variable; or ■ an asterisk (*) defines an extensible bound, otherwise known as an X-array (eXtensible array). If only one bound is specified, the value represents the upper bound and the lower bound is assumed to be 1.

X-Arrays

If at least one bound in at least one dimension of an array is specified as extensible, that array is then called an X-array (eXtensible array). Only one bound (either upper or lower) may be extensible in any one dimension, but not both. Multi-dimensional arrays may have a mixture of constant and extensible bounds, for example: `#a(1:100, 1:*)`.

Example:

```
DEFINE DATA LOCAL
1 #ARRAY1(I4/1:10)
1 #ARRAY2(I4/10)
1 #X-ARRAY3(I4/1:*)
1 #X-ARRAY4(I4/*,1:5)
1 #X-ARRAY5(I4/*:10)
1 #X-ARRAY6(I4/1:10,100:*,*:1000)
END-DEFINE
```

In the following table you can see the bounds of the arrays in the above program more clearly.

	Dimension1		Dimension2		Dimension3	
	Lower bound	Upper bound	Lower bound	Upper bound	Lower bound	Upper bound
#ARRAY1	1	10	-	-	-	-
#ARRAY2	1	10	-	-	-	-
#X-ARRAY3	1	eXtensible	-	-	-	-
#X-ARRAY4	1	eXtensible	1	5	-	-
#X-ARRAY5	eXtensible	10	-	-	-	-
#X-ARRAY6	1	10	100	eXtensible	eXtensible	1000

Examples of array definitions:

```
#ARRAY2(I4/10)                 /* a one-dimensional array with 10 occurrences (1:10)
#X-ARRAY4(I4/*,1:5)               /* a two-dimensional array
#X-ARRAY6(I4/1:10,100:*,*:1000)  /* a three-dimensional array
```

Variable Arrays in a Parameter Data Area

In a parameter data area, you may specify an array with a variable number of occurrences. This is done with the index notation `1:V`.

Example 1: `#ARR01 (A5/1:V)`

Example 2: `#ARR02 (I2/1:V,1:V)`

A parameter array which contains a variable index notation `1:V` can only be redefined in the length of

- its elementary field length, if the `1:V` index is right-most; for example:

  `#ARR(A6/1:V)` can be redefined up to a length of 6 bytes
  `#ARR(A6/1:2,1:V)` can be redefined up to a length of 6 bytes
  `#ARR(A6/1:2,1:3,1:V)` can be redefined up to a length of 6 bytes

- the product of the right-most fixed occurrences and the elementary field length; for example:

  `#ARR(A6/1:V,1:2)` can be redefined up to a length of 2*6 = 12 bytes
  `#ARR(A6/1:V,1:3,1:2)` can be redefined up to a length of 3*2*6 = 36 bytes
  `#ARR(A6/1:2,1:V,1:3)` can be redefined up to a length of 3*6 = 18 bytes

A variable index notation `1:V` cannot be used within a redefinition.

Example:

```
DEFINE DATA PARAMETER
 1 #ARR(A6/1:V)
 1 REDEFINE #ARR
   2 #R-ARR(A1/1:V)    /* (1:V) is not allowed in a REDEFINE block
END-DEFINE
```

As the number of occurrences is not known at compilation time, it must not be referenced with the index notation (*) in the statements `INPUT`, `WRITE`, `READ WORK FILE`, `WRITE WORK FILE`. Index notation (*) may be applied either to all dimensions or to none.

Valid examples:

```
#ARR01 (*)
#ARR02 (*,*)
#ARR01 (1)
#ARR02 (5,#FIELDX)
#ARR02 (1,1:3)
```

Invalid example:

```
#ARRAYY (1,*)  /* not allowed
```

To avoid runtime errors, the maximum number of occurrences of such an array should be passed to the subprogram/subroutine via another parameter. Alternatively, you may use the system variable `*OCCURRENCE`.

Notes:

1. If a parameter data area that contains an index `1:V` is used as a local data area (that is, specified in a `DEFINE DATA LOCAL` statement), a variable named `V` must have been defined as `CONSTANT`.
2. In a dialog, an index `1:V` cannot be used in conjunction with `BY VALUE`.

42 Initial-Value Definition

- Function 228
- Restriction 228
- Syntax Description 228

The *init-definition* option is used in the *variable-definition* option of DEFINE DATA LOCAL, DEFINE DATA INDEPENDENT, DEFINE DATA CONTEXT and DEFINE DATA OBJECT.

The *init-definition* option has the following syntax:

```
{ <constant>                  }
{ <system-variable>           }
{ FULL LENGTH <character-s>   }
{ LENGTH n <character-s>      }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

With the *init-definition* option, you define the initial/constant values for a variable.

Note: If, in the *variable-definition* option, the keyword INIT was used for the initialization, the value may be modified by any statement that affects the content of a variable. If the keyword CONST was used for the initialization, any attempt to change the value will be rejected by the compiler.

See also *Defining Fields*, *Initial Values* in the *Programming Guide*.

Restriction

For a redefined field, an *init-definition* is not permitted.

Syntax Description

Syntax Element	Description
<constant>	**Constant Value Option:** The constant value with which the variable is to be initialized; or the constant value to be assigned to the field. For further information, see *User-Defined Constants* in the *Programming Guide*.
<system-variable>	**System Variable Option:**

Syntax Element	Description
	The initial value for a variable may also be the value of a Natural system variable, for example: DEFINE DATA LOCAL 1 #MYDATE (D) INIT <*DATX> END-DEFINE **Note:** When the variable is referenced in a RESET INITIAL statement, the system variable is evaluated again; that is, it will be reset not to the value it contained when program execution started but to the value it contains when the RESET INITIAL statement is executed.
FULL LENGTH <*character-s*> LENGTH *n* <*character-s*>	**Character/String Option:** As initial value, a variable can be filled, entirely or partially, with a specific single character or string of characters; this is only possible for alphanumeric (code page or Unicode) variables. **FULL LENGTH Option:** With the FULL LENGTH option, the entire field will be filled with the specified *character* or *characters*. In the following example, the entire field will be filled with asterisks. DEFINE DATA LOCAL 1 #FIELD (A25) INIT FULL LENGTH <'*'> END-DEFINE **LENGTH Option:** With the LENGTH *n* option, the first *n* positions of the field will be filled with the specified *character* or *characters*. *n* must be a numeric constant. In the following example, the first 4 positions of the field will be filled with exclamation marks. DEFINE DATA LOCAL 1 #FIELD (A25) INIT LENGTH 4 <'!'> END-DEFINE

43 Initial/Constant Values for an Array

- Function 232
- Restriction 232
- Syntax Description 233

The *array-init-definition* option is used in the *variable-definition* option of DEFINE DATA LOCAL, DEFINE DATA INDEPENDENT, DEFINE DATA CONTEXT and DEFINE DATA OBJECT.

The *array-init-definition* option has the following syntax:

```
ALL                                         FULL LENGTH     <character-s ...>
[ ( index[:index] ,...3 ) ]                 LENGTH n
  ( V               )
                                            < { constant             } >
                                                system-variable,...
...
```

Function

With an *array-init-definition* you define the initial/constant values for an array.

Note: If, in the *variable-definition* option, the keyword INIT was used for the initialization, the value may be modified by any statement that affects the content of a variable. If the keyword CONST was used for the initialization, any attempt to change the value will be rejected by the compiler.

See also *Defining Fields* in the *Programming Guide*, particularly the following sections:

- *Initial Values*
- *User-Defined Constants*

Restriction

For a redefined field, an *array-init-definition* is not permitted.

Syntax Description

Syntax Element	Description
ALL	**ALL Option:** All occurrences in all dimensions of the array are initialized with the same value.
index	**Index Option:** Only the array occurrences specified by the *index* are initialized. If you specify *index*, you can only specify one value with *constant*; that is, all specified occurrences are initialized with the same value.
V	**V Notation:** This notation is only relevant for multidimensional arrays if the occurrences of one dimension are to be initialized with different values. V indicates an index range that comprises all occurrences of the dimension specified with V; that is, all occurrences in that dimension are initialized. Only one dimension per array may be specified with V. The occurrences are initialized occurrence by occurrence with the values specified for that dimension. The number of values must not exceed the number of occurrences of the dimension specified with V.
constant	**Constant Value Option:** The constant (value) with which the array is to be initialized (INIT), or the constant to be assigned to the array (CONSTANT). For further information, see *User-Defined Constants* in the *Programming Guide*. **Note:** Occurrences for which no values are specified, are initialized with a **default value**.
system-variable	**System Variable Option:** The initial value for an array may also be the value of a Natural system variable. **Note:** Multiple constant values/system variables must be separated either by the input delimiter character (as specified with the session parameter ID) or by a comma. A comma must not be used for this purpose, however, if the comma is defined as decimal character (with the session parameter DC).
FULL LENGTH LENGTH *n*	**Character/String Option:** As initial value, a variable can be filled, entirely or partially, with a specific single character or string of characters (only possible for variables of format A or U). **FULL LENGTH Option:**

Syntax Element	Description
	With FULL LENGTH, the entire array occurrence(s) are filled with the specified *character* or *characters*. With LENGTH *n*, the first *n* positions of the array occurrence(s) are filled with the specified *character* or *characters*. **LENGTH Option:** A *system-variable* must not be specified with FULL LENGTH or LENGTH *n*. Within one *array-init-definition*, only either FULL LENGTH or LENGTH *n* may be specified; both notations must not be mixed.

Example of LENGTH *n* for Array:

In this example, the first 5 positions of each occurrence of the array will be filled with NONON.

```
DEFINE DATA LOCAL
1 #FIELD (A25/1:3) INIT ALL LENGTH 5 <'NO'>
...
END-DEFINE
```

Numerous examples of assigning initial values to arrays are provided in *Initial Values (and the RESET Statement)* in the *Programming Guide*.

44 EM, HD, PM Parameters for Field/Variable

- Function 236
- Syntax Description 236

The *emhdpm* option is used in the *view-definition* option of DEFINE DATA LOCAL and DEFINE DATA OBJECT and in the *variable-definition* option of DEFINE DATA LOCAL, DEFINE DATA INDEPENDENT, DEFINE DATA CONTEXT and DEFINE DATA OBJECT.

The *emhdpm* option has the following syntax:

```
( [ EM=value  ] [HD='text'] [PM=value])
  [ EMU=value ]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

With this option, additional parameters to be in effect for a field/variable may be defined.

Note: If for a database field you specify neither an edit mask (EM= or EMU=) nor a header (HD=), the default edit mask and default header as defined in the data definition module (**DDM**) will be used. However, if you specify one of the two, the other's default from the DDM will *not* be used.

Syntax Description

Syntax Element	Description
EM=*value*	**Edit Mask:** The EM parameter may be used to define an edit mask used when the field is displayed with an I/O statement. For further information, see the session parameter EM in the *Parameter Reference*.
EMU=*value*	**Unicode Edit Mask:** The EMU parameter may be used to define a Unicode edit mask used when the field is displayed with an I/O statement. For further information, see the session parameter EMU in the *Parameter Reference*.
HD='*text*'	**Header Definition:** The HD parameter may be used to define the header to be used as the default header for the field. For further information, see the session parameter HD in the *Parameter Reference*.
PM=*value*	**Print Mode:**

Syntax Element	Description
	The PM parameter may be used to set the print mode, which indicates how fields are to be output. For further information, see the session parameter PM in the *Parameter Reference*.

45 Examples of DEFINE DATA Statement Usage

- Example 1 - DEFINE DATA LOCAL (Direct Data Definition) 240
- Example 2 - DEFINE DATA LOCAL (Array Definition/Initialization) 240
- Example 3 - DEFINE DATA (View Definition, Array Redefinition) 241
- Example 4 - DEFINE DATA (Global, Parameter and Local Data Areas) 242
- Example 5 - DEFINE DATA (Initialization) 243
- Example 6 - DEFINE DATA (Variable Array) 244

The following topics are covered:

Example 1 - DEFINE DATA LOCAL (Direct Data Definition)

```
** Example 'DDAEX1': DEFINE DATA
************************************************************************
DEFINE DATA LOCAL
1 #VAR1     (A15)
1 #VAR2
  2 #VAR2A  (N4.1) INIT <1111>
  2 #VAR2B  (N6.2) INIT <222222>
1 REDEFINE #VAR2
  2 #VAR2C  (A2)
  2 #VAR2D  (A2)
  2 #VAR2E  (A6)
END-DEFINE
*
WRITE NOTITLE '=' #VAR2A / '=' #VAR2B /
              '=' #VAR2C / '=' #VAR2D / '=' #VAR2E
*
END
```

Output of Program DDAEX1:

```
#VAR2A:  1111.0
#VAR2B:  222222.00
#VAR2C: 11
#VAR2D: 11
#VAR2E: 022222
```

Example 2 - DEFINE DATA LOCAL (Array Definition/Initialization)

```
** Example 'DDAEX2': DEFINE DATA (array definition/initialization)
************************************************************************
DEFINE DATA LOCAL
1 #VAR1 (A1/1:2,1:2) INIT (1,V)   <'A','B'>
1 #VAR2 (N5/1:2,1:3) INIT (1,2)   <200>
1 #VAR3 (A1/1:4,1:3) INIT (V,2:3) <'W','X','Y','Z'>
END-DEFINE
*
WRITE NOTITLE '=' #VAR1 (1,1) '=' #VAR1 (1,2)
            / '=' #VAR1 (2,1) '=' #VAR1 (2,2)
*
WRITE     /// '=' #VAR2 (1,1) '=' #VAR2 (1,2)
            / '=' #VAR2 (2,1) '=' #VAR2 (2,2)
```

```
*
WRITE     /// '=' #VAR3 (1,1) '=' #VAR3 (1,2) '=' #VAR3 (1,3)
WRITE       / '=' #VAR3 (2,1) '=' #VAR3 (2,2) '=' #VAR3 (2,3)
WRITE       / '=' #VAR3 (3,1) '=' #VAR3 (3,2) '=' #VAR3 (3,3)
WRITE       / '=' #VAR3 (4,1) '=' #VAR3 (4,2) '=' #VAR3 (4,3)
*
END
```

Output of Program DDAEX2:

```
#VAR1: A #VAR1: B
#VAR1:   #VAR1:

#VAR2:      0 #VAR2:    200
#VAR2:      0 #VAR2:      0

#VAR3:   #VAR3: W #VAR3: W

#VAR3:   #VAR3: X #VAR3: X

#VAR3:   #VAR3: Y #VAR3: Y

#VAR3:   #VAR3: Z #VAR3: Z
```

Example 3 - DEFINE DATA (View Definition, Array Redefinition)

```
** Example 'DDAEX3': DEFINE DATA (view definition, array redefinition)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE (A20/2)
  2 PHONE
*
1 #ARRAY    (A75/1:4)
1 REDEFINE #ARRAY
  2 #ALINE  (A25/1:4,1:3)
1 #X        (N2) INIT <1>
1 #Y        (N2) INIT <1>
END-DEFINE
*
FORMAT PS=20
LIMIT 5
FIND EMPLOY-VIEW WITH NAME = 'SMITH'
```

```
  MOVE NAME            TO #ALINE (#X,#Y)
  MOVE ADDRESS-LINE(1) TO #ALINE (#X+1,#Y)
  MOVE ADDRESS-LINE(2) TO #ALINE (#X+2,#Y)
  MOVE PHONE           TO #ALINE (#X+3,#Y)
  IF  #Y = 3
    RESET INITIAL #Y
    PERFORM PRINT
  ELSE
    ADD 1 TO #Y
  END-IF
  AT END OF DATA
    PERFORM PRINT
  END-ENDDATA
END-FIND
*
DEFINE SUBROUTINE PRINT
  WRITE NOTITLE (AD=OI) #ARRAY(*)
  RESET #ARRAY(*)
  SKIP 1
END-SUBROUTINE
*
END
```

Output of Program DDAEX3:

```

SMITH                    SMITH                    SMITH
ENGLANDSVEJ 222          3152 SHETLAND ROAD       14100 ESWORTHY RD.
                         MILWAUKEE                MONTERREY
554349                   877-4563                 994-2260

SMITH                    SMITH
5 HAWTHORN               13002 NEW ARDEN COUR
OAK BROOK                SILVER SPRING
150-9351                 639-8963
```

Example 4 - DEFINE DATA (Global, Parameter and Local Data Areas)

```
** Example 'DDAEX4': DEFINE DATA (global and local data area definition)
************************************************************************
DEFINE DATA
GLOBAL
  USING DDAEX4G
LOCAL
1 #FIELD1 (A10)
1 #FIELD2 (N5)
END-DEFINE
*
```

```
MOVE 'HELLO' TO #FIELD1
MOVE 123     TO #FIELD2
*
CALLNAT 'DDAEX4N' #FIELD1 #FIELD2
*
END
```

Global Data Area DDAEX4G Used by Program DDAEX4:

```
1 GLOBAL-FIELD                    A   10
```

Subprogram DDAEX4N Called by Program DDAEX4:

```
** Example 'DDAEX4N': DEFINE DATA PARAMETER (called by DDAEX4)
************************************************************************
DEFINE DATA
PARAMETER
1 #FIELDA (A10)
1 #FIELDB (N5)
END-DEFINE
*
WRITE '=' #FIELDA '=' #FIELDB
END
```

Output of Program DDAEX4:

```
Page      1                                                  05-01-12  08:55:53

#FIELDA: HELLO      #FIELDB:    123
```

Example 5 - DEFINE DATA (Initialization)

```
** Example 'DDAEX5': DEFINE DATA (initialization)
************************************************************************
DEFINE DATA LOCAL
1 #START-DATE (D)   INIT <*DATX>
1 #UNDERLINE  (A50) INIT FULL LENGTH <'_'>
1 #SCALE      (A65) INIT LENGTH 65 <'....+..../'>
END-DEFINE
*
WRITE NOTITLE #START-DATE (DF=L)
            / #UNDERLINE
            / #SCALE
END
```

Output of Program DDAEX5:

```
2005-01-12
________________________________________________________
....+..../....+..../....+..../....+..../....+..../....+..../....+
```

Example 6 - DEFINE DATA (Variable Array)

```
** Example 'DDAEX6': DEFINE DATA (variable array with (1:V))
************************************************************************
DEFINE DATA LOCAL
1 #ARRAY   (A1/1:10)
1 #MAX-ARR (P3)
END-DEFINE
*
#ARRAY (1) := 'R'
#ARRAY (2) := 'E'
#ARRAY (3) := 'D'
#MAX-ARR   := 4
*
WRITE #ARRAY(*)
*
CALLNAT 'DDAEX6N' #ARRAY(1:4) #MAX-ARR
*
WRITE #ARRAY(*)
*
*
#MAX-ARR   := 5
*
CALLNAT 'DDAEX6N' #ARRAY(1:5) #MAX-ARR
*
WRITE #ARRAY(*)
*
END
```

Subprogram DDAEX6N Called by Program DDAEX6:

```
** Example 'DDAEX6N': DEFINE DATA (variable array with (1:V))
************************************************************************
DEFINE DATA
PARAMETER
1 #STRING (A1/1:V)
1 #MAX    (P3)
END-DEFINE
*
IF #MAX = 4
  MOVE 'B' TO #STRING (1)
  MOVE 'L' TO #STRING (2)
```

```
  MOVE 'U' TO #STRING (3)
  MOVE 'E' TO #STRING (4)
END-IF
*
IF #MAX = 5
  MOVE 'W' TO #STRING (1)
  MOVE 'H' TO #STRING (2)
  MOVE 'I' TO #STRING (3)
  MOVE 'T' TO #STRING (4)
  MOVE 'E' TO #STRING (5)
END-IF
END
```

Output of Program DDAEX4:

```
Page      1                                                  05-01-12  09:06:43

46 DEFINE FUNCTION

- Function 248
- Syntax Description 248
- Example 250

```
DEFINE FUNCTION function-name
  [return-data-definition]
  [function-data-definition]
  statement...
END-FUNCTION
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The DEFINE FUNCTION statement may be used to create new user-defined functions which may be called instead of operands in the Natural statements. Functions can be defined inside the object type Function only.

For further information, see the following sections in the *Programming Guide*:

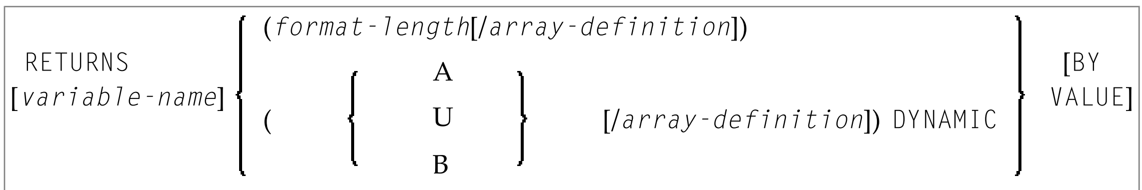
- Natural object type Function
- *Function Call*
- *User-Defined Functions*

Syntax Description

Syntax Element	Description
function-name	**Name of Natural Function:** *function-name* is the symbolic name of the Natural function which is to be defined. The name must follow the same rules as used for user-defined variables, see *Naming Conventions for User-Defined Variables* in the *Using Natural Studio* documentation. This means that the name may have a maximum length of 32 characters and may start with a letter or some special characters such as a hash (#). You may not use the same function name twice in one library (including the libraries of the STEPLIB mechanism). Function overloading is not allowed. This means that all function definitions must have unique function names.
return-data-definition	**Return Data Definition Clause:** For details on this clause, see ***Return Data Definition***.
function-data-definition	**Function Data Definition Clause:**

Syntax Element	Description
	For details on this clause, see ***Function Data Definition***.
statement...	**Statement(s) to be Executed:** In place of *statement*, you must supply one or several suitable statements, depending on the situation. For an example of a statement, see ***Example***.
END-FUNCTION	**End of DEFINE FUNCTION Statement:** The Natural reserved word END-FUNCTION must be used to terminate the DEFINE FUNCTION statement.

Return Data Definition



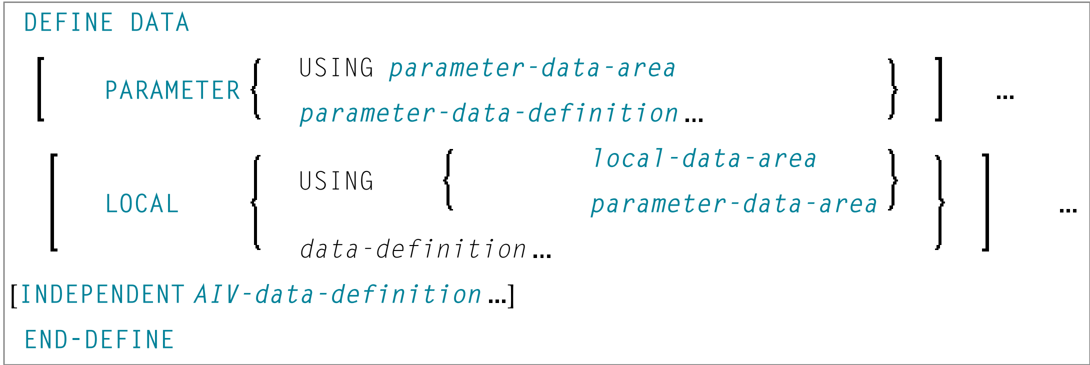
Syntax Element Description:

Syntax Element	Description
RETURNS	**RETURNS Clause:** Each function may contain only one definition of the return variable; that is, only one RETURNS clause is possible.
variable-name	**Return Value:** The return value may be assigned using the *variable-name*. If no explicit variable name is given in the definition, the name of the function is used as a return variable. The return value must not be an array.
BY VALUE	**Return Values by Value or by Reference:** Each parameter may be defined as BY VALUE RESULT or by reference, so that it is possible to return values to the caller using the parameters. Recursive function calls may be used inside a function definition. If you are using the BY VALUE keyword inside the RETURNS clause, the return value of the function will be converted into the return *format-length* which is set by the RETURNS clause.
format-length	**Format/Length Definition:** If the BY VALUE keyword is missing, the *format-length* of the RETURNS clause must match the *format-length* which is returned by the function evaluated at run time.
A, U or B	**Data Type:** Alphanumeric (A), Unicode (U) or binary (B).
array-definition	**Array Dimension Definition:**

Syntax Element	Description
	With *array-definition*, you define the lower and upper bounds of a dimension in an array-definition. For further information, see DEFINE DATA statement, ***Array Dimension Definition***.
DYNAMIC	**Dynamic Variable:** A parameter may be defined as DYNAMIC. For more information on processing dynamic variables, see *Introduction to Dynamic Variables and Fields*.

Function Data Definition

Each Function object may contain only one function data definition.



When a function calls another Natural object which uses a global data area, it establishes its own global data area (GDA). Therefore, it is not possible to modify the current GDA data of the calling object. A GDA cannot be defined in the function.

Example

Function object containing function definition:

```
DEFINE FUNCTION GET-FIRST-BYTE
  RETURNS (A1)
  DEFINE DATA PARAMETER
    1 #PARA (A10)
  END-DEFINE
  GET-FIRST-BYTE := #PARA /* return value is assigned
END-FUNCTION
END
```

47 DEFINE PRINTER

- Function 252
- Syntax Description 252
- Examples 254

```
DEFINE PRINTER ([logical-printer-name=]n)
 [OUTPUT operand1]
 [PROFILE operand2]
 [DISP operand2]
 [COPIES operand3]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The DEFINE PRINTER statement is used to assign a symbolic name to a report number and to control the allocation of a report to a logical destination. This provides you with additional flexibility when creating output for various logical print queues.

When this statement is executed and the specified printer is already open, the statement will implicitly cause that printer to be closed. To explicitly close a printer, however, you should use the CLOSE PRINTER statement.

Syntax Description

Operand Definition Table:

Operand	Possible Structure			Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C	S		A	yes	no
operand2	C	S		A	yes	no

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>(n)</td><td>Printer Number (Report Number):

The report number n may be a value in the range of 0 - 31. This is the number also to be used in a DISPLAY / WRITE or CLOSE PRINTER statement.

Report number 0 indicates the output channel of the main report. Only output statements such as PRINT, WRITE or DISPLAY are affected. The INPUT statement is not affected.</td></tr>
<tr><td>logical-printer-name</td><td>Logical Printer Name:

Optionally you can assign a logical name logical-printer-name to printer n. This name can be used for the rep notation in a DISPLAY / WRITE statement.

Naming conventions for logical-printer-name are the same as for user-defined variables. Multiple logical names may be assigned to the same printer number. Unlike the value of the OUTPUT operand (see below), logical-printer-name is evaluated at compilation time and therefore independent of the program control flow.</td></tr>
<tr><td>OUTPUT operand1</td><td>Printer Name:

If operand1 is a variable, its format/length must be A8 or one of the following. The name must be specified as LPTnn, where nn may be a number in the range of 1 - 31. See also Example 1.

Note: If the output data written to a report is to be sent to an Entire Connection terminal and then be written to an NCD file on a PC, one of the printer names LPTnn (where nn is a number in the range of 1 - 31) must be specified as operand1. The device assignments of logical printer LPTnn must be set in the Configuration Utility; see Device/Report Assignments. As Device Destination of the Physical Output Device, the value E (send data to an Entire Connection terminal) must be specified.

Additional reports can be assigned with the following names:
<table>
<tr><th>Report</th><th>Function</th></tr>
<tr><td>DUMMY</td><td>Output to be deleted.</td></tr>
<tr><td>INFOLINE</td><td>Output to the Natural infoline. For details on the infoline, see the Natural terminal command %X in the Terminal Commands documentation. See also Example 2.</td></tr>
<tr><td>SOURCE</td><td>Output to the Natural source area.</td></tr>
</table></td></tr>
<tr><td>PROFILE operand2</td><td>Name of Printer Control Characters Table:

With the PROFILE clause, you specify as operand2 the name of a printer control characters table. The maximum length allowed for operand2 is 8.</td></tr>
</table>

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td></td><td colspan="2">Such a table is defined in the global configuration file. See Printer Profiles in the Configuration Utility documentation for details on how to set printer profiles.</td></tr>
<tr><td rowspan="4"><code>DISP</code> operand2</td><td colspan="2">Disposition:

Maximum length of operand: 4 bytes.

Possible values for operand2:</td></tr>
<tr><td><code>DEL</code></td><td>The temporary spool file is deleted after its content has been printed.

This is the default value.</td></tr>
<tr><td><code>KEEP</code></td><td>The temporary spool file is not deleted after its content has been printed.</td></tr>
<tr><td><code>HOLD</code></td><td>The temporary spool file is neither deleted nor printed.</td></tr>
<tr><td><code>COPIES</code> operand3</td><td colspan="2">Number of Copies:

operand3 must be an integer value.</td></tr>
</table>

Examples

- Example 1 - Printer Name Definition
- Example 2 - Print Output to Infoline

Example 1 - Printer Name Definition

```
/* PRINTER NAME DEFINED FOR WINDOWS
*
DEFINE PRINTER (REPORT1 = 1) OUTPUT 'LPT1'
WRITE (REPORT1) 'REPORT 1 PRINTED ON PRINTER LPT1'
END
```

Example 2 - Print Output to Infoline

```
** Example 'DPIEX1': DEFINE PRINTER
************************************************************************
*
SET CONTROL 'XI+'        /* SWITCH INFOLINE MODE ON
SET CONTROL 'XT'         /* INFOLINE TOP
*
DEFINE PRINTER (1) OUTPUT 'INFOLINE'
WRITE (1) 'EXECUTING' *PROGRAM 'BY' *INIT-USER
WRITE 'TEST OUTPUT'
EJECT                    /* FORCE PHYSICAL I/O
```

```
*
SET CONTROL 'X'          /* SWITCH BACK TO NORMAL
*
END
```

Output of Program DPIEX1:

```

EXECUTING DPIEX1   BY HTR
Page      1                                                    05-01-13  14:54:33

TEST OUTPUT
```

48 DEFINE PROTOTYPE

- Function 258
- Syntax Description 258
- Example 260

```
DEFINE PROTOTYPE

   {  prototype-name                 }  [ UNKNOWN                                                  ]
   {  [FOR] VARIABLE                 }  [ signature-clause                                         ]
   {  prototype-variable-name        }  [ same-as-clause                                           ]
                                        [ [USING FUNCTION [DEFINITION [OF]] function-name          ]

END-PROTOTYPE
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statement: DEFINE FUNCTION

Function

The prototype definition may be used to specify a signature according to a certain function call. For each function call, the return type must be known, as well as the kind of the function call (VARIABLE). Therefore, this data must be available for each function call. If any of this data is missing, the prototype keyword must be used inside the function call reference. If there is a parameter definition inside the prototype, the parameter values of the function call are compared with the parameters of the prototype definition. If the parameters should not be checked, use the UNKNOWN keyword inside the DEFINE DATA PARAMETER statement of the prototype definition.

For further information, see the following sections in the *Programming Guide*:

- Natural object type Function
- *Function Call*
- *User-Defined Functions*

Syntax Description

Syntax Element	Description
prototype-name	The *prototype-name* must follow the same rules as those used for defining user-defined variables - with one exception: prototype names may contain periods (.). The *prototype-name* is completely arbitrary. It is not necessary for it to have the same name as a corresponding function definition. The maximum length of the whole *prototype-name* is 32 characters.
VARIABLE *prototype-variable-name*	The *prototype-variable-name* allows you to call functions using variable function names. This is similar to CALLNAT

Syntax Element	Description
	function calls. The *prototype-variable-name* is the name of an alphanumeric variable containing the real name of the function, which is to be called in the function reference.
UNKNOWN	If the parameters should not be checked, use the UNKNOWN keyword inside the DEFINE DATA PARAMETER statement of the prototype definition.
signature-clause	See ***Signature Clause*** below.
prototype-return-data-definition	See ***Prototype Return Data Definition*** below.
same-clause	See ***SAME AS Clause*** below.
USING FUNCTION [DEFINITION [OF]] *function-name*	See ***USING FUNCTION Clause*** below.
END-PROTOTYPE	The Natural reserved word END-PROTOTYPE must be used to terminate the DEFINE PROTOTYPE statement.

Signature Clause

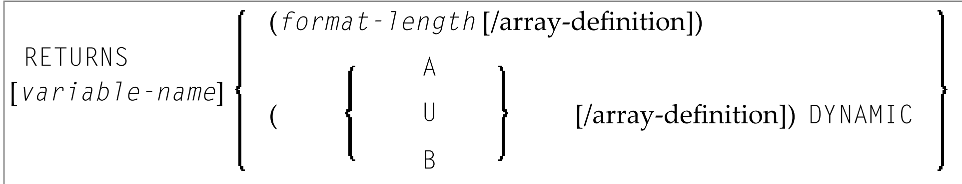
```
    [prototype-return-data-definition]
[   DEFINE DATA                                                          ]
[ { PARAMETER UNKNOWN                                                  } ]
[ {                                 { USING parameter-data-area     }  } ]
[ { PARAMETER                       { parameter-data-definition     } ... } ]
[   END-DEFINE                                                           ]
```

This clause looks like a certain function call. Normally, the prototype agrees with the function definition. But it does not need to be exactly the same. So it is possible to omit the parameter data and to set the keyword UNKNOWN instead. In this case, there will be no parameter checking at compilation time.

The type of the return value must be set in every case. If no return value is defined, there is no assignment allowed from the function call to a variable.

If no signature is specified inside a prototype definition (signature is UNKNOWN), the corresponding signature of a function call must be specified using the keyword PT. For further information about PT, see *Function Call*, section *prototype-cast* in the *Programming Guide*.

Prototype Return Data Definition



This clause defines the *format-length* of the return value which must be known at compilation time.

The optional variable name is ignored. It was introduced to have a syntax structure similar to the RETURNS clause of the DEFINE FUNCTION statement.

SAME AS Clause

SAME AS [PROTOTYPE]	{ *prototype-name* / *prototype-variable-name* }

This clause may be used in order to use signatures previously defined to define a new prototype.

USING FUNCTION Clause

[USING FUNCTION [DEFINITION [OF]] *function-name*]

This explicit clause offers you the possibility to analyze a generated object for function parameter definitions which will then be taken to create an indirect DEFINE PROTOTYPE statement under the logical name of that function. *function-name* is the logical name, but not the object name of the function object. The logical function name is defined in the function body of the corresponding function object: DEFINE FUNCTION *function-name* ... END-FUNCTION.

Example

- Example 1 - DEFINE PROTOTYPE

- Example 2 - DEFINE PROTOTYPE

Example 1 - DEFINE PROTOTYPE

This is a prototype definition of a function named GET-FIRST-BYTE. Using the following prototype, the function GET-FIRST-BYTE can be called as a symbolic function call:

```
GET-FIRST-BYTE(<#A>)
```

```
DEFINE DATA LOCAL
1 #A(A10) INIT <'abcdefghij'>
END-DEFINE
DEFINE PROTOTYPE GET-FIRST-BYTE
  RETURNS (A1)
  DEFINE DATA PARAMETER
  1 PARM1(A10)
  END-DEFINE
END-PROTOTYPE
WRITE GET-FIRST-BYTE(<#A>)
END
```

Example 2 - DEFINE PROTOTYPE

The following Natural code contains the prototype definition of a function, in this case GET-FIRST-BYTE. In order to be able to call the function dynamically, the name of the function must be stored inside the alphanumeric variable #A. The variable #A must be defined as an alphanumeric variable within the DEFINE DATA statement definition before it may be used.

```
DEFINE DATA LOCAL
1 FUNCTION-NAME(A32) INIT<'GET-FIRST-BYTE'>
1 #A(A10) INIT <'abcdefghij'>
END-DEFINE
DEFINE PROTOTYPE VARIABLE FUNCTION-NAME
  RETURNS (A1)
  DEFINE DATA PARAMETER
  1 PARM1(A10)
  END-DEFINE
END-PROTOTYPE
WRITE FUNCTION-NAME(<#A>)
END
```

49 DEFINE SUBROUTINE

- Function 264
- Restrictions 265
- Syntax Description 266
- Examples 266

```
DEFINE [SUBROUTINE] subroutine-name
            statement ...
{           END-SUBROUTINE (structured mode only)  }
            RETURN (reporting mode only)
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CALL | CALL FILE | CALL LOOP | CALLNAT | ESCAPE | FETCH | PERFORM

Belongs to Function Group: ***Invoking Programs and Routines***

Function

The DEFINE SUBROUTINE statement is used to define a Natural subroutine. A subroutine is invoked with a PERFORM statement.

Inline/External Subroutines

A subroutine may be defined within the object which contains the PERFORM statement that invokes the subroutine (**inline subroutine**); or it may be defined external to the object that contains the PERFORM statement (**external subroutine**). An inline subroutine may be defined before or after the first PERFORM statement which references it.

Note: Although the structuring of a program function into multiple external subroutines is recommended for achieving a clear program structure, please note that a subroutine should always contain a larger function block because the invocation of the external subroutine represents an additional overhead as compared with inline code or subroutines.

Data Available in a Subroutine

Inline Subroutines

No explicit parameters can be passed from the invoking program via the PERFORM statement to an internal subroutine.

An inline subroutine has access to the currently established global data area as well as to the local data area used by the invoking program.

External Subroutines

An external subroutine has access to the currently established global data area. In addition, parameters can be passed directly with the PERFORM statement from the invoking object to the external subroutine; thus, you may reduce the size of the global data area.

An external subroutine has no access to the local data area defined in the calling program; however, an external subroutine may have its own local data area.

Restrictions

- Any processing loop initiated within a subroutine must be closed before `END-SUBROUTINE` is issued.
- An inline subroutine must not contain another `DEFINE SUBROUTINE` statement (see ***Example 1*** below).
- An external subroutine (that is, an object of type subroutine) must not contain more than one `DEFINE SUBROUTINE` statement block (see ***Example 2*** below). However, an external `DEFINE SUBROUTINE` block may contain further inline subroutines (see ***Example 1*** below).

Example 1

The following construction is possible in an object of type subroutine, but not in any other object (where `SUBR01` would be considered an inline subroutine):

```
...
DEFINE SUBROUTINE SUBR01
   ...
   PERFORM SUBR02
   PERFORM SUBR03
   ...
   DEFINE SUBROUTINE SUBR02
   /* inline subroutine...
   END-SUBROUTINE
 ...
   DEFINE SUBROUTINE SUBR03
   /* inline subroutine...
   END-SUBROUTINE
END-SUBROUTINE
END
```

Example 2 (invalid):

The following construction is *not* allowed in an object of type subroutine:

```
...
DEFINE SUBROUTINE SUBR01
...
END-SUBROUTINE
DEFINE SUBROUTINE SUBR02
...
END-SUBROUTINE
END
```

Syntax Description

Syntax Element	Description
subroutine-name	**Name of Subroutine:** For a subroutine name (maximum 32 characters), the same naming conventions apply as for user-defined variables; see *Naming Conventions for User-Defined Variables* in the *Using Natural* documentation. The subroutine name is independent of the name of the module in which the subroutine is defined (it may but need not be the same).
statement	**Statement(s) to be Executed:** In place of *statement*, you must supply one or several suitable statements, depending on the situation. For an example of a statement, see ***Examples*** below.
END-SUBROUTINE RETURN	**End of DEFINE SUBROUTINE Statement:** In structured mode, the subroutine definition is terminated with END-SUBROUTINE. In reporting mode, RETURN may also be used to terminate a subroutine.

Examples

- Example 1 - Define Subroutine

- Example 2 - Sample Structure for External Subroutine Using GDA Fields

Example 1 - Define Subroutine

```
** Example 'DSREX1S': DEFINE SUBROUTINE (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE  (A20/2)
  2 PHONE
*
1 #ARRAY    (A75/1:4)
1 REDEFINE #ARRAY
  2 #ALINE  (A25/1:4,1:3)
1 #X        (N2) INIT <1>
1 #Y        (N2) INIT <1>
END-DEFINE
*
FORMAT PS=20
LIMIT 5
FIND EMPLOY-VIEW WITH NAME = 'SMITH'
  MOVE NAME            TO #ALINE (#X,#Y)
  MOVE ADDRESS-LINE(1) TO #ALINE (#X+1,#Y)
  MOVE ADDRESS-LINE(2) TO #ALINE (#X+2,#Y)
  MOVE PHONE           TO #ALINE (#X+3,#Y)
  IF  #Y = 3
    RESET INITIAL #Y
    PERFORM PRINT
  ELSE
    ADD 1 TO #Y
  END-IF
  AT END OF DATA
    PERFORM PRINT
  END-ENDDATA
END-FIND
*
DEFINE SUBROUTINE PRINT
  WRITE NOTITLE (AD=OI) #ARRAY(*)
  RESET #ARRAY(*)
  SKIP 1
END-SUBROUTINE
*
END
```

Output of Program DSREX1S:

```
SMITH                    SMITH                    SMITH
ENGLANDSVEJ 222          3152 SHETLAND ROAD       14100 ESWORTHY RD.
                         MILWAUKEE                MONTERREY
554349                   877-4563                 994-2260

SMITH                    SMITH
5 HAWTHORN               13002 NEW ARDEN COUR
OAK BROOK                SILVER SPRING
150-9351                 639-8963
```

Equivalent reporting-mode example: **DSREX1R**.

Example 2 - Sample Structure for External Subroutine Using GDA Fields

```
** Example 'DSREX2': DEFINE SUBROUTINE (using GDA fields)
************************************************************************
DEFINE DATA
GLOBAL
  USING DSREX2G
END-DEFINE
*
INPUT 'Enter value in GDA field' GDA-FIELD1
*
*  Call external subroutine in DSREX2S
*
PERFORM DSREX2-SUB
*
END
```

Global Data Area DSREX2G Used by Program DSREX2:

```
1 GDA-FIELD1                       A    2
```

Subroutine DSREX2S Called by Program DSREX2:

```
** Example 'DSREX2S': SUBROUTINE (external subroutine using global data)
************************************************************************
DEFINE DATA
GLOBAL
  USING DSREX2G
END-DEFINE
*
DEFINE SUBROUTINE DSREX2-SUB
*
  WRITE 'IN SUBROUTINE' *PROGRAM '=' GDA-FIELD1
*
```

```
END-SUBROUTINE
*
END
```

50 DEFINE WINDOW

- Function 272
- Syntax Description 273
- Protection of Input Fields in a Window 277
- Invoking Different Windows 277
- Example 277

```
DEFINE WINDOW window-name
[ SIZE { AUTO
         QUARTER
         operand1 * operand2 } ]
[ BASE { CURSOR
         { TOP    }  { LEFT  }
         { BOTTOM }  { RIGHT }
         operand3 / operand4 } ]
[REVERSED [(CD=background-color)]]
[TITLE operand5]
[ CONTROL { WINDOW
            SCREEN } ]
[ FRAMED { [ON] [(CD=frame-color)] [position-clause]
           OFF } ]
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: INPUT | REINPUT | SET WINDOW

Belongs to Function Group: *Screen Generation for Interactive Processing*

Function

The DEFINE WINDOW statement is used to specify the size, position and attributes of a window.

A window is that segment of a logical page, built by a program, which is displayed on the terminal screen. There is always a window present, although you may not be aware of its existence: unless specified differently, the size of the window is identical to the physical size of your terminal screen.

A DEFINE WINDOW statement does not activate a window; this is done with a SET WINDOW statement or with the WINDOW clause of an INPUT statement.

Note: There is always only *one* Natural window, that is, the most recent window. Any previous windows may still be visible on the screen, but are no longer active and are ignored by Natural. You may enter input only in the most recent window. If there is not enough space to enter input, the window size must be adjusted first.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S						N	P	I									yes	no
operand2	C	S						N	P	I									yes	no
operand3	C	S						N	P	I									yes	no
operand4	C	S						N	P	I									yes	no
operand5	C	S				A	U												yes	no

Syntax Element Description:

Syntax Element	Description
window-name	The *window-name* identifies the window. The name may be up to 32 characters long. For a window name, the same naming conventions apply as for user-defined variables, see *Naming Conventions for User-Defined Variables* in the *Using Natural* documentation.
SIZE	With the SIZE clause, you specify the size of the window. **Note:** On mainframe computers, Natural requires additional columns for so-called attribute bytes to be able to display data on the screen (on other platforms, such attribute bytes are not needed). Consequently, on mainframe computers the screen area overlaid by a window is wider, and the size of the page segment visible inside a window is smaller than on other platforms. Example: Assume a window whose size is defined as SIZE 5 * 15 (that is, with a width of 15 columns): ■ On mainframe computers, the screen area overlaid by the window is 16 columns; the size of what is visible inside the window is 14 columns without frame, and 10 columns with frame respectively. ■ On other platforms, the screen area overlaid by the window is 15 columns; the size of what is visible inside the window is 15 columns without frame, and 13 columns with frame respectively.
SIZE AUTO	The size of the window is determined automatically by Natural at runtime. The size is determined by the data generated into the window as follows: ■ The number of window lines will be the number of INPUT lines generated (plus possibly the PF-key lines, message line, and infoline/statistics line).

Syntax Element	Description

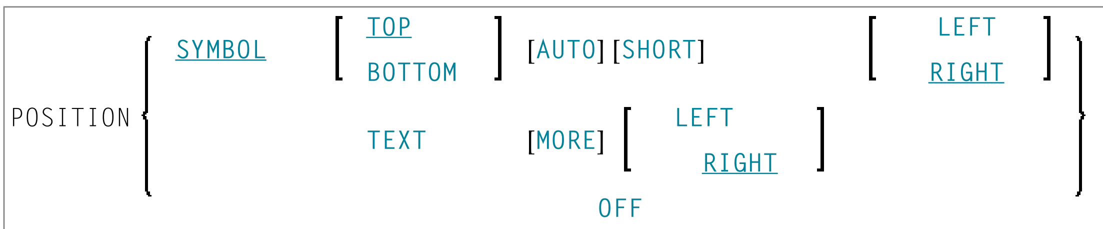
	■ The number of window columns is determined by the longest `INPUT` line: Natural scans, starting from the ends of the lines, for the rightmost significant byte in a line. This may cause an input-only or modifiable field (`AD=A` or `AD=M`) to be truncated; to avoid this, you either put a single-character text string after such a field or explicitly set the window size with the following:
	`SIZE operand1 *`
	`operand2`
	
	If you omit the `SIZE` clause, `SIZE AUTO` applies by default.
	
	Note: The title is not part of the window data. Therefore, if the window size has been determined as described above *and* the title is longer than the window, it will be truncated.

`SIZE QUARTER`	The size of the window will be one quarter of the physical screen.
`SIZE` *`operand1`* `*` *`operand2`*	The size of the window will be *n* lines by *n* columns. The number of lines is determined by *`operand1`*, the number of columns by *`operand2`*. Neither of the two operands must contain decimal digits. If the window is `FRAMED`, the specified size will be inclusive of the frame. The minimum possible window size is: ■ without frame: 2 lines by 10 columns, ■ with frame: 4 lines by 13 columns. The maximum possible window size is the size of the physical screen.
`BASE`	With the `BASE` clause, you determine the position of the window on the physical screen. If you omit the `BASE` clause, `BASE CURSOR` applies by default.
`BASE CURSOR`	Places the top left corner of the window at the current cursor position. The cursor position is the physical position of the cursor on the screen. If the size of the window makes it impossible to place the window at the cursor position, Natural automatically places the window as close as possible to the desired position.
`BASE TOP/BOTTOM LEFT/RIGHT`	Places the window at the top-left, bottom-left, top-right, or bottom-right corner respectively of the physical screen.
`BASE` *`operand3`*`/`*`operand4`*	This places the top left corner of the window at the specified line/column of the physical screen. The line number is determined by *`operand3`*, the column number by *`operand4`*. Neither of the two operands must contain decimal digits. If the size of the window makes it impossible to place the window at the specified position, you will get an error message.
`REVERSED`	`REVERSED` will cause the window to be displayed in reverse video (if the screen used supports this feature; if it does not, `REVERSED` will be ignored).

Syntax Element	Description
`REVERSED CD=` *`background-color`*	This will cause the window to be displayed in reverse video and the background of the window in the specified color (if the screen used supports these features; if it does not, the respective specification will be ignored). For information on valid color codes, see session parameter `CD` in the *Parameter Reference*.
`TITLE` *`operand5`*	With the `TITLE` clause, you may specify a heading for the window. The specified title (*`operand5`*) will be displayed centered in the top frame-line of the window. The title can be specified either as a text constant (in apostrophes) or as the content of a user-defined variable. If the title is longer than the window, it will be truncated. The title is only displayed if the window is `FRAMED`; if `FRAMED OFF` is specified for the window, the `TITLE` clause will be ignored. **Note:** If the title contains trailing blanks, these will be removed. If the first character of the title is a blank, one blank will automatically be appended to the title.
`CONTROL`	With the `CONTROL` clause, you determine whether the PF-key lines, the message line and the statistics line are displayed in the window or on the full physical screen.
`CONTROL WINDOW`	`CONTROL WINDOW` causes the lines to be displayed inside the window. If you omit the `CONTROL` clause, `CONTROL WINDOW` applies by default.
`CONTROL SCREEN`	`CONTROL SCREEN` causes the lines to be displayed on the full physical screen outside the window.
`FRAMED`	By default, that is, if you omit the `FRAMED` clause, the window is framed. The top and bottom frame lines are cursor-sensitive: where applicable, you can page forward, backward, left or right within the window by simply placing the cursor over the appropriate symbol (`<`, `-`, `+`, or `>`; see *`position-clause`* below) and then pressing ENTER. If no symbols are displayed, you can page backward and forward within the window by placing the cursor in the top frame line (for backward positioning) or bottom frame line (for forward positioning) and then pressing ENTER. **Note:** If the window size is smaller than 4 lines by 12 (or 13 on mainframe computers) columns, the frame will not be visible.
`FRAMED OFF`	If you specify `FRAMED OFF`, the framing and everything attached to the frame (window title and position information) will be switched off.
`FRAMED (CD=`*`frame-color`*`)`	This causes the frame of the window to be displayed in the specified color (if the screen used is a color screen; if it is not, the color specification will be ignored). For information on valid color codes, see session parameter `CD` (in the *Parameter Reference*). **Note:** In Natural for Windows, this specification is ignored.
`position-clause`	The `POSITION` clause is only evaluated on mainframe computers; on all other platforms it is ignored. For details, refer to ***Position Clause*** below.

POSITION Clause

The POSITION clause is only evaluated on mainframe computers; on all other platforms it is ignored.



The POSITION clause causes information on the position of the window on the logical page to be displayed in the frame of the window. This applies only if the logical page is larger than the window; if it is not, the POSITION clause will be ignored. The position information indicates in which directions the logical page extends above, below, to the left and to the right of the current window.

If the POSITION clause is omitted, POSITION SYMBOL TOP RIGHT applies by default.

Syntax Element Description:

Syntax Element	Description
POSITION SYMBOL	Causes the position information to be displayed in form of symbols: More: < - + >. The information is displayed in the top and/or bottom frame line.
TOP/BOTTOM	Determines whether the position information is displayed in the top or bottom frame line.
AUTO	Is only applicable if the logical page is fully visible in the window as far as its horizontal size is concerned, that is, if only a minus sign character (-) and/or a plus sign character (+) are to be displayed. In this case, AUTO automatically switches from the symbols to the words Top, Bottom and More respectively.
SHORT	Causes the word More: before the symbols < - + > to be suppressed.
LEFT/RIGHT	Determines whether the position information is displayed in the left or right part of the frame line.
POSITION TEXT	Causes the position information to be displayed in text form. The information is displayed in the top and/or bottom frame line with the words More,Top and Bottom. The text is language-dependent and may also be displayed in another language if the language code is set accordingly.
POSITION TEXT MORE	Suppresses the words Top and Bottom and only displays the word More where applicable, i.e., in the top or bottom frame line or both.
LEFT/RIGHT	Determines whether the position information is displayed in the left or right part of the top frame line.
POSITION OFF	Causes the position information to be suppressed; no position information will be displayed.

Protection of Input Fields in a Window

The following rules apply to input fields (with AD=A or AD=M) which are not entirely within the window:

- Input fields whose beginning is not inside the window are always made protected.
- Input fields which begin inside and end outside the window are only made protected if the values they contain cannot be displayed completely in the window. Please note that in this case it is decisive whether the *value length*, not the *field length*, exceeds the window size. Filler characters (as specified with the profile parameter FC) do not count as part of the value.

If you wish to access input fields thus protected, you have to adjust the window size accordingly so that the beginning of the field/end of the value is within the window.

Invoking Different Windows

A DEFINE WINDOW statement must not be placed within a logical condition statement block. To invoke different windows depending on a condition, use different SET WINDOW statements (or INPUT statements with a WINDOW clause respectively) in a condition.

Example

```
** Example 'DWDEX1': DEFINE WINDOW
************************************************************************
DEFINE DATA LOCAL
01 #I (P3)
END-DEFINE
*
SET KEY PF1='%W<<' PF2='%W>>' PF4='%W--' PF5='%W++'
*
DEFINE WINDOW WIND1
       SIZE QUARTER
       BASE TOP RIGHT
       FRAMED ON POSITION SYMBOL AUTO
*
SET WINDOW 'WIND1'
FOR #I = 1 TO 10
  WRITE 25X #I 'THIS IS SOME LONG TEXT' #I
END-FOR
*
END
```

Output of Program DWDEX1:

```
                                        +-----------------------More:     + >+
> r                                     ! Page      1                        !
All    ....+....1....+....2....+....3.. !                                    !
  0010 ** Example 'DWDEX1': DEFINE WIND !                             1 THIS  !
  0020 ******************************** !                             2 THIS  !
  0030 DEFINE DATA LOCAL                !                             3 THIS  !
  0040 01 #I (P3)                       !                             4 THIS  !
  0050 END-DEFINE                       !                             5 THIS  !
  0060 *                                !                             6 THIS  !
  0070 SET KEY PF1='%W<<' PF2='%W>>' PF !                             7 THIS  !
  0080 *                                ! MORE                               !
  0090 DEFINE WINDOW WIND1              +------------------------------------+
  0100        SIZE QUARTER
  0110        BASE TOP RIGHT
  0120        FRAMED ON POSITION SYMBOL AUTO
  0130 *
  0140 SET WINDOW 'WIND1'
  0150 FOR #I = 1 TO 10
  0160   WRITE 25X #I 'THIS IS SOME LONG TEXT' #I
  0170 END-FOR
  0180 *

```

51 DEFINE WORK FILE

- Function 280
- Syntax Description 280

```
DEFINE WORK FILE n { operand1 [TYPE operand2] } [ATTRIBUTES {operand3}...]
                   { TYPE operand2          }
```

Note: The elements shown in square brackets [...] are optional, however, at least one of them must be specified with this statement.

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `CLOSE WORK FILE` | `READ WORK FILE` | `WRITE WORK FILE`

Belongs to Function Group: ***Control of Work Files / PC Files***

Function

The statement `DEFINE WORK FILE` is used to assign a file name to a Natural work file number within a Natural application.

This allows you to make or change work file assignments dynamically within a Natural session or overwrite work file assignments made at another level.

When this statement is executed and the specified work file is already open, the statement will implicitly close the work file.

Note: For Unicode and code page support, see *Work Files and Print Files on Windows, UNIX and OpenVMS Platforms* in the *Unicode and Code Page Support* documentation.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S				A	U											yes	no
operand2	C	S				A	U											yes	no
operand3	C	S				A	U											yes	no

Note: If a format U operand is specified in Unicode (UTF-16), it is converted to session code page characters before it is evaluated.

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td><code>DEFINE WORK FILE n</code></td><td colspan="2">Work File Number:

n is the work file number (1 to 32). This is the number to be used in a <code>WRITE WORK FILE</code>, <code>READ WORK FILE</code> or <code>CLOSE WORK FILE</code> statement.</td></tr>
<tr><td>operand1</td><td colspan="2">Work File Name:

operand1 is the name of the work file.

The file name (operand1) may contain environment variables. It is possible to use physical work file names. If a file with the specified name does not exist, it will be created.

If operand1 is not specified, the value of operand1 is determined by taking the work file name stored with the Configuration Utility in the parameter file for the corresponding work file number.

Note: If operand1 is not specified, the behavior of Natural for Mainframes and Natural for Windows/UNIX/OpenVMS is different.</td></tr>
<tr><td rowspan="4"><code>TYPE</code> operand2</td><td colspan="2">TYPE Clause:

operand2 specifies the type of work file.

The value of operand2 is handled in a case insensitive way and must be enclosed in quotes or provided in an alphanumeric variable.</td></tr>
<tr><td><code>DEFAULT</code></td><td>Determines the file type from the extension.

Format: Depends on the work file type.

Note: The file type <code>TRANSFER</code> cannot be determined by the work file type <code>DEFAULT</code>. You must explicitly define <code>TRANSFER</code> as the file type you wish to use.</td></tr>
<tr><td><code>TRANSFER</code></td><td>Is used to transfer data to and from a PC with Entire Connection.

This work file type represents a data connection between a Natural session on UNIX or OpenVMS and an Entire Connection terminal on a PC.

Format: <code>ENTIRE CONNECTION</code>

Note:

1. This work file type cannot be used in conjunction with the ATTRIBUTES Clause.

2. This work file type is not available under Windows.</td></tr>
<tr><td><code>SAG</code></td><td>Format: binary</td></tr>
</table>

Syntax Element	Description	
	ASCII	Files in ASCII are "text" files with records terminated by [a carriage return] line feed. Format: ASCII
	ASCII-COMPRESSED	Is a file in ASCII format, with the exception that all trailing blanks are removed. Format: ASCII
	ENTIRECONNECTION	With this work file type, you can read and write (using the statements READ and WRITE, for example) directly from/to a work file in Entire Connection format on the local disc. Format: ENTIRE CONNECTION **Note:** This work file type is available on PCs, on UNIX and on OpenVMS. No transfer to PC is possible. The Entire Connection terminal is not used in this process.
	UNFORMATTED	A completely unformatted file. No formatting information is written (neither for fields nor for records). Format: UNFORMATTED
	PORTABLE	Files which can handle dynamic variables exactly and can also be transported: for example, from a Little Endian machine to a Big Endian machine, and vice versa. Format: PORTABLE
	CSV	Comma-separated values. Each record is written to one line in the file. By default, a header is not written. The default character which is used to separate the data fields is a semicolon (;). For further information, see *Work Files* in the *Configuration Utility* documentation.
ATTRIBUTES {*operand3*}...	**ATTRIBUTES Clause:** *operand3* specifies a work file attribute.	

Syntax Element	Description

Several attributes separated by a comma or a blank can be specified, for example:

```
DEFINE WORK FILE ATTRIBUTES 'APPEND,KEEP'
```

If multiple values for the same attribute type are specified, the last value is taken, for example:

```
DEFINE WORK FILE ATTRIBUTES 'APPEND,NOAPPEND'
```

In this case, `NOAPPEND` will be taken.

Example for `BOM/NOBOM` usage:

```
...
DEFINE WORK FILE 11 'x.tmp' ATTRIBUTES 'BOM'
*
* write work file with BOM
*
DEFINE WORK FILE 11 'x.tmp' ATTRIBUTES 'NOBOM'
*
* write work file without BOM
...
```

Note: If *operand3* is omitted, the corresponding value defined in the parameter file, as created by the Configuration Utility, is implicitly used.

The following is an overview of the attribute types and their possible values:

Enable/Disable Append Mode:	
APPEND	Activates the append mode. In this mode, new records are added at the end of the file.
NOAPPEND	Deactivates the append mode. The file is rewritten from the start. This is the default value.
Enable/Disable Write BOM Mode:	
BOM	Activates the write BOM (byte order mark) mode. A BOM will be written that precedes the work file data.
NOBOM	Deactivates the write BOM mode. No BOM will be written. This is the default value.
Keep/Delete File after Work File Close:	
DELETE	The work file is deleted after a close work file operation.
KEEP	The work file is kept after a close work file operation. This is the default value.

52 DELETE

- Function 286
- Restriction 286
- Syntax Description 286
- Database-Specific Considerations 287
- Examples 287

`DELETE [RECORD] [IN] [STATEMENT] [(r)]`

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The DELETE statement is used to delete a record from a database.

Hold Status

The use of the DELETE statement causes each record selected in the corresponding FIND or READ statement to be placed in hold status.

Record hold logic is explained in the section *Database Update - Transaction Processing* (in the *Programming Guide*).

Restriction

A DELETE statement cannot be specified in the same statement line as a FIND, READ, or GET statement.

Syntax Description

Syntax Element	Description
(*r*)	**Statement Reference:** The notation (*r*) is used to reference the statement which was used to select/read the record to be deleted. If no statement reference is specified, the DELETE statement will reference the innermost active processing loop in which a database record was selected/read.

Database-Specific Considerations

SQL Databases	The DELETE statement is used to delete a row from the database table. It corresponds with the SQL statement DELETE WHERE CURRENT OF CURSOR-NAME, that is, only the row which was read last can be deleted. With most SQL databases, a row that was read with a FIND SORTED BY or READ LOGICAL statement cannot be deleted.
XML Databases	The DELETE statement is used to delete an XML object from a database. For XML databases, this implies that only the record which was read last can be deleted.

Examples

- Example 1
- Example 2

Example 1

In this example, all records with the name ALDEN are deleted.

```
** Example 'DELEX1': DELETE
**
**
CAUTION: Executing this example will modify the database records!
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
END-DEFINE
*
FIND EMPLOY-VIEW WITH NAME = 'ALDEN'
  /*
  DELETE
  END TRANSACTION
  /*
  AT END OF DATA
    WRITE NOTITLE *NUMBER 'RECORDS DELETED'
  END-ENDDATA
END-FIND
END
```

Example 2

If no records are found in the VEHICLES file for the person named ALDEN, the EMPLOYEE record for ALDEN is deleted.

```
** Example 'DELEX2': DELETE
**
**
CAUTION: Executing this example will modify the database records!
***********************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
1 VEHIC-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
END-DEFINE
*
EMPL. FIND EMPLOY-VIEW WITH NAME = 'ALDEN'
  /*
 VEHC. FIND VEHIC-VIEW WITH PERSONNEL-ID = PERSONNEL-ID (EMPL.)
    IF NO RECORDS FOUND
      /*
      DELETE (EMPL.)
      /*
      END TRANSACTION
    END-NOREC
  END-FIND
  /*
END-FIND
END
```

53 DISPLAY

- Function 290
- Syntax Description 290
- Defaults Applicable for a DISPLAY Statement 302
- Examples 303

```
DISPLAY [(rep)] [options] {[/...] [output-format] output-element} ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The DISPLAY statement is used to specify the fields to be output on a report in column format. A column is created for each field and a field header is placed over the column.

Note: The statements WRITE and PRINT can be used to produce output in free (non-column) format.

See also the following topics (in the *Programming Guide*):

- *Controlling Data Output*
- *Statements DISPLAY and WRITE*
- *Index Notation for Multiple-Value Fields and Periodic Groups*
- *Column Headers*
- *Layout of an Output Page*

Syntax Description

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the DISPLAY statement is applicable. As report identification, a value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified. If (*rep*) is not specified, the statement will apply to the first report (Report 0). If this printer file is defined to Natural as PC, the report will be downloaded to the PC, see ***Example 8***.

Syntax Element	Description
	For information on how to control the format of an output report created with Natural, see *Controlling Data Output* in the *Programming Guide*.
options	**Display Options:** For details, see ***Display Options*** below.
output-format	**Output Format Definitions:** For details, see ***Output Format Definitions*** below.
/	**Line Advance - Slash Notation:** When specified within a text element, a slash (/) causes a line advance for the text displayed. When specified between output elements, it causes the output element specified by the slash (/) to be placed vertically within the same column. The header for this column will be constructed by placing the headers of the vertically displayed elements vertically above the column. See also the following topics in the *Programming Guide*: ■ *Line Advance - Slash Notation* ■ *Example 1 - Line Advance in DISPLAY Statement* ■ *Suppressing Column Headers - Slash Notation*
output-element	**Output Element:** For details, see ***Output Element*** below.

Display Options

```
[NOTITLE] [NOHDR] [ [AND] [GIVE] [SYSTEM] FUNCTIONS ] [(statement-parameters)]
```

Syntax Element Description:

Syntax Element	Description
NOTITLE	**Default Page Title Suppression:** By default, Natural generates a single title line for each page resulting from a DISPLAY statement. This title contains the page number, the time of day, and the date. Time of day is set at the beginning of the program execution or at the beginning of the job (batch mode). The default title line may be overridden by using a WRITE TITLE statement, or it may be suppressed by specifying the keyword NOTITLE in the DISPLAY statement.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>Examples:

■ Default title will be produced:

<code>DISPLAY NAME</code>

■ User title will be produced:

<code>DISPLAY NAME WRITE TITLE 'user-title'</code>

■ No title will be produced:

<code>DISPLAY NOTITLE NAME</code>

Note: If the NOTITLE option is used, it applies to all DISPLAY, PRINT and WRITE statements within the same object which write data to the same report.</td></tr>
<tr><td>NOHDR</td><td>Column Headers:

Column headers are produced for each field specified in the DISPLAY statement using the following rules:

■ The header text may be explicitly specified in the DISPLAY statement before the field name. For example:

<code>DISPLAY 'EMPLOYEE' NAME 'SALARY' SALARY</code>

■ If you do not specify an explicit header for a field, the header as defined in the DEFINE DATA statement will be used.
■ If for a database field no header is defined in the DEFINE DATA statement, the default header as defined in the DDM will be used.
■ If no default header is defined in the DDM, the field name will be used as header.
■ If for a user-defined variable no header is defined in the DEFINE DATA statement, the variable name will be used as header. See also the DEFINE DATA statement for header definition.

<code>DISPLAY NAME SALARY #NEW-SALARY</code>

■ Natural always underlines column headings and generates one blank line between the underlining and the data being displayed.
■ If there are multiple DISPLAY statements in a program, the first DISPLAY statement determines the column header(s) to be used; this is evaluated at compilation time.

Column Header Suppression:</td></tr>
</table>

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>To suppress the column header for a single field

■ Specify the following characters (apostrophe-slash-apostrophe) before the field name:

<code>'/'</code>

For example:

<code>DISPLAY '/' NAME 'SALARY' SALARY</code>

To suppress all column headers

■ Specify the keyword <code>NOHDR</code>:

<code>DISPLAY NOHDR NAME SALARY</code>

Note:

1. <code>NOHDR</code> only takes effect for the first <code>DISPLAY</code> statement, as subsequent <code>DISPLAY</code> statements cannot create column headers anyhow.
2. If both <code>NOTITLE</code> and <code>NOHDR</code> are used, they must be specified in the following order: <code>DISPLAY NOTITLE NOHDR NAME SALARY</code></td></tr>
<tr><td><code>GIVE SYSTEM FUNCTIONS</code></td><td>Natural System Function Usage:

The <code>GIVE SYSTEM FUNCTIONS</code> clause is used to make available the following Natural system functions: <code>AVER</code>, <code>COUNT</code>, <code>MAX</code>, <code>MIN</code>, <code>NAVER</code>, <code>NCOUNT</code>, <code>NMIN</code>, <code>SUM</code>, <code>TOTAL</code>. These are evaluated when the <code>DISPLAY</code> statement containing the <code>GIVE SYSTEM FUNCTIONS</code> clause is executed.

These functions may then be referred to in a statement executed as a result of an end-of-page condition.

Note:

1. Only one <code>DISPLAY</code> statement per report may contain a <code>GIVE SYSTEM FUNCTIONS</code> clause. When system functions are evaluated from a <code>DISPLAY</code> statement, they are evaluated on a page basis, which means that all functions (except <code>TOTAL</code>) are reset to zero when a new page is initiated.
2. When system functions are used within a <code>DISPLAY</code> statement within a subroutine, the end-of-page processing must occur within the same routine.

See also Example 2 - DISPLAY Statement Using GIVE SYSTEM FUNCTIONS Clause.</td></tr>
<tr><td><code>statement-parameters</code></td><td>Parameter Definition at Statement Level:</td></tr>
</table>

Syntax Element	Description
	One or more parameters, enclosed within parentheses, may be specified at statement level, that is, immediately after the `DISPLAY` statement. Each parameter specified will override the corresponding parameter previously specified in a `GLOBALS` command, `SET GLOBALS` (Reporting Mode only) or `FORMAT` statement. If more than one parameter is specified, they must be separated by one or more blanks from one another. Each parameter specification must not be split between two statement lines. **Note:** The parameter settings applied here will only be regarded for variable fields, but they have no effect on text-constants. If you would like to set field attributes for a text-constant, they have to be set explicitly for this element, see *Parameter Definition at Element (Field) Level*. See also: ■ *List of Parameters* ■ *Example of Parameter Usage at Statement and Element (Field) Level* ■ *Example 7 - DISPLAY Statement Using Parameters on Statement/Element Level*

List of Parameters

The following parameters can be specified with the `DISPLAY` statement

Parameter Name	Explanation	Specification possible at statement level (S), at element level (E) or both (SE)
`AD`	Attribute Definition	SE
`AL`	Alphanumeric Length for Output	SE
`CD`	Color Definition	SE
`CV`	Control Variable	SE
`DF`	Date Format	SE
`DL`	Display Length for Output	SE
`DY`	Dynamic Attributes	SE
`EM`	Edit Mask	SE
`EMU`	Unicode Edit Mask	E
`ES`	Empty Line Suppression	S
`FC`	Filler Character	SE
`FL`	Floating Point Mantissa Length	SE

Parameter Name	Explanation	Specification possible at statement level (S), at element level (E) or both (SE)
GC	Filler Character for Group Headers	SE
HC	Header Centering	SE
HW	Heading Width	SE
IC	Insertion Character	SE
IS	Identical Suppress	SE
LC	Leading Characters	SE
LS	Line Size	S
MC	Multiple-Value Field Count	S
MP	Maximum Number of Pages of a Report	S
NL	Numeric Length for Output	SE
PC	Periodic Group Count	S
PM	Print Mode	SE
PS	Page Size	S
SF	Spacing Factor	SE
SG	Sign Position	SE
TC	Trailing Characters	SE
UC	Underlining Character	SE
ZP	Zero Printing	SE

The individual parameters are described in the *Parameter Reference* (session parameters).

See also the following topics in the *Programming Guide*:

- *Centering of Column Headers - HC Parameter*
- *Width of Column Headers - HW Parameter*
- *Filler Characters for Headers - Parameters FC and GC*
- *Underlining Character for Titles and Headers - UC Parameter*

Example of Parameter Usage at Statement and Element (Field) Level

```
DEFINE DATA LOCAL
1 VARI (A4)     INIT <'1234'>                           /*     Output
END-DEFINE                                              /*    Produced
*                                                       /*    ---------
DISPLAY NOHDR           'Text'         '='   VARI         /*    Text 1234
DISPLAY NOHDR (AD=U)    'Text'         '='   VARI         /*    Text 1234
DISPLAY NOHDR           'Text' (AD=U)  '='   VARI (AD=U)  /*    Text 1234
DISPLAY NOHDR           'Text' (AD=U)  '='   VARI         /*    Text 1234
END
```

Output Format Definitions

```
[ nX              ]
[ nT              ]     [ 'text' [(attributes)]   ]
[ x/y             ]     [ 'c'(n) [(attributes)]   ] ...
[ T*field-name    ]
[ P*field-name    ]

[ VERTICALLY   [ AS { 'text' [(attributes)] [CAPTIONED] } ]  [/ ...] ]
[                   { [CAPTIONED]                         }          ]
[ [HORIZONTALLY]                                                      ]
```

Field Positioning Notations

Syntax Element	Description
*n*X	**Column Spacing:** This notation inserts *n* spaces between columns. Example: `DISPLAY NAME 5X SALARY` See also: ■ ***Example 1 - DISPLAY Statement Using nX and nT Notation*** (below) ■ *Column Spacing - SF Parameter and nX Notation* (in the *Programming Guide*)
*n*T	**Tab Setting:** The *n*T notation causes positioning (tabulation) to display position *n*. Backward positioning is not permitted. In the following example, NAME is displayed beginning in position 25, and SALARY beginning in position 50: `DISPLAY 25T NAME 50T SALARY` See also: ■ ***Example 1 - DISPLAY Statement Using nX and nT Notation*** (below) ■ *Tab Setting - nT Notation* (in the *Programming Guide*)

Syntax Element	Description
x/*y*	**x/y Positioning:** The *x*/*y* notation causes the next element to be placed *x* lines below the output of the last statement, beginning in column *y*. *y* must not be zero. Backward positioning is not permitted.
T**field-name*	**Field Related Positioning:** The T* notation is used to position to a specific print position of a field used in a previous DISPLAY statement. Backward positioning is not permitted.
P**field-name*	**Field and Line Related Positioning:** The P* notation is used to position to a specific print position and line of a field used in a previous DISPLAY statement. It is most often used in conjunction with vertical display mode. Backward positioning is not permitted. See also: ■ *Example 3 - DISPLAY Statement Using P* Notation* (below) ■ *Tab Notation P*field* (in the *Programming Guide*)

Override Column Heading Assignment

Syntax Element	Description
'*text*' '/'	**Text Assignment:** If placed immediately before a field, the text enclosed by single quotes overrides the column heading. The slash character '/' before a field causes the header for the field to be suppressed. `DISPLAY 'EMPLOYEE' NAME 'MARITAL/STATUS' MAR-STAT` If multiple '*text*' elements are specified before a field name, the *last* '*text*' element will be used as the column header and the other text elements will be placed before the value of the field within the column. See also: ■ *Define Your Own Column Headers* (in the *Programming Guide*) ■ *Text Notation, Defining a Text to Be Used with a Statement* (in the *Programming Guide*) ■ *Example 4 - DISPLAY Statement Using 'text', 'c(n)' and Attribute Notation* (below)
'*c*'(*n*)	**Character Repetition:**

Syntax Element	Description

	The character enclosed by single quotes is displayed *n* times immediately before the field value. For example:
	`DISPLAY '*' (5) '=' NAME`
	results in
	`***** SMITH`
	See also:
	■ *Text Notation, Defining a Character to Be Displayed n Times before a Field Value* (in the *Programming Guide*)
	■ ***Example 4 - DISPLAY Statement Using 'text', 'c(n)' and Attribute Notation*** (below)

Output Attributes

attributes indicates the output attributes to be used for text display. Attributes may be:

```
{ { AD=AD-value ... }     }
{ { CD=CD-value ... }     }
{ { PM=PM-value ... } ... }
{                         }
{ { AD-value ...    }     }
{ { CD-value ...    } ... }
```

For the possible session parameter values, refer to the corresponding sections in the *Parameter Reference* documentation:

- *AD - Attribute Definition*, section *Field Representation*
- *CD - Color Definition*
- *PM - Print Mode*

Note: The compiler actually accepts more than one attribute value for an output field. For example, you may specify: `AD=BDI`. In such a case, however, only the last value applies. In the given example, only the value `I` will become effective and the output field will be displayed intensified.

Vertical/Horizontal Display

The `VERT` clause may be used to cause multiple field values to be positioned underneath one another in the same column. In vertical mode, a new column may be initiated by specifying the keyword `VERT` or `HORIZ`.

The column heading in vertical mode is controlled using the entry or entries specified with the AS clause as described below.

Syntax Element	Description
VERTICALLY	**DISPLAY VERT without AS Clause:** Vertical column orientation. No column heading is produced if the AS clause is omitted. `DISPLAY VERT NAME SALARY` For an example, see *DISPLAY VERT without AS Clause* in the *Programming Guide*.
AS '*text*'	**DISPLAY VERT AS '*text*' Clause:** Vertical column orientation. If AS '*text*' is specified, the text enclosed by single quotes is used as the column heading. For an example, see *DISPLAY VERT AS 'text'* in the *Programming Guide*. The slash character / in the character string of '*text*' will cause multiple lines of column headings. `DISPLAY VERT AS 'LAST/NAME' NAME`
AS '*text*' CAPTIONED	**DISPLAY VERT AS '*text*' CAPTIONED Clause:** Vertical column orientation. If AS '*text*' CAPTIONED is specified, '*text*' is used as the column heading and the standard heading text or field name is inserted immediately before the field value in each detail display line. `DISPLAY VERT AS 'PERSONS/SELECTED' CAPTIONED NAME FIRST-NAME` For an example, see *DISPLAY VERT AS 'text' CAPTIONED* in the *Programming Guide*.
AS CAPTIONED	**DISPLAY VERT AS CAPTIONED Clause:** Vertical column orientation. If AS CAPTIONED is specified, the standard heading text for the field (either heading text or the field name) will be used as the column heading. `DISPLAY VERT AS CAPTIONED NAME FIRST-NAME`
HORIZONTALLY	**DISPLAY HORIZ Clause:** Horizontal column orientation. This is the default display mode.

Vertical and horizontal column orientation may be intermixed by using the respective keyword.

To suspend vertical display for a single output element, you may place a dash (-) in front of the element. For example:

```
DISPLAY VERT NAME - FIRST-NAME SALARY
```

In the above example, `FIRST-NAME` will be output horizontally next to `NAME`, while `SALARY` will be output vertically again, i.e. below `NAME`.

The standard display mode is horizontal. A column is constructed for each field to be displayed.

Column headings are obtained and used by Natural according to the following priority:

1. heading '*text*' supplied in the `DISPLAY` statement;
2. the default heading defined in the DDM (database fields), or the name of a user-defined variable;
3. the field name as defined in the DDM (if no heading text was defined for the database field).

For group names, a group heading is produced for the entire group. When specifying a group, only the heading for the entire group may be overridden by a user-specified heading.

The maximum number of column header lines is 15.

Line size overflow is not permitted for output resulting from a `DISPLAY` statement. If a line overflow occurs, an error message is issued.

For more information about vertical/horizontal display usage, see:

- *Example 5 - DISPLAY Statement Using Horizontal Display*
- *Example 6 - DISPLAY Statement Using Vertical and Horizontal Display*
- *DISPLAY VERT AS CAPTIONED and HORIZ* (in the *Programming Guide*)

Output Element

```
[ { 'text' [(attributes)]  } ...  ]
[ { 'c'(n) [(attributes)]  }      ]
[   nX                            ]  ['='] {operand1 [(parameters)]}
[   nT                            ]
[   x/y                           ]
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1		S	A	G	N	A	N	P	I	F	B	D	T	L		G	O	yes	no

Syntax Element Description

Syntax Element	Description
*n*X	**Column Spacing:** This is the same as under *Output Format Definitions* (**see above**).
*n*T	**Tab Setting:** This is the same as under *Output Format Definitions* (**see above**).
x/*y*	**x/y Positioning:** This is the same as under *Output Format Definitions* (**see above**).
'*text*'	**Text Assignment:** This is the same as under *Output Format Definitions* (**see above**).
'*c*'(*n*)	**Character Repetition:** This is the same as under *Output Format Definitions* (**see above**).
'*text*' '=' '*c*' (*n*) '='	If '*text*' '=' is placed immediately before the field, *text* is output immediately before the field value. This applies analogously with '*c*' (*n*) '='. `DISPLAY '*****' '=' NAME`
attributes	**Output Attributes:** This is the same as under *Output Format Definitions* (**see above**).
operand1	The field to be displayed.
parameters	**Parameter Definition at Element (Field) Level:** One or more parameters, enclosed within parentheses, may be specified at element (field) level, that is, immediately after *operand1*. Each parameter specified in this manner will override the corresponding parameter previously specified **at statement level** or in a GLOBALS command, SET GLOBALS (in Reporting Mode only) or FORMAT statement. If more than one parameter is specified, one or more blanks must be placed between each entry. An entry must not be split between two statement lines. See also: ■ *List of Parameters*

Syntax Element	Description
	■ *Example of Parameter Usage at Statement and Element (Field) Level*

Defaults Applicable for a DISPLAY Statement

The following defaults are applicable for a DISPLAY statement:

- **Report Width**
  The width of the report defaults to the value set when Natural is installed. This default value is normally 132 in batch mode or the line length of the terminal in TP mode. It may be overridden with the session parameter LS. In TP mode, line size (LS) and page size (PS) parameters are set by Natural based on the physical characteristics of the terminal type in use.
- **Terminal Screen Output**
  When the DISPLAY output is displayed on a terminal (emulation) screen, the output begins in physical Column 2 (because Column 1 must be reserved for possible use as an attribute position on a 3270-type terminal).
- **Printout on Paper**
  When the DISPLAY output is printed on paper, the printout begins in the leftmost column (Column 1).
- **Spacing Factor**
  The default spacing factor between elements is one position. There is a minimum of one space between columns (reserved for terminal attributes). This default may be overridden with the session parameter SF.
- **Field Output**
  The length of the field or the field heading, whichever is greater, determines the column width for the report (unless the HW parameter is used).
  - If the field is longer than the heading, the heading will be centered over the column unless the HC=L or HC=R parameter is used to produce a left-justified or right-justified heading.
  - If the heading is longer than the field, the field will be left-justified under the heading.
  - The values contained in the field are left-justified for alphanumeric fields and right-justified for numeric fields.
  - Numeric fields may be displayed left-justified by specifying AD=L.
  - Alphanumeric fields may be displayed right-justified by specifying AD=R.
  - In a vertical display, the longest data value or heading among all fields determines the column width (unless the HW parameter is used).

- **Sign**
  One extra high-order print position is reserved for a sign when printing a numeric field. The session parameter `SG` may be used to suppress the sign position.
- **Page Overflow**
  Page overflow is checked before execution of a `DISPLAY` statement. No new page title or trailer information is generated during the execution of a `DISPLAY` statement.

Examples

- Example 1 - DISPLAY Statement Using nX and nT Notation
- Example 2 - DISPLAY Statement Using GIVE SYSTEM FUNCTIONS Clause
- Example 3 - DISPLAY Statement Using P* Notation
- Example 4 - DISPLAY Statement Using 'text ', 'c(n)' and Attribute Notation
- Example 5 - DISPLAY Statement Using Horizontal Display
- Example 6 - DISPLAY Statement Using Vertical and Horizontal Display
- Example 7 - DISPLAY Statement Using Parameters on Statement/Element Level
- Example 8 - Report Specification with Output File Defined to Natural as PC

Example 1 - DISPLAY Statement Using nX and nT Notation

```
** Example 'DISEX1': DISPLAY (with nX, nT notation)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 JOB-TITLE
END-DEFINE
*
LIMIT 4
READ EMPL-VIEW BY NAME
  DISPLAY NOTITLE 5X NAME 50T JOB-TITLE
END-READ
*
END
```

Output of Program DISEX1:

```
        NAME                                             CURRENT
                                                        POSITION
--------------------                                -------------------------

ABELLAN                                             MAQUINISTA
ACHIESON                                            DATA BASE ADMINISTRATOR
ADAM                                                CHEF DE SERVICE
ADKINSON                                            PROGRAMMER
```

Example 2 - DISPLAY Statement Using GIVE SYSTEM FUNCTIONS Clause

```
** Example 'DISEX2': DISPLAY (with GIVE SYSTEM FUNCTIONS)

54 DIVIDE

- Function 312
- Syntax 1 - DIVIDE Statement without GIVING Clause 312
- Syntax 2 - DIVIDE Statement with GIVING Clause 313
- Syntax 3 - DIVIDE Statement with REMAINDER Clause 314
- Example 316

Related Statements: ADD | COMPRESS | COMPUTE | EXAMINE | MOVE | MOVE ALL | MULTIPLY | RESET | SEPARATE | SUBTRACT

Belongs to Function Group: *Arithmetic and Data Movement Operations*

Function

The DIVIDE statement is used to divide two operands.

Note: Concerning Division by Zero: If an attempt is made to use a divisor (*operand1*) which is zero, either an error message or a result equal to zero will be returned; this depends on the setting of the session parameter ZD (described in the *Parameter Reference* documentation).

Syntax 1 - DIVIDE Statement without GIVING Clause

```
DIVIDE [ROUNDED] operand1 INTO operand2
```

For an explanation of the symbols used in the syntax diagrams, see *Syntax Symbols* .

Operand Definition Table:

Operand	Possible Structure				Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C	S	A	N	N P I F	yes	no
operand2	C	S	A	M	N P I F	yes	no

Syntax Element Description:

Syntax Element	Description
operand1 INTO *operand2*	**Operands:**

Syntax Element	Description
	`operand1` is the divisor, `operand2` is the dividend. The result is stored in `operand2` (result field), hence the statement is equivalent to: `<oper2> := <oper2> / <oper1>` The result field may be a database field or a user-defined variable. If `operand2` is a constant or a non-modifiable Natural system variable, the `GIVING` clause is required. The number of decimal positions for the result of the division is evaluated from the result field (that is, `operand2`). For the precision of the result, see *Rules for Arithmetic Assignments*, *Precision of Results for Arithmetic Operations* in the *Programming Guide*.
`ROUNDED`	**ROUNDED Option:** If you specify the keyword `ROUNDED`, the result will be rounded. For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.

Syntax 2 - DIVIDE Statement with GIVING Clause

```
DIVIDE [ROUNDED] operand1 INTO operand2  [GIVING  operand3]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A		N			N	P	I	F								yes	no
operand2	C	S	A		N			N	P	I	F								yes	no
operand3		S	A			A	U	N	P	I	F	B*							yes	yes

* Format B of `operand3` may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
operand1 INTO *operand2* GIVING *operand3*	**Operands:** *operand1* is the divisor, *operand2* is the dividend. The result of the division is stored in *operand3*, hence the statement is equivalent to: `<oper3> := <oper2> / <oper1>` If a database field is used as the result field, the division only results in an update to the internal value of the field as used within the program. The value for the field in the database remains unchanged. The number of decimal positions for the result of the division is evaluated from the result field (that is, *operand3*). For the precision of the result, see *Rules for Arithmetic Assignments*, *Precision of Results for Arithmetic Operations* in the *Programming Guide*.
ROUNDED	**ROUNDED Option:** If you specify the keyword ROUNDED, the result will be rounded. For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.

Syntax 3 - DIVIDE Statement with REMAINDER Clause

```
DIVIDE operand1 INTO operand2 [GIVING operand3] REMAINDER operand4
```

For an explanation of the symbols used in the syntax diagrams, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure				Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C	S	A	N	N P I	yes	no
operand2	C	S	A	N	N P I	yes	no
operand3		S	A		A U N P I F B*	yes	yes
operand4		S	A		A U N P I F B* T	yes	yes

* Format B of *operand3* and *operand4* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
operand1 *operand2*	**Operands:** *operand1* is the divisor; that is, the number or quantity by which the dividend is to be divided to produce the quotient. *operand2* is the dividend. If the GIVING clause is not used, the result is stored in *operand2*. The result field may be a database field or a user-defined variable. If *operand2* is a constant or a non-modifiable Natural system variable, the GIVING clause is required.
ROUNDED	**ROUNDED Option:** If you specify the keyword ROUNDED, the result will be rounded. For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.
GIVING *operand3*	**GIVING Clause:** If this clause is used, *operand2* will not be modified and the result will be stored in *operand3*. If a database field is used as the result field, the division only results in an update to the internal value of the field as used within the program. The value for the field in the database remains unchanged. The number of decimal positions for the result of the division is evaluated from the result field (that is, *operand2* if no GIVING clause is used, or *operand3* if the GIVING clause is used). For the precision of the result, see *Rules for Arithmetic Assignments*, *Precision of Results for Arithmetic Operations* (in the *Programming Guide*).
REMAINDER *operand4*	**REMAINDER Clause:** The remainder of the division is placed into the field specified in *operand4*. If the GIVING and REMAINDER clause are used together, none of the four operands may be an array range. Internally, the remainder is computed as follows: 1. The quotient of the division of *operand1* into *operand2* is computed. 2. The quotient is multiplied by *operand1*. 3. The product of this multiplication is subtracted from *operand2*. 4. The result of this subtraction is assigned to *operand4*.

Syntax Element	Description
	For each of these steps, the rules described in *Precision of Results for Arithmetic Operations* in the *Programming Guide* apply.

Example

```
** Example 'DIVEX1': DIVIDE
************************************************************************

WRITE 'DIVIDE 5 INTO #A GIVING #B' 10X '=' #B
*
DIVIDE 3 INTO 3.10 GIVING #C
WRITE 'DIVIDE 3 INTO 3.10 GIVING #C' 8X '=' #C
*
DIVIDE 3 INTO 3.1 GIVING #D
WRITE 'DIVIDE 3 INTO 3.1 GIVING #D' 9X '=' #D
*
DIVIDE 2 INTO #E REMAINDER #F
WRITE 'DIVIDE 2 INTO #E REMAINDER #F' 7X '=' #E '=' #F
*
END
```

Output of Program DIVEX1:

```
DIVIDE 5 INTO #A                    #A:        4
DIVIDE 5 INTO #A GIVING #B          #B:        4
DIVIDE 3 INTO 3.10 GIVING #C        #C:    1.03
DIVIDE 3 INTO 3.1 GIVING #D         #D:  1
DIVIDE 2 INTO #E REMAINDER #F       #E:  1 #F:  1
```

55 DO/DOEND

- Function 318
- Restrictions 318
- Example 319

```
DO statement ... DOEND
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The `DO` and `DOEND` statements are used in reporting mode to specify a group of statements to be executed based on a logical condition as specified in any of the following statements:

- `AT BREAK`
- `AT END OF DATA`
- `AT END OF PAGE`
- `AT START OF DATA`
- `AT TOP OF PAGE`
- `BEFORE BREAK PROCESSING`
- `FIND ... IF NO RECORDS FOUND`
- `IF`
- `IF SELECTION`
- `ON ERROR`
- `READ WORK FILE ... AT END OF FILE`

Restrictions

- The `DO` and `DOEND` statements are only valid in reporting mode.
- `WRITE TITLE`, `WRITE TRAILER`, and the `AT` condition statements `AT BREAK`, `AT END OF DATA`, `AT END OF PAGE`, `AT START OF DATA`, `AT TOP OF PAGE` are not permitted *within* a `DO`/`DOEND` statement group.
- A loop-initiating statement may be used within a `DO`/`DOEND` statement group provided that the loop is closed prior to the `DOEND` statement.

Example

```
** Example 'DOEEX1': DO/DOEND
************************************************************************
*
EMP. FIND EMPLOYEES WITH CITY = 'MILWAUKEE'
  VEH. FIND VEHICLES WITH PERSONNEL-ID = PERSONNEL-ID
    IF NO RECORDS FOUND DO
      ESCAPE
    DOEND
    DISPLAY PERSONNEL-ID (EMP.) NAME (EMP.)
            SALARY (EMP.,1)
            MAKE (VEH.) MAINT-COST (VEH.,1)
    AT END OF DATA DO
      WRITE NOTITLE
        / 10X 'AVG SALARY:'
               T*SALARY (1) AVER(SALARY (1))
        / 10X 'AVG MAINTENANCE (ZERO VALUES EXCLUDED):'
               T*MAINT-COST (1) NAVER(MAINT-COST (1))
    DOEND
    /*
  LOOP
LOOP
END
```

Output of Program DOEEX1:

```
PERSONNEL         NAME           ANNUAL           MAKE         MAINT-COST
   ID                            SALARY
--------- -------------------- ---------- -------------------- ----------

20021100  JONES                     31000 GENERAL MOTORS              140
20027800  LAWLER                    29000 GENERAL MOTORS                0
20027800  LAWLER                    29000 TOYOTA                       86
20030600  NORDYKE                   47000 FORD                        194

          AVG SALARY:               35666
          AVG MAINTENANCE (ZERO VALUES EXCLUDED):                     140
```

56 DOWNLOAD PC FILE

- Function 322
- Syntax Description 322
- Examples 323

```
            DOWNLOAD       PC                      [VARIABLE] operand1
          {          } {        } [FILE]         {                                   }
            WRITE          WORK   work-file-number   COMMAND  operand2 { SYNC  }
                                                                       { ASYNC }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: CLOSE PC FILE | UPLOAD PC FILE | WRITE WORK FILE

Belongs to Function Group: *Control of Work Files / PC Files*

Function

This statement is used to transfer data from a UNIX platform to the PC.

See also the Natural Connection and Entire Connection documentation

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats											Referencing Permitted	Dynamic Definition
operand1	C	S	A	G		A	U	N	P	I	F	B	D	T	L	C	yes	no
operand2	C	S				A											yes	yes

When using the work file types ENTIRECONNECTION or TRANSFER, *operand1* may neither be of Format C, nor G.

Syntax Element Description:

Syntax Element	Description
work-file-number	**Work File Number:** The work file number to be used. This number must correspond to one of the work file numbers for the PC as defined to Natural.
VARIABLE	**Variable Format:** The records in the PC file will be written in variable format. Note that variable records cannot be converted to PC spreadsheet formats.
operand1	**Field Specification:**

Syntax Element	Description
	With *operand1* you specify the fields to be downloaded to the PC.
COMMAND	**COMMAND Clause:** With the COMMAND clause, you can send PC commands (that is, any command that can be entered in the command line of Entire Connection on the PC) from the mainframe to the PC. Entire Connection checks whether the command sent is valid or not. A command that cannot be recognized by the PC is rejected. In this case, Natural issues the error message that the downloaded command was rejected by the PC. You can use the COMMAND clause, for example, to execute Entire Connection tasks from the mainframe. If you have the task DIR which lists PC directory information, you can initiate this directly out of your Natural program on the mainframe with the following statement: `DOWNLOAD PC FILE 7 COMMAND 'DIR'` In ***Example 2*** below, the COMMAND clause is used to define the name of the PC file that is to receive the downloaded data. In this way, you can avoid prompting for the name of the file.
operand2	**COMMAND Specification:** With *operand2*, you specify the DOS command or Entire Connection task that is to be executed on the PC. *operand2* must be an alphanumeric constant or variable.
SYNC	**SYNC Option:** With SYNC, you specify that the PC returns control to Natural after executing and terminating COMMAND. SYNC can be used, for example, to ensure that the command SET PCFILE has been executed before a file transfer starts.
ASYNC	**ASYNC Option:** With ASYNC, you specify that the PC immediately returns control to Natural, regardless of whether the execution of COMMAND has terminated or not.

Examples

- Example 1 - Use of DOWNLOAD PC FILE Statement

- Example 2 - Use of COMMAND Clause

Example 1 - Use of DOWNLOAD PC FILE Statement

The following program demonstrates the use of the DOWNLOAD PC FILE statement. The data is first selected and then downloaded to the PC by using Work File 7.

```
** Example 'PCDOEX1': DOWNLOAD PC FILE
**
** NOTE: Example requires that Natural Connection is installed.
************************************************************************
DEFINE DATA LOCAL
01 PERS VIEW OF EMPLOYEES
  02 PERSONNEL-ID
  02 NAME
  02 CITY
END-DEFINE
*
FIND PERS WITH CITY = 'NEW YORK'                     /* Data selection
  DOWNLOAD PC FILE 7 CITY NAME PERSONNEL-ID    /* Data download
END-FIND
END
```

Output of Program PCDOEX1:

When you run the program, a window appears in which you specify the name of the PC file into which the data is to be downloaded. The data is then downloaded to the PC.

Example 2 - Use of COMMAND Clause

The following program demonstrates the use of the COMMAND clause in the DOWNLOAD PC FILE statement. The name of the receiving PC file is first defined. Then the data is selected and downloaded to this file.

```
** Example 'PCDOEX2': DOWNLOAD PC FILE
**
** NOTE: Example requires that Natural Connection is installed.
************************************************************************
DEFINE DATA LOCAL
01 PERS VIEW OF EMPLOYEES
  02 PERSONNEL-ID
  02 NAME
  02 CITY
01 CMD (A80)                                   /* Variable for transfer
END-DEFINE                                     /* of the PC command
*
MOVE 'SET PCFILE 7 DOWN DATA PERS.NCD' TO CMD  /* PC command to define
*
```

```
DOWNLOAD PC FILE 6 COMMAND CMD                  /* Command download
*
FIND PERS WITH CITY = 'NEW YORK'                /* Data selection
  DOWNLOAD PC FILE 7 CITY NAME PERSONNEL-ID     /* Data download
END-FIND
END
```

Note: The PC file number in two successive `DOWNLOAD PC FILE` statements must be different.

Output of Program PCDOEX2:

When you run the program, the data is downloaded to the PC file that was specified in the program. A window does not appear.

57 EJECT

- Function 328
- Syntax Description 328
- Processing 330
- Example 330

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: *Creation of Output Reports*

Function

The EJECT statement may be used to control page advance/page ejection.

Syntax Description

Two different structures are possible for this statement.

- EJECT - Syntax 1
- EJECT - Syntax 2

For an explanation of the symbols used in the syntax diagrams below, see ***Syntax Symbols***.

EJECT - Syntax 1

```
EJECT { ON  } [(rep)]
      { OFF }
```

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td rowspan="3">EJECT ON/OFF (rep)</td><td colspan="2">With Report Specification - Online and Batch Modes:</td></tr>
<tr><td>EJECT OFF (rep)</td><td>Causes no page advance (except as specified with Syntax 2 of the EJECT statement) for the specified report to be executed.</td></tr>
<tr><td>EJECT ON (rep)</td><td>Causes page advances for the specified report to be executed.</td></tr>
<tr><td>EJECT ON/OFF</td><td colspan="2">Without Report Specification - Batch Mode only:

Without report notation (rep), EJECT ON/OFF may be used in batch mode to control page ejection between the output listings created during the execution of a program.</td></tr>
</table>

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td rowspan="2"></td><td>EJECT ON</td><td>Causes Natural to generate a page eject between the source program listing, the output report and the message

EXECUTION COMPLETED

. This is the default setting.</td></tr>
<tr><td>EJECT OFF</td><td>Causes Natural to suppress page breaks between the above output. EJECT OFF remains in effect until revoked with a subsequent EJECT ON statement.</td></tr>
<tr><td>(rep)</td><td colspan="2">Report Specification:

The notation (rep) may be used to specify the identification of the report for which the EJECT statement is applicable.

A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified.

If (rep) is not specified, the EJECT statement will be applicable to the first report (Report 0).

For information on how to control the format of an output report created with Natural, see Controlling Data Output in the Programming Guide.</td></tr>
</table>

EJECT - Syntax 2

This form of the EJECT statement may be used to cause a page advance without a title or heading line being generated on the next page and without TOP/END PAGE processing.

```
EJECT [(rep)] [ [ IF   ] LESS [THAN] operand1 [LINES] [LEFT] ]
                  WHEN
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S				N	P	I										yes	no

Syntax Element Description:

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the EJECT statement is applicable. A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified. If (*rep*) is not specified, the EJECT statement will be applicable to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* in the *Programming Guide*.
IF LESS THAN *operand1* LINES LEFT	**IF LESS THAN ... LINES LEFT Clause:** A page advance will be performed only when the current line for the page is greater than the page size minus *operand1*. The value for *operand1* may be specified as a numeric constant or as a variable.

Processing

The execution of an EJECT statement does not cause any statements used with an AT TOP OF PAGE, AT END OF PAGE, WRITE TITLE or WRITE TRAILER statement to be executed. It does not affect system functions evaluated by DISPLAY GIVE SYSTEM FUNCTIONS.

EJECT causes a new physical page only. It causes the Natural system variable *LINE-COUNT to be set to 1 but has no effect on the setting of the Natural system variable *PAGE-NUMBER.

Example

```
** Example 'EJTEX1': EJECT
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 NAME
  2 JOB-TITLE
END-DEFINE
*
FORMAT PS=15
LIMIT 9
```

```
READ EMPLOY-VIEW BY CITY
  /*
  AT START OF DATA
    EJECT
    WRITE /// 20T '%' (29) /
              20T '%%'                        47T '%%' /
              20T '%%' 3X 'REPORT OF EMPLOYEES' 47T '%%' /
              20T '%%' 3X '  SORTED BY CITY   ' 47T '%%' /
              20T '%%'                        47T '%%' /
              20T '%' (29) /
    EJECT
  END-START
  EJECT WHEN LESS THAN 3 LINES LEFT
  /*
  WRITE '*' (64)
  DISPLAY NOTITLE NOHDR CITY NAME JOB-TITLE 5X *LINE-COUNT
  WRITE '*' (64)
END-READ
END
```

Output of Program EJTEX1:

```
                     %%%%%%%%%%%%%%%%%%%%%%%%%%%%%
                     %%                         %%
                     %%   REPORT OF EMPLOYEES   %%
                     %%     SORTED BY CITY      %%
                     %%                         %%
                     %%%%%%%%%%%%%%%%%%%%%%%%%%%%%
```

After pressing ENTER:

```
****************************************************************

**********************************************************************
```

58 END

- Function 334
- Syntax Description 334
- Examples 335

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The END statement is used to mark the physical end of a Natural program. No symbols may follow the END statement.

In reporting mode, any processing loop which is currently active (that is, which has not been closed with a LOOP statement) is closed by the END statement.

Considerations for Program Execution

When an END statement is executed in a main program (that is, a program executing on Level 1), final end-page processing is performed as well as final break processing for user-initiated breaks (PERFORM BREAK PROCESSING) which have not been associated with a processing loop by specifying a reference notation (*r*).

When an END statement is executed in a subprogram, or in a program invoked with FETCH RETURN, control will be returned to the invoking program without any final processing.

Syntax Description

Syntax Element	Description
END	**Keyword:** The Natural reserved keyword END is normally used to mark the physical end of a Natural program.
.	**Period:** Instead of the Natural reserved keyword END, a period (.) may be used. It must be preceded by at least one blank if other statements are contained in the same line.

Examples

For some typical examples, see *Examples of DEFINE DATA Statement Usage*.

59 END TRANSACTION

- Function 338
- Restriction 338
- Syntax Description 339
- Databases Affected 339
- Database-Specific Considerations 340
- Examples 340

```
END [OF] TRANSACTION  [operand1 ...]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | FIND | GET | GET SAME | GET TRANSACTION DATA | FIND HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The END TRANSACTION statement is used to indicate the end of a logical transaction. A logical transaction is the smallest logical unit of work (as defined by the user) which must be performed in its entirety to ensure that the information contained in the database is logically consistent.

Successful execution of an END TRANSACTION statement ensures that all updates performed during the transaction have been or will be physically applied to the database regardless of subsequent user, Natural, database or operating system interruption. Updates performed within a transaction for which the END TRANSACTION statement has not been successfully completed will be backed out automatically.

The END TRANSACTION statement also results in the release of all records placed in hold status during the transaction.

The END TRANSACTION statement can be executed based upon a logical condition.

For further information, see the section *Database Update - Transaction Processing* (in the *Programming Guide*).

Restriction

This statement cannot be used with Entire System Server.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S			N	A	U	N	P	I	F	B	D	T					yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Storage of Transaction Data:** For a transaction applied to an Adabas database, you may also use this statement to store transaction-related information. These transaction data must not exceed 2000 bytes. They may be read with a GET TRANSACTION DATA statement. The transaction data are written to the database specified with the profile parameter ETDB. If the ETDB parameter is not specified, the transaction data are written to the database specified with the profile parameter UDB, except on mainframe computers: here, they are written to the database where the Natural Security system file (FSEC) is located (if FSEC is not specified, it is considered to be identical to the Natural system file, FNAT; if Natural Security is not installed, the transaction data are written to the database where FNAT is located).

Databases Affected

An END TRANSACTION statement *without* transaction data (that is, without *operand1*) will only be executed if a database transaction under control of Natural has taken place. Depending on the setting of the Natural profile parameter ET, the statement will be executed only for the database affected by the transaction (ET=OFF), or for all databases that have been referenced since the last execution of a BACKOUT TRANSACTION or END TRANSACTION statement (ET=ON).

An END TRANSACTION statement *with* transaction data (that is, with specifying *operand1*) will always be executed and the transaction data be stored in a database as described in the following section. It depends on the setting of the ET parameter (see above) for which other databases the END TRANSACTION statement will be executed.

Database-Specific Considerations

SQL Databases	As most SQL databases close all cursors when a logical unit of work ends, an `END TRANSACTION` statement must not be placed within a database modification loop; instead, it has to be placed after such a loop.
XML Databases	An `END TRANSACTION` statement must not be placed within a database modification loop; instead, it has to be placed after such a loop.

Examples

- Example 1 - END TRANSACTION
- Example 2 - END TRANSACTION with ET Data

Example 1 - END TRANSACTION

```
** Example 'ETREX1': END TRANSACTION
**
** CAUTION: Executing this example will modify the database records!
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 COUNTRY
END-DEFINE
*
FIND EMPLOY-VIEW WITH CITY = 'BOSTON'
  ASSIGN COUNTRY = 'USA'
  UPDATE
  END TRANSACTION
  /*
  AT END OF DATA
    WRITE NOTITLE *NUMBER 'RECORDS UPDATED'
  END-ENDDATA
  /*
END-FIND
END
```

Output of Program ETREX1:

```
7 RECORDS UPDATED
```

Example 2 - END TRANSACTION with ET Data

```
** Example 'ETREX2': END TRANSACTION (with ET data)
**
** CAUTION: Executing this example will modify the database records!
***********************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 FIRST-NAME
  2 CITY
*
1 #PERS-NR (A8) INIT <' '>
END-DEFINE
*
REPEAT
  INPUT 'ENTER PERSONNEL NUMBER TO BE UPDATED:' #PERS-NR
  IF #PERS-NR = ' '
    ESCAPE BOTTOM
  END-IF
  /*
  FIND EMPLOY-VIEW PERSONNEL-ID = #PERS-NR
    INPUT (AD=M)    NAME / FIRST-NAME / CITY
    UPDATE
    END TRANSACTION #PERS-NR
  END-FIND
  /*
END-REPEAT
END
```

Output of Program ETREX2:

```
ENTER PERSONNEL NUMBER TO BE UPDATED: 20027800
```

After entering and confirming the personnel number:

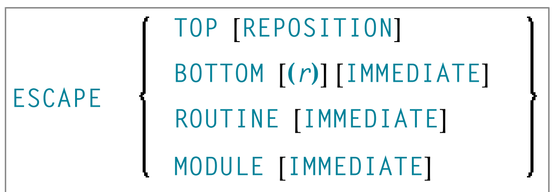
```

NAME LAWLER
FIRST-NAME SUNNY
CITY MILWAUKEE
```

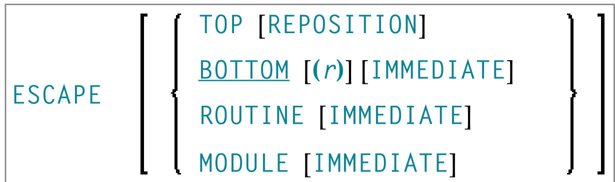
60 ESCAPE

- Function 344
- Syntax Description 345
- Example 346

Structured Mode Syntax



Reporting Mode Syntax



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements:

- FOR | REPEAT | PROCESS PAGE MODAL
- CALL | CALL FILE | CALL LOOP | CALLNAT | DEFINE SUBROUTINE | FETCH | PERFORM

Belongs to Function Group:

- ***Loop Execution***
- ***Invoking Programs and Routines***

Function

The ESCAPE statement is used to interrupt the linear flow of execution of a processing loop or a routine.

With the keywords TOP, BOTTOM and ROUTINE you indicate where processing is to continue when the ESCAPE statement is encountered.

An ESCAPE TOP/BOTTOM statement, when encountered for processing, will internally refer to the innermost active processing loop. The ESCAPE statement need not be physically placed within the processing loop.

If an ESCAPE TOP/BOTTOM statement is placed in a routine (subroutine, subprogram, or program invoked with FETCH RETURN), the routine(s) entered during execution of the processing loop will be terminated automatically.

Additional Considerations

More than one ESCAPE statement may be contained within the same processing loop.

The execution of an ESCAPE statement may be based on a logical condition. If an ESCAPE statement is encountered during processing of an AT END OF DATA, AT BREAK or AT END OF PAGE block, the execution of the special condition block will be terminated and ESCAPE processing will continue as required.

If an ESCAPE statement is encountered during processing of an if-no-records-found condition, no loop-end processing will be performed (equivalent to ESCAPE IMMEDIATE).

Syntax Description

Syntax Element	Description
ESCAPE TOP	**Top Option:** TOP indicates that processing is to continue at the top of the processing loop. This starts the next repetition of the processing loop.
REPOSITION	**Top Reposition Option:** When an ESCAPE TOP REPOSITION statement is executed, Natural immediately continues processing at the top of the active READ loop, using the current value of the search variable as new start value. At the same time, ESCAPE TOP REPOSITION resets the system variable *COUNTER to zero. ESCAPE TOP REPOSITION can be specified within a READ statement loop accessing an Adabas database. The READ statement concerned must contain the option WITH REPOSITION.
ESCAPE BOTTOM	**Bottom Option:** BOTTOM indicates that processing is to continue with the first statement following the processing loop. The loop is terminated and loop-end processing (final BREAK and END DATA) is executed for all loops being terminated. In reporting mode, ESCAPE BOTTOM is the default.
(*r*)	**Statement Reference:** Notation (*r*): If BOTTOM is followed by a label or reference number, processing will continue with the first statement following the processing loop identified by the label or reference number. A label or a reference number can only be specified if the ESCAPE BOTTOM statement is physically placed within the referenced processing loop.

Syntax Element	Description
IMMEDIATE	**Immediate Option:** If you specify the keyword IMMEDIATE, no loop-end processing will be performed.
ESCAPE ROUTINE	**Routine Option:** This option indicates that the current Natural routine, which may have been invoked via a PERFORM, CALLNAT, FETCH RETURN, or as a main program, is to relinquish control. In the case of a subroutine, processing will continue with the first statement after the statement used to invoke the subroutine. In the case of a main program, Natural command mode will be entered. All loops currently active within the routine will be terminated and loop-end processing performed as well as final processing for user-initiated (PERFORM BREAK) processing. If the program containing the ESCAPE ROUTINE is executed as a main program (Level 1), final end-page processing is performed.
ESCAPE MODULE	**Module Option:** This option indicates that the entire current program level, with all internal subroutines, is to relinquish control. The control is then returned to the object of the former program level. If ESCAPE MODULE is used in a hierarchy of internal subroutines, it allows to escape all routines working at this level at once. If no internal subroutine is active, ESCAPE MODULE has the same result as ESCAPE ROUTINE. ESCAPE MODULE is only relevant in inline subroutines. In external subroutines, subprograms and invoked programs, it has the same effect as ESCAPE ROUTINE. As with ESCAPE ROUTINE, loop-end processing will be performed. However, if you specify the keyword IMMEDIATE, no loop-end processing will be performed.

Example

```
** Example 'ESCEX1': ESCAPE
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 FIRST-NAME
  2 NAME

```

Output of Program ESCEX1:

```

ENTER VALUE FOR CITY:  PARIS
(OR '.' TO TERMINATE)
```

After entering and confirming city name:

```

RECORDS FOUND:        26
ENTER 'D' TO DISPLAY RECORDS D
```

Result after entering and confirming D:

```

Syntax 1 - EXAMINE

```
EXAMINE [DIRECTION-clause]

                                          operand1
        [FULL [VALUE [OF]]]  {            SUBSTRING                            }
                                          (operand1,operand2,operand3)
        POSITION-clause
        [FOR] [FULL [VALUE [OF]]] [PATTERN] operand4
        [DELIMITERS-option]
        {[DELETE-REPLACE-clause] [GIVING-clause]}
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Syntax Description - Syntax 1

The EXAMINE statement is used to observe the content of an alphanumeric or binary field, or a range of fields within an array, and to

- return the number of how many times a search-pattern was found;
- return the byte position where a search-pattern appears first;
- return the significant content length of a field; that is, the field length without trailing blanks;
- return the occurrence number (indices) of an array field, where a pattern was found first;
- replace a pattern by another pattern;
- delete a pattern.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C*	S	A			A	U					B							yes	no
operand2	C	S						N	P	I		B*							yes	no
operand3	C	S						N	P	I		B*							yes	no
operand4	C	S	A			A	U					B							yes	no

* *operand1* can only be a constant if the `GIVING` clause is used, but not if the `DELETE`/`REPLACE` clause is used.

* Format B of *operand2* and *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
DIRECTION-clause	**DIRECTION Clause:** This clause determines the search direction. For details, see ***DIRECTION Clause*** below.
operand1	**Field to be Examined:** *operand1* is the field whose content is to be examined. If *operand1* is a `DYNAMIC` variable, a `REPLACE` operation may cause its length to be increased or decreased; a `DELETE` operation may cause its length to be set to zero. The current length of a `DYNAMIC` variable can be ascertained by using the system variable `*LENGTH`.
POSITION-clause	**POSITION Clause:** This clause may be used to specify a starting and ending position within *operand1* (or the substring of *operand1*) for the examination. For details, see ***POSITION Clause*** below.
operand4	**Value to be Used for EXAMINE Operation:** *operand4* is the value to be used for the examine operation. For more information on *operand4* and *operand6*, see *operand6*, which is used in the ***DELETE REPLACE Clause*** described below.
`FULL`	**FULL Option:** If `FULL` is specified for an operand, the entire value, including trailing blanks, will be processed. If `FULL` is not specified, trailing blanks in the operand will be ignored.
`SUBSTRING`	**SUBSTRING Option:** Normally, the content of a field is examined from the beginning of the field to the end or to the last non-blank character. With the `SUBSTRING` option, you examine only a certain part of the field. After the field name (*operand1*) in the `SUBSTRING` clause, you specify first the starting position (*operand2*) and then the length (*operand3*) of the field portion to be examined.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>For example, to examine the 5th to 12th position inclusive of a field #A, you would specify:

<code>EXAMINE SUBSTRING(#A,5,8).</code>

Note:

1. If you omit operand2, the starting position is assumed to be 1.
2. If you omit operand3, the length is assumed to be from the starting position to the end of the field.
3. If SUBSTRING is used in conjunction with a DYNAMIC variable, the field behaves like a fixed length variable; that is, the length (*LENGTH) does not change as a result of the EXAMINE operation, regardless of whether a DELETE or REPLACE operation was executed or not.</td></tr>
<tr><td>PATTERN</td><td>PATTERN Option:

If you wish to examine the field for a value which contains “wild characters”, that is symbols for positions not to be examined, you use the PATTERN option. operand4 may then include the following symbols for positions to be ignored:

■ A period (.), question mark (?) or underscore (_) indicates a single position that is not to be examined.
■ An asterisk (*) or a percent sign (%) indicates any number of positions not to be examined.

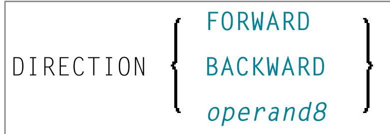
Example: With PATTERN 'NAT*AL' you could examine the field for any value which contains NAT and AL no matter which and how many other characters are between NAT and AL (this would include the values NATURAL and NATIONAL as well as NATAL).</td></tr>
<tr><td>DELIMITERS-option</td><td>DELIMITERS Option:

This option is used to scan for a value which exhibits delimiters. For details, see DELIMITERS Option below.</td></tr>
<tr><td>DELETE-REPLACE-clause</td><td>DELETE REPLACE Clause:

The DELETE option of this clause is used to delete each search-value (operand4) found in operand1, whereas the REPLACE option is used to replace each search-value (operand4) found in operand1 by the value specified in operand6. For details, see DELETE REPLACE Clause below.</td></tr>
<tr><td>GIVING-clause</td><td>For details, see GIVING Clause below.</td></tr>
</table>

DIRECTION Clause

The direction clause determines the search direction.



Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand8	C	S				A1												yes	no

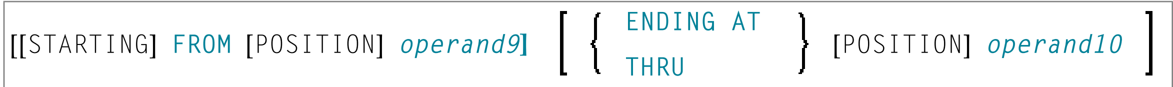
Syntax Element Description:

Syntax Element	Description
FORWARD	**Examine in Left-to-Right Direction:** If you specify FORWARD, the contents of the field are examined from left to right.
BACKWARD	**Examine in Right-to-Left Direction:** If you specify BACKWARD, the contents of the field are examined from right to left.
operand8	**Alternative Specification:** If you specify *operand8*, the search direction is determined by the contents of *operand8*. *operand8* must be defined with format/length A1. If *operand8* contains an F, then the search direction is FORWARD, if *operand8* contains a B, the search direction is BACKWARD. All other values are invalid and are rejected at compile time if *operand8* is a constant, or at run time if *operand8* is a variable.

Note: If the DIRECTION clause is not specified, the default direction is FORWARD.

POSITION Clause

The POSITION clause may be used to specify a starting and ending position within *operand1* (or the substring of *operand1*) for the examination.



```
[[STARTING] FROM [POSITION] operand9] [ { ENDING AT } [POSITION] operand10 ]
                                        { THRU      }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand9	C	S					N	P	I										yes	no
operand10	C	S					N	P	I										yes	no

Syntax Element Description:

Syntax Element	Description
FROM *operand9*	**Starting Position:** *operand9* is used to define the starting position for the examination.
ENDING AT / THROUGH *operand10*	**Ending Position:** *operand10* is used to define the ending position for the examination.

The starting position (*operand9*) and the ending position (*operand10*) are relative to *operand1* or the substring of *operand1*, and both are processed.

The search is performed starting from the starting position and ending at the ending position.

If the starting and/or ending position are not specified, the default position value applies. This value is determined by the search direction:

Direction	Default Starting Position	Default Ending Position
FORWARD	1 (first character)	length of *operand1* (last character)
BACKWARD	length of *operand1* (last character)	1 (first character)

With this solution, EXAMINE BACKWARD ... is identical to EXAMINE BACKWARD ... FROM *LENGTH(...) THRU 1, and works as expected.

Note: If the search direction is `FORWARD` and the start position is greater than the end position, or if the search direction is `BACKWARD` and the start position is less than the end position, no search is performed.

DELIMITERS Option

```
{ ABSOLUTE                         }
{ [WITH DELIMITERS]                }
{ [WITH DELIMITERS] operand5       }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand5	C	S				A					B							yes	no

Syntax Element Description:

Syntax Element	Description
`ABSOLUTE`	**Absolute Scan Option:** This is the default option. It results in an absolute scan of the field for the specified value regardless of what other characters may surround the value.
`WITH DELIMITERS`	**WITH DELIMITERS Options:** This option is used to scan for a value which is delimited by blanks or by any characters that are neither letters nor numeric characters.
`WITH DELIMITERS` *operand5*	**Specific Delimiter Option:** This option is used to scan for a value which is delimited by the character(s) specified in *operand5*.

DELETE REPLACE Clause

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand6	C	S	A			A	U				B							yes	no

Syntax Element Description:

Syntax Element	Description
DELETE	**DELETE Option:** This option is used to delete the first (or all) occurrence(s) of the search-value (*operand4*) in the content of *operand1*.
REPLACE	**REPLACE Option:** This option is used to replace the first (or all) occurrence(s) of the search-value (*operand4*) in *operand1* by the replace value specified in *operand6*.
FIRST	**FIRST Option:** If you specify the keyword FIRST, only the first identical value will be deleted/replaced.

Notes:

1. If the REPLACE operation results in more characters being generated than will fit into *operand1*, you will receive an error message.
2. If *operand1* is a dynamic variable, a REPLACE operation may cause its length to be increased or decreased; a DELETE operation may cause its length to be set to zero. The current length of a dynamic variable can be ascertained by using the system variable *LENGTH. For general information on dynamic variables, see *Using Dynamic Variables*.
3. If a runtime error occurs, the examined field remains unchanged.

Search and Replace with Multiple Values

The search (*operand4*) and replace value (*operand6*) may also be defined as array fields. This allows to substitute multiple different patterns in the examined field (*operand1*), all with an unique EXAMINE statement. It is not necessary to have the same number of occurrences for the search and replace operand. All what is required is the transfer compatibility between these fields; that is, *operand4*:=*operand6* must be a valid operation; see *Assignment Operations with Arrays* in the *Programming Guide*.

The operation logic for the multi-value search is as follows:

- The field to be examined (*operand1*) is passed through only a single time, either from left to right for direction FORWARD or from right to left for direction BACKWARD.

- Beginning with the first position, the values in the search array (*operand4*) are tested for a match, one after the other, starting with the array occurrence with the lowest index.
- If no search value was found, the comparison repeats on the next field position.
- If one of the searched patterns is detected in the examined field (*operand1*), it is substituted with the value of the replace array (*operand6*), which overlays the matching pattern in *operand4*, if a *operand4*:=*operand6* would be executed.
- After a pattern replacement was performed, the compare process continues with the first occurrence for the search array, immediately after the inserted value. This means, a replaced pattern is skipped and may not be replaced a second time.

Example 1:

This example shows an HTML translation for the characters less than (<), greater than (>), and ampersand (&).

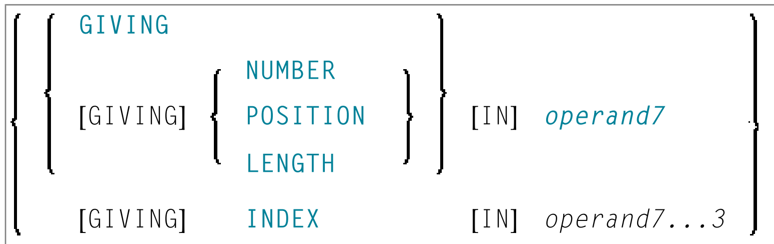
```
DEFINE DATA LOCAL
1 #HTML  (A/1:3) DYNAMIC INIT <'&lt;','&gt;','&amp;'>
1 #TAB   (A/1:3) DYNAMIC INIT <'<','>','&'>
1 #DOC(A) DYNAMIC  /* document to be replaced
END-DEFINE
#DOC := 'a&lt;&lt;b&amp;b&gt;c&gt;'
WRITE #DOC (AL=30) 'before'
/* Replace #DOC using #HTML to #TAB (n:1 replacement)
EXAMINE   #DOC FOR  #HTML(*)  REPLACE  #TAB(*)
/* '&lt;'  is replaced by '<'  (4:1 replacement)
/* '&gt;'  is replaced by '>'  (4:1 replacement)
/* '&amp;' is replaced by '&'  (5:1 replacement)
WRITE #DOC (AL=30) 'after'
END
```

Example 2:

This example shows a translation of pattern 'AA', 'Aa' and 'aA' into '++', of pattern 'BB', 'Bb' and 'bB' into '--' and of pattern 'CC', 'Cc' and 'cC' into '**'.

```
DEFINE DATA LOCAL
1 #SV     (A2/1:3,1:3) INIT (1,V) <'AA','BB','CC'>
                            (3,V) <'Aa','Bb','Cc'>
                            (2,V) <'aA','bB','cC'>
1 #RV     (A2/1:3)     INIT       <'++','--','**'>
1 #STRING (A20)        INIT <'AAABbbbbBCCCccccCaaaA'>
END-DEFINE
DISPLAY #STRING   /* shows   'AAABbbbbBCCCccccCaaaA'
EXAMINE #STRING FOR #SV(*,*)
   AND REPLACE WITH #RV(*)
DISPLAY #STRING   /* shows   '++A--bb--****c**aa++'
END
```

GIVING Clause



Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand7		S					N	P	I									yes	yes

Syntax Element Description:

Syntax Element	Description
GIVING	**GIVING Clause:** If only the keyword GIVING is specified, this corresponds to GIVING NUMBER (default).
NUMBER	**GIVING NUMBER Clause:** Is used to obtain information on how many times the search value (*operand4*) was found in the field (*operand1*) whose content is to be examined.
POSITION	**GIVING POSITION Clause:** Is used to obtain the byte position within *operand1* (or the substring of *operand1*) where the first value identical to *operand4* was found.
LENGTH	**GIVING LENGTH Clause:** Is used to obtain the remaining content length of *operand1* (or the substring of *operand1*) after all delete/replace operations have been performed. Trailing blanks are ignored.
operand7	**Number of Occurrences:** The number of occurrences of the search-value. If the REPLACE FIRST or DELETE FIRST option is also used, the number will not exceed 1.
INDEX *operand7...3*	**GIVING INDEX Clause:** See **GIVING INDEX Clause**.

GIVING INDEX Clause

```
[GIVING] INDEX [IN] operand7 ... 3
```

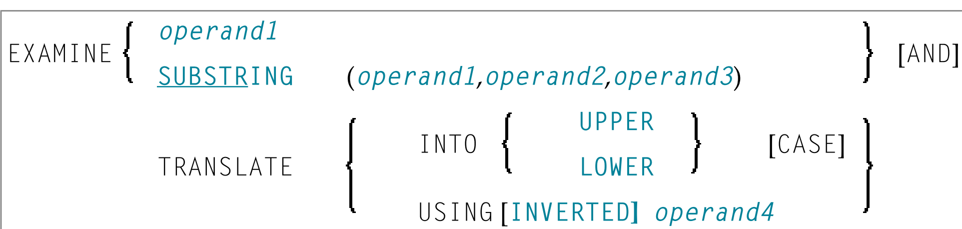
This option is only applicable if the underlying field to be examined is an array field.

Syntax Element Description:

Syntax Element	Description
INDEX	GIVING INDEX is used to obtain the array occurrence number (index) of *operand1* in which the first search-value (*operand4*) was found.
operand7...3	*operand7* must be specified as many times as there are dimensions in *operand1* (maximum three times). *operand7* will return 0 if the search-value is found in none of the occurrences.

Note: If the index range of *operand1* includes the occurrence 0 (for example, 0:5), a value of 0 in *operand7* is ambiguous. In this case, an additional GIVING NUMBER clause should be used to ascertain whether the search-value was actually found or not.

Syntax 2 - EXAMINE TRANSLATE



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Syntax Description - Syntax 2

The EXAMINE TRANSLATE statement is used to translate the characters contained in a field into upper-case or lower-case, or into other characters.

Operand Definition Table:

Operand	Possible Structure			Possible Formats				Referencing Permitted	Dynamic Definition
operand1		S	A	A			B	yes	no
operand2	C	S			N P I		B*	yes	no
operand3	C	S			N P I		B*	yes	no
operand4		S	A	A			B	yes	no

*Format B of *operand2* and *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
`EXAMINE` *operand1*	**Complete Field Content Translation:** *operand1* is the field whose content is to be translated.
`EXAMINE SUBSTRING` *operand1 operand2 operand3*	**Partial Field Content Translation:** Normally, the entire content of a field is translated. With the `SUBSTRING` option, you translate only a certain part of the field. After the field name (*operand1*) in the `SUBSTRING` clause, you specify first the starting position (*operand2*) and then the length (*operand3*) of the field portion to be examined. For example, to translate the 5th to 12th position inclusive of a field `#A`, you would specify: `EXAMINE SUBSTRING(#A,5,8) AND TRANSLATE ...` **Note:** If you omit *operand2*, the starting position is assumed to be `1`. If you omit *operand3*, the length is assumed to be from the starting position to the end of the field.
`TRANSLATE INTO UPPER CASE`	**Upper Case Translation:** The content of *operand1* will be translated into upper case.
`TRANSLATE INTO LOWER CASE`	**Lower Case Translation:** The content of *operand1* will be translated into lower case.
`TRANSLATE USING` *operand4*	**Translation Table:** *operand4* is the translation table to be used for character translation. The table must be of format/length A2 or B2.

Syntax Element	Description
	Note: If for a character to be translated more than one translation is defined in the translation table, the last of these translations applies.
INVERTED	**INVERTED Option:** If you specify the keyword INVERTED, the translation table (*operand4*) will be used inverted; that is, the translation direction will be reversed.

Syntax 3 - EXAMINE for Unicode Graphemes

```
EXAMINE [FULL [VALUE [OF]]] { operand1                                 }
                            { SUBSTRING(operand1,operand2,operand3)    }
[POSITION-clause]
                            { CHARPOSITION operand4 CHARLENGTH operand5 }
[FOR]                       { CHARPOSITION operand4                     }
                            { CHARLENGTH operand5                       }
[GIVING] POSITION IN operand6 [[GIVING] LENGTH IN operand7]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Syntax Description - Syntax 3

A “grapheme” is what a user normally thinks of as a character. In most cases, a UTF-16 code unit (= U format character) is a grapheme, however, a grapheme can also consist of several code units. Examples are: a sequence of a base character followed by combining characters or a surrogate pair. For more information on graphemes and other Unicode terms, see *The Unicode Standard* at ***http://www.unicode.org/***.

The EXAMINE statement for U format operands in general operates on code units. However, with the CHARPOSITION and CHARLENGTH clauses it is possible to obtain the starting position and length (in terms of code units) of a graphemes sequence. The returned code unit values can then be used in other statements/clauses which require code unit operands (for example, in a SUBSTRING clause).

For further information on this syntax of the EXAMINE statement, see also *Unicode and Code Page Support* in the *Natural Programming Language*, section *Statements*, *EXAMINE*.

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S	A			U					B							yes	no
operand2	C	S					N	P	I		B*							yes	no
operand3	C	S					N	P	I		B*							yes	no
operand4	C	S	A				N	P	I									yes	no
operand5	C	S	A				N	P	I									yes	no
operand6	C	S					N	P	I									yes	no
operand7	C	S					N	P	I									yes	no

* Format B of *operand2* and *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
`FULL`	**FULL Option:** If `FULL` is specified for an operand, the entire value, including trailing blanks, will be processed. If `FULL` is not specified, trailing blanks in the operand will be ignored.
`SUBSTRING` *operand1 operand2 operand3*	**SUBSTRING Clause:** Normally, the content of a field is examined from the beginning of the field to the end or to the last non-blank character. With the `SUBSTRING` option, you examine only a certain part of the field. After the field name (*operand1*) in the `SUBSTRING` clause, you specify first the starting position (*operand2*) and then the length (*operand3*) of the field portion to be examined. *operand2* and *operand3* are specified in terms of code units. For example, to examine the 5th to 12th position inclusive of a field `#A`, you would specify: `EXAMINE SUBSTRING (#A,5,8)` **Note:** 1. If you omit *operand2*, the starting position is assumed to be `1`. 2. If you omit *operand3*, the length is assumed to be from the starting position to the end of the field. 3. If `SUBSTRING` is used in conjunction with a `DYNAMIC` variable, the field behaves like a fixed length variable; that is, the length (`*LENGTH`) does not change as a result of the `EXAMINE` operation, regardless of whether a `DELETE` or `REPLACE` operation was executed or not.

Syntax Element	Description
POSITION-clause	**POSITION Clause:** FROM and THRU positions are given in terms of code units. For further information, see *POSITION Clause* under *Syntax 1*.
CHARPOSITION *operand4*	**CHARPOSITION Clause:** *operand4* defines the starting position (in terms of Unicode graphemes) of the grapheme sequence. The according position in terms of code units is returned in *operand6*. This clause can be omitted if the CHARLENGTH clause is specified; in this case the starting position 1 is assumed.
CHARLENGTH *operand5*	**CHARLENGTH Clause:** *operand5* defines the length (in terms of Unicode graphemes) of the grapheme sequence. The length of the grapheme sequence in terms of code units is returned in *operand7*. This clause can be omitted if the CHARPOSITION clause is specified; in this case the length from the starting position up to the end of the string is returned.
GIVING POSITION IN *operand6*	**GIVING POSITION Clause:** *operand6* receives the starting position (in terms of code units) of the grapheme sequence defined by *operand4* and *operand5*. If *operand1* has less than *operand4* graphemes, 0 is returned. This clause can be omitted if the GIVING LENGTH clause is specified.
GIVING LENGTH IN *operand7*	**GIVING LENGTH Clause:** *operand7* receives the length (in terms of code units) of the grapheme sequence defined by *operand4* and *operand5*. If *operand1* has less than *operand4*+*operand5* graphemes, 0 is returned. This clause can be omitted if the GIVING POSITION clause is specified.

Notes:

1. Either the CHARPOSITION or the CHARLENGTH clause or both must be specified.
2. Either the GIVING POSITION or GIVING LENGTH clause or both must be specified.

```

Example 4 - EXAMINE for Unicode Graphemes

This example demonstrates the analysis of a Unicode string containg the characters `ä` und `ü`. Both characters are defined as base character followed by a combining character: `ä` is coded with `U+0061` followed by `U+0308`, and `ü` is coded with `U+0075` followed by `U+0308`.

```
DEFINE DATA LOCAL
1 #U (U20)
1 #START (I2)
1 #POS (I2)
1 #LEN (I2)
END-DEFINE
#U := U'AB'-UH'00610308'-U'CD'-UH'00750308'-U'EF'
*
REPEAT
  #START := #START + 1
  EXAMINE #U FOR CHARPOSITION #START
                 CHARLENGTH      1
            GIVING POSITION IN #POS
                     LENGTH IN #LEN
*
  INPUT (AD=O) MARK POSITION #POS IN FIELD *#U
    '         UNICODE-STRING:' #U     (AD=MI)
 // '          CHARACTER NO.:' #START (EM=9)
  / 'STARTS AT BYTE POSITION:' #POS   (EM=9)
  / '      AND THE LENGTH IS:' #LEN   (EM=9)
WHILE #POS NE 0
END-REPEAT
END
```

Output:

Mainframe Environments:	**Windows, UNIX and OpenVMS Environments (with Natural Web I/O Interface):**

`UNICODE-STRING: ABa?CDu?EF`
 	
`CHARACTER NO.: 1`
`STARTS AT BYTE POSITION: 1`
`AND THE LENGTH IS: 1`
	`UNICODE-STRING: ABäCDüEF`
	
	`CHARACTER NO.: 1`
	`STARTS AT BYTE POSITION: 1`
	`AND THE LENGTH IS: 1`

Press ENTER to continue.	Press ENTER to continue.

`UNICODE-STRING: ABa?CDu?EF`
 	
`CHARACTER NO.: 2`
`STARTS AT BYTE POSITION: 2`
`AND THE LENGTH IS: 1`
	`UNICODE-STRING: ABäCDüEF`
	
	`CHARACTER NO.: 2`
	`STARTS AT BYTE POSITION: 2`
	`AND THE LENGTH IS: 1`

Press ENTER to continue.	Press ENTER to continue.
Note that the character in position 3 is a combining character sequence and is two code units long.	

`UNICODE-STRING: AB<b>a</b>?CDu?EF`
 	
`CHARACTER NO.: 3`
`STARTS AT BYTE POSITION: 3`
`AND THE LENGTH IS: 2`
	`UNICODE-STRING: AB<b>ä</b>CDüEF`
	
	`CHARACTER NO.: 3`
	`STARTS AT BYTE POSITION: 3`
	`AND THE LENGTH IS: 2`

And so on.	And so on.

62 EXPAND

- Function 372
- Syntax Description 372

```
EXPAND { dynamic-clause } [GIVING operand5]
       { array-clause   }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related statements: REDUCE | RESIZE

Belongs to Function Group: *Memory Management Control for Dynamic Variables or X-Arrays*

Function

The EXPAND statement is used to expand:

- the allocated length of a dynamic variable (*dynamic-clause*), or
- the number of occurrences of X-arrays (*array-clause*).

For further information, see the following sections in the *Programming Guide*:

Using Dynamic Variables

Allocating/Freeing Memory Space for a Dynamic Variable

X-Arrays

Storage Management of X-Group Arrays

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A			A	U					B							no	no
operand2	C	S								I									no	no
operand3			A	G		A	U	N	P	I	F	B	D	T	L	C	G	O	yes	no
operand4	C	S						N	P	I									no	no
operand5		S								I4									no	yes

Syntax Element Description:

Syntax Element	Description
dynamic-clause	**Dynamic Clause:** The EXPAND DYNAMIC VARIABLE statement expands the allocated length of a dynamic variable (*operand1*) to the value specified with *operand2*. For more information, see ***Dynamic Clause*** below.
operand1	**Dynamic Variable:** *operand1* is the dynamic variable for which the size is to be expanded.
operand2	**Target Length of Dynamic Variable:** *operand2* is used to specify the length to which the dynamic variable is to be expanded. The value specified must be a non-negative integer constant or a variable of type Integer4 (I4).
array-clause	**Array Clause:** The EXPAND ARRAY statement increases the number of occurrences of the X-array (*operand3*) to the upper and lower bound specified with (*dim*[,*dim*[,*dim*]]). For more information, see ***Array Clause*** below.
operand3	**X-Array:** *operand3* is the X-array for which the number of occurrences may be increased. The index notation of the array is optional. As index notation only the complete range notation * is allowed for each dimension.
dim *operand4*	**Dimension:** The lower and upper bound notation (*operand4* or asterisk) to which the X-array should be expanded is specified here. If the current value of the upper or lower bound should be used, an asterisk (*) may be specified in place of *operand4*. For more information, see ***Dimension*** below.
GIVING *operand5*	**GIVING Clause:** If the GIVING clause is not specified, Natural runtime error processing is triggered if an error occurs. If the GIVING clause is specified, *operand5* contains the Natural message number if an error occurred, or zero upon success.

Dynamic Clause

```
[SIZE OF] DYNAMIC [VARIABLE] operand1 TO operand2
```

The `EXPAND DYNAMIC VARIABLE` statement expands the allocated size of a dynamic variable (*operand1*) to the value specified with *operand2*.

If *operand2* is less than the currently allocated length of *operand1*, the statement will be ignored for this dynamic variable. The currently allocated length (`*LENGTH`) of the dynamic variable is not modified.

Array Clause

```
[AND RESET [OCCURRENCES OF] ARRAY operand3 TO (dim[,dim [,dim]])]
```

The `EXPAND ARRAY` statement increases the number of occurrences of the X-array (*operand3*) to the upper and lower bound specified with `TO (dim [,dim[,dim]])`.

The `RESET` option resets all occurrences of the resized X-array to its default zero value. By default (no `RESET` option), the actual values are kept and the resized (new) occurrences are reset.

When using the `EXPAND` statement, it is only possible to increase the number of occurrences. If the requested number is smaller than the currently allocated number of occurrences, it will simply be ignored.

An upper or lower bound used in an `EXPAND` statement must be exactly the same as the corresponding upper or lower bound defined for the array.

Example:

```
DEFINE DATA LOCAL
1 #a(I4/1:*)
1 #g(1:*)
  2 #ga(I4/1:*)

1 #i(i4)
END-DEFINE
...
/* allocating #a(1:10)
EXPAND ARRAY #a TO (1:10)       /* #a is allocated 10
EXPAND ARRAY #a TO (*:10)       /* occurrences.

/* allocating #ga(1:10,1:20)
EXPAND ARRAY #g TO (1:10)       /* 1st dimension is set to (1:10)
EXPAND ARRAY #ga TO (*:*,1:20)  /* 1st dimension is dependent and
                                /* therefore kept with (*:*)
```

```
                                /* 2nd dimension is set to (1:20)

EXPAND ARRAY #a TO (5:10)       /* This is rejected because the lower index
                                /* must be 1 or *
EXPAND ARRAY #a TO (#i:10)      /* This is rejected because the lower index
                                /* must be 1 or *

EXPAND ARRAY #ga TO (1:10,1:20) /* (1:10) for the 1st dimension is rejected
                                /* because the dimension is dependent and
                                /* must be specified with (*:*).
```

For further information, see the following topics in the *Programming Guide*:

- *Storage Management of X-Arrays*
- *Storage Management of X-Group Arrays*

Dimension

Each of the dimensions (*dim*) specified in the ***Array Clause*** is defined using the following syntax:

```
{ operand4 }   { operand4 }
{ *        } : { *        }
```

The lower and upper bound notation (*operand4* or asterisk) to which the X-array should be expanded is specified here. If the current value of the upper or lower bound should be used, an asterisk (*) may be specified in place of *operand4*. Instead of `*:*`, you may also specify a single asterisk.

The number of dimensions (`dim`) must exactly match the defined number of dimensions of the X-array (1, 2 or 3).

If the number of occurrences for a specified dimension is less than the number of the currently allocated occurrences, the number of occurrences is not changed for the corresponding dimension.

63 FETCH

- Function 378
- Syntax Description 379
- Example 380

```
FETCH [ { REPEAT } ] operand1 [operand2 [(parameter)]] ...
          { RETURN }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CALL | CALL FILE | CALL LOOP | CALLNAT | DEFINE SUBROUTINE | ESCAPE | FETCH | PERFORM

Belongs to Function Group: ***Invoking Programs and Routines***

Function

The FETCH statement is used to execute a Natural object program written as a main program. The program to be loaded must have been previously stored in the Natural system file with a CATALOG or STOW command. Execution of the FETCH statement does not overwrite any source program in the Natural source work area.

For Natural RPC: See *Notes on Natural Statements on the Server* (in the *Natural Remote Procedure Call (RPC)* documentation).

Additional Considerations

In addition to the parameters passed explicitly with FETCH, the fetched program also has access to the established global data area.

The FETCH statement may cause the internal execution of an END TRANSACTION statement based on the setting of the Natural profile parameter OPRB (Database Open/Close Processing) as set by the Natural administrator. If a logical transaction is to span multiple Natural programs, the Natural administrator should be consulted to ensure that the OPRB parameter is set correctly.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no
operand2	C	S	A	G		A	U	N	P	I	F	B	D	T	L		G		yes	yes

Syntax Element Description:

Syntax Element	Description
REPEAT	**REPEAT Option:** The REPEAT option causes Natural to suppress the prompt for user input for each INPUT statement issued during the execution of the FETCHed program. It may be used to send information about the execution of the program to the terminal without the user having to reply with ENTER.
RETURN	**RETURN Option:** Without the specification of RETURN, the execution of the program issuing the FETCH statement will be terminated immediately and the fetched program will be activated as a "main program" (Level 1). If a program is invoked with FETCH RETURN, the execution of the invoking program will be suspended - not terminated - and the FETCHed program will be activated as a "subordinate program" on a higher level. Control is returned to the invoking program when an END or ESCAPE ROUTINE statement is encountered in the FETCHed program. Processing is continued with the statement following the FETCH RETURN statement.
operand1	**Program Name:** The name of the program module (maximum 8 characters) can be specified as an alphanumeric constant or the content of an alphanumeric variable of length 1 to 8. Natural will attempt to locate the program in the library currently active at the time the FETCH statement is issued. If the program is not found, Natural will attempt to locate the program in the steplibs. If the program is still not found, an error message will be issued. The program name may contain an ampersand (&); at execution time, this character will be replaced by the one-character code corresponding to the current value of the system variable *LANGUAGE. This makes it possible, for example, to invoke different programs for the processing of input, depending on the language in which input is provided.
operand2	**Passing Parameter Fields:**

Syntax Element	Description
	The FETCH statement may also be used to pass parameter fields to the invoked program. A parameter field may be defined with any format. The parameters are converted to a format suitable for a corresponding INPUT field. All parameters are placed on the top of the Natural stack. The parameter fields can be read by the FETCHed program using an INPUT statement. The first INPUT statement will result in the insertion of all parameter field values into the fields specified in the INPUT statement. The INPUT statement must have the sign position specification (session parameter SG=ON) for parameter fields defined with numeric format, because each parameter field defined with numeric format in the FETCH statement will receive a sign position if its value is negative. If more parameters are passed than are read by the next INPUT statement, the extra parameters are ignored. The number of parameters may be obtained with the Natural system variable *DATA. **Note:** If *operand2* is a time variable (format T), only the time component of the variable content is passed, but not the date component.
parameter	**Date Format:** If *operand2* is a date variable, you can specify the session parameter DF (Date Format) as *parameter* for this variable.

Example

Invoking Program:

```
** Example 'FETEX1': FETCH  (with parameter)
************************************************************************
DEFINE DATA LOCAL
1 #PNUM (N8)
1 #FNC  (A1)
END-DEFINE
*
INPUT 10X 'SELECTION MENU FOR EMPLOYEES SYSTEM' /
      10X '-' (35) //
      10X 'ADD      (A)' /
      10X 'UPDATE   (U)' /
      10X 'DELETE   (D)' /
      10X 'STOP     (.)' //
      10X 'PLEASE ENTER FUNCTION: ' #FNC ///
      10X 'PERSONNEL NUMBER:' #PNUM
*
DECIDE ON EVERY VALUE OF #FNC
  VALUE 'A', 'U', 'D'
```

```
    IF #PNUM = 0
      REINPUT 'PLEASE ENTER A VALID NUMBER' MARK *#PNUM
    END-IF
  VALUE 'A'
    FETCH 'FETEXAD' #PNUM
  VALUE 'U'
    FETCH 'FETEXUP' #PNUM
  VALUE 'D'
    FETCH 'FETEXDE' #PNUM
  VALUE '.'
    STOP
  NONE
    REINPUT 'PLEASE ENTER A VALID FUNCTION' MARK *#FNC
END-DECIDE
*
END
```

Invoked Program FETEXAD:

```
** Example 'FETEXAD': FETCH (called by FETEX1)
************************************************************************
DEFINE DATA LOCAL
1 #PERS-NR (N8)
END-DEFINE
*
INPUT #PERS-NR
*
WRITE *PROGRAM 'Record added with personnel number:' #PERS-NR
*
END
```

Invoked Program FETEXUP:

```
** Example 'FETEXUP': FETCH (called by FETEX1)
************************************************************************
DEFINE DATA LOCAL
1 #PERS-NR (N8)
END-DEFINE
*
INPUT #PERS-NR
*
WRITE *PROGRAM 'Record updated with personnel number:' #PERS-NR
*
END
```

Invoked Program FETEXDE:

```
** Example 'FETEXDE': FETCH (called by FETEX1)
************************************************************************
DEFINE DATA LOCAL
1 #PERS-NR (N8)
END-DEFINE
*
INPUT #PERS-NR
*
WRITE *PROGRAM 'Record deleted with personnel number:' #PERS-NR
*
END
```

Output of Program FETEX1:

```
SELECTION MENU FOR EMPLOYEES SYSTEM
-----------------------------------

ADD      (A)
UPDATE   (U)
DELETE   (D)
STOP     (.)

PLEASE ENTER FUNCTION: D

PERSONNEL NUMBER: 1150304
```

After entering and confirming function and personnel number:

```
Page      1                                                05-01-13  11:58:46

FETEXDE  Record deleted with personnel number:   1150304
```

64 FIND

- Function 384
- Restrictions 386
- Syntax Description 386
- Examples 406

```
FIND  [ { ALL          } ]  [MULTI-FETCH-clause] [ { RECORD  } ]  [IN] [FILE]
      [ { (operand1)   } ]  []                   [ { RECORDS } ]  view-name
      [ { FIRST        } ]
      [ { NUMBER       } ]
      [ { UNIQUE       } ]
      [PASSWORD=operand2]
      [CIPHER=operand3]
      [WITH] [[LIMIT] (operand4)] basic-search-criterion
      [COUPLED-clause] ... 4/42
      [STARTING WITH ISN=operand5]
      [SORTED-BY-clause]
      [RETAIN-clause]
      [WHERE-clause]
      [IF-NO-RECORDS-FOUND-clause]
      statement ...
END-FIND                        (structured mode only)
[LOOP]                          (reporting mode only)
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | GET | GET SAME | GET TRANSACTION | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The FIND statement is used to select a set of records from the database based on a search criterion consisting of fields defined as descriptors (keys).

This statement causes a processing loop to be initiated and then executed for each record selected. Each field in each record may be referenced within the processing loop. It is not necessary to issue a READ statement following the FIND in order to reference the fields within each record selected.

See also *FIND Statement* (in the *Programming Guide*).

Database-Specific Considerations

SQL	FIND FIRST as well as the PASSWORD, CIPHER, COUPLED and RETAIN clauses are not permitted. FIND UNIQUE is not permitted. The SORTED BY clause corresponds with the SQL clause ORDER BY. The basic search criterion for an SQL-database table may be specified in the same manner as for an Adabas file. The term record used in this context corresponds with the SQL term "row".
XML	FIND FIRST, as well as the PASSWORD, CIPHER, COUPLED and RETAIN clauses are not permitted. FIND UNIQUE is not permitted. The basic search criterion for an XML-database may be specified in the same manner as for an Adabas file. The term record used in this context corresponds with the XML term "XML object".

System Variables with the FIND Statement

The Natural system variables *ISN, *NUMBER, and *COUNTER are automatically created for each FIND statement issued. A reference number must be supplied if the system variable was referenced outside the current processing loop or through a FIND UNIQUE, FIND FIRST, or FIND NUMBER statement. The format/length of each of these system variables is P10; this format/length cannot be changed.

*ISN	Adabas	*ISN contains the Adabas internal sequence number (ISN) of the record currently being processed. *ISN is not available for the FIND NUMBER statement.
	Tamino	*ISN contains the XML object ID.
	SQL	*ISN is not available.
	Entire System Server	*ISN is not available.
*NUMBER	Adabas	*NUMBER contains the number of records which satisfied the basic search criterion specified in the WITH clause.
	Tamino	See **NUMBER for SQL Databases* in the *System Variables* documentation.
	Entire System Server	*NUMBER is not available.
*COUNTER	The system variable *COUNTER contains the number of times the processing loop has been entered.	

See also ***Example 13 - Using System Variables with the FIND Statement***.

Issuing Multiple FIND Statements

Multiple `FIND` statements may be issued to create nested loops whereby an inner loop is entered for each record selected in the outer loop.

See also *Example 14 - Multiple FIND Statements*.

Restrictions

With Entire System Server, `FIND NUMBER` and `FIND UNIQUE` as well as the `PASSWORD`, `CIPHER`, `COUPLED` and `RETAIN` clauses are not permitted.

Syntax Description

Operand Definition Table:

Operand	Possible Structure				Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C	S			N P I B*	yes	no
operand2	C	S			A	yes	no
operand3	C	S			N	yes	no
operand4	C	S			N P I B*	yes	no
operand5	C	S			N P I B*	yes	no

* Format B of *operand1*, *operand4* and *operand5* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
`ALL`/*operand1*	**Processing Limit:** The number of records to be processed from the selected set may be limited by specifying *operand1* either as a numeric constant (in the range from `0` to `4294967295`) or as the name of a numeric variable enclosed in parentheses. `ALL` may be optionally specified. It emphasizes that all selected records are to be processed.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>If you specify a limit with operand1, this limit applies to the FIND loop being initiated. Records rejected for processing by the WHERE clause are not counted against this limit.
<pre>FIND (5) IN EMPLOYEES WITH ...

MOVE 10 TO #CNT(N2)
FIND (#CNT) EMPLOYEES WITH ...</pre>For this statement, the specified limit has priority over a limit set with a LIMIT statement.

If a smaller limit is set with the LT parameter, the LT limit applies.

Note:

1. If you wish to process a 4-digit number of records, specify it with a leading zero: (0nnnn); because Natural interprets every 4-digit number enclosed in parentheses as a line-number reference to a statement.
2. operand1 has no influence on the size of an ISN set that is to be retained by a RETAIN clause. operand1 is evaluated when the FIND loop is entered. If the value of operand1 is modified within the FIND loop, this does not affect the number of records processed.</td></tr>
<tr><td>FIND FIRST | FIND NUMBER | FIND UNIQUE</td><td>FIND FIRST, FIND NUMBER, FIND UNIQUE Option:

These options are used

■ to select the first record of a selected set (see FIND FIRST),
■ to determine the number of records in a selected set (see FIND NUMBER), or
■ to ensure that only one record satisfies a selection criterion (see FIND UNIQUE).

For a detailed description of these options, see below.</td></tr>
<tr><td>MULTI-FETCH-clause</td><td>MULTI-FETCH Clause:

For Adabas databases, Natural offers a MULTI-FETCH clause that allows you to read more than one record per database access. For further information, see MULTI-FETCH Clause.</td></tr>
<tr><td>view-name</td><td>View Name:

The name of a view as defined either within a DEFINE DATA block or in a separate global or local data.

In reporting mode, view-name is the name of a DDM if no DEFINE DATA LOCAL statement is used.</td></tr>
<tr><td>PASSWORD=operand2</td><td>PASSWORD Clause:</td></tr>
</table>

Syntax Element	Description
	The PASSWORD clause applies only for Adabas databases. This clause is not permitted with Entire System Server. The PASSWORD clause is used to provide a password (*operand2*) when reading/writing data from an Adabas file which is password protected. If you require access to a password-protected file, contact the person responsible for database security concerning password usage/assignment. If the password is specified as a constant, the PASSWORD clause should always be coded at the very beginning of a source-code line; and there should be no blank between the keyword PASSWORD and the equal sign; this ensures that the password is not visible/displayable in the source code of the program. In TP mode, you may enter the PASSWORD clause invisible by entering the terminal command %* before you type in the PASSWORD clause. If the PASSWORD clause is omitted, the default password specified with the PASSW statement applies. The password value must not be changed during the execution of a processing loop. See also ***Example 1 - PASSWORD Clause***.
CIPHER=*operand3*	**CIPHER Clause:** The CIPHER clause only applies to Adabas databases. This clause is not permitted with Entire System Server. The CIPHER clause is used to provide a cipher key (*operand3*) when retrieving data from Adabas files which are enciphered. If you require access to an enciphered file, contact the person responsible for database security concerning cipher key usage/assignment. The cipher key may be specified as a numeric constant with 8 digits or as a user-defined variable with format/length N8. If the cipher key is specified as a constant, the CIPHER clause should always be coded at the very beginning of a source-code line; this ensures that the cipher key is not visible/displayable in the source code of the program. In TP mode, you may enter the CIPHER clause invisible by entering the Natural terminal command %* before you type in the CIPHER clause. The value of the cipher key must not be changed during the processing of a loop initiated by a FIND statement. See also ***Example 2 - CIPHER Clause***.
WITH LIMIT *operand4* *basic-search-criterion*	**WITH Clause:**

Syntax Element	Description
	The `WITH` clause is required. It is used to specify the basic-search-criterion (see ***Search Criterion for Adabas Files***) consisting of key fields (descriptors) defined in the database. The following database-specific consideration applies: You may use Adabas descriptors, subdescriptors, superdescriptors, hyperdescriptors, and phonetic descriptors within a `WITH` clause. A non-descriptor (that is, a field marked in the DDM with `N`) can also be specified. The number of records to be selected as a result of a `WITH` clause may be limited by specifying the keyword `LIMIT` together with a numeric constant or a user-defined variable, enclosed within parentheses, which contains the limit value (*operand4*). If the number of records selected exceeds the limit, the program will be terminated with an error message. **Note:** If the limit is to be a 4-digit number, specify it with a leading zero (0*nnnn*); because Natural interprets every 4-digit number enclosed in parentheses as a line-number reference to a statement.
COUPLED-clause	**COUPLED Clause:** This clause may be used used to specify a search which involves the use of the Adabas coupling facility. See ***COUPLED Clause***.
STARTING WITH ISN=*operand5*	**STARTING WITH Clause:** This clause may be used for repositioning within a `FIND` loop whose processing has been interrupted. See ***STARTING WITH Clause***.
SORTED-BY-clause	**SORTED BY Clause:** This clause may be used to cause Adabas to sort the selected records based on the sequence of one to three descriptors. See ***SORTED BY Clause***.
RETAIN-clause	**RETAIN Clause:** This clause may be used to retain the result of an extensive search in large files for further processing. See ***RETAIN Clause***.
WHERE-clause	**WHERE Clause:** This clause may be used to specify an additional selection criterion (*logical-condition*). See ***WHERE Clause***.
IF-NO-RECORDS-FOUND-clause	**IF NO RECORDS FOUND Clause:** This clause may be used to cause a processing loop initiated with a `FIND` statement to be entered in the event that no records meet the selection criteria specified in the `WITH` clause and the `WHERE` clause. See ***IF NO RECORDS FOUND Clause***.
END-FIND	**End of FIND Statement:**

Syntax Element	Description
	The Natural reserved keyword END-FIND must be used to end the FIND statement.

FIND FIRST

The FIND FIRST statement may be used to select and process the first record which meets the WITH and WHERE criteria.

For Adabas databases, the record processed will be the record with the lowest Adabas ISN from the set of qualifying records.

This statement does *not* initiate a processing loop.

Restrictions with FIND FIRST

- FIND FIRST can only be used in reporting mode.
- FIND FIRST is not available for SQL databases.
- The IF NO RECORDS FOUND clause must not be used in a FIND FIRST statement.

System Variables with FIND FIRST

The following Natural system variables are available with the FIND FIRST statement:

*ISN	The system variable *ISN contains the Adabas ISN of the selected record. *ISN will be zero if no record is found after the evaluation of the WITH and WHERE criteria. *ISN is not available with Entire System Server.
*NUMBER	The system variable *NUMBER contains the number of records found after the evaluation of the WITH criterion and before evaluation of any WHERE criterion. *NUMBER will be zero if no record meets the WITH criterion. *NUMBER is not available with Entire System Server.
*COUNTER	The system variable *COUNTER contains 1 if a record was found; contains 0 if no record was found.

Example of FIND FIRST Statement: See the program FNDFIR (reporting mode)

FIND NUMBER

The FIND NUMBER statement is used to determine the number of records which satisfy the WITH/WHERE criteria specified. It does *not* result in the initiation of a processing loop and *no data fields from the database are made available*.

Note: Use of the WHERE clause may result in significant overhead.

Restrictions with FIND NUMBER

- The SORTED BY clause and the IF NO RECORDS FOUND clause must not be used with the FIND NUMBER statement.
- The WHERE clause can only be used in reporting mode.
- FIND NUMBER is not available with Entire System Server.

System Variables with FIND NUMBER

The following Natural system variables are available with the FIND NUMBER statement:

*NUMBER	The system variable *NUMBER contains the number of records found after the evaluation of the WITH criterion.
*COUNTER	The system variable *COUNTER contains the number of records found after the evaluation of the WHERE criterion. *COUNTER is only available if the FIND NUMBER statement contains a WHERE clause.

Example for FIND NUMBER: See the program FNDNUM (reporting mode).

FIND UNIQUE

The FIND UNIQUE statement may be used to ensure that only one record is selected for processing. It does *not* result in the initiation of a processing loop. If a WHERE clause is specified, an automatic internal processing loop is created to evaluate the WHERE clause.

If no records or more than one record satisfy the criteria, an error message will be issued. This condition can be tested with the ON ERROR statement.

Restrictions with FIND UNIQUE

- FIND UNIQUE can only be used in reporting mode.
- FIND UNIQUE is not available with Entire System Server.
- For SQL databases, FIND UNIQUE cannot be used. (Exception: On mainframe computers, FIND UNIQUE can be used for primary keys; however, this is only permitted for compatibility reasons and should not be used.)

- The SORTED BY and IF NO RECORDS FOUND clauses must not be used with the FIND UNIQUE statement.

System Variables with FIND UNIQUE

*ISN	The system variable *ISN contains the unique ISN number of the record, which itself must be unique.
*NUMBER	The system variable *NUMBER always contains 1 for a valid FIND UNIQUE execution. *NUMBER may contain any other positive value (= 0 or >= 2) if an error has occurred. This error condition may be used by the ON ERROR statement. *NUMBER is not allowed if the WHERE clause is missing.
*COUNTER	The system variable *COUNTER contains the number of records found after the evaluation of the WHERE criterion. *COUNTER is not allowed if the WHERE clause is missing.

Example for FIND UNIQUE: See the Program FNDUNQ (reporting mode).

MULTI-FETCH Clause

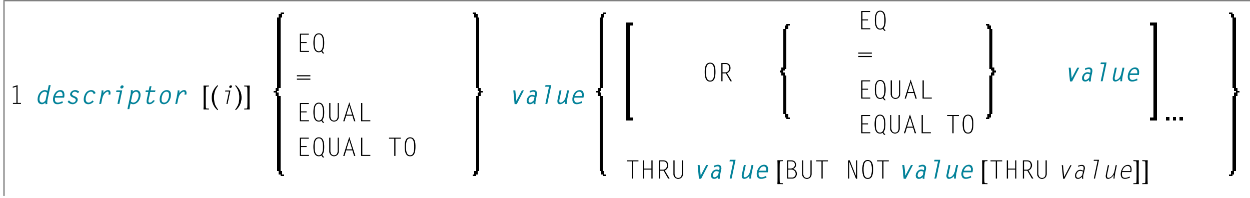
Note: This clause can only be used for Adabas databases.

```
[ MULTI-FETCH { ON                          } ]
[             { OFF                         } ]
[             { OF multi-fetch-factor       } ]
```

Note: [MULTI-FETCH OF *multi-fetch-factor*] is not evaluated for database types ADA and ADA2. The default processing mode is applied; see profile parameter MFSET. When used in conjunction with database type ADA2, the MULTI-FETCH clause is ignored completetly; see *Database Management System Assignments* in the *Configuration Utility* documentation.

For more information, see the section *Multi-Fetch Clause* (Adabas) in the *Programming Guide*.

Search Criterion for Adabas Files



```
                  EQ
                  =

                  NOT >
                  NOT GT
3 set-name
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
descriptor		S	A			A	U	N	P	I	F	B	D	T	L				no	no
value	C	S				A	U	N	P	I	F	B	D	T	L				yes	no
set-name	C	S				A													no	no

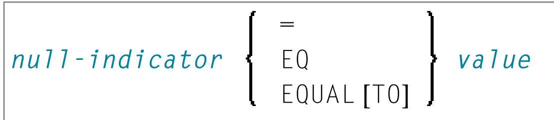
Syntax Element Description:

Syntax Element	Description
descriptor	**Descriptor:** Adabas descriptor, subdescriptor, superdescriptor, hyperdescriptor, or phonetic descriptor. A field marked as non-descriptor in the DDM can also be specified.
(*i*)	**Index Specification:** A descriptor contained within a periodic group may be specified with or without an index. If no index is specified, the record will be selected if the value specified is located in any occurrence. If an index is specified, the record is selected only if the value is located in the occurrence specified by the index. The index specified must be a constant. An index range must not be used. No index must be specified for a descriptor which is a multiple-value field. The record will be selected if the value is located in the record regardless of the position of the value.
value	**Search Value:** The formats of the descriptor and the search value must be compatible.
set-name	**Set Name:** Identifies a set of records previously selected with a FIND statement in which the RETAIN clause was specified. The set referenced in a FIND must have been created from the same physical Adabas file. *set-name* may be specified as a text constant (maximum 32 characters) or as the content of an alphanumeric variable. *set-name* cannot be used with Entire System Server.

See also:

- *Example 3 - Basic Search Criterion in WITH Clause*
- *Example 4 - Basic Search Criterion with Multiple-Value Field*

Search Criterion with Null Indicator



Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
null-indicator		S							I									no	no
value	C	S					N	P	I	F	B							yes	no

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>null-indicator</td><td>The null indicator.</td></tr>
<tr><td>value</td><td><table>
<tr><th>Possible Values:</th><th>Meaning:</th></tr>
<tr><td>-1</td><td>The corresponding field contains no value.</td></tr>
<tr><td>0</td><td>The corresponding field does contain a value.</td></tr>
</table></td></tr>
</table>

Connecting Search Criteria (for Adabas Files)

Basic-search-criteria can be combined using the Boolean operators AND, OR, and NOT. Parentheses may also be used to control the order of evaluation. The order of evaluation is as follows:

1. `( )`: Parentheses
2. `NOT`: Negation (only for a *basic-search-criterion* of form [2]).
3. `AND`: AND operation
4. `OR`: OR operation

Basic-search-criteria may be connected by logical operators to form a complex *search-expression*. The syntax for such a complex *search-expression* is as follows:

```
[NOT] { basic-search-criterion } [ { OR  } search-expression ] ...
      { (search-expression)    }   { AND }
```

See also ***Example 5 - Various Samples of Complex Search Expression in WITH Clause***.

Descriptor-Key Usage

Adabas users may use database fields which are defined as descriptors to construct basic search criteria.

Subdescriptors, Superdescriptors, Hyperdescriptors and Phonetic Descriptors

With Adabas, subdescriptors, superdescriptors, hyperdescriptors and phonetic descriptors may be used to construct search criteria.

- A subdescriptor is a descriptor formed from a portion of a field.
- A superdescriptor is a descriptor whose value is formed from one or more fields or portions of fields.
- A hyperdescriptor is a descriptor which is formed using a user-defined algorithm.
- A phonetic descriptor is a descriptor which allows the user to perform a phonetic search on a field (for example, a person's name). A phonetic search results in the return of all values which sound similar to the search value.

Which fields may be used as descriptors, subdescriptors, superdescriptors, hyperdescriptors and phonetic descriptors with which file is defined in the corresponding DDM.

Values for Subdescriptors, Superdescriptors, Phonetic Descriptors

Values used with these types of descriptors must be compatible with the internal format of the descriptor. The internal format of a subdescriptor is the same as the format of the field from which the subdescriptor is derived. The internal format of a superdescriptor is binary if all of the fields from which it is derived are defined with numeric format; otherwise, the format is alphanumeric. Phonetic descriptors always have alphanumeric format.

Values for subdescriptors and superdescriptors may be specified in the following ways:

- Numeric or hexadecimal constants may be specified. A hexadecimal constant must be used for a value for a superdescriptor which has binary format (see above).
- Values in user-defined variable fields may be specified using the `REDEFINE` statement to select the portions that form the subdescriptor or superdescriptor value.

Using Descriptors Contained within a Database Array

A descriptor which is contained within a database array may also be used in the construction of basic search criterion. For Adabas databases, such a descriptor may be a multiple-value field or a field contained within a periodic group.

A descriptor contained within a periodic group may be specified with or without an index. If no index is specified, the record will be selected if the value specified is located in any occurrence. If an index is specified, the record is selected only if the value is located in the occurrence specified by the index. The index specified must be a constant. An index range must not be used.

No index must be specified for a descriptor which is a multiple-value field. The record will be selected if the value is located in the record regardless of the position of the value.

See also ***Example 6 - Various Samples Using Database Arrays***.

COUPLED Clause

This clause only applies to Adabas databases.

This clause is not permitted with Entire System Server.

```
{ AND }  COUPLED  [TO] [FILE] view-name
{ OR  }
                  [                    { EQ       }              ]
                  [                    { =        }              ]
                  [ VIA descriptor1    { EQUAL    }  descriptor2 ]
                  [                    { EQUAL TO }              ]

                  [WITH]
                  basic-search-criteria
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
descriptor1		S	A			A	N	P			B							no	no
descriptor2		S	A			A	N	P			B							no	no

Note: Without the `VIA` clause, the `COUPLED` clause may be specified up to 4 times; with the `VIA` clause, it may be specified up to 42 times.

The `COUPLED` clause is used to specify a search which involves the use of the Adabas coupling facility. This facility permits database descriptors from different files to be specified in the search criterion of a single `FIND` statement.

The same Adabas file must not be used in two different `FIND COUPLED` clauses within the same `FIND` statement.

A *`set-name`* (see ***RETAIN Clause***) must not be specified in the *`basic-search-criteria`*.

Database fields in a file specified within the `COUPLED` clause are not available for subsequent reference in the program unless another `FIND` or `READ` statement is issued separately against the coupled file.

Note: If the `COUPLED` clause is used, the main `WITH` clause may be omitted. If the main `WITH` clause is omitted, the keywords `AND`/`OR` of the `COUPLED` clause must not be specified.

Physical Coupling without VIA Clause

The files used in a `COUPLED` clause without `VIA` must be physically coupled using the appropriate Adabas utility (as described in the Adabas documentation).

See also ***Example 7 - Using Physically Coupled Files***.

The reference to `NAME` in the `DISPLAY` statement of the above example is valid since this field is contained in the `EMPLOYEES` file, whereas a reference to `MAKE` would be invalid since `MAKE` is contained in the `VEHICLES` file, which was specified in the `COUPLED` clause.

In this example, records will be found only if `EMPLOYEES` and `VEHICLES` have been physically coupled.

Logical Coupling - VIA Clause

The option `VIA` *`descriptor1`* `=` *`descriptor2`* allows you to logically couple multiple Adabas files in a search query, where:

- *`descriptor1`* is a field from the first view.
- *`descriptor2`* is a field from the second view.

The two files need not be physically coupled in Adabas. This `COUPLED` option uses the soft-coupling feature of Adabas Version 5 and above, as described in the Adabas documentation.

See also ***Example 8 - VIA Clause***.

STARTING WITH Clause

This clause applies only to Adabas databases.

You can use this clause to specify as *operand5* an Adabas ISN (internal sequence number) which is to be used as a start value for the selection of records.

This clause may be used for repositioning within a FIND loop whose processing has been interrupted, to easily determine the next record with which processing is to continue. This is particularly useful if the next record cannot be identified uniquely by any of its descriptor values. It can also be useful in a distributed client/server application where the reading of the records is performed by a server program while further processing of the records is performed by a client program, and the records are not processed all in one go, but in batches.

Note: The start value actually used will not be the value of *operand5*, but the next higher value.

Example:

See the program FNDSISN in the library SYSEXSYN.

SORTED BY Clause

This clause only applies to Adabas, Tamino and SQL databases.

This clause is not permitted with Entire System Server.

```
SORTED [BY] descriptor ... 3 [DESCENDING]
```

The SORTED BY clause is used to cause Adabas to sort the selected records based on the sequence of one to three descriptors. The descriptors used for controlling the sort sequence may be different from those used for selection.

By default, the records are sorted in *ascending* sequence of values; if you want them to be in descending sequence, specify the keyword DESCENDING. The sort is performed using the Adabas inverted lists and does not result in any records being read.

Note: The use of this clause may result in significant overhead if any descriptor used to control the sort sequence contains a large number of values. This is because the entire value list may have to be scanned until all selected records have been located in the list. When a large number of records is to be sorted, you should use the SORT statement.

Adabas sort limits (see the ADARUN LS parameter in the Adabas documentation) are in effect when the SORTED BY clause is used.

A descriptor which is contained in a periodic group must not be specified in the SORTED BY clause. A multiple-value field (without an index) may be specified.

Non-descriptors may also be specified in the SORTED BY clause. However, this function is not available on mainframes.

If the SORTED BY clause is used, the RETAIN clause must not be used.

See also *Example 9 - SORTED BY Clause*.

Considerations for Combined Use of STARTING WITH and SORTED BY Clauses

If both the STARTING WITH and the SORTED BY clause are used in the same FIND statement and the underlying database is Adabas, the following should be considered.

With Adabas for Mainframes

On Adabas for Mainframes, the FIND statement is executed in the following steps:

1. All records matching the search criterion are gathered and put in ISN sequence.
2. The records are sorted by the descriptor specified in the SORTED BY clause.
3. The record whose ISN value is specified in the STARTING WITH clause is positioned in the “sorted-by-descriptor” record list.
4. The records following the record found under Step 3 are returned in the FIND loop.

With Adabas for OpenSystems

On Adabas for OpenSystems (UNIX, OpenVMS, Windows) the same statement is executed as follows:

1. All records matching the search criterion are gathered and put in ISN sequence.
2. The record whose ISN value is specified in the STARTING WITH clause is positioned in the “sorted-by-ISN” record list.
3. All records following the record found under Step 2 are sorted by the descriptor specified in the SORTED BY clause and returned in the FIND loop.

Example:

If the following program is executed with Adabas Version 8 for mainframes and Adabas Version 6.1 for UNIX/OpenVMS/Windows:

```
DEFINE DATA LOCAL
1 V1 VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 CITY
1 #ISN (I4)
END-DEFINE
FORMAT NL=5 SG=OFF PS=43 AL=15
*
PRINT   'FIND' (I)
FIND V1 WITH NAME = 'B' THRU 'BALBIN'
  RETAIN AS 'SET1'
  IF *COUNTER = 4 THEN
    #ISN := *ISN
  END-IF
  DISPLAY *ISN V1
END-FIND
*
PRINT / 'FIND .. SORTED BY NAME' (I)
FIND V1 WITH 'SET1'
  SORTED BY NAME
  DISPLAY *ISN V1
END-FIND
*
PRINT / 'FIND .. STARTING WITH ISN = ' (I) #ISN (AD=I)
FIND V1 WITH 'SET1'
  STARTING WITH ISN = #ISN
  DISPLAY *ISN V1
END-FIND
*
PRINT / 'FIND .. STARTING WITH ISN = ' (I) #ISN (AD=I)
        ' .. SORTED BY NAME' (I)
FIND V1 WITH 'SET1'
  STARTING WITH ISN = #ISN
  SORTED BY NAME
  DISPLAY *ISN V1
END-FIND
END
```

The result is as follows:

<table>

A `FIND` statement with at most one of these options (`SORTED BY` or `STARTING WITH ISN`) always returns the same records in the same sequence, regardless under which system the statement is executed. If, however, both clauses are used together, the result returned dependends on which Adabas platform is used to serve the database statement.

Therefore, if a Natural program is intended to be used on multiple platforms, the combination of a `SORTED BY` and `STARTING WITH ISN` clause in the same `FIND` statement should be avoided.

RETAIN Clause

This clause only applies to Adabas databases.

This clause is not permitted with Entire System Server.

```
RETAIN AS operand6
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand6	C	S				A												yes	no

Syntax Element Description:

Syntax Element	Description
`RETAIN AS`	By using the `RETAIN` clause, the result of an extensive search in large files can be retained for further processing. The selection is retained as an `ISN-set` in the Adabas work file. The set may be used in subsequent `FIND` statements as a basic search criterion for further refinement of the set or for further processing of the records. The set created is file-specific and may only be used in another `FIND` statement that processes the same file. The set may be referenced by any Natural program.
operand6	**Set Name:** The set name is used to identify the record set. It may be specified as an alphanumeric constant or as the content of an alphanumeric user-defined variable. Duplicate set names are not checked; consequently, if a duplicate set name is specified, the new set replaces the old set.

See also ***Example 10 - RETAIN Clause***.

Releasing Sets

There is no specific limit for the number of sets that can be retained or the number of ISNs in a set. It is recommended that the minimum number of ISN sets needed at one time be defined. Sets that are no longer needed should be released using the `RELEASE SETS` statement.

If they are not released with a `RELEASE` statement, retained sets exist until the end of the Natural session, or until a logon to another library, when they are released automatically. A set created by one program may be referenced by another program for processing or further refinement using additional search criteria.

Updates by Other Users

The records identified by the ISNs in a retained set are not locked against access and/or update by other users. Before you process records from the set, it is therefore useful to check whether the original search criteria which were used to create the set are still valid: This check is done with another `FIND` statement, using the set name in the `WITH` clause as basic search criterion and specifying in a `WHERE` clause the original search criterion (that is, the basic search criteria as specified in the `WITH` clause of the `FIND` statement which was used to create the set).

Restriction

If the RETAIN clause is used, the SORTED BY clause must not be used.

WHERE Clause

```
WHERE logical-condition
```

The WHERE clause may be used to specify an additional selection criterion (*logical-condition*) which is evaluated *after* a value has been read and *before* any processing is performed on the value (including the AT BREAK evaluation).

The syntax for a *logical-condition* is described in the section *Logical Condition Criteria* in the *Programming Guide*.

If a processing limit is specified in a FIND statement containing a WHERE clause, records which are rejected as a result of the WHERE clause are *not* counted against the limit. These records are, however, counted against a global limit specified in the Natural session parameter LT, the GLOBALS command, or LIMIT statement.

See also ***Example 11 - WHERE Clause***.

IF NO RECORDS FOUND Clause

Structured Mode Syntax

```
IF NO     [RECORDS] [FOUND]
        { ENTER         }
        { statement ... }
END-NOREC
```

Reporting Mode Syntax

```
IF NO [RECORDS] [FOUND]
{      ENTER                   }
{      statement               }
{      DO statement ... DOEND  }
```

The IF NO RECORDS FOUND clause may be used to cause a processing loop initiated with a FIND statement to be entered in the event that no records meet the selection criteria specified in the WITH clause and the WHERE clause.

If no records meet the specified WITH and WHERE criteria, the IF NO RECORDS FOUND clause causes the FIND processing loop to be executed once with an “empty” record. If this is not desired, specify the statement ESCAPE BOTTOM within the IF NO RECORDS FOUND clause.

If one or more statements are specified with the `IF NO RECORDS FOUND` clause, the statements will be executed immediately before the processing loop is entered. If no statements are to be executed before entering the loop, the keyword `ENTER` must be used.

See also *Example 12 - IF NO RECORDS FOUND Clause*.

Database Values

Unless other value assignments are made in the statements accompanying an `IF NO RECORDS FOUND` clause, Natural will reset to empty all database fields which reference the file specified in the current loop.

Evaluation of System Functions

Natural system functions are evaluated once for the empty record that is created for processing as a result of the `IF NO RECORDS FOUND` clause.

Restriction

This clause cannot be used with `FIND FIRST`, `FIND NUMBER` and `FIND UNIQUE`.

Examples

- Example 2 - CIPHER Clause
- Example 3 - Basic Search Criterion in WITH Clause
- Example 4 - Basic Search Criterion with Multiple-Value Field
- Example 5 - Various Samples of Complex Search Expression in WITH Clause
- Example 6 - Various Samples of Using Database Arrays
- Example 7 - Using Physically Coupled Files
- Example 8 - VIA Clause
- Example 9 - SORTED BY Clause
- Example 10 - RETAIN Clause
- Example 11 - WHERE Clause
- Example 12 - IF NO RECORDS FOUND Clause
- Example 13 - Using System Variables with the FIND Statement
- Example 14 - Multiple FIND Statements

See also the example for `FIND NUMBER`: program `FNDNUM`.

Example 1 - PASSWORD Clause

```
** Example 'FNDPWD': FIND (with PASSWORD clause)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 PERSONNEL-ID
*
1 #PASSWORD (A8)
END-DEFINE
*
INPUT 'ENTER PASSWORD FOR EMPLOYEE FILE:' #PASSWORD (AD=N)
LIMIT 2
*
FIND EMPLOY-VIEW PASSWORD = #PASSWORD
                 WITH NAME = 'SMITH'
  DISPLAY NOTITLE NAME PERSONNEL-ID
END-FIND
*
END
```

Output of Program FNDPWD:

```
ENTER PASSWORD FOR EMPLOYEE FILE:
```

Example 2 - CIPHER Clause

```
** Example 'FNDCIP': FIND (with PASSWORD/CIPHER clause)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 PERSONNEL-ID
*
1 #PASSWORD (A8)
1 #CIPHER   (N8)
END-DEFINE
*
LIMIT 2
INPUT 'ENTER PASSWORD FOR EMPLOYEE FILE:   ' #PASSWORD (AD=N)
    / 'ENTER CIPHER KEY FOR EMPLOYEE FILE: ' #CIPHER   (AD=N)
*
FIND EMPLOY-VIEW PASSWORD = #PASSWORD
                 CIPHER   = #CIPHER
                 WITH NAME = 'SMITH'
  DISPLAY NOTITLE NAME PERSONNEL-ID
END-FIND
*
END Output of Program FNDCIP:
```

```
ENTER PASSWORD FOR EMPLOYEE FILE:
ENTER CIPHER KEY FOR EMPLOYEE FILE:
```

Example 3 - Basic Search Criterion in WITH Clause

```
FIND STAFF WITH NAME = 'SMITH'
FIND STAFF WITH CITY NE 'BOSTON'
FIND STAFF WITH BIRTH = 610803
FIND STAFF WITH BIRTH = 610803 THRU 610811
FIND STAFF WITH NAME = 'O HARA' OR = 'JONES' OR = 'JACKSON'
FIND STAFF WITH PERSONNEL-ID = 100082 THRU 100100
                                 BUT NOT 100087 THRU 100095
```

Example 4 - Basic Search Criterion with Multiple-Value Field

When the descriptor used in the basic search criterion is a multiple-value field, basically four different kinds of results can be obtained (the field `MU-FIELD` in the following examples is assumed to be a multiple-value field):

```
FIND XYZ-VIEW WITH MU-FIELD = 'A'
```

This statement returns records in which *at least one* occurrence of `MU-FIELD` has the value `A`.

```
FIND XYZ-VIEW WITH MU-FIELD NOT EQUAL 'A'
```

This statement returns records in which *at least one* occurrence of `MU-FIELD` does *not* have the value `A`.

```
FIND XYZ-VIEW WITH NOT MU-FIELD NOT EQUAL 'A'
```

This statement returns records in which *every* occurrence of `MU-FIELD` has the value `A`.

```
FIND XYZ-VIEW WITH NOT MU-FIELD = 'A'
```

This statement returns records in which *none* of the occurrences of `MU-FIELD` has the value `A`.

Example 5 - Various Samples of Complex Search Expression in WITH Clause

```
FIND STAFF WITH BIRTH LT 19770101 AND DEPT = 'DEPT06'
```

```
FIND STAFF WITH JOB-TITLE = 'CLERK TYPIST'
                    AND (BIRTH GT 19560101 OR LANG = 'SPANISH')
```

```
FIND STAFF WITH JOB-TITLE = 'CLERK TYPIST'
                    AND NOT (BIRTH GT 19560101 OR LANG = 'SPANISH')
```

```
FIND STAFF WITH DEPT = 'ABC' THRU 'DEF'
                    AND CITY = 'WASHINGTON' OR = 'LOS ANGELES'
                    AND BIRTH GT 19360101
```

```
FIND CARS WITH MAKE = 'VOLKSWAGEN'
                   AND COLOR = 'RED' OR = 'BLUE' OR = 'BLACK'
```

Example 6 - Various Samples of Using Database Arrays

The following examples assume that the field `SALARY` is a descriptor contained within a periodic group, and the field `LANG` is a multiple-value field.

```
FIND EMPLOYEES WITH SALARY LT 20000
```

Results in a search of all occurrences of `SALARY`.

```
FIND EMPLOYEES WITH SALARY (1) LT 20000
```

Results in a search of the first occurrence only.

```
FIND EMPLOYEES WITH SALARY (1:4) LT 20000    /* invalid
```

A range specification must not be specified for a field within a periodic group used as a search criterion.

```
FIND EMPLOYEES WITH LANG = 'FRENCH'
```

Results in a search of all values of LANG.

```
FIND EMPLOYEES WITH LANG (1) = 'FRENCH'        /* invalid
```

An index must not be specified for a multiple-value field used as a search criterion.

Example 7 - Using Physically Coupled Files

```
** Example 'FNDCPL': FIND (using coupled files)
** NOTE: Adabas files must be physically coupled when using the
**       COUPLED clause without the VIA clause.
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
1 VEHIC-VIEW VIEW OF VEHICLES
  2 MAKE
END-DEFINE
*
FIND EMPLOY-VIEW WITH CITY = 'FRANKFURT'
     AND COUPLED TO
     VEHIC-VIEW WITH MAKE = 'VW'
  DISPLAY NOTITLE NAME
END-FIND
*
END
```

Example 8 - VIA Clause

```
** Example 'FNDVIA': FIND (with VIA clause)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 FIRST-NAME
1 VEHIC-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
END-DEFINE
*
FIND EMPLOY-VIEW WITH NAME = 'ADKINSON'
     AND COUPLED TO VEHIC-VIEW
     VIA PERSONNEL-ID = PERSONNEL-ID WITH MAKE = 'VOLVO'
  DISPLAY PERSONNEL-ID NAME FIRST-NAME
END-FIND
*
END
```

Output of Program FNDVIA:

```
Page      1                                                   05-01-17  13:18:22

PERSONNEL         NAME              FIRST-NAME
   ID
--------- -------------------- --------------------

20011000  ADKINSON             BOB
```

Example 9 - SORTED BY Clause

```
** Example 'FNDSOR': FIND (with SORTED BY clause)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 NAME
  2 FIRST-NAME
  2 PERSONNEL-ID
END-DEFINE
*
LIMIT 10
FIND EMPLOY-VIEW WITH CITY = 'FRANKFURT'
                 SORTED BY NAME PERSONNEL-ID

  DISPLAY NOTITLE NAME (IS=ON) FIRST-NAME PERSONNEL-ID
END-FIND
*
END
```

Output of Program FNDSOR:

```
        NAME              FIRST-NAME      PERSONNEL
                                             ID
-------------------- -------------------- ---------

BAECKER              JOHANNES             11500345

DOLLINGER            MARGA                11500322
FALTER               CLAUDIA              11300311
                     HEIDE                11400311
FREI                 REINHILD             11500301
```

Example 10 - RETAIN Clause

```
** Example 'RELEX1': FIND (with RETAIN clause and RELEASE statement)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 BIRTH
  2 NAME
*
1 #BIRTH (D)
END-DEFINE
*
MOVE EDITED '19400101' TO #BIRTH (EM=YYYYMMDD)
*
FIND NUMBER EMPLOY-VIEW WITH BIRTH GT #BIRTH
     RETAIN AS 'AGESET1'
IF *NUMBER = 0
  STOP
END-IF
*
FIND EMPLOY-VIEW WITH 'AGESET1' AND CITY = 'NEW YORK'
  DISPLAY NOTITLE NAME CITY BIRTH (EM=YYYY-MM-DD)
END-FIND
*
RELEASE SET 'AGESET1'
*
END
```

Output of Example 10:

```
        NAME                 CITY            DATE
                                              OF
                                            BIRTH
-------------------- -------------------- ----------

RUBIN                NEW YORK             1945-10-27
WALLACE              NEW YORK             1945-08-04
```

Example 11 - WHERE Clause

```
** Example 'FNDWHE': FIND (with WHERE clause)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 JOB-TITLE
  2 CITY
END-DEFINE
```

```
*
FIND EMPLOY-VIEW WITH CITY = 'PARIS'
                 WHERE JOB-TITLE = 'INGENIEUR COMMERCIAL'
  DISPLAY NOTITLE
          CITY JOB-TITLE PERSONNEL-ID NAME
END-FIND
*
END
```

Output of Program FNDWHE:

```
        CITY                  CURRENT          PERSONNEL         NAME
                             POSITION             ID

Example 13 - Using System Variables with the FIND Statement

```
** Example 'FNDVAR': FIND (using *ISN, *NUMBER, *COUNTER)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 CITY
END-DEFINE
*
LIMIT 3
FIND EMPLOY-VIEW WITH CITY = 'MADRID'
  DISPLAY NOTITLE PERSONNEL-ID NAME
                  *ISN *NUMBER *COUNTER
END-FIND
*
END
```

Output of Program FNDVAR

```
PERSONNEL         NAME             ISN         NMBR        CNT
   ID
--------- -------------------- ----------- ----------- -----------

60000114  DE JUAN                      400          41           1
60000136  DE LA MADRID                 401          41           2
60000209  PINERO                       405          41           3
```

Example 14 - Multiple FIND Statements

In the following example, first all people named SMITH are selected from the EMPLOYEES file. Then the PERSONNEL-ID from the EMPLOYEES file is used as the search key for an access to the VEHICLES file.

```
** Example 'FNDMUL': FIND (with multiple files)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 FIRST-NAME
1 VEHIC-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
  2 MAKE
END-DEFINE
*
LIMIT 15
EMP. FIND EMPLOY-VIEW WITH NAME = 'SMITH'
  /*
  VEH. FIND VEHIC-VIEW WITH PERSONNEL-ID = EMP.PERSONNEL-ID
    IF NO RECORDS FOUND
      MOVE '*** NO CAR ***' TO MAKE
    END-NOREC
    DISPLAY NOTITLE
            EMP.NAME (IS=ON)
            EMP.FIRST-NAME (IS=ON)
            VEH.MAKE
  END-FIND
END-FIND
END
```

Output of Program FNDMUL:

The resulting report shows the NAME and FIRST-NAME (obtained from the EMPLOYEES file) of all people named SMITH as well as the MAKE of each car (obtained from the VEHICLES file) owned by these people.

```
       NAME              FIRST-NAME             MAKE
-------------------- -------------------- --------------------

SMITH                GERHARD              ROVER
                     SEYMOUR              *** NO CAR ***
                     MATILDA              FORD
                     ANN                  *** NO CAR ***
                     TONI                 TOYOTA

```

65 FOR

- Function 418
- Syntax Description 419
- Example 420

```
FOR operand1   { [:]=  }   { operand2                }
               { EQ    }   { (arithmetic-expression) }
               { FROM  }

               { TO    }   { operand3                }
               { THRU  }   { (arithmetic-expression) }

             [ STEP        { operand4                } ]
                           { (arithmetic-expression) }

         statement ...
END-FOR         (structured mode only)
[LOOP]          (reporting mode only)
```

Note: For compatibility reasons, the keywords :=, EQ, FROM, TO, THRU and STEP are optional if the corresponding subsequent operand (*operand2*, *operand3* or *operand4*) is used instead of an arithmetic expression.

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Loop Execution***

Function

The FOR statement is used to initiate a processing loop and to control the number of times the loop is processed.

Consistency Check

Before the FOR loop is entered, the values of the operands are checked to ensure that they are consistent (that is, the value of *operand3* can be reached or exceeded by repeatedly adding *operand4* to *operand2*). If the values are not consistent, the FOR loop is not entered (however, no error message is output, except when the STEP value is zero).

Syntax Description

Operand Definition Table:

Operand	Possible Structure						Possible Formats												Referencing Permitted	Dynamic Definition
operand1		S						N	P	I	F								yes	yes
operand2	C	S			N	E		N	P	I	F								yes	no
operand3	C	S			N	E		N	P	I	F								yes	no
operand4	C	S			N	E		N	P	I	F								yes	no

Syntax Element Description:

Syntax Element	Description
operand1 *operand2*	**Loop Control Variable (*operand1*) and Initial Setting (*operand2*):** *operand1* is used to control the number of times the processing loop is to be executed. It may be a database field or a user-defined variable. The value specified after the keyword FROM (*operand2*) is assigned to the loop control variable field before the processing loop is entered for the first time. This value is incremented (or decremented if the STEP value is negative) using the value specified after the STEP keyword (*operand4*) each additional time the loop is processed. The loop control variable value may be referenced during the execution of the processing loop and will contain the current value of the loop control variable.
operand3	**TO Value:** The processing loop is terminated when *operand1* is greater than (or less than if the initial value of the STEP value was negative) the value specified for *operand3*.
operand4	**STEP Value:** The STEP value may be positive or negative. If a STEP value is not specified, an increment of +1 is used. The compare operation will be adjusted to “less than” or “greater than” depending on the sign of the STEP value when the loop is entered for the first time. *operand4* must not be zero.
(*arithmetic-expression*)	**Arithmetic Expression:**

Syntax Element	Description
	In place of *operand2*, *operand3* or *operand4*, any arithmetic expression may be specified. For further information on arithmetic expressions, see *arithmetic-expression* in the COMPUTE statement description. **Note:** The arithmetic expression must be enclosed in parentheses.
END-FOR	**End of FOR Statement:** The Natural reserved word END-FOR must be used to end the FOR statement.

Example

```
** Example 'FOREX1S': FOR (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 #INDEX (I1)
1 #ROOT  (N2.7)
END-DEFINE
*
FOR #INDEX 1 TO 5
  COMPUTE #ROOT = SQRT (#INDEX)
  WRITE NOTITLE '=' #INDEX 3X '=' #ROOT
END-FOR
*
SKIP 1
FOR #INDEX 1 TO 5 STEP 2
  COMPUTE #ROOT = SQRT (#INDEX)
  WRITE '=' #INDEX 3X '=' #ROOT
END-FOR
*
END
```

Output of Program FOREX1S:

```
#INDEX:    1   #ROOT:   1.0000000
#INDEX:    2   #ROOT:   1.4142135
#INDEX:    3   #ROOT:   1.7320508
#INDEX:    4   #ROOT:   2.0000000
#INDEX:    5   #ROOT:   2.2360679

#INDEX:    1   #ROOT:   1.0000000
#INDEX:    3   #ROOT:   1.7320508
#INDEX:    5   #ROOT:   2.2360679
```

Equivalent reporting-mode example: **FOREX1R**.

66 FORMAT

- Function 422
- Syntax Description 422
- Applicable Parameters 423
- Example 424

FORMAT [(*rep*)] *parameter* ...

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The FORMAT statement is used to specify input and output parameter settings.

Settings specified with a FORMAT statement override (at compilation time) default settings in effect for the session that have been set by a GLOBALS command, SET GLOBALS statement, or by the Natural administrator.

These settings may in turn be overridden by parameters specified in a DISPLAY, INPUT, PRINT, WRITE, WRITE TITLE, or WRITE TRAILER statement.

The settings remain in effect until the end of a program or until another FORMAT statement is encountered.

A FORMAT statement does not generate any executable code in the Natural program. It is not executed in dependence of the logical flow of a program. It is evaluated during program compilation in order to set parameters for compiling DISPLAY, WRITE, PRINT and INPUT statements. The settings defined with a FORMAT statement are applicable to all DISPLAY, WRITE, PRINT and INPUT statements which follow.

Syntax Description

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the FORMAT statement is applicable. A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>If <code>(rep)</code> is not specified, the <code>FORMAT</code> statement will be applicable to the first report (Report 0).

For information on how to control the format of an output report created with Natural, see Controlling Data Output (in the Programming Guide).</td></tr>
<tr><td>parameter</td><td>Parameter(s):

The parameters can be specified in any order and must be separated by one or more spaces. A single entry must not be split between two statement lines.

Field sensitive parameter settings applied here will only be regarded for variable fields used in a <code>INPUT</code>, <code>WRITE</code>, <code>DISPLAY</code> or <code>PRINT</code> statement of the selected report. They do not apply for text-constants used in any of the mentioned statements.

Example:
<pre>
DEFINE DATA LOCAL
1 VARI (A4)   INIT <'1234'>   /*   Output
END-DEFINE   /*   Produced
FORMAT AD=U   /*   ---------
WRITE 'Text'   VARI   /*   Text 1234
WRITE 'Text' (AD=U)   VARI   /*   Text 1234
END
</pre>
See also Applicable Parameters below.</td></tr>
</table>

Applicable Parameters

See the *Parameter Reference* for a detailed description of the session parameters which may be used.

Parameter	Description
AD	Attribute Definition
AL	Alphanumeric Length for Output
CD	Color Definition
DF	Date Format
DL	Display Length for Output
EM	Edit Mask
ES	Empty Line Suppression
FC	Filler Character
FL	Floating Point Mantissa Length
GC	Filler Character for Group Heading

Parameter	Description
HC	Header Centering
HW	Heading Width
IC	Insertion Character
IP	Input Prompting Text
IS	Identical Suppress
KD	Key Definition
LC	Leading Characters
LS	Line Size
MC	Multiple-Value Field Count (Can only be used in reporting mode.)
MP	Maximum Number of Pages of a Report, see Note below.
MS	Manual Skip
NL	Numeric Length for Output
PC	Periodic Group Count (Can only be used in reporting mode.)
PM	Print Mode
PS	Page Size, see Note below.
SF	Spacing Factor
SG	Sign Position
TC	Trailing Characters
UC	Underlining Character
ZP	Zero Printing

Note: The parameters MP and PS do not take effect for a specific I/O statement, but apply to the complete output created for the report. If multiple settings for MP and PS are performed, the last definition is used.

See also *Underlining Character for Titles and Headers - UC Parameter* (in the *Programming Guide*).

Example

```
** Example 'FMTEX1': FORMAT
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 CITY
  2 POST-CODE
  2 COUNTRY
END-DEFINE
*
```

```
FORMAT AL=7     /* Alpha-numeric field output length
       FC=+     /* Filler character for field header
       GC=*     /* Filler character for group header
       HC=L     /* Header left justified
       IC=<<    /* Insert characters
       IS=ON    /* Identical suppress on
       TC=>>    /* Trailing character
       UC==     /* Underline character
       ZP=OFF   /* Zero print off
*
LIMIT 5
READ EMPLOY-VIEW BY NAME
  DISPLAY NOTITLE
          NAME 3X CITY 3X POST-CODE 3X COUNTRY
END-READ
*
END
```

Output of Program FMTEX1:

```
NAME+++++++   CITY+++++++   POSTAL+++++   COUNTRY++++
                              ADDRESS++++
===========   ===========   ===========   ===========

<<ABELLAN>>   <<MADRID >>   <<28014  >>   <<E  >>
<<ACHIESO>>   <<DERBY  >>   <<DE3 4TR>>   <<UK >>
<<ADAM   >>   <<JOIGNY >>   <<89300  >>   <<F  >>
<<ADKINSO>>   <<BROOKLY>>   <<11201  >>   <<USA>>
              <<BEVERLE>>   <<90211  >>
```

67 GET

- Function 428
- Restrictions 429
- Syntax Description 429
- Example 430

In structured mode and in reporting mode using a DEFINE DATA LOCAL statement, the following syntax applies:

```
GET    [IN] [FILE] view-name
       [PASSWORD=operand1]
       [CIPHER=operand2]
       [ { [RECORD]  } ]  { operand3      }
       [ { [RECORDS] } ]  { *ISN [(r)]    }
```

In reporting mode using no DEFINE DATA LOCAL statement, the following syntax applies:

```
GET    [IN] [FILE] ddm-name
       [PASSWORD=operand1]
       [CIPHER=operand2]
       [ { [RECORD]  } ]  { operand3      }  operand4
       [ { [RECORDS] } ]  { *ISN [(r)]    }  ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET SAME | GET TRANSACTION | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The GET statement is used to read a record with a given Adabas Internal Sequence Number (ISN).

For XML databases, the GET statement is used to read an XML object with a given object ID.

The GET statement does not cause a processing loop to be initiated.

Restrictions

- The `GET` statement cannot be used for SQL databases.
- The `GET` statement cannot be used with Entire System Server.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S				A												yes	no
operand2	C	S					N											no	no
operand3	C	S			N		N	P	I		B *							yes	no
operand4		S	A			A	N	P	I	F	B	D	T	L				yes	yes

* Format B of *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
view-name	**View Name:** In structured mode and in reporting mode using a `DEFINE DATA LOCAL` statement, the name of a view as defined either directly within a `DEFINE DATA` statement or in a separate global or local data area.
ddm-name	**DDM Name:** In reporting mode using no `DEFINE DATA LOCAL` statement, the name of the data definition module (DDM) is referenced.
`PASSWORD=`*operand1* `CIPHER=`*operand2*	**PASSWORD Clause/CYPHER Clause:** These clauses are applicable only to Adabas databases. The `PASSWORD` clause is used to provide a password when retrieving data from an Adabas file which is password protected. The `CIPHER` clause is used to provide a cipher key when retrieving data from an Adabas file which is enciphered. See the statements `FIND` and `PASSW` for further information.

Syntax Element	Description
`*ISN / operand3`	**Internal Sequence Number:** The ISN must be provided either in the form of a numeric constant or user-defined variable (*operand3*), or via the Natural system variable `*ISN`.
`(r)`	**Statement Reference:** The notation `(r)` is used to specify the statement which contains the `FIND` or `READ` statement used to initially read the record. If `(r)` is not specified, the `GET` statement will be related to the innermost active processing loop. `(r)` may be specified as a reference statement number or as a statement label.
operand4	**Reference to Database Fields:** In reporting mode, subsequent references to database fields that have been read with a `GET` statement can contain the label or line number of the `GET` statement.

Example

```
** Example 'GETEX1': GET
************************************************************************
DEFINE DATA LOCAL
1 PERSONS VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 FIRST-NAME
1 SALARY-INFO VIEW OF EMPLOYEES
  2 NAME
  2 CURR-CODE (1:1)
  2 SALARY    (1:1)
*
1 #ISN-ARRAY  (B4/1:10)
1 #LINE-NR    (N2)
END-DEFINE
*
FORMAT PS=16
LIMIT 10
READ PERSONS BY NAME
  MOVE *COUNTER TO #LINE-NR
  MOVE *ISN     TO #ISN-ARRAY (#LINE-NR)
  DISPLAY #LINE-NR PERSONNEL-ID NAME FIRST-NAME
  /*
  AT END OF PAGE
    INPUT / 'PLEASE SELECT LINE-NR FOR SALARY INFORMATION:' #LINE-NR
    IF #LINE-NR = 1 THRU 10
      GET SALARY-INFO #ISN-ARRAY (#LINE-NR)
```

```
      WRITE / SALARY-INFO.NAME
              SALARY-INFO.SALARY    (1)
              SALARY-INFO.CURR-CODE (1)
    END-IF
  END-ENDPAGE
  /*
END-READ
END
```

Output of Program GETEX1:

```
Page      1                                                   05-01-13  13:17:42

#LINE-NR PERSONNEL         NAME               FIRST-NAME
            ID

PLEASE SELECT LINE-NR FOR SALARY INFORMATION: 1

ABELLAN                 1450000 PTA
```

68 GET SAME

- Function 434
- Restrictions 434
- Syntax Description 435
- Example 435

Structured Mode Syntax

```
GET SAME [(r)]
```

Reporting Mode Syntax

```
GET SAME [(r)] [operand1 ...]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The GET SAME statement is used to re-read the record currently being processed. It is most frequently used to obtain database array values (periodic groups or multiple-value fields) if the number and range of existing or desired occurrences was not known when the record was initially read.

Restrictions

- GET SAME is only valid for Natural users who are using Adabas.
- GET SAME cannot be used with Entire System Server.
- An UPDATE or DELETE statement must not reference a GET SAME statement. These statements should instead make reference to the FIND, READ or GET statement used to read the record initially.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A			A	U	N	P			B							no	yes

Syntax Element Description:

Syntax Element	Description
(*r*)	**Statement Reference:** The notation (*r*) is used to specify the statement which contains the FIND or READ statement used to initially read the record. If (*r*) is not specified, the GET SAME statement will be related to the innermost active processing loop. (*r*) may be specified as a reference statement number or as a statement label.
operand1	**Fields to Be Made Available:** As *operand1*, you specify the field(s) to be made available as a result of the GET SAME statement. **Note:** *operand1* cannot be specified if the field is defined in a DEFINE DATA statement.

Example

```
** Example 'GSAEX1': GET SAME
************************************************************************
DEFINE DATA LOCAL
1 I                 (P3)
1 POST-ADDRESS VIEW OF EMPLOYEES
  2 FIRST-NAME
  2 NAME
  2 ADDRESS-LINE   (I:I)
  2 C*ADDRESS-LINE
  2 POST-CODE
  2 CITY
*
1 #NAME             (A30)
END-DEFINE
*
```

```
FORMAT PS=20
MOVE 1 TO I
*
READ (10) POST-ADDRESS BY NAME
  COMPRESS NAME FIRST-NAME INTO #NAME WITH DELIMITER ','
  WRITE // 12T #NAME
  WRITE /  12T ADDRESS-LINE (I.1)
  /*
  IF C*ADDRESS-LINE > 1
    FOR I = 2 TO C*ADDRESS-LINE
      GET SAME                      /* READ NEXT OCCURRENCE
      WRITE 12T ADDRESS-LINE (I.1)
    END-FOR
  END-IF
  WRITE / POST-CODE CITY
  SKIP 3
END-READ
END
```

Output of Program GSAEX1:

```
Page      1                                                   05-01-13  13:23:36

```

69 GET TRANSACTION DATA

- Function 438
- Restriction 438
- Syntax Description 439
- Example 439

```
GET TRANSACTION [DATA] operand1 ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The GET TRANSACTION DATA statement is used to read the data saved with a previous END TRANSACTION statement.

GET TRANSACTION DATA does not create a processing loop.

System Variable *ETID

The content of the Natural system variable *ETID identifies the transaction data to be retrieved from the database.

No Transaction Data Stored

If the GET TRANSACTION DATA statement is issued and no transaction data are found, all fields specified in the GET TRANSACTION DATA statement will be filled with blanks regardless of format definition.

Caution: Make sure that arithmetic operations are not performed on "empty" transaction data, because this would result in an abnormal termination of the program.

Restriction

The GET TRANSACTION DATA statement is only valid for transactions applied to Adabas databases.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S				A	U	N	P	I	F	B	D	T					yes	yes

Syntax Element Description:

Syntax Element	Description
operand1	**Field Specification:** The sequence, lengths and formats of the fields used in the `GET TRANSACTION DATA` statement must be identical to the sequence, lengths and formats of the fields specified with the corresponding `END TRANSACTION` statement.

Example

```
** Example 'GTREX1': GET TRANSACTION
**
** CAUTION: Executing this example will modify the database records!
************************************************************************

[LOOP]                                (reporting mode only)
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The HISTOGRAM statement is used to read the values of a database field which is defined as a descriptor, subdescriptor, or a superdescriptor. The values are read directly from the Adabas inverted lists.

The HISTOGRAM statement causes a processing loop to be initiated but does not provide access to any database fields other than the field specified in the HISTOGRAM statement.

See also *HISTOGRAM Statement* (in the *Programming Guide*).

Note: For SQL databases: HISTOGRAM returns the number of rows which have the same value in a specific column.

Restrictions

- This statement cannot be used with XML databases.
- This statement cannot be used with Entire System Server.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S						N	P	I		B *							yes	no
operand2	C	S				A													yes	no
operand3		S				A													yes	no
operand4		S				A		N	P	I	F	B	D	T	L				no	no

* Format B of *operand1* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
operand1 / ALL	**Processing Loop Limit:** You can limit the number of descriptor values to be processed with the HISTOGRAM statement by specifying *operand1* - either as a numeric constant (0 - 4294967295) or as a user-defined variable (containing an integer value). ALL may optionally be specified to emphasize that all descriptor values are to be processed. For this statement, the specified limit has priority over a limit set with a LIMIT statement. If a smaller limit is set with the LT parameter (Limit for Processing Loops), the LT limit applies. **Note:** If you wish to process a 4-digit number of descriptor values, specify it with a leading zero (0*nnnn*); because Natural interprets every 4-digit number enclosed in parentheses as a line-number reference to a statement. *operand1* is evaluated when the HISTOGRAM loop is entered. If the value of *operand1*

Syntax Element	Description
	is modified within the `HISTOGRAM` loop, this does not affect the number of values read.
MULTI-FETCH-clause	**MULTI-FETCH Clause:** See ***MULTI-FETCH Clause*** below.
view-name	**View Name:** As *view-name*, you specify the name of a view, which is defined either within a `DEFINE DATA` statement or in a separate global or local data area. The view must not contain any other fields apart from the field used in the `HISTOGRAM` statement (*operand4*). If the field in the view is a periodic-group field or multiple-value field that is defined with an index range, only the first occurrence of that range is filled by the `HISTOGRAM` statement; all other occurrences are not affected by the execution of the `HISTOGRAM` statement. In reporting mode, *view-name* is the name of a DDM if no `DEFINE DATA LOCAL` statement is used.
PASSWORD=*operand2*	**PASSWORD Clause:** The `PASSWORD` clause is used to provide a password (*operand2*) when retrieving data from an Adabas file which is password-protected. See the statements `FIND` and `PASSW` for further information.
SEQUENCE	**SEQUENCE Clause:** This clause can only be used for Adabas and SQL databases. With this clause, you can determine whether the records are to be read in ascending sequence or in descending sequence. ■ The default sequence is ascending (which may, but need not, be explicitly specified by using the keyword `ASCENDING`). ■ If the records are to be read in descending sequence, you specify the keyword `DESCENDING`. ■ If, instead of determining it in advance, you want to have the option of determining at runtime whether the records are to be read in ascending or descending sequence, you either specify the keyword `VARIABLE` or `DYNAMIC`, followed by a variable (*operand3*). *operand3* has to be of format/length A1 and can contain the value `A` (for "ascending") or `D` (for "descending"). ■ If keyword `VARIABLE` is used, the reading direction (value of *operand3*) is evaluated at start of the `HISTOGRAM` processing loop and remains same until the loop is terminated, regardless if the *operand3* field is altered in the `HISTOGRAM` loop or not.

Syntax Element	Description
	■ If keyword DYNAMIC is used, the reading direction (value of *operand3*) is evaluated before every record fetch in the HISTOGRAM processing loop and may be changed from record to record. This allows to change the scroll sequence from ascending to descending (and vice versa) at any place in the HISTOGRAM loop. Examples of SEQUENCE clause: ■ ***Example 2 - HISTOGRAM Statement with Records Read in Descending Sequence*** ■ ***Example 3 - HISTOGRAM Statement Using Variable Sequence***
operand4	**Descriptor:** As *operand4*, a descriptor, subdescriptor, superdescriptor or hyperdescriptor may be specified. A descriptor contained within a periodic group may be specified with or without an index. If no index is specified, the descriptor will be selected if the value specified is located in any occurrence. If an index is specified, the descriptor will be selected only if the value is located in the occurrence specified by the index. The index specified must be a constant. An index range must not be used. For a descriptor which is a multiple-value field an index must not be specified; the descriptor will be selected if the value is located in the record regardless of the position of the value.
STARTING-ENDING-clause	**STARTING/ENDING Clause:** Starting and ending values may be specified using the keywords STARTING and ENDING (or THRU) followed by a constant or a user-defined variable representing the value with which processing is to begin/end. For further information, see ***Specifying Starting/Ending Values*** below.
WHERE *logical-condition*	**WHERE Clause:** The WHERE clause may be used to specify an additional selection criterion (*logical-condition*) which is evaluated *after* a value has been read and *before* any processing is performed on the value (including the AT BREAK evaluation). The descriptor specified in the WHERE clause must be the same descriptor referenced in the HISTOGRAM statement. No other fields from the selected file are available for processing with a HISTOGRAM statement. The syntax for a *logical-condition* is described in the section *Logical Condition Criteria* (in the *Programming Guide*). **System Variables**

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>The Natural system variables *ISN, *NUMBER, and *COUNTER are available with the HISTOGRAM statement.

*NUMBER and *ISN are only set after the evaluation of the WHERE clause. They must not be used in the logical condition of the WHERE clause.
<table>
<tr><td>*NUMBER</td><td>The system variable *NUMBER contains the number of database records that contain the last value read.

For SQL databases, see *NUMBER for SQL Databases in the System Variables documentation.</td></tr>
<tr><td>*ISN</td><td>The system variable *ISN contains the number of the occurrence in which the descriptor value last read is contained. *ISN will contain 0 if the descriptor is not contained within a periodic group.

*ISN is not available for SQL databases.</td></tr>
<tr><td>*COUNTER</td><td>The system variable *COUNTER contains a count of the total number of values which have been read (after evaluation of the WHERE clause).</td></tr>
</table></td></tr>
<tr><td>END-HISTOGRAM</td><td>End of HISTOGRAM Statement:

The Natural reserved word END-HISTOGRAM must be used to end the HISTOGRAM statement.</td></tr>
</table>

MULTI-FETCH Clause

Note: This clause can only be used for Adabas databases.

Note: [MULTI-FETCH OF *multi-fetch-factor*] is not evaluated for database types ADA and ADA2. The default processing mode is applied; see profile parameter MFSET. When used in conjunction with database type ADA2, the MULTI-FETCH clause is ignored completetly; see *Database Management System Assignments* in the *Configuration Utility* documentation.

For more information, see the section *Multi-Fetch Clause* (Adabas) in the *Programming Guide*.

Specifying Starting/Ending Values

Starting and ending values may be specified using the keywords `STARTING` and `ENDING` (or `THRU`) followed by a constant or a user-defined variable representing the value with which processing is to begin/end.

If a starting value is specified and the value is not present, the next higher value is used as the starting value. If no higher value is present, the `HISTOGRAM` loop will not be entered.

If an ending value is specified, values will be read up to and including the ending value.

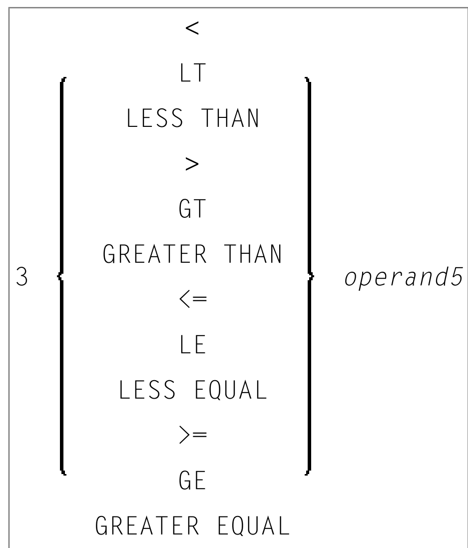
Hexadecimal constants may be specified as a starting or ending value for descriptors of format A or B.

Syntax Option 1:

Syntax Option 2:

```
2  [STARTING] [ WITH ] [VALUES] operand5  TO  operand6
              [ FROM ]
```

Syntax Option 3:



Note: If the comparators of Diagram 3 are used, the options `ENDING AT`, `THRU` and `TO` may not be used. These comparators are also valid for the `READ` statement.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand5	C	S				A	U	N	P	I	F	B	D	T	L				yes	no
operand6	C	S				A	U	N	P	I	F	B	D	T	L				yes	no

Syntax Element Description:

Syntax Element	Description
`STARTING FROM ... ENDING AT` |`TO`	**STARTING FROM / ENDING AT Clauses:** The `STARTING FROM` and `ENDING AT` clauses are used to limit reading to a user-specified range of values. The `STARTING FROM` clause (= or `EQ` or `EQUAL TO` or `[STARTING] FROM`) determines the starting value for the read operation. If a starting value is specified, reading will begin with the value specified. If the starting value does not exist, the next higher (or lower for a `DESCENDING` read) value will be returned. If no higher (or lower for `DESCENDING`) value exists, the `HISTOGRAM` loop will not be entered. In order to limit the values to an end-value, you may specify an `ENDING AT` clause with the terms `THRU`, `ENDING AT` or `TO`, that imply an inclusive range. Whenever the descriptor field exceeds the end-value specified, an automatic loop termination is performed. Although the basic functionality of the `TO`, `THRU` and `ENDING AT` keywords looks quite similar, internally they differ in how they work.
`THRU | ENDING AT`	**THRU / ENDING AT Option:** If `THRU` or `ENDING AT` is used, only the start-value is supplied to the database, but the end-value check is performed by the Natural runtime system, after the value is returned by the database. The `THRU` and `ENDING AT` options can be used for all databases which support the `HISTOGRAM` statements.
`TO`	**Range:** If the keyword `TO` is used, both the start-value and the end-value are sent to the database and Natural does not perform checks for value ranges. If the end-value is exceeded, the database reacts in the same way as when “end-of-file” is reached and the database loop is exited. Since the complete range checking is done by the database, the lower-value (of the range) is always supplied in the start-value and the higher-value filled into the end-value, regardless wether you are browsing in `ASCENDING` or in `DESCENDING` order.

Examples

- Example 1 - HISTOGRAM Statement
- Example 2 - HISTOGRAM Statement with Records Read in Descending Sequence
- Example 3 - HISTOGRAM Statement Using Variable Sequence

Example 1 - HISTOGRAM Statement

```
** Example 'HSTEX1S': HISTOGRAM (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
END-DEFINE
*
LIMIT 8
HISTOGRAM EMPLOY-VIEW CITY STARTING FROM 'M'
  DISPLAY NOTITLE
          CITY 'NUMBER OF/PERSONS' *NUMBER *COUNTER
END-HISTOGRAM
*
END
```

Output of Program HSTEX1S:

```
        CITY          NUMBER OF     CNT
                       PERSONS
-------------------- ----------- -----------

MADISON                        3           1
MADRID                        41           2
MAILLY LE CAMP                 1           3
MAMERS                         1           4
MANSFIELD                      4           5
MARSEILLE                      2           6
MATLOCK                        1           7
MELBOURNE                      2           8
```

Equivalent reporting-mode example: HSTEX1R.

Example 2 - HISTOGRAM Statement with Records Read in Descending Sequence

```
** Example 'HSTDSCND': HISTOGRAM (with DESCENDING)
************************************************************************
DEFINE DATA LOCAL
1 EMPL VIEW OF EMPLOYEES
  2 NAME
END-DEFINE
*
HISTOGRAM (10) EMPL IN DESCENDING SEQUENCE FOR NAME FROM 'ZZZ'
  DISPLAY NAME *NUMBER
END-HISTOGRAM
END
```

Output of Program HSTDSCND:

```
Page      1                                                  05-01-13  13:41:03

        NAME            NMBR
-------------------- -----------

ZINN                           1

YNCLAN                         1
YATES                          1
YALCIN                         1
YACKX-COLTEAU                  1
XOLIN                          1
WYLLIS                         2
WULFRING                       1
WRIGHT                         1
```

Example 3 - HISTOGRAM Statement Using Variable Sequence

```
** Example 'HSTVSEQ': HISTOGRAM (with VARIABLE SEQUENCE)
************************************************************************
DEFINE DATA LOCAL
1 EMPL VIEW OF EMPLOYEES
  2 NAME
*
1 #DIR      (A1)
1 #STARTVAL (A20)
END-DEFINE
*
SET KEY PF3 PF7 PF8
*
MOVE 'ADKINSON' TO #STARTVAL
*
HISTOGRAM (9) EMPL FOR NAME FROM #STARTVAL
  WRITE NAME *NUMBER
```

```
  IF *COUNTER = 5
    MOVE NAME TO #STARTVAL
  END-IF
END-HISTOGRAM
*
#DIR := 'A'
*
REPEAT
  HISTOGRAM EMPL IN VARIABLE #DIR SEQUENCE
            FOR NAME FROM #STARTVAL
    MOVE NAME TO #STARTVAL
    INPUT NO ERASE  (IP=OFF AD=O)
          15/01 NAME *NUMBER
          //   'Direction:' #DIR
          //   'Press PF3 to stop'
          /    '      PF7 to go step back'
          /    '      PF8 to go step forward'
          /    '      ENTER to continue in that direction'
    /*
    IF *PF-KEY = 'PF7' AND #DIR = 'A'
      MOVE 'D' TO #DIR
      ESCAPE BOTTOM
    END-IF
    IF *PF-KEY = 'PF8' AND #DIR = 'D'
      MOVE 'A' TO #DIR
      ESCAPE BOTTOM
    END-IF
    IF *PF-KEY = 'PF3'
      STOP
    END-IF
  END-HISTOGRAM
  /*
  IF *COUNTER(0250) = 0
    STOP
  END-IF
END-REPEAT
END
```

Output of Program HSTVSEQ:

```

71 IF

- Function 454
- Syntax Description 454
- Example 455

Structured Mode Syntax

```
IF logical-condition
 [THEN] statement ...
 [ELSE statement ...]
END-IF
```

Reporting Mode Syntax

```
IF logical-condition
 [THEN]  { statement                 }
         { DO statement ... DOEND    }
[  ELSE  { statement                 } ]
[        { DO statement ... DOEND    } ]
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: DECIDE FOR | DECIDE ON | IF SELECTION | ON ERROR

Belongs to Function Group: *Processing of Logical Conditions*

Function

The IF statement is used to control execution of a statement or group of statements based on a logical condition.

Note: If no action is to be performed in case the condition is met, you must specify the statement IGNORE in the THEN clause.

Syntax Description

Syntax Element	Description
IF *logical-condition*	**Logical Condition Criterion:** The logical condition which is used to determine whether the statement or statements specified with the IF statement are to be executed.

Syntax Element	Description

	Examples:
	
	`IF #A = #B`
	`IF LEAVE-TAKEN GT 30`
	`IF #SALARY(1) * 1.15 GT 5000`
	`IF SALARY (4) = 5000 THRU 6000`
	`IF DEPT = 'A10' OR = 'A20' OR = 'A30'`
	
	For further information, see the section *Logical Condition Criteria* (in the *Programming Guide*).

THEN *statement*	**THEN Clause:** In the THEN clause, you specify the *statement*(s) to be executed if the logical condition is true.
ELSE *statement*	**ELSE Clause:** In the ELSE clause, you specify the *statement*(s) to be executed if the logical condition is *not* true.
END-IF	**END of IF Statement:** The Natural reserved word END-IF must be used to end the IF statement.

Example

```
** Example 'IFEX1S': IF (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 FIRST-NAME
  2 SALARY (1)
  2 BIRTH
1 VEHIC-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
  2 MAKE
*
1 #BIRTH (D)
END-DEFINE
*
MOVE EDITED '19450101' TO #BIRTH (EM=YYYYMMDD)
SUSPEND IDENTICAL SUPPRESS
LIMIT 20
*
FND. FIND EMPLOY-VIEW WITH CITY = 'FRANKFURT'
          SORTED BY NAME BIRTH
```

```
  IF SALARY (1) LT 40000
    WRITE NOTITLE '*****' NAME 30X 'SALARY LT 40000'
  ELSE
    IF BIRTH GT #BIRTH
      FIND VEHIC-VIEW WITH PERSONNEL-ID = PERSONNEL-ID (FND.)
        DISPLAY (IS=ON)
                NAME BIRTH (EM=YYYY-MM-DD)
                SALARY (1) MAKE (AL=8)
      END-FIND
    END-IF
  END-IF
END-FIND
END
```

Output of Program IFEX1S:

```
        NAME              DATE      ANNUAL     MAKE
                           OF       SALARY
                         BIRTH

***** KRAMER                                            SALARY LT 40000
```

Equivalent reporting-mode example: **IFEX1R**.

72 IF SELECTION

- Function 458
- Syntax Description 458
- Example 459

Structured Mode Syntax

```
IF SELECTION [NOT UNIQUE [IN [FIELDS]]] operand1 ...
 [THEN] statement...
 [ELSE statement...]
END-IF
```

Reporting Mode Syntax

```
IF SELECTION [NOT UNIQUE [IN [FIELDS]]] operand1...
          [THEN]  {   statement                 }
                  {   DO statement... DOEND     }
        [ ELSE    {   statement                 }         ]
        [         {   DO statement... DOEND     }         ]
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: DECIDE FOR | DECIDE ON | IF

Belongs to Function Group: *Processing of Logical Conditions*

Function

The IF SELECTION statement is used to verify that in a sequence of alphanumeric fields one and only one contains a value.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A			A	U								L	C			yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Selection Field(s):** As *operand1* you specify the fields which are to be checked. If you specify an attribute control variable (Format C), it is considered to contain a value if its status has been changed to MODIFIED. **Note:** To check if a specific attribute control variable has been assigned the status MODIFIED, use the MODIFIED option of, for example, an IF statement. This enables you to check that exactly one field was *modified*.
THEN *statement*	**THEN Clause:** The statement(s) specified in the THEN clause will be executed if one of the following conditions is true: ■ None of the fields specified in *operand1* contains a value. ■ More than one of the fields specified in *operand1* contains a value. This statement is generally used to verify that a terminal user has entered only one function in response to a map displayed via an INPUT statement. **Note:** If *no* action is to be performed if one of the conditions is met, you specify the statement IGNORE in the THEN clause.
ELSE *statement*	**ELSE Clause:** In the ELSE clause, you specify the statement(s) to be executed if exactly one field contains a value.
END-IF	**End of IF SELECTION Statement:** The Natural reserved word END-IF must be used to end the IF SELECTION statement.

Example

```
** Example 'IFSEL': IF SELECTION
************************************************************************
DEFINE DATA LOCAL
1 #A (A1)
1 #B (A1)
END-DEFINE
*
INPUT 'Select one function:' //
   9X 'Function A:' #A
   9X 'Function B:' #B
```

```
*
IF SELECTION NOT UNIQUE #A #B
  REINPUT 'Please enter one function only.'
END-IF
*
IF #A NE ' '
  WRITE 'Function A selected.'
END-IF
IF #B NE ' '
  WRITE 'Function B selected.'
END-IF
*
END
```

Output of Program IFSEL:

```
Select one function:

         Function A:           Function B:
```

After selecting and confirming function A:

```
Page      1                                                   05-01-17  11:04:07

Function A selected.
```

73 IGNORE

- Function 462
- Example 462

```
IGNORE
```

Function

The `IGNORE` statement is an “empty” statement which itself does not perform any function.

During the development phase of an application, you can insert `IGNORE` temporarily within statement blocks in which one or more statements are required, but which you intend to code later (for example, within `AT BREAK` or `AT START OF DATA` / `AT END OF DATA`). This allows you to continue programming in another part of the application without the as yet incomplete statement block leading to an error.

The `IGNORE` statement must also be used in condition statements, such as `IF` or `DECIDE FOR`, if no function is to be performed in the case of a condition being met.

Example

```
...
...
AT TOP OF PAGE
   IGNORE         /* top-of-page processing still to be coded
END-TOPPAGE
...
...
```

74 INCLUDE

- Function 464
- Syntax Description 464
- Examples 465

```
INCLUDE  copycode-name  [operand1 ... 99]
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Function

The `INCLUDE` statement is used to include source lines from an external object of type copycode into another object at compilation.

The `INCLUDE` statement is evaluated at *compilation* time. The source lines of the copycode will not be physically included in the source of the program that contains the `INCLUDE` statement, but they will be included during the program compilation and thus in the resulting object module.

Caution: A source code line which contains an `INCLUDE` statement must not contain any other statement.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C					A	U												no	no

Syntax Element Description:

Syntax Element	Description
copycode-name	**Copycode Name:** As *copycode-name* you specify the name of the copycode whose source is to be included. *copycode-name* may contain an ampersand (&); at compile time, this character will be replaced by the one-character code corresponding to the current value of the Natural system variable `*LANGUAGE`. This feature allows the use of multilingual copycode names. The object you specify must be of the type copycode. The copycode must be contained either in the same library as the program which contains the `INCLUDE` statement or in the respective steplib (the default steplib is `SYSTEM`). When the source of a copycode is modified, all programs using that copycode must be compiled again to reflect the changed source in their object codes. The source code of the copycode must consist of syntactically complete statements.

Syntax Element	Description
operand1	**Insert Values for Dynamic Insertion:** You can dynamically insert values in the copycode which is included. These values are specified with *operand1*. In the copycode, the values are referenced with the following notation: `&n&` That is, you mark the position where a value is to be inserted with `&n&`. *n* is the sequential number of each value passed with the `INCLUDE` statement. For example, `&3&` would refer to the third value specified with the statement. For every `&n&` notation in the copycode you must specify a value in the `INCLUDE` statement. For example, if the copycode contains `&5&`, *operand1* must be specified at least five times. You may write one copy code parameter (`&n&`) after another without blanks (that is, `&1&&2&&3&`). This method is used to concatenate multiple copy code parameters to a source. A string may follow one or several copy code parameters without a blank (that is, `&1&abc` or `&1&&2&abc`). This method is used to concatenate a string to multiple copy code parameters. **Note:** Because `&n&` is a valid part of an identifier, this notation may not be used as a copy code parameter substitution in other positions described above (i.e. `abc&1&` or `&1&abc&2&`). In other words, a string may only come after copy code parameters, not before or between. Values that are specified in the `INCLUDE` statement but not referenced in the copycode will be ignored.

Examples

- Example 1 - INCLUDE Statement Including Copycode
- Example 2 - INCLUDE Statement Including Copycode with Parameters
- Example 3 - INCLUDE Statement Using Nested Copycodes

- Example 4 - INCLUDE Statement with Concatenated Parameters in Copycode

Example 1 - INCLUDE Statement Including Copycode

Program containing the INCLUDE statement:

```
** Example 'INCEX1': INCLUDE  (include copycode)
************************************************************************
*
WRITE 'Before copycode'
*
INCLUDE INCEX1C
*
WRITE 'After copycode'
*
END
```

Copycode INCEX1C to be included:

```
** Example 'INCEX1C': INCLUDE (copycode used by INCEX1)
************************************************************************
*
WRITE 'Inside copycode'
```

Output of Program INCEX1:

```
Page      1                                                05-01-25  16:26:36

```

Example 2 - INCLUDE Statement Including Copycode with Parameters

Program INCEX2 containing the INCLUDE statement:

```
** Example 'INCEX2': INCLUDE  (include copycode with parameters)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 NAME
END-DEFINE
*
*
INCLUDE INCEX2C 'EMPL-VIEW' 'NAME' '''ARCHER''' '20' '''BAILLET'''
*
END
```

Copycode INCEX2C to be included:

```
** Example 'INCEX2C': INCLUDE (copycode used by INCEX2)
************************************************************************
* Transferred parameters from INCEX2:
*
* &1& : EMPL-VIEW
* &2& : NAME
* &3& : 'ARCHER'
* &4& : 20
* &5& : 'BAILLET'
*
*
READ (&4&) &1&  BY &2&  = &3&
  DISPLAY &2&
  IF &2& = &5&
    WRITE 5X 'LAST RECORD FOUND' &2&
    STOP
  END-IF
END-READ
*
* Statements above will be completed to:
*
* READ (20) EMPL-VIEW  BY NAME  = 'ARCHER'
*   DISPLAY NAME
*   IF NAME = 'BAILLET'
*     WRITE 5X 'LAST RECORD FOUND' NAME
*     STOP
*   END-IF
* END-READ
```

Output of Program INCEX2:

```
Page      1                                                  05-01-25  16:30:43

        NAME

```

```
BAILLET
     LAST RECORD FOUND BAILLET
```

Example 3 - INCLUDE Statement Using Nested Copycodes

Program containing INCLUDE statement:

```
** Example 'INCEX3': INCLUDE  (using nested copycodes)
************************************************************************
DEFINE DATA LOCAL
1 #A (I4)
END-DEFINE
*
MOVE 123 TO #A
WRITE 'Program  INCEX3  ' '=' #A
*
INCLUDE INCEX31C '#A' '5'            /* source line is #A := 5
*
*
MOVE 300 TO #A
WRITE 'Program  INCEX3  ' '=' #A
*
INCLUDE INCEX32C '''#A'''  '''20'''  /* source line is #A := 20
*
WRITE 'Program  INCEX3  ' '=' #A
END
```

Copycode INCEX31C to be included:

```
** Example 'INCEX31C': INCLUDE (copycode used by INCEX3)
************************************************************************
* Transferred parameters from INCEX3:
*
* &1& : #A
* &2& : 5
*
*
&1& := &2&
*
WRITE 'Copycode INCEX31C' '=' &1&
```

Copycode INCEX32C to be included:

```
** Example 'INCEX32C': INCLUDE (copycode used by INCEX3)
************************************************************************
* Transferred parameters from INCEX3:
*
* &1& : '#A'
* &2& : '20'
*
*
WRITE 'Copycode INCEX32C' &1& &2&
*
INCLUDE INCEX31C &1& &2&
```

Output of Program INCEX3:

```
Page      1                                                  05-01-25  16:35:36

Program  INCEX3   #A:         123
Copycode INCEX31C #A:           5
Program  INCEX3   #A:         300
Copycode INCEX32C #A 20
Copycode INCEX31C #A:          20
Program  INCEX3   #A:          20
```

Example 4 - INCLUDE Statement with Concatenated Parameters in Copycode

Program containing INCLUDE statement:

```
** Example 'INCEX4': INCLUDE  (with concatenated parameters in copycode)
************************************************************************
DEFINE DATA LOCAL
1 #GROUP
  2  ABC(A10) INIT <'1234567890'>
END-DEFINE
*
INCLUDE INCEX4C  '#GROUP.'  'ABC'  'AB'
*
END
```

Copycode INCEX4C to be included:

```
** Example 'INCEX4C': INCLUDE (copycode used by INCEX4)
************************************************************************
* Transferred parameters from INCEX4:
*
* &1& : #GROUP.
* &2& : ABC
* &3& : AB
*
*
WRITE  '=' &2&          /* 'ABC'             results into ABC
WRITE  '=' &1&ABC       /* '#GROUP.' ABC     results into #GROUP.ABC
WRITE  '=' &1&&2&       /* '#GROUP.' 'ABC'   results into #GROUP.ABC
WRITE  '=' &1&&3&C      /* '#GROUP.' 'AB' C  results into #GROUP.ABC
```

Output of Program INCEX4:

```
Page      1                                                   05-01-25  16:37:59

ABC: 1234567890
ABC: 1234567890
ABC: 1234567890
ABC: 1234567890
```

75 INPUT

- Function 472
- Input Modes 472
- Entering Data in Response to an INPUT Statement 473
- SB - Selection Box 475
- Error Correction 476
- Split-Screen Feature 476
- System Variables with the INPUT Statement 476

The syntax is described separately. See:

- *INPUT Syntax 1 - Dynamic Screen Layout Specification*
- *INPUT Syntax 2 - Using Predefined Map Layout*

Related Statements: DEFINE WINDOW | REINPUT | SET WINDOW

Belongs to Function Group: *Screen Generation for Interactive Processing*

Function

The INPUT statement is used in interactive mode to create a formatted screen or map for data entry.

It may also be used in conjunction with the Natural stack (see the STACK statement); and on mainframe computers, it may also be used to provide user data for programs being executed in batch mode.

For Natural RPC: See *Notes on Natural Statements on the Server* (in the *Natural Remote Procedure Call (RPC)* documentation).

Input Modes

The INPUT statement may be used in screen, forms, or keyword/delimiter mode. Screen mode is generally used with video terminals/screens. Forms mode may be used with TTY terminals. Delimiter mode is used with TTY terminals, and also in batch mode (on mainframe computers). The default mode is screen mode.

You can change the input mode with the session parameter IM.

Screen Mode

In screen mode, execution of the INPUT statement results in the display of a screen according to the fields and positioning notation specified. The message line of the screen is used by Natural for error messages. The position of the message line (top or bottom of screen) may be controlled by the terminal command %M. The terminal user may position to specific fields using the various tabulation keys.

As Natural allows for screen window processing, the layout of the logical screen map may be larger (theoretically 250 characters per line and 250 lines, but limited by the internal screen buffer) than the physical screen size.

The windowing terminal command %W may be used to modify logical and physical window position and size (see the terminal command %W for details of window handling).

For input fields (`AD=A` or `AD=M`) that are not fully displayed on the physical screen, the following rules apply:

- Input fields whose beginning is not inside the window are always made protected.
- Input fields which begin inside and end outside the window are only made protected if the values they contain cannot be displayed completely in the window. Please note that in this case it is decisive whether the value length, not the field length, exceeds the window size. Filler characters (as specified with the profile parameter `FC` or session parameter `AD`) do not count as part of the value.
- Before an input field thus protected can be accessed and processed, the window size must be adjusted so as to fully display the field or value respectively (see the terminal command `%W`).

Non-Screen Modes

The `INPUT` statement may be used for an operation on line-oriented devices or for the processing of batch input from sequential files.

The same map layouts as defined for screen mode operation can also be processed in non-screen mode.

Forms mode and keyword/delimiter mode are also available to process the input either by simulating the screen layout in line mode or by just processing the data without any map layout.

See also:

- *Using the INPUT Statement in Non-Screen Modes*
- *Processing Data from the Natural Stack*

Entering Data in Response to an INPUT Statement

Data for an alphanumeric field must be entered left-justified. Any character, including a blank, is meaningful. The data are assigned one character per byte to the internal field. Data entered for an alphanumeric field are not validated.

Lower and upper case translation are controlled by the terminal commands `%L` and `%U` as well as the attributes `AD=T` and `AD=W`.

Data for a numeric field may be placed anywhere in the input field. Leading and/or trailing blanks, leading zeros, a leading sign and one decimal point are permitted. Natural adjusts the value according to the internal definition of the field. If `SG=OFF` is specified, Natural does not assume or allocate a position for a sign position. Data for a field defined with format P must be entered in decimal form. Natural will convert decimal to packed wherever necessary. A field containing all blanks is interpreted as a zero value. Data for a numeric field are validated by Natural to ensure

that the value consists only of leading and/or trailing blanks, an optional leading sign, an optional decimal point, and numeric characters. If no decimal point is entered, it is assumed to be to the right of the value entered.

Data for a binary field must be entered for all positions (two characters per byte). Only valid hexadecimal characters (0 - 9, A - F) may be used. A blank (H'20' in ASCII or H'40' in EBCDIC respectively) is valid and is converted to binary zeros. Data for a binary field are validated by Natural for hexadecimal characters.

Data for format L fields may be entered as blank (false) or non-blank (true).

Data for format F, D, and T are entered according to the rules stated for F, D, and T constants.

Numeric Edit Mask Free Mode

Within a field element, you may format the representation of the field content with an edit mask. The edit mask is used for two purposes:

- to build the layout for displaying the field on the screen;
- when a string has been modified and ENTER has been pressed, to extract the field data from the string entered.

The advantage of improving the format of the field data displayed with additional insert characters may actually be a disadvantage, because a new data value entered has to perfectly match the format of the edit mask.

Example:

```
SET GLOBALS ID=; DC=,
RESET N (N7,3)
INPUT N (AD=M EM=Z'.'ZZZ'.'ZZZ,999EUR)
END
```

Output value	is displayed as:	Input value	must be entered as:	leads to an input error if entered as:
0	,000EUR	1	1,000EUR	1 1EUR 01,000EUR
1234	1.234,000EUR	1234567	1.234.567,000EUR	1234567 1.234.567 1.234.567EUR
0,123	,123EUR	1,234	1,234EUR	1,234

Another option for entering numeric fields with the edit mask is to use an alternative INPUT mode, which is called the edit mask free mode. When activated (either at session startup with the profile parameter EMFM or in a running Natural session via the terminal command %FM+), all or some of the edit mask insert characters may be left out from input.

However, when a contiguous string of insertion characters appears in the edit mask (like EUR in the example below), you may only supply or leave out the string completely. The number of optional or mandatory digits (edit-mask character Z and 9) to be supplied is not affected.

Example with Edit Mask Free Mode activated:

```
SET GLOBALS ID=; DC=,
SET CONTROL 'FM+'        /* activate numeric Edit Mask Free Mode
RESET N (N7,3)
INPUT N (AD=M EM=Z'.'ZZZ'.'ZZZ,999EUR)
END
```

Input value	can be entered as:	leads to an error if entered as:
1	1 1,0 001 1,00EUR 0.001 1,EUR	1EUR
1234567	1234567 1.234.567 1234.567 1234567,0 1.234.567,0 1.234.567,EUR 1.234.567,0EUR 1.234.567,000EUR	1.234.567EUR
1,234	1,234 1,234EUR 001,234 0.001,234EUR 00001,234EUR	1,234EU

Note: The edit mask free mode applies only for INPUT, but is ignored in a MOVE EDITED statement.

SB - Selection Box

Selection boxes in an INPUT statement are available on mainframe computers only. On Windows, selection boxes may be defined in the map editor only. On UNIX and OpenVMS, selection boxes cannot be defined and are ignored, if they are imported from a Windows or mainframe environment.

Selection boxes can be attached to input fields. They are a comfortable alternative to help routines attached to fields, since you can code a selection box direct in your program. You do not need an extra program as with help routines.

For more information, see the session parameter `SB` in the *Parameter Reference*.

Error Correction

If the value entered in an input field does not correspond to the format or edit mask of the field, Natural displays an error message (without terminating the program execution) and positions the cursor in the field in error. The user may then enter a valid value, whereupon processing continues.

Split-Screen Feature

In general, each `INPUT` statement generates a new page (or terminal screen) of output. Any `INPUT` statement which is specified within an `AT END OF PAGE` statement will not produce a new screen. This feature allows for the creation of a split screen where the upper portion of the screen may be used to display multiple lines and the lower portion can be used to create an input map for communication. The profile parameter `PS` (page size) should be used, either in a `SET GLOBALS` or `FORMAT` statement, to set the logical page size to ensure that the input map is built on the same physical screen.

The first `INPUT` line will be placed after the last displayed line. If the `NO ERASE` option is used, the first `INPUT` line will be placed at the top of the page.

System Variables with the INPUT Statement

For information on relevant system variables, see the section *Input/Output Related System Variables* in the *System Variables* documentation.

76 INPUT Syntax 1 - Dynamic Screen Layout Specification

- INPUT Syntax 1 - Description 478
- Examples - Syntax 1 487

This form of the INPUT statement is used to create a layout of an INPUT screen, or to create an INPUT data layout which is to be read (on mainframe computers) in batch mode from a sequential input file.

```
INPUT  [WINDOW='window-name'] [NO ERASE]
       [(statement-parameters)]
       [WITH-TEXT-option]
       [MARK-option]
       [ALARM-option]
  {                  {  { 'text'   }  [(attributes)]                                      }  }
  {  [ nX  ]         {  { 'c'(n)   }                                                      }  }
  {  [ nT  ]         {                                                                    }  }
  {  [ x/y ] ...     {                                                                    }  } ...
  {  [ /   ]         {  [ '-' ] [ *IN     ]   {operand1 [(parameter)]}                    }  }
  {                  {  [ '=' ] [ *OUT    ]                                               }  }
  {                  {          [ *OUTIN  ]                                               }  }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

INPUT Syntax 1 - Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G	N	A	U	N	P	I	F	B	D	T	L		G		yes	yes

Syntax Element Description:

Syntax Element	Description
INPUT WINDOW='*window-name*'	**INPUT WINDOW='*window-name*' Option:** With this option, you indicate that the INPUT statement is to be executed for the specified window. The specified window must be defined in a DEFINE WINDOW statement; see ***Example 2 - INPUT Statement with DEFINE WINDOW Statement***. The specified window is only active for the duration of that INPUT statement, and is automatically deactivated when the INPUT statement has been executed. See also the statements DEFINE WINDOW and SET WINDOW.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td><code>NO ERASE</code></td><td>

NO ERASE Option:

This option causes a screen map of an `INPUT` statement to be overlaid onto an existing screen without erasing the screen contents.

Screen as used here refers to a logical screen rather than a physical screen.

All unprotected fields that existed on the screen are converted to protected (display only) fields. The old data remain on the screen until the new layout is displayed. If a field from the new screen content partially overlays an existing field, the one character before the new field and the next character in the existing field will be replaced by a blank.

</td></tr>
<tr><td>statement-parameters</td><td>

Statement Parameter(s):

One or more parameters, enclosed within parentheses, may be specified immediately after the `INPUT` statement or an element being displayed.

For a list of parameters that can be specified with the `INPUT` statement, refer to the section *Statement Parameters*.

Each parameter specified in this manner will override any previous parameter specified in a `GLOBALS` command, `SET GLOBALS` or `FORMAT` statement. If more than one parameter is specified, one or more blanks must be present between each entry. An entry may not be split between two statement lines.

The parameter settings applied here will only be regarded for variable fields, but they have no effect on text-constants. If you would like to set field attributes for a text-constant, they have to be set explicitly for this element.

Example:

```
DEFINE DATA LOCAL
1 VARI (A4)     INIT <'1234'>                  /*    Output
END-DEFINE                                     /*   Produced
*                                              /*   ---------
INPUT           'Text'          VARI           /*   Text 1234
INPUT (AD=U)    'Text'          VARI           /*   Text 1234
INPUT           'Text' (AD=U)   VARI (AD=U)    /*   Text 1234
INPUT           'Text' (AD=U)   VARI           /*   Text 1234
END
```

Examples of using parameters at the statement and element level are provided below.

</td></tr>
<tr><td>WITH TEXT-option</td><td>

WITH TEXT Option:
This option is used to provide text which is to be displayed in the message line; see ***WITH TEXT Option*** below.

</td></tr>
<tr><td>MARK-option</td><td>

MARK Option:

See the section ***MARK Option*** below.

</td></tr>
</table>

Syntax Element	Description
ALARM-option	**Alarm Option:** See the section *Alarm Option* below.
Other syntax elements (*n*X, *n*T, *x*/*y*, *operand1*, etc.)	**Field Positioning, Text Specification, Attribute Assignment:** See the section *Field Positioning, Text Specification, Attribute Assignment* below.

Statement Parameters

Parameters that can be specified with the INPUT statement		Specification (S = at statement level, E = at element level)
AD	Attribute Definition	SE
AL	Alphanumeric Length for Output	SE
CD	Color Definition	SE
CV	Control Variable	SE
DF	Date Format	SE
DL	Display Length for Output	SE
DY	Dynamic Attributes	SE
EM	Edit Mask	SE
EMU	Unicode Edit Mask	E
FL	Floating Point Mantissa Length	SE
HE	Helproutine	SE
IP	Input Prompting Text	SE
LS	Line Size	S
MC	Multiple-Value Field Count	S
MS	Manual Skip	S
NL	Numeric Length for Output	SE
PC	Periodic Group Count	S
PM	Print Mode [*]	SE
PS	Page Size [**]	S
SB	Selection Box	E
SG	Sign Position	SE
ZP	Zero Printing	SE

[*] The PM session parameter may not be specified for text constants.

[**] The PS session parameter setting is not considered if the number of occurrences of an array exceeds the PS value.

The individual session parameters are described in the *Parameter Reference*.

WITH TEXT Option

```
[WITH] TEXT { *operand1 } [(attributes)][,operand3] ... 7
            {  operand2 }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S					N	P	I		B*							yes	yes
operand2	C	S				A												yes	yes
operand3	C	S				A	N	P	I	F	B	D	T	L				yes	yes

* Format B of *operand1* may be used only with a length of less than or equal to 4.

`WITH TEXT` is used to provide text which is to be displayed in the message line. This is usually a message indicating what action should be taken to process the screen or to correct an error.

Syntax Element Description:

Syntax Element	Description
operand1	**Message Text Number:** *operand1* represents the number of a message text that is to be retrieved from a Natural message file. You can retrieve either user-defined messages or Natural system messages: ■ If you specify a positive value of up to four digits (for example: `954`), you will retrieve user-defined messages. ■ If you specify a negative value of up to four digits (for example: `-954`), you will retrieve Natural system messages. See also ***Example 4 - WITH TEXT Options*** in the description of the `REINPUT` statement. Natural message files are created and maintained with the `SYSERR` utility as described in the relevant documentation.
operand2	**Message Text:** *operand2* represents the message to be placed in the message line. See also ***Example 4 - WITH TEXT Options*** in the description of the `REINPUT` statement.
attributes	**Output Attributes:**

Syntax Element	Description
	It is possible to assign various output attributes for *operand1/2*. These attributes and the syntax that may be used are described in the section *Output Attributes* below.
operand3	**Dynamic Replacement of Message Text:** *operand3* represents a numeric or text constant or the name of a variable. The values provided are used to replace parts of a message text that are either specified with *operand1* or *operand2*. The notation :*n*: is used within the message text as a reference to *operand3* contents, where *n* represents the *operand3* occurrence (1 - 7). See also ***Example 4 - WITH TEXT Options*** in the description of the REINPUT statement. **Note:** Multiple specifications of *operand3* must be separated from each other by a comma. If the comma is used as a decimal character (as defined with the session parameter DC) and numeric constants are specified as *operand3*, put blanks before and after the comma so that it cannot be misinterpreted as a decimal character. Alternatively, multiple specifications of *operand3* can be separated by the input delimiter character (as defined with the session parameter ID); however, this is not possible in the case of ID=/ (slash), because the slash has a different meaning in the INPUT statement syntax. Leading zeros or trailing blanks will be removed from the field value before it is displayed in a message.

Output Attributes

attributes indicates the output attributes to be used for text display. Attributes may be:

```
{ { AD=AD-value ...  }     }
{ { CD=CD-value ...  }     }
{ { PM=PM-value ...  } ... }
{                          }
{ { AD-value ...     }     }
{ { CD-value ...     } ... }
```

For the possible session parameter values, refer to the corresponding sections in the *Parameter Reference* documentation:

- *AD - Attribute Definition*, section *Field Representation*
- *CD - Color Definition*
- *PM - Print Mode*

Note: The compiler actually accepts more than one attribute value for an output field. For example, you may specify: AD=BDI. In such a case, however, only the last value applies. In

the given example, only the value `I` will become effective and the output field will be displayed intensified.

MARK Option

With the `MARK` option, you can cause the cursor to be placed at any non-protected field on screen. In addition, you can specify the position of the cursor within that field. By default, that is, when the `MARK` option is omitted, the cursor is placed at the beginning of the first non-protected field.

```
MARK [POSITION operand4 [IN]] [FIELD] { operand1   }
                                      { *fieldname }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand4	C	S					N	P	I									yes	yes
operand1	C	S	A				N	P	I									yes	yes

Syntax Element Description:

Syntax Element	Description
operand1	**Field Reference Number:** *operand1* specifies the number of the field where the cursor is to be positioned in. Each field attribute `AD=A` or `AD=M` (that is, non-protected field) specified in an `INPUT` statement is assigned a field reference number, beginning with 1.
**fieldname*	**Field Name for Referencing:** Instead of the field reference number, the field name may be used to position to a field, using the **fieldname* notation.
operand4	**Cursor Position within Referenced Field:** With `MARK POSITION`, you can have the cursor placed at a specific position - as specified with *operand4* - within a field specified with *operand1* or **fieldname*. *operand4* must not contain decimal digits.

Examples:

```
MARK #NUMBER                /* Field number
MARK 3                      /* Third map field
MARK *#FIELD1               /* Map field
MARK POSITION 3 IN #NUMBER /* Third character in field number
```

See also *Example 3 - INPUT Statement with MARK POSITION Option* at the end of this section.

ALARM Option

This option causes the sound alarm feature of the terminal to be activated when the INPUT statement is executed. The appropriate hardware must be available to be able to use this feature.

```
[[AND] [SOUND] ALARM]
```

Default Prompting Text

Unless the session parameter IP (input prompting) is set to IP=OFF, the field name of the field used in an INPUT statement will be displayed preceding the field value (forms mode) or as a prompting keyword to select the field (keyword/delimiter mode). This default field name may be overridden by specifying either a '*text*' element (which replaces the default name) or '-' (which suppresses the display of the default field name) immediately preceding the field name.

Field Positioning, Text Specification, Attribute Assignment

Several notations are available for field positioning, attribute assignment, and text creation.

```
          'text'   [(attributes)]
[ nX  ]   'c'(n)  [(attributes)]    [ *IN    ]  {operand1
[ nT  ] [       '-'              ]  [ *OUT   ]  [(parameter(s))]}
[ x/y ]         '='                 [ *OUTIN ]
                / ...
```

Syntax Element Description:

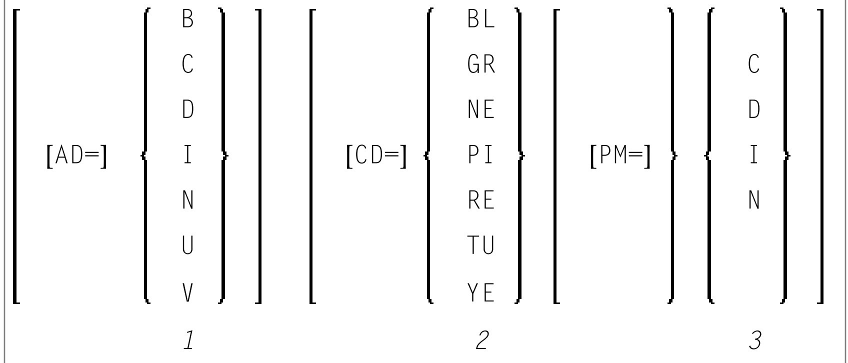
Syntax Element	Description
*n*X	**Insert Option:** This option causes *n* spaces to be inserted between fields.
*n*T	**Tabulator Option:** This option causes positioning (tabulation) to print position *n*.
x/*y*	**Positioning Option:** Places the next element on line *x*, beginning in column *y*. *y* must not be zero. Backward positioning in the same line is not permitted.
'*text*'	**Write Protection:** Causes *text* to be displayed write protected; see also *Text Notation, Defining a Text to Be Used with a Statement*.
'*c*' (*n*)	**Character Repetition:** Identical to '*text*', except that the character *c* is displayed *n* times. *n* must be 1 - 132; see also *Text Notation, Defining a Character to Be Displayed n Times before a Field Value*.
attributes	**Display Attributes:** Attributes to be used for display. See ***Attributes*** below.
'-'	**Minus Sign:** When placed before a field, '-' suppresses the generation of a field name as prompting text. **Note:** Any text string before a field will replace the field name as prompting text.
'='	**Equal Sign:** When placed before a field, '=' results in the display of the field heading followed by the field contents.
'/'	**Slash Sign:** When placed between fields or text elements, '/' causes positioning to the beginning of the next print line. The contents of fields may be specified for input, output only, and output for modification using the attribute settings AD=A, AD=O, and AD=M respectively. The default is AD=A. All fields specified with AD=A (input only) or AD=M (output for modification) will create unprotected fields on the screen. A value for such a field may be entered by the user. For TTY devices, output for modification fields will occupy twice the size of the field (one for output, one for input) so that a new value may be entered. An input field (with AD=A or AD=M) specified as non-displayable will always start on a new line on a TTY device.

Syntax Element	Description
	Example: `INPUT #A (AD=A) #B (AD=O) #C (AD=M)` `#A` is an input field which is unprotected, i.e., a value is to be entered for the field. `#B` is a field which is to be displayed write-protected, that is, no value may be entered for the field. `#C` is a field whose current value is to be displayed, and the value may be modified by entering a new value for the field.
`*IN`, `*OUT` and `*OUTIN`	**Field Attribute Definition:** Equivalent to the attributes `AD=A`, `AD=O`, `AD=M` respectively. **Note:** If a non-modifiable system variable is used in an `INPUT` statement, the value will be displayed as an output-only field `AD=O` or `*OUT` attribute.
operand1	**Field(s) to be Used:** *operand1* represents the field to be used. Database fields or user-defined variables may be specified. Natural directly maps the content of each field from the data area to the `INPUT` statement, no move operation is necessary. When the content of a database field is modified as a result of `INPUT` processing, only the value as contained in the data area is modified. Appropriate database `UPDATE` / `STORE` statements must be used to change the content of the database. When the name of a group of database fields is referenced in an `INPUT` statement, all fields belonging to that group will be individually used as input fields. When reference is made to a range of occurrences within an array, all occurrences are individually processed as input fields, but no prompting text will be created for each individual occurrence, only for the first one. On mainframe computers, arrays with ranges that allow to vary the number of occurrences at execution time may not be specified.
parameter(s)	**Parameter(s):** One or more parameters, enclosed within parentheses, may be specified immediately after *operand1* (see table and example below). Each parameter specified will override any previous parameter specified in a `GLOBALS` command, `SET GLOBALS` (in Reporting Mode) or `FORMAT` statement. If more than one parameter is specified, they must be separated by one or more blanks from one another. Each parameter specification must not be split between two statement lines.

Syntax Element	Description
	The parameter settings applied here will only be regarded for variable fields, but they have no effect on text constants. If you would like to set field attributes for a text-constant, they have to be set explicitly for this element. For information on the individual parameters, see the table in the section ***Statement Parameters***. **Note:** The session parameter `EM` will be referenced dynamically in the DDM if an edit mask is defined for a database field. Edit masks may be specified for output and input fields. When an edit mask is defined for an input field, the data for the field must be entered according to the edit mask specification.

Attributes

The following attributes may be used:



1. Display attributes; see the session parameter `AD` (in the *Parameter Reference*).
2. Color attributes; see the session parameter `CD` (in the *Parameter Reference*).
3. Print mode attributes; see the session parameter `PM` (in the *Parameter Reference*).

Examples - Syntax 1

- Example 1 - INPUT Statement
- Example 2 - INPUT Statement with DEFINE WINDOW Statement

- Example 3 - INPUT Statement with MARK POSITION Option

Example 1 - INPUT Statement

```
** Example 'IPTEX1': INPUT
************************************************************************
DEFINE DATA LOCAL
1 #FNC  (A1)
END-DEFINE
*
INPUT 10X 'SELECTION MENU FOR EMPLOYEES SYSTEM' /
      10X '-' (35) //
      10X 'ADD       (A)' /
      10X 'UPDATE    (U)' /
      10X 'DELETE    (D)' /
      10X 'STOP      (.)' //
      10X 'PLEASE ENTER FUNCTION: ' #FNC
*
DECIDE ON EVERY VALUE OF #FNC
  VALUE 'A'   /* invoke the object containing the add function here
    WRITE 'Add function selected.'
  VALUE 'U'   /* invoke the object containing the update function here
    WRITE 'Update function selected.'
  VALUE 'D'   /* invoke the object containing the delete function here
    WRITE 'Delete function selected.'
  VALUE '.'
    STOP
  NONE
    REINPUT 'Please enter a valid function.' MARK *#FNC
END-DECIDE
*
END
```

Output of Program IPTEX1:

```
SELECTION MENU FOR EMPLOYEES SYSTEM
-----------------------------------

ADD      (A)
UPDATE   (U)
DELETE   (D)
STOP     (.)

PLEASE ENTER FUNCTION:
```

Example 2 - INPUT Statement with DEFINE WINDOW Statement

```
** Example 'INPEX1': INPUT (with DEFINE WINDOW statement)
************************************************************************
DEFINE DATA LOCAL
1 #STRING (A15)
END-DEFINE
*
DEFINE WINDOW WIND1
  SIZE 10 * 40
  BASE 5 / 10
  FRAMED ON POSITION TEXT
*
INPUT WINDOW='WIND1'
      'PLEASE ENTER HERE:' / #STRING
*
END
```

Output of Program INPEX1:

```

+-----------------------------------Top+
! PLEASE ENTER HERE:                    !
! #STRING                               !
!                                       !
!                                       !
!                                       !
!                                       !
!                                       !
!                                       !
+--------------------------------Bottom+

```

Example 3 - INPUT Statement with MARK POSITION Option

```
** Example 'INPEX2': INPUT (with POSITION)
************************************************************************
DEFINE DATA LOCAL
1 #START (A30)
END-DEFINE
*
ASSIGN #START = 'EXAM_'
*
INPUT (AD=M) MARK POSITION 5 IN *#START
     / 'PLEASE COMPLETE START VALUE FOR SEARCH'
     / 5X #START
END
```

Output of Program INPEX2:

```
PLEASE COMPLETE START VALUE FOR SEARCH
       #START EXAM[]
```

77 INPUT Syntax 2 - Using Predefined Map Layout

- INPUT USING MAP without Parameter List 492
- INPUT Fields Defined in the Program 493
- INPUT Syntax 2 - Description 493
- Using the INPUT Statement in Non-Screen Modes 494
- Processing Data from the Natural Stack 496

This form of the INPUT statement is used to perform input processing using a map layout that has been created using the Natural map editor.

Map layouts can be used in two ways:

- the program does not provide a parameter list;
- the program does provide a parameter list (*operand1*).

```
INPUT [WINDOW='window-name'] [WITH-TEXT-option]
 [MARK-option]
 [ALARM-option]
 [USING] MAP map-name [NO ERASE]
[               operand1 ...      ]
[               NO PARAMETER      ]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

INPUT USING MAP without Parameter List

The following requirements must be met when INPUT USING MAP is used without parameter list:

- The *map-name* must be specified as an alphanumeric constant (up to 8 characters).
- The map used in this manner must have been created prior to the compilation of the program which references the map.
- The names of the fields to be processed are taken dynamically from the map source definition at compilation time. The field names used in both program and map must be identical.
- All fields to be referenced in the INPUT statement must be accessible at that point.
- In structured mode, fields must have been previously defined (database fields must be properly referenced to processing loops or views).
- In reporting mode, user-defined variables may be newly defined in the map.
- When the map layout is changed, the programs using the map need not be recataloged. However, when array structures or names, formats/lengths of fields are changed, or fields are added/deleted in the map, the programs using the map must be recataloged.
- The map source must be available at program compilation; otherwise the INPUT USING MAP statement cannot be compiled.

Note: If you wish to compile the program even if the map is not yet available, specify NO PARAMETER: the INPUT USING MAP can then be compiled even if the map is not yet available.

INPUT Fields Defined in the Program

By specifying the names of the fields to be processed within the program (`operand1`), it is possible to have the names of the fields in the program differ from the names of the fields in the map.

The sequence of fields in the program must match the map sequence. Please note that the map editor sorts the fields as specified in the map in alphabetical order by field name. For more information, see the map editor description in your Natural Editors documentation.

The program editor line command `.I(mapname)` can be used to obtain a complete `INPUT USING MAP` statement with a parameter list derived from the fields defined in the specified map.

When the layout of the map is changed, the program using the map need not be recataloged. However, when field names, field formats/lengths, or array structures in the map are changed or fields are added or deleted in the map, the program must be recataloged.

A check is made at execution time to ensure that the format and length of the fields as specified in the program match the fields as specified in the map. If both layouts do not agree, an error message is produced.

INPUT Syntax 2 - Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
map-name	C	S				A	U												yes	no
operand1		S	A			A	U	N	P	I	F	B	D	T	L	C			yes	yes

Syntax Element Description:

Syntax Element	Description
`INPUT WINDOW='window-name'`	**INPUT WINDOW='*window-name*' Option:** This option is described under ***Syntax 1*** of the `INPUT` statement.
WITH TEXT/MARK/ALARM-options	**WITH TEXT/MARK/ALARM Options:** These options are described under *Syntax 1* of the `INPUT` statement; see ***WITH TEXT Option***, ***MARK Option***, ***ALARM Option***.
`USING MAP map-name`	**USING MAP Clause:**

Syntax Element	Description
	USING MAP invokes a map definition which has been previously stored in a Natural system file using the map editor. The *map-name* may be a 1- to 8-character alphanumeric constant or user-defined variable. If a variable is used, it must have been previously defined. The map name may contain an ampersand (&); at execution time, this character will be replaced by the one-character code corresponding to the current value of the Natural system variable *LANGUAGE. This feature allows the use of multi-lingual maps. The execution of the INPUT statement causes the corresponding map to replace the current contents of the screen, unless the NO ERASE option is specified, in which case the map will overlay the current contents of the screen.
NO ERASE	**NO ERASE Option:** This option is described under ***Syntax 1*** of the INPUT statement; see NO ERASE.
operand1	**Field Specification:** A list of database fields and/or user-defined variables. The fields must agree in number, sequence, format, length and (for arrays) number of occurrences with the fields in the referenced map; otherwise, an error occurs. When the content of a database field is modified as a result of INPUT processing, only the value as contained in the data area is modified. Appropriate database UPDATE / STORE statements must be used to change the content of the database.

Using the INPUT Statement in Non-Screen Modes

You can change the input mode with the session parameter IM.

In Forms Mode

In forms mode (profile/session parameter IM=F), Natural will display all output text of the map layout on the terminal field by field according to the positioning parameters. This permits the user to enter data on a field by field basis. When all data are entered, the hardcopy output is produced exactly as it would have appeared on the screen.

In forms mode, entering %R permits the operator to retype the entire form in case of an error. The input is processed as in the first execution of the INPUT statement.

In Keyword/Delimiter Mode

In keyword/delimiter mode (profile/session parameter `IM=D`), data can be entered using keywords or positional input values.

Using keyword input, the terminal operator may enter data for the individual fields using the prompting text that, in forms mode, would have been displayed before the value as a keyword to identify the field. The keyword must be followed by the input assign character (`IA` parameter), followed immediately by the data. Any spaces following the assign character are taken as data up to the delimiter character (`ID` parameter). A delimiter character is not required after the last data element. Keyword data for the different fields may be entered in any order separated by the delimiter character. If the operator types in a keyword which is not defined in the `INPUT` statement, an error message will be returned. Data need not be entered for all input fields. Fields for which no data are entered are set to blank for alphanumeric fields and zero for numeric and hexadecimal fields.

Using positional value input, the terminal operator enters only data for all input fields separated by the currently defined input delimiter character (`ID` parameter). The sequence of fields for input must correspond to the sequence of the fields in the `INPUT` statement.

The user may switch from positional to keyword input by entering a number of values in positional input separated by the delimiter character and then switching to keyword mode for selected fields by specifying keywords in front of the values.

After a keyword has been used to position to a field, any non-keyword input following the keyword will be processed as positional input to be assigned to fields following the previously selected field in the `INPUT` statement.

Note: A keyword and the corresponding input field must be on the same logical line. If their aggregate length exceeds the line size, adjust the line size (`LS` parameter) accordingly so that keyword and field fit onto one line.

Data entered in keyword/delimiter mode are validated as for screen mode. An error message will be returned if an attempt is made to enter more characters than defined for a field.

If the `INPUT` statement is to be processed in keyword/delimiter mode on a buffered (3270-type) terminal or a workstation, all data to be assigned to one `INPUT` statement must be entered on one screen. ENTER is only to be used when all data to the `INPUT` statement have been entered.

Processing Data from the Natural Stack

Data elements that have been placed in the Natural stack via a FETCH, RUN or STACK statement will be processed by the next INPUT statement encountered for execution.

The INPUT statement will process the data in keyword/delimiter mode as described above.

If data elements are not available to fill all input fields, fields will be filled with blank/zero depending on the field format. If more data elements are specified than input fields exist, the remaining data are ignored.

When a field is filled with data from the stack, the field attributes do not apply to the data.

The Natural system variable *DATA may be referenced to determine the number of data elements currently available in the Natural stack.

78 INTERFACE

- Function 498
- Syntax Description 499

```
INTERFACE   interface-name
 [ EXTERNAL]
 [ID interface-GUID]
 [property-definition]
 [method-definition]
END-INTERFACE
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `CREATE OBJECT` | `DEFINE CLASS` | `INTERFACE` | `METHOD` | `PROPERTY` | `SEND METHOD`

Belongs to Function Group: ***Component Based Programming***

Function

In component-based programming, an interface is a collection of methods and properties that belong together semantically and represent a certain feature of a class.

You can define one or several interfaces for a class. Defining several interfaces allows you to structure/group methods according to what they do, for example, you put all methods that deal with persistency (load, store, update) in one interface and put other methods in other interfaces.

The `INTERFACE` statement is used to define an interface. It may only be used in a Natural class module and can be defined as follows:

- within a `DEFINE CLASS` statement. This form is used when the interface is only to be implemented in one class, or
- in a copycode which is included by the `INTERFACE USING` clause of the `DEFINE CLASS` statement. This form is used when the interface is to be implemented in more than one class.

The properties and methods that are associated with the interface are defined by the property and method definitions.

Syntax Description

Syntax Element	Description
interface-name	**Interface Name:** This is the name to be assigned to the interface. The interface name can be up to a maximum of 32 characters long and must conform to the Natural naming conventions for user-defined variables; see *Naming Conventions for User-Defined Variables* in the *Using Natural* documentation. It must be unique per class and different from the class name. If the interface is planned to be used by clients written in different programming languages, the interface name should be chosen in a way that it does not conflict with the naming conventions that apply in these languages.
EXTERNAL	**EXTERNAL Clause:** This clause is used to indicate that this interface is implemented by the class, but which is originally defined in a different class. The clause is only relevant if the class is to be registered with DCOM. Interfaces with the EXTERNAL clause are ignored when the class is registered with DCOM. It is assumed that the interface is registered by the class that originally defines it.
ID *interface-GUID*	**ID Clause:** This clause is used to assign a globally unique ID to the interface. The *interface-GUID* is the name of a GUID defined in a data area that is included by the LOCAL clause. The *interface-GUID* is a (named) alpha constant. A GUID must be assigned to an interface if the class is to be registered with DCOM.
property-definition	**Property Definition:** The property definition is used to define a property of the interface. See ***Property Definition*** below.
method-definition	**Method Definition:** The method definition is used to define a method for the interface. See ***Method Definition*** below.
END-INTERFACE	**End of INTERFACE Statement:** The Natural reserved word END-INTERFACE must be used to end the INTERFACE statement.

Property Definition

The property definition is used to define a property of the interface.

```
PROPERTY property-name
 [(format-length/array-definition)]
 [ID dispatch-ID]
 [READONLY]
 [IS operand]
END-PROPERTY
```

Properties are attributes of an object that can be accessed by clients. An object that represents an employee might for example have a `Name` property and a `Department` property. Retrieving or changing the name or department of the employee by accessing her `Name` or `Department` property is much simpler for a client than calling one method that returns the value and another method that changes the value.

Each property needs a variable in the object data area of the class to store its value - this is referred to as the object data variable. The property definition is used to make this variable accessible to clients. The property definition defines the name and format of the property and connects it to the object data variable. In the simplest case, the property takes the name and format of the object data variable itself. It is also possible to override the name and format within certain limits.

Syntax Element Description:

Syntax Element	Description
property-name	**Property Name:** This is the name to be assigned to the property. The property name can contain up to a maximum of 32 characters and must conform to the Natural naming conventions for user variables; see *Naming Conventions for User-Defined Variables* in the *Using Natural* documentation. If the property is planned to be used by clients written in different programming languages, the property name should be chosen in a way that it does not conflict with the naming conventions that apply in these languages.
format-length/array-definition	***format-length/array-definition*** **Option:** This option defines the format of the property as it will be seen by clients.

Syntax Element	Description
	If *format-length/array-definition* is omitted, the format-length and array-definition will be taken from the object data variable assigned in the IS clause. If *format-length/array-definition* is specified, it must be data transfer-compatible both to and from the format of the object data variable specified in *operand* in the IS clause. In the case of a READONLY property, the data transfer-compatibility needs to hold only in one direction: with the object data variable as source operand and the property as destination operand. If an array-definition is specified, it must be equal in dimensions, occurrences per dimension, lower bounds and upper bounds to the array definition of the corresponding object data variable. This is expressed by specifying an asterisk for each dimension.
ID *dispatch-ID*	**ID Clause:** The ID clause is used to assign a specific numeric identifier to a property. This identifier (*dispatch-ID*) is only relevant if the class is to be registered with DCOM. Normally, Natural automatically assigns a dispatch ID to a property. It is only necessary to explicitly define a specific dispatch ID for a property if the property belongs to an interface with the EXTERNAL clause. (This is an interface that shall be implemented in this class, but which is originally defined in a different class.) In this case the dispatch IDs to be used are usually dictated by the original implementation of the interface. The *dispatch-ID* is a positive, non-zero constant of format I4.
READONLY	**READONLY Option:** If the keyword READONLY is specified, the value of the property can only be read and not set. The format of the object data variable specified in *operand* in the IS clause must be data transfer-compatible to the format specified in *format-length/array-definition*. It does not have to be data transfer-compatible in the inverse direction. If the keyword READONLY is omitted, the property value can be both read and set.
IS *operand*	**IS Clause:** The *operand* in the IS clause assigns an object data variable as the place to store the property value. The assigned object data variable may not be a group. The variable is referenced in normal operand syntax. This means, if the object data variable is an array, it must be referenced with index notation. Only the full index range notation and asterisk notation is allowed.

Syntax Element	Description
	The IS clause should not be used if the INTERFACE statement will be included from a copycode member and reused in several classes. If you want to reuse the INTERFACE statement, you must assign the object data variable in a PROPERTY statement outside the INTERFACE statement. If the IS clause is omitted, the property is connected to the object data variable with the same name as the property. If a variable with this name is not defined or if it is a group, a syntax error results.
END-PROPERTY	**End of Interface Property Definition:** The Natural reserved word END-PROPERTY must be used to end the interface PROPERTY definition.

Examples

Let the object data area contain the following data definitions:

```
1 Salary(p7.2)
1 SalaryHistory(p7.2/1:10)
```

Then the following property definitions are allowed:

```
property Salary
  end-property
  property Pay is Salary
  end-property
  property Pay(P7.2) is Salary
  end-property
  property Pay(N7.2) is Salary
  end-property
  property SalaryHistory
  end-property
  property OldPay is SalaryHistory(*)
  end-property
  property OldPay is SalaryHistory(1:10)
  end-property
  property OldPay(P7.2/*) is SalaryHistory(1:10)
  end-property
  property OldPay(N7.2/*) is SalaryHistory(*)
  end-property
```

The following property definitions are not allowed:

```
/* Not data transfer-compatible. */
  property Pay(L) is Salary
  end-property
  /* Not data transfer-compatible. */
  property OldPay(L/*) is SalaryHistory(*)
  end-property
  /* Not data transfer-compatible. */
  property OldPay(L/1:10) is SalaryHistory(1:10)
  end-property
  /* Assigns an array to a scalar. */
  property OldPay(P7.2) is SalaryHistory(1:10)
  end-property
  /* Takes only a sub-array. */
  property OldPay(P7.2/3:5) is SalaryHistory(*)
  end-property
  /* Index specification omitted in ODA variable SalaryHistory. */
  property OldPay is SalaryHistory
  end-property
  /* Only asterisk notation allowed in property format specification. */
  property OldPay(P7.2/1:10) is SalaryHistory(*)
  end-property
```

Method Definition

The method definition is used to define a method for the interface.

```
METHOD method-name
 [ID dispatch-ID]
 [IS subprogram-name]
[ PARAMETER { USING parameter-data-area } ] ...
            { data-definition ...        }
END-METHOD
```

To make the interface reusable in different classes, include the interface definition from a copycode and define the subprogram after the interface definition with a `METHOD` statement. Then you can implement the method differently in different classes.

Syntax Element Description:

Syntax Element	Description
method-name	**Method Name:** This is the name to be assigned to the method. The method name can contain a maximum of up to 32 characters and must conform to the Natural naming conventions; see *Naming Conventions for User-Defined Variables* in the *Using Natural* documentation. It must be unique per interface. If the method is planned to be used by clients written in different programming languages, the method name should be chosen in a way that it does not conflict with the naming conventions that apply in these languages.
ID *dispatch-ID*	**ID Clause:** The ID clause is used to assign a specific numeric identifier to a method. This identifier (the so-called dispatch ID) is only relevant if the class is to be registered with DCOM. Normally, Natural automatically assigns a dispatch ID to a method. It is only necessary to explicitly define a specific dispatch ID for a method if the method belongs to an interface with the EXTERNAL clause. (This is an interface that shall be implemented in this class, but which is originally defined in a different class.) In this case, the dispatch IDs to be used are usually dictated by the original implementation of the interface. The dispatch ID is a positive, non-zero constant of format I4.
IS *subprogram-name*	**IS Clause:** This clause can be used to specify the name of the subprogram that implements the method. The name of the subprogram consists of up to 8 characters. The default is method-name (if the IS clause is not specified).
PARAMETER	**PARAMETER Clause:** The PARAMETER clause specifies the parameters of the method, and has the same syntax as the PARAMETER clause of the DEFINE DATA statement. The parameters must match the parameters which are later used in the implementation of the subprogram. This is ensured best by using a parameter data area. Parameters that are marked BY VALUE in the parameter data area are input parameters of the method. Parameters which are not marked BY VALUE are passed “by reference” and are input/output parameters. This is the default. The first parameter that is marked BY VALUE RESULT is returned as the return value for the method. If more than one parameter is marked in this way, the others will be treated as input/output parameters.
END-METHOD	**End of Method Definition:**

Syntax Element	Description
	The Natural reserved word `END-METHOD` must be used to end the `METHOD` definition for the interface.

79 LIMIT

- Function 508
- Syntax Description 509
- Examples 509

```
LIMIT n
```

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION | HISTOGRAM | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The LIMIT statement is used to limit the number of iterations of a processing loop initiated with a FIND, READ, or HISTOGRAM statement.

The limit remains in effect for all subsequent processing loops in the program until it is overridden by another LIMIT statement.

The LIMIT statement does not apply to individual statements in which a limit is explicitly specified (for example, FIND (*n*) ...).

If the limit is reached, processing stops and a message is displayed; see also the session parameter LE which determines the reaction when the limit for the processing loop is exceeded.

If no LIMIT statement is specified, the default global limit defined with the Natural profile parameter LT during Natural installation will be used.

Record Counting

To determine whether a processing loop has reached the limit, each record read in the loop is counted against the limit. If the processing loop has reached the limit, the following will apply:

- A record that is rejected because of criteria specified in a FIND or READ statement WHERE clause is *not* counted against the limit.
- A record that is rejected as a result of an ACCEPT/REJECT statement is counted against the limit.

Syntax Description

Syntax Element	Description
`LIMIT n`	**Limit Specification:** The limit *n* must be specified as a numeric constant in the range from `0 - 4294967295` (leading zeros are optional). The processing loop is not entered if the limit is set to zero.

Examples

- Example 1 - LIMIT Statement
- Example 2 - LIMIT Statement (Valid for Two Database Loops)

Example 1 - LIMIT Statement

```
** Example 'LMTEX1': LIMIT
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 CITY
END-DEFINE
*
LIMIT 4
*
READ EMPLOY-VIEW BY NAME STARTING FROM 'BAKER'
  DISPLAY NOTITLE
          NAME PERSONNEL-ID CITY *COUNTER
END-READ
*
END
```

Output of Program LMTEX1:

```
        NAME         PERSONNEL         CITY            CNT
                        ID
-------------------- --------- -------------------- -----------

BAKER                20016700  OAK BROOK                      1
BAKER                30008042  DERBY                          2
BALBIN               60000110  BARCELONA                      3
BALL                 30021845  DERBY                          4
```

Example 2 - LIMIT Statement (Valid for Two Database Loops)

```
** Example 'LMTEX2': LIMIT (valid for two database loops)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
END-DEFINE
*
LIMIT 3
*
FIND EMPLOY-VIEW WITH NAME > 'A'
  READ EMPLOY-VIEW BY NAME STARTING FROM 'BAKER'
    DISPLAY NOTITLE 'CNT(0100)' *COUNTER(0100)
                    'CNT(0110)' *COUNTER(0110)
  END-READ
END-FIND
*
END
```

Output of Program LMTEX2:

```
 CNT(0100)   CNT(0110)
----------- -----------

          1           1
          1           2
          1           3
          2           1
          2           2
          2           3
          3           1
          3           2
          3           3
```

80 LOOP

- Function 512
- Restriction 512
- Syntax Description 512
- Examples 513

```
[CLOSE] LOOP [(r)]
```

Function

The LOOP statement is used to close a processing loop. It causes processing of the current pass through the loop to be terminated and control to be returned to the beginning of the processing loop.

When the processing loop for which the LOOP statement is issued is terminated (that is, when all records have been processed or iterations have been performed), execution continues with the statement after the LOOP statement.

Database Variable References

A LOOP statement, in addition to closing a processing loop, will eliminate all field references to FIND, FIND FIRST, FIND UNIQUE, READ and GET statements contained within the loop.

A field within a view may be referenced outside the processing loop by using the view name as a qualifier.

Restriction

- This statement is for reporting mode only.
- A LOOP statement may not be specified based on a conditional statement such as IF or AT BREAK.

Syntax Description

Syntax Element	Description
LOOP (*r*)	**Statement Reference Notation:** The LOOP statement may be specified with a statement label or reference number (notation (*r*)), in which case all inner loops up to and including the loop initiated by the statement referenced will be closed. If no statement reference is specified, the innermost active processing loop will be closed.

Note: In reporting mode, any processing loop which is currently active, that is, which has not explicitly been closed with a LOOP statement, will be closed automatically by an END statement.

Examples

Example 1

```
FIND ...
  READ ...
    READ ...
LOOP (0010)    /* closes all loops
```

Example 2

```
FIND ...
  READ ...
    READ ...
    LOOP       /* closes loop initiated on line 0030
  LOOP         /* closes loop initiated on line 0020
LOOP           /* closes loop initiated on line 0010
```

81 METHOD

- Function 516
- Syntax Description 516
- Example 517

```
METHOD method-name
 OF [INTERFACE] interface-name
 IS subprogram-name
END-METHOD
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `CREATE OBJECT` | `DEFINE CLASS` | `INTERFACE` | `PROPERTY` | `SEND METHOD`

Belongs to Function Group: ***Component Based Programming***

Function

The `METHOD` statement assigns a subprogram as the implementation to a method, *outside* an interface definition. It is used if the interface definition in question is included from a copycode and is to be implemented in a class-specific way.

The `METHOD` statement may only be used within the `DEFINE CLASS` statement and after the interface definition. The interface and method names specified must be defined in the `INTERFACE` clause of the `DEFINE CLASS` statement.

Syntax Description

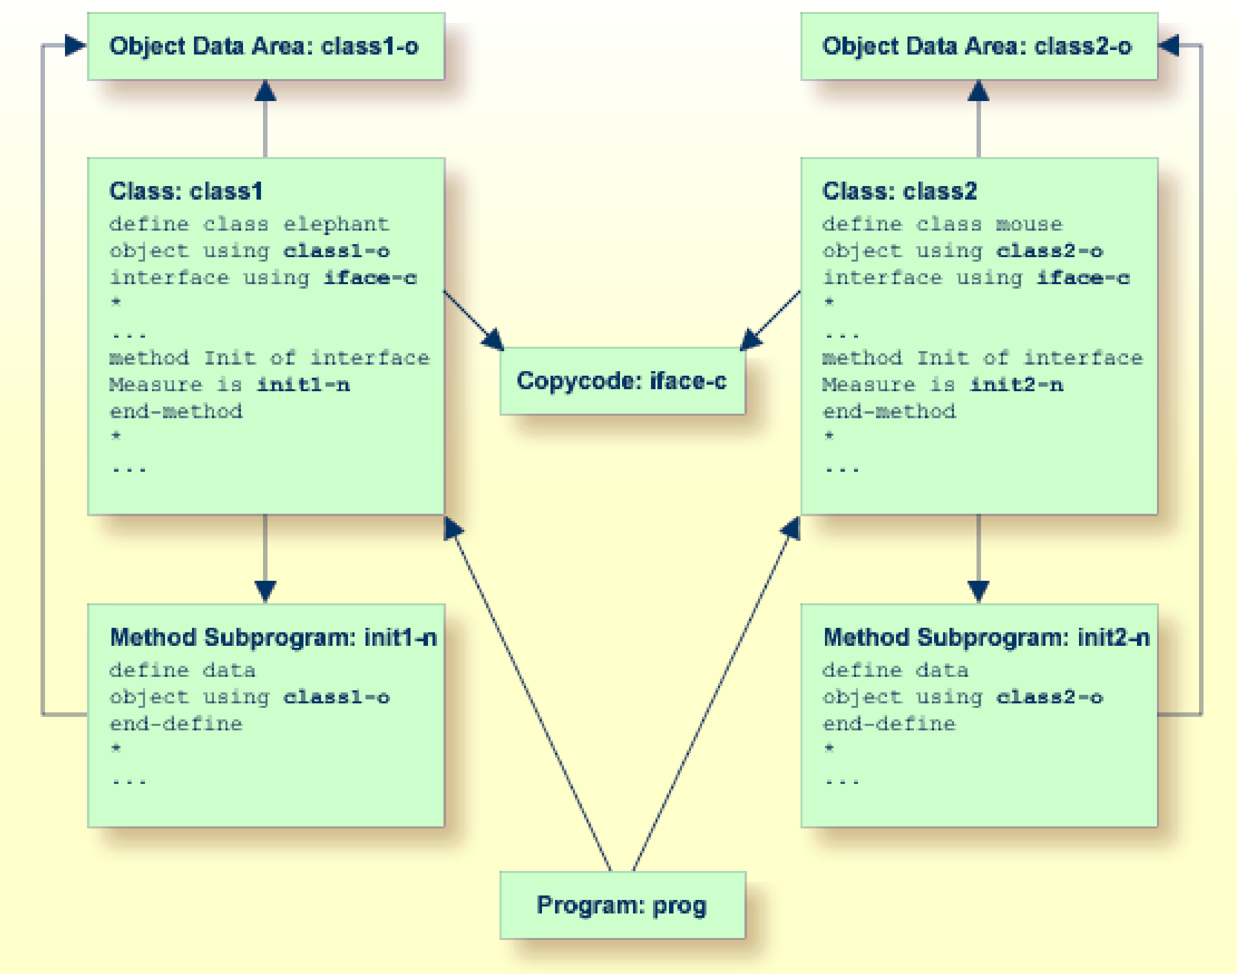
Syntax Element	Description
method-name	**Method Name:** This is the name assigned to the *method*.
OF *interface-name*	**Interface Name:** This is the name assigned to the *interface*.
IS *subprogram-name*	**IS Clause:** This clause can be used to specify the name of the subprogram that implements the method. The name of the subprogram consists of up to 8 characters. The default is *method-name* (if the IS clause is not specified).
END-METHOD	**End of Method Statement:** The Natural reserved word END-METHOD must be used to end the METHOD statement.

Example

The following example shows how the same interface is implemented differently in two classes and how the PROPERTY statement and the METHOD statement are used to achieve this.

The interface Measure is defined in the copycode iface-c. The classes Elephant and Mouse implement both the interface Measure. Therefore, they both include the copycode iface-c. But the classes implement the property Height using different variables from their respective object data areas, and they implement the method Init with different subprograms. They use the PROPERTY statement to assign the selected data area variable to the property and the METHOD statement to assign the selected subprogram to the method.

Now the program prog can create objects of both classes and initialize them using the same method Init, leaving the specifics of the initialization to the respective class implementation.



The following shows the complete contents of the Natural modules used in the example above:

Copycode: iface-c

```
interface Measure
*
property Height(p5.2)
end-property
*
property Weight(i4)
end-property
*
method Init
end-method
*
end-interface
```

Class: class1

```
define class elephant
object using class1-o
interface using iface-c
*
property Height of interface Measure is height
end-property
*
property Weight of interface Measure is weight
end-property
*
method Init of interface Measure is init1-n
end-method
*
end-class
end
```

LDA Object Data: class1-o

```
*   *** Top of Data Area ***
  1 HEIGHT                  P 5.2
  1 WEIGHT                  I 2
*   *** End of Data Area ***
```

Method Subprogram: init1-n

```
define data
object using class1-o
end-define
*
height := 17.3
weight := 120
*
end
```

Class: class2

```
define class mouse
object using class2-o
interface using iface-c
*
property Height of interface Measure is size
end-property
*
property Weight of interface Measure is weight
end-property
*
method Init of interface Measure is init2-n
end-method
*
end-class
end
```

LDA Object Data: class2-o

```
*   *** Top of Data Area ***
  1 SIZE                    P 3.2
  1 WEIGHT                  I 1
*   *** End of Data Area ***
```

Method Subprogram: init2-n

```
define data
object using class2-o
end-define
*
size := 1.24
weight := 2
*
end
```

Program: prog

```
define data local
1 #o handle of object
1 #height(p5.2)
1 #weight(i4)
end-define
*
create object #o of class 'Elephant'
send "Init" to #o
#height := #o.Height
#weight := #o.Weight
write #height #weight
*
```

```
create object #o of class 'Mouse'
send "Init" to #o
#height := #o.Height
#weight := #o.Weight
write #height #weight
*
end
```

82 MOVE

- Function 522
- Syntax 1 - MOVE ROUNDED 523
- Syntax 2 - MOVE SUBSTRING 525
- Syntax 3 - MOVE BY NAME / POSITION 527
- Syntax 4 - MOVE EDITED (Edit Mask Specified with operand2) 528
- Syntax 5 - MOVE EDITED (Edit Mask Specified with operand1) 529
- Syntax 6 - MOVE LEFT / RIGHT JUSTIFIED 530
- Syntax 7 - MOVE NORMALIZED 532
- Syntax 8 - MOVE ENCODED 533
- Examples 536

Related Statements: ADD | COMPRESS | COMPUTE | DIVIDE | EXAMINE | MOVE ALL | MULTIPLY | RESET | SEPARATE | SUBTRACT

Belongs to Function Group: ***Arithmetic and Data Movement Operations***

Function

The MOVE statement is used to move the value of an operand to one or more operands (field or array).

A MOVE statement with multiple target operands is identical to the corresponding individual MOVE statements:

```
MOVE #SOURCE TO #TARGET1 #TARGET2
```

is identical to

```
MOVE #SOURCE TO #TARGET1
MOVE #SOURCE TO #TARGET2
```

Example:

```
DEFINE DATA LOCAL
1 #ARRAY(I4/1:3) INIT <3,0,9>
1 #INDEX(I4)
1 #RESULT(I4)
END-DEFINE
*
#INDEX := 1
MOVE #ARRAY(#INDEX) TO #INDEX       /* #INDEX is 3
                       #RESULT      /* #RESULT is 9
*
#INDEX := 2
MOVE #ARRAY(#INDEX) TO  #INDEX     /* #INDEX is 0
                        #ARRAY(3)  /* returns run time error NAT1316
```

If *operand2* is a dynamic variable, its length may be modified by the MOVE operation. The current length of a dynamic variable can be ascertained by using the system variable *LENGTH. For general information on the dynamic variable, see the section *Using Dynamic and Large Variables* in the *Programming Guide*.

If `operand2` is of format C, `operand1` may also be specified as parameter. Valid parameters are:

Parameters that can be specified with the `MOVE` statement		Specification (S = at statement level, E = at element level)
`AD`	Attribute Definition	SE
`CD`	Color Definition	S

For more information on data transfer compatibility and the rules for data transfer, see the section *Data Transfer* in the *Programming Guide*.

Other Considerations

If a database field is used as the result field, the `MOVE` operation results in an update only to the internal value of the field as used within the program. The value of the field in the database remains unchanged.

A Natural system function may be used only if the `MOVE` statement is specified in conjunction with an `AT BREAK`, `AT END OF DATA` or `AT END OF PAGE` statement.

See also the section *Rules for Arithmetic Assignment* in the *Programming Guide*.

Note: If `operand1` is a time variable (Format T), only the time component of the variable content is transferred, but not the date component (except with `MOVE EDITED`, described under ***Syntax 4*** and ***Syntax 5***).

Syntax 1 - MOVE ROUNDED

```
MOVE [ROUNDED] operand1 [(parameter)] TO operand2 ...
```

For an explanation of the symbols used in the syntax diagrams below, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A		N	A	U	N	P	I	F	B	D	T	L	C	G	O	yes	no
operand2		S	A		M	A	U	N	P	I	F	B	D	T	L	C	G	O	yes	yes

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>MOVE ROUNDED</td><td>MOVE ROUNDED Option:

This option causes operand2 to be rounded.

ROUNDED is ignored if operand2 is not numeric.

If operand2 is of format N or P and operand2 is specified more than once, ROUNDED is ignored for target operands with seven positions after the decimal point.

See also Example 1 - Various Samples of MOVE Statement Usage.</td></tr>
<tr><td>parameter</td><td>Parameter:

As parameter, you can specify the option PM=I or the session parameter DF:
<table>
<tr><td>PM=I</td><td>Right-to-Left Display Option:

In order to support languages whose writing direction is from right to left, you can specify PM=I so as to transfer the value of operand1 in inverse (right-to-left) direction to operand2.

For example, as a result of the following statements, the content of #B would be ZYX:

MOVE 'XYZ' TO #A
MOVE #A (PM=I) TO #B

PM=I can only be specified if operand2 has alphanumeric format.

Any trailing blanks in operand1 will be removed , then the value is reversed and moved to operand2. If operand1 is not of alphanumeric format, the value will be converted to alphanumeric format before it is reversed.

See also the use of PM=I in conjunction with MOVE LEFT/RIGHT JUSTIFIED.</td></tr>
<tr><td>DF</td><td>Date Format:

If operand1 is a date variable and operand2 is an alphanumeric field, you can specify the session parameter DF as parameter for this date variable.</td></tr>
</table></td></tr>
</table>

Syntax 2 - MOVE SUBSTRING

```
       { operand1                                 }  [(parameter)] { operand2                                  }
MOVE   { SUBSTRING                                }  TO            { SUBSTRING                                 } ...
       { (operand1,operand3,operand4)             }                { (operand2,operand5,operand6)              }
```

For an explanation of the symbols used in the syntax diagrams below, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A			A	U					B							yes	no
operand2		S	A			A	U					B							yes	no
operand3	C	S						N	P	I		B*							yes	no
operand4	C	S						N	P	I		B*							yes	no
operand5	C	S						N	P	I		B*							yes	no
operand6	C	S						N	P	I		B*							yes	no

* See text.

Syntax Element Description:

Syntax Element	Description
MOVE SUBSTRING	**MOVE SUBSTRING Option:** Without the SUBSTRING option, the whole content of a field is moved. The SUBSTRING option allows you to move only a certain part of an alphanumeric, Unicode or a binary field. After the field name (*operand1*) in the SUBSTRING clause you specify first the starting position (*operand3*) and then the length (*operand4*) of the field portion to be moved. If the underlying field format of *operand1* is ■ alphanumeric (A) or binary (B), then the values supplied with *operand3* or *operand4* are considered as byte numbers; ■ Unicode (U), then the values supplied with *operand3* or *operand4* are considered as number of Unicode code units; that is, as double-bytes.

Syntax Element	Description

	For example, to move the 5th to 12th position inclusive of the value in a field `#A` into a field `#B`, you would specify:
	`MOVE SUBSTRING(#A,5,8) TO #B`
	If *operand1* is a dynamic variable, the specified field portion to be moved must be within its current length; otherwise, a runtime error will occur.
	Also, you can move a value of an alphanumeric, Unicode or binary field into a certain part of the target field. After the field name (*operand2*) in the `SUBSTRING` clause you specify first the starting position (*operand5*) and then the length (*operand6*) of the field portion into which the value is to be moved.
	If the underlying field format of *operand2* is
	■ alphanumeric (A) or binary (B), then the values supplied with *operand5* or *operand6* are considered as byte numbers;
	■ Unicode (U), then the values supplied with *operand3* or *operand4* are considered as number of Unicode code units; that is, as double-bytes.
	For example, to move the value of a field `#A` into the 3rd to 6th position inclusive of a field `#B`, you would specify:
	`MOVE #A TO SUBSTRING(#B,3,4)`
	If *operand2* is a dynamic variable, the specified starting position (*operand5*) must not be greater than the variable's current length plus 1; a greater starting position will lead to a runtime error, because it would cause an undefined gap within the content of *operand2*.
	If *operand3*/*operand5* or *operand4*/*operand6*is a binary variable, it may be used only with a length of less than or equal to 4.
	If you omit *operand3*/*operand5*, the starting position is assumed to be `1`. If you omit *operand4*/*operand6*, the length is assumed to range from the starting position to the end of the field.
	If *operand2* is a dynamic variable and the specified starting position (*operand5*) is the variable's current length plus 1, which means that the `MOVE` operation is used to increase the length of the variable, *operand6* must be specified in order to determine the new length of the variable.
	Note: `MOVE` with the `SUBSTRING` option is a byte-by-byte move (that is, the rules described under *Rules for Arithmetic Assignment* in the *Programming Guide* do not apply).

Syntax 3 - MOVE BY NAME / POSITION

```
MOVE   BY  { [NAME]    }  operand1 TO operand2
           { POSITION  }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1				G														yes	no
operand2				G														yes	no

Syntax Element Description:

Syntax Element	Description
`MOVE BY NAME` *operand1* `TO` *operand2*	**MOVE BY NAME Option:** This option is used to move individual fields contained in a data structure to another data structure, independent of their position in the structure. A field is moved only if its name appears in both structures (this includes `REDEFINE`d fields as well as fields resulting from a redefinition). The individual fields may be of any format. The operands can also be views. **Note:** The sequence of the individual moves is determined by the sequence of the fields in *operand1*. See also ***Example 2 - MOVE BY NAME Statement***. **MOVE BY NAME with Arrays:** If the data structures contain arrays, these will internally be assigned the index `(*)` when moved; this may lead to an error if the arrays do not comply with the rules for assignment operations with arrays; see the section *Processing of Arrays* in the *Programming Guide*. See also ***Example 3 - MOVE BY NAME with Arrays***.
`MOVE BY POSITION` *operand1* `TO` *operand2*	**MOVE BY POSITION Option:** This option allows you to move the contents of fields in a group to another group, regardless of the field names. The values are moved field by field from one group to the other in the order in which the fields are defined (this does not include fields resulting from a redefinition).

Syntax Element	Description
	The individual fields may be of any format. The number of fields in each group must be the same; also, the level structure and array dimensions of the fields must match. Format conversion is done according to the rules for arithmetic assignment; see the section *Rules for Arithmetic Assignments* in the *Programming Guide*. The operands can also be views. See also ***Example 4 - MOVE BY POSITION***.

Syntax 4 - MOVE EDITED (Edit Mask Specified with operand2)

```
MOVE EDITED operand1 TO operand2  { (EM=value)  }
                                  { (EMU=value) }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A			A	U					B							yes	no
operand2		S	A			A	U	N	P	I	F	B	D	T	L				yes	yes

Syntax Element Description:

Syntax Element	Description
MOVE EDITED	**MOVE EDITED Option:** If an edit mask is specified for *operand2*, the value of *operand1* will be placed into *operand2* using this edit mask. The edit mask can be considered as an *input* edit mask for *operand2*, that is used to specify at which positions in the alphanumeric contents of *operand1* the significant input data for *operand2* can be found. If the edit mask refers more characters or digits than existent in *operand2*, it is truncated accordingly. The length of *operand1* may not be smaller than the length of the input value represented by the edit mask. If *operand1* is longer than the edit mask length, all the overhanging data is ignored.

Syntax Element	Description

	Under the pre-condition not to have an *operand1* length larger than the edit mask length, you may regard a
	
	`MOVE EDITED operand1 TO operand2 (EM=value)`
	
	operation like the execution of
	
	`STACK TOP DATA operand1`
	`INPUT operand2 (EM=value)`
	
	See also ***Example 1 - Various Samples of MOVE Statement Usage***.

EM	**Edit Mask:** For details on edit masks, see the session parameter EM in the *Parameter Reference*.
EMU	**Unicode Edit Mask:** For details on Unicode edit masks, see the session parameter EMU in the *Parameter Reference*.

Syntax 5 - MOVE EDITED (Edit Mask Specified with operand1)

```
MOVE EDITED operand1 { (EM=value)  } TO operand2
                     { (EMU=value) }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A		N	A	U	N	P	I	F	B	D	T	L				yes	no
operand2		S	A			A	U					B							yes	yes

Syntax Element Description:

Syntax Element	Description
MOVE EDITED	**MOVE EDITED Option:** If an edit mask is specified for *operand1*, the edit mask will be applied to *operand1* and the result will be moved to *operand2*. The edit mask can be considered as an *output* edit mask for *operand1*, that is used to create an alphanumeric string with the layout and length described by the edit mask. Besides data

Syntax Element	Description

	characters or digits originating from *operand1*, you may include additional decoration characters into the output string.
	
	If the edit mask refers more characters or digits than existent in *operand1*, it is truncated accordingly. The length of the created output string (resulting from *operand1* value after the edit mask has been applied) must not exceed the length of *operand2*.
	
	Under the pre-condition not to have an *operand2* length smaller than the edit mask length, you may regard a
	
	`MOVE EDITED operand1 (EM=value) TO operand2`
	
	operation like a
	
	`WRITE operand1 (EM=value)`
	
	that does not write the output to the screen, but fills it into variable *operand2*.
	
	See also ***Example 1 - Various Samples of MOVE Statement Usage***.

EM	**Edit Mask:** For details on edit masks, see the session parameter EM in the *Parameter Reference*.
EMU	**Unicode Edit Mask:** For details on Unicode edit masks, see the session parameter EMU in the *Parameter Reference*.

Syntax 6 - MOVE LEFT / RIGHT JUSTIFIED

Operand Definition Table:

Operand	Possible Structure			Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C	S	A	N A U N P I F B D T L	yes	no
operand2		S	A	A U	yes	yes

Syntax Element Description:

Syntax Element	Description
`MOVE LEFT / RIGHT JUSTIFIED`	**MOVE LEFT / RIGHT JUSTIFIED Options:** This option is used to cause the values to be moved to be left- or right-justified in *operand2*. `MOVE LEFT/RIGHT JUSTIFIED` cannot be used if *operand2* is a dynamic variable.
`MOVE LEFT JUSTIFIED`	**MOVE LEFT Option:** With `MOVE LEFT JUSTIFIED`, any leading blanks in *operand1* are removed before the value is placed left-justified into *operand2*. The remainder of *operand2* will then be filled with blanks. If the value is longer than *operand2*, the value will be truncated on the right-hand side.
`MOVE RIGHT JUSTIFIED`	**RIGHT JUSTIFIED Option:** With `MOVE RIGHT JUSTIFIED`, any trailing blanks in *operand1* are truncated before the value is placed right-justified into *operand2*. The remainder of *operand2* will then be filled with blanks. If the value is longer than *operand2*, the value will be truncated on the left-hand side. See also ***Example 1 - Various Samples of MOVE Statement Usage***.
parameter	**Parameter:** When you use `MOVE LEFT/RIGHT JUSTIFIED` in conjunction with `PM=I`, the move is performed in the following steps: 1. If *operand1* is not of alphanumeric format, the value is converted to alphanumeric format. 2. Any trailing blanks in *operand1* are removed. 3. In the case of `LEFT JUSTIFIED`, any leading blanks in *operand1* are also removed. 4. The value is reversed, and then moved to *operand2*. 5. If applicable, the remainder of *operand2* is filled with blanks, or the value is truncated (see above).

Syntax 7 - MOVE NORMALIZED

The `MOVE NORMALIZED` statement converts a Unicode string into the “Unicode Normalization Form C” (NFC). The resulting Unicode string does no longer contain combining sequences for characters which are available as pre-composed characters.

If the format of the target operand is not Unicode itself, an implicit conversion from Unicode into the target operand takes place - during this conversion the default code page (see system variable `*CODEPAGE`) will be used.

For further information on the `MOVE NORMALIZED` statement, see the section *Statements* in the *Unicode and Code Page Support* documentation.

Syntax Diagram:

```
MOVE NORMALIZED operand1 TO operand2
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A				U												yes	no
operand2		S	A			A	U												yes	yes

Syntax Element Description:

Syntax Element	Description
`MOVE NORMALIZED`	**MOVE NORMALIZED Option:** This option is used to convert Unicode fields with potentially unnormalized content into the “Unicode Normalization Form C” (NFC). This composite form of a Unicode string does not contain combining sequences for characters which are available as pre-composed characters. See also: ***http://www.unicode.org/reports/tr15/#Canonical_Composition_Examples*** (“Normalization Forms D and C Examples”).

Syntax Element	Description
	Example: `MOVE NORMALIZED #SCR TO #TGT`
operand1	**Source Operand:** *operand1* contains the Unicode string to be converted.
operand2	**Target Operand:** *operand2* receives the converted Unicode string.

Example:

Some code points have different representations in Unicode. For example, the German letter `'Ä'`: the decomposed representation in Unicode is `U+0041` followed by `U+0308` and uses a combining character (`U+0308`); another representation is the pre-composed character `U+00C4`. The `MOVE NORMALIZED` statement converts the Unicode representation with combining characters into a normalized Unicode representation using pre-composed characters, where possible.

Syntax 8 - MOVE ENCODED

This section explains the syntax of the `MOVE ENCODED` statement. For information on the purpose of this statement, see the section *Statements* in the *Unicode and Code Page Support* documentation.

Syntax Diagram:

```
MOVE ENCODED
  operand1 [[IN] CODEPAGE operand2] TO
  operand3 [[IN] CODEPAGE operand4]
  [GIVING operand5]
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A			A	U	B											yes	no
operand2		S				A	U												yes	no
operand3		S				A	U	B											yes	yes
operand4		S	A			A	U												yes	no
operand5		S							I4										yes	yes

Syntax Element Description:

Syntax Element	Description
MOVE ENCODED	**MOVE ENCODED Option:** This option converts a character string, encoded in one code page, into the equivalent character string of another code page. **Note:** Natural uses the International Components for Unicode (ICU) library for Unicode conversion. For more information, see *http://icu.sourceforge.net/userguide/*.
operand1	**Source Operand:** *operand1* contains the string to be converted.
CODEPAGE *operand2*	**Code Page of Source Operand:** As *operand2*, you specify the code page of *operand1*. Can only be supplied if *operand1* is of format A or B. See Note 1.
TO *operand3*	**Target Operand:** *operand3* receives the converted string. If the conversion result does not fit into the target field, the result is padded or truncated, respectively, and as padding character the blank of the resulting code page is used. If the target field is defined as a dynamic variable, no padding or truncation is needed, since the length of the dynamic variable is automatically adjusted to the length of the conversion result.
CODEPAGE *operand4*	**Code Page of Target Operand:** As *operand4*, you specify the code page of *operand3*. Can only be supplied if *operand3* is of format A or B. See Note 1.
GIVING *operand5*	**GIVING Clause:** If you omit this clause, a Natural error message is returned if an error occurs. If you specify the keyword GIVING, *operand5* returns 0 or the Natural error code instead of the Natural error message. If the target gets truncated, no Natural error message is given, but when the keyword GIVING is used, *operand5* will contain an appropriate error code to indicate truncation.

Notes:

1. If a code page operand is not supplied, then the default code page (value of the system variable *CODEPAGE) is used.

2. If the session parameter `CPCVERR` in the statement `SET GLOBALS` or in the system command `GLOBALS` is set to `ON`, an error is output if at least one character of the source field could not be converted properly into the destination code page, but was replaced in the target field by a substitution character.

Examples of MOVE ENCODED:

```
MOVE ENCODED A-FIELD1 TO A-FIELD2
```

Invalid: This results in a syntax error, since the code page names are taken by default and are the same for *operand1* and *operand3*.

```
MOVE ENCODED A-FIELD1 CODEPAGE 'IBM01140' TO A-FIELD2 CODEPAGE 'IBM01140'
```

Invalid: This results in an error, since the coded code page names are the same for *operand1* and *operand3*.

```
MOVE ENCODED A-FIELD1 CODEPAGE 'IBM01140' TO A-FIELD2 CODEPAGE 'IBM037'
```

Valid: The string in `A-FIELD1` which is coded in IBM01140 is converted into `A-FIELD2` which is coded in IBM037.

```
MOVE ENCODED U-FIELD TO U-FIELD
```

Invalid: This results in an error, since at least one operand must be of format A or B.

```
MOVE ENCODED U-FIELD TO A-FIELD
```

Valid: The Unicode string in `U-FIELD` which, considered to be encoded in UTF-16, is converted into the alphanumeric `A-FIELD` in the default code page (`*CODEPAGE`).

```
MOVE ENCODED A-FIELD TO U-FIELD
```

Valid: The string in `A-FIELD` which, considered to be encoded in the default code page (`*CODEPAGE`), is converted into the Unicode field `U-FIELD`.

```
MOVE ENCODED A100-FIELD CODEPAGE 'IBM1140' TO A50-FIELD CODEPAGE 'IBM037'
```

Valid: Conversion is done from `A100-FIELD` (format/length: A100) to `A50-FIELD` (format/length: A50), using the relevant code pages. The target is truncated. No Natural error message is returned.

```
MOVE ENCODED A100-FIELD CODEPAGE 'IBM1140' TO A50-FIELD CODEPAGE 'IBM037' GIVING
RC-FIELD
```

Valid: Conversion is done from `A100-FIELD` (format/length: A100) to `A50-FIELD` (format/length: A50), using the relevant code pages. The target is truncated. Since a `GIVING` clause is supplied, the `RC-FIELD` receives an error code, indicating that a value truncation has taken place.

Examples

- Example 1 - Various Samples of MOVE Statement Usage
- Example 2 - MOVE BY NAME
- Example 3 - MOVE BY NAME with Arrays
- Example 4- MOVE BY POSITION

Example 1 - Various Samples of MOVE Statement Usage

```
** Example 'MOVEX1': MOVE
************************************************************************
DEFINE DATA LOCAL
1 #A (N3)
1 #B (A5)
1 #C (A2)
1 #D (A7)
1 #E (N1.0)
1 #F (A5)
1 #G (N3.2)
1 #H (A6)
END-DEFINE
*
MOVE 5 TO #A
WRITE NOTITLE 'MOVE 5 TO #A'      30X '=' #A
*
MOVE 'ABCDE' TO #B #C #D
WRITE 'MOVE ABCDE TO #B #C #D'    20X '=' #B '=' #C '=' #D
*
MOVE -1  TO #E
WRITE 'MOVE -1  TO #E'            28X '=' #E
*
MOVE ROUNDED 1.995 TO #E
WRITE 'MOVE ROUNDED 1.995 TO #E'  18X '=' #E
*
*
MOVE RIGHT JUSTIFIED 'ABC' TO #F
WRITE 'MOVE RIGHT JUSTIFIED ''ABC'' TO #F'      10X '=' #F
```

```
*
MOVE EDITED '003.45' TO #G (EM=999.99)
WRITE 'MOVE EDITED ''003.45'' TO #G (EM=999.99)'  4X '=' #G
*
MOVE EDITED 123.45 (EM=999.99) TO #H
WRITE 'MOVE EDITED 123.45 (EM=999.99) TO #H'      6X '=' #H
*
END
```

Output of Program MOVEX1:

```
MOVE 5 TO #A                                 #A:    5
MOVE ABCDE TO #B #C #D                       #B: ABCDE #C: AB #D: ABCDE
MOVE -1  TO #E                               #E: -1
MOVE ROUNDED 1.995 TO #E                     #E:  2
MOVE RIGHT JUSTIFIED 'ABC' TO #F             #F:   ABC
MOVE EDITED '003.45' TO #G (EM=999.99)       #G:    3.45
MOVE EDITED 123.45 (EM=999.99) TO #H         #H: 123.45
```

Example 2 - MOVE BY NAME

```
** Example 'MOVEX2': MOVE BY NAME
************************************************************************
DEFINE DATA LOCAL
1 #SBLOCK
  2 #FIELDA (A10) INIT <'AAAAAAAAAA'>
  2 #FIELDB (A10) INIT <'BBBBBBBBBB'>
  2 #FIELDC (A10) INIT <'CCCCCCCCCC'>
  2 #FIELDD (A10) INIT <'DDDDDDDDDD'>
1 #TBLOCK
  2 #FIELD1 (A15) INIT <' '>
  2 #FIELDA (A10) INIT <' '>
  2 #FIELD2 (A10) INIT <' '>
  2 #FIELDB (A10) INIT <' '>
  2 #FIELD3 (A20) INIT <' '>
  2 #FIELDC (A10) INIT <' '>
END-DEFINE
*
MOVE BY NAME #SBLOCK TO #TBLOCK
*
WRITE NOTITLE 'CONTENTS OF #TBLOCK AFTER MOVE BY NAME:'
       // '=' #TBLOCK.#FIELD1
        / '=' #TBLOCK.#FIELDA
        / '=' #TBLOCK.#FIELD2
        / '=' #TBLOCK.#FIELDB
        / '=' #TBLOCK.#FIELD3
        / '=' #TBLOCK.#FIELDC
*
END
```

Contents of #TBLOCK after MOVE BY NAME Processing:

```
CONTENTS OF #TBLOCK AFTER MOVE BY NAME:

#FIELD1:
#FIELDA: AAAAAAAAAA
#FIELD2:
#FIELDB: BBBBBBBBBB
#FIELD3:
#FIELDC: CCCCCCCCCC
```

Example 3 - MOVE BY NAME with Arrays

```
DEFINE DATA LOCAL
  1 #GROUP1
    2 #FIELD (A10/1:10)
  1 #GROUP2
    2 #FIELD (A10/1:10)
END-DEFINE
...
MOVE BY NAME #GROUP1 TO #GROUP2
...
```

In this example, the `MOVE` statement would internally be resolved as:

```
MOVE #GROUP1.#FIELD (*) TO #GROUP2.#FIELD (*)
```

If part of an indexed group is moved to another part of the same group, this may lead to unexpected results as shown in the example below.

```
DEFINE DATA LOCAL
  1 #GROUP1 (1:5)
    2 #FIELDA (N1) INIT <1,2,3,4,5>
    2 REDEFINE #FIELDA
      3 #FIELDB (N1)
END-DEFINE
...
MOVE BY NAME #GROUP1 (2:4) TO #GROUP1 (1:3)
...
```

In this example, the MOVE statement would internally be resolved as:

```
MOVE #FIELDA (2:4) TO #FIELDA (1:3)MOVE #FIELDB (2:4) TO #FIELDB (1:3)
```

First, the contents of the occurrences 2 to 4 of #FIELDA are moved to the occurrences 1 to 3 of #FIELDA; that is, the occurrences receive the following values:

Occurrence:	1.	2.	3.	4.	5.
Value before:	1	**2**	**3**	**4**	5
Value after:	**2**	**3**	**4**	4	5

Then the contents of the occurrences 2 to 4 of #FIELDB are moved to the occurrences 1 to 3 of #FIELDB; that is, the occurrences receive the following values:

Occurrence:	1.	2.	3.	4.	5.
Value before:	2	**3**	**4**	**4**	5
Value after:	**3**	**4**	**4**	4	5

Example 4- MOVE BY POSITION

```
DEFINE DATA LOCAL
  1 #GROUP1
    2 #FIELD1A (N5)
    2 #FIELD1B (A3/1:3)
    2 REDEFINE #FIELD1B
      3 #FIELD1BR (A9)
  1 #GROUP2
    2 #FIELD2A (N5)
    2 #FIELD2B (A3/1:3)
    2 REDEFINE #FIELD2B
      3 #FIELD2BR (A9)
END-DEFINE
...
MOVE BY POSITION #GROUP1 TO #GROUP2
...
```

In this example, the content of #FIELD1A is moved to #FIELD2A, and the content of #FIELD1B to #FIELD2B; the fields #FIELD1BR and #FIELD2BR are not affected.

83 MOVE ALL

- Function 542
- Syntax Description 542
- Example 543

```
MOVE ALL operand1 TO operand2 [UNTIL operand3]
```

Related Statements: ADD | COMPRESS | COMPUTE | DIVIDE | EXAMINE | MOVE | MULTIPLY | RESET | SEPARATE | SUBTRACT

Belongs to Function Group: *Arithmetic and Data Movement Operations*

Function

The MOVE ALL statement is used to move repeatedly the value of *operand1* to *operand2* until *operand3* is full.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A	U	N				B							yes	no
operand2		S	A			A	U					B							yes	yes
operand3	C	S						N	P	I									yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Source Operand:** The source operand contains the value to be moved. All digits of a numeric operand including leading zeros are moved
TO *operand2*	**Target Operand:** The target operand is not reset before the execution of the MOVE ALL operation. This is of particular importance when using the UNTIL option since data previously in *operand2* is retained if not explicitly overlaid during the MOVE ALL operation.
UNTIL *operand3*	**UNTIL Option:** The UNTIL option can be used to limit the MOVE ALL operation to a given number of positions in *operand2*. *operand3* is used to specify the number of positions. The MOVE ALL operation is terminated when this value is reached.

Syntax Element	Description
	If *operand3* is greater than the length of *operand2*, the MOVE ALL operation is terminated when *operand2* is full. The UNTIL option may also be used to assign an initial value to a dynamic variable: if *operand2* is a dynamic variable, its length after the MOVE ALL operation will correspond to the value of *operand3*. The current length of a dynamic variable can be ascertained by using the system variable *LENGTH. For general information on dynamic variables, see *Usage of Dynamic Variables*.

Example

```
** Example 'MOAEX1': MOVE ALL
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 FIRST-NAME
  2 NAME
  2 CITY
1 VEH-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
  2 MAKE
END-DEFINE
*
LIMIT 4
RD. READ EMPLOY-VIEW BY NAME
  SUSPEND IDENTICAL SUPPRESS
  /*
  FD. FIND VEH-VIEW WITH PERSONNEL-ID = PERSONNEL-ID (RD.)
    IF NO RECORDS FOUND
      MOVE ALL '*' TO FIRST-NAME (RD.)
      MOVE ALL '*' TO CITY (RD.)
      MOVE ALL '*' TO MAKE (FD.)
    END-NOREC
    /*
    DISPLAY NOTITLE (ES=OFF IS=ON ZP=ON AL=15)
            NAME (RD.) FIRST-NAME (RD.)
            CITY (RD.)
            MAKE (FD.) (IS=OFF)
    /*
  END-FIND
END-READ
END
```

Output of Program MOAEX1:

```
     NAME          FIRST-NAME         CITY            MAKE
--------------- --------------- --------------- ---------------

ABELLAN         *************** *************** ***************
ACHIESON        ROBERT          DERBY           FORD
ADAM            *************** *************** ***************
ADKINSON        JEFF            BROOKLYN        GENERAL MOTORS
```

84 MOVE INDEXED

The `MOVE INDEXED` statement is supported for compatibility reasons only.

Caution: In contrast to a `MOVE` statement with array operands, checks for out-of-bound index values are not possible when a `MOVE INDEXED` statement is executed. As a consequence, when executing an incorrect `MOVE INDEXED` statement, you may unintentionally destroy user data.

Therefore, Software AG strongly recommends that you replace `MOVE INDEXED` statements by `MOVE` statements.

See the statement `MOVE`.

85 MULTIPLY

- Function 548
- Syntax 1 - MULTIPLY Statement without GIVING Clause 548
- Syntax 2 - MULTIPLY Statement with GIVING Clause 549
- Example 550

Related Statements: ADD | COMPRESS | COMPUTE | DIVIDE | EXAMINE | MOVE | MOVE ALL | RESET | SEPARATE | SUBTRACT

Belongs to Function Group: ***Arithmetic and Data Movement Operations***

Function

The MULTIPLY statement is used to multiply two operands. Depending on the syntax used, the result of the multiplication may be stored in *operand1* or *operand3*.

If a database field is used as the result field, the multiplication results in an update only to the internal value of the field as used within the program. The value for the field in the database remains unchanged.

For multiplications involving arrays, see also *Rules for Arithmetic Assignments*, *Arithmetic Operations with Arrays* (in the *Programming Guide*).

Two different structures are possible for this statement.

Syntax 1 - MULTIPLY Statement without GIVING Clause

When Syntax 1 used, the result of the multiplication can be stored in *operand1*.

```
MULTIPLY [ROUNDED] operand1 BY operand2
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1		S	A		M		N	P	I	F								yes	no
operand2	C	S	A		N		N	P	I	F								yes	no

Syntax Element Description:

Syntax Element	Description
operand1 BY *operand2*	**Operands:** *operand1* is the multiplicand, *operand2* is the multiplier. As the `GIVING` clause is *not* used, the result is stored in *operand1*, hence the statement is equivalent to: `<oper1> := <oper1> * <oper2>` **Note:** If *operand1* is a numeric constant, the `GIVING` clause is required; see ***Syntax 2 - MULTIPLY with GIVING Clause***
ROUNDED	**ROUNDED Option:** If you specify the keyword `ROUNDED`, the value will be rounded before it is assigned to *operand1* or *operand3*. For information on rounding, see *Rules for Arithmetic Assignment, Field Truncation and Field Rounding* in the *Programming Guide*.

Syntax 2 - MULTIPLY Statement with GIVING Clause

When Syntax 2 used, the result of the multiplication can be stored in *operand3*.

```
MULTIPLY [ROUNDED] operand1 BY operand2 GIVING operand3
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A		M			N	P	I	F								yes	no
operand2	C	S	A		N			N	P	I	F								yes	no
operand3		S	A		M	A	U	N	P	I	F	B*		T					yes	yes

* Format B of *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
operand1 BY *operand2* GIVING *operand3*	**Operands:** *operand1* is the multiplicand, *operand2* is the multiplier. As the GIVING clause is used, *operand1* will not be modified and the result will be stored in *operand3*, hence the statement is equivalent to: `<oper3> := <oper1> * <oper2>` If *operand1* is a numeric constant, the GIVING clause is required.
ROUNDED	**ROUNDED Option:** If you specify the keyword ROUNDED, the value will be rounded before it is assigned to *operand1* or *operand3*. For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.

Example

```
** Example 'MULEX1': MULTIPLY

```

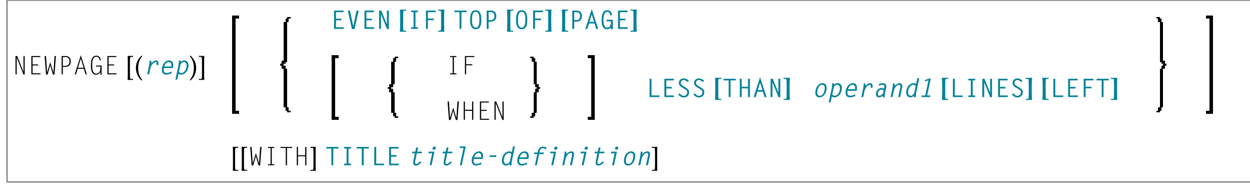
86 NEWPAGE

- Function 554
- Syntax Description 554
- Example 555



For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: *Creation of Output Reports*

Function

The NEWPAGE statement is used to cause an advance to a new page. NEWPAGE also causes any AT END OF PAGE and WRITE TRAILER statements to be executed. A default title containing the date, time of day, and page number will appear on each new page unless a WRITE TITLE, WRITE NOTITLE, or DISPLAY NOTITLE statement is specified to define specific title processing.

Notes:

1. The advance to a new page is not performed at the time when the NEWPAGE statement is executed. It is performed only when a subsequent statement which produces output is executed.
2. If the NEWPAGE statement is not used, page advance is controlled automatically based on the Natural profile/session parameter PS (Page Size for Natural Reports).

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				N	P	I											yes	no

Syntax Element Description:

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the NEWPAGE statement is applicable. A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified. If (*rep*) is not specified, the NEWPAGE statement will be applicable to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* (in the *Programming Guide*).
EVEN IF TOP OF PAGE	**EVEN IF TOP OF PAGE Option:** This option is used to cause a new page (with corresponding AT TOP OF PAGE and page title processing) to be generated, even if a new page was initiated immediately before the NEWPAGE statement was encountered.
WHEN LESS THAN *operand1* LINES LEFT	**WHEN LESS THAN ... LINES LEFT Option:** This option is used to cause a new page to be generated when there are less than *operand1* lines left on the current page (current line count compared with value for the Natural profile/session parameter PS).
WITH TITLE *title-definition*	**WITH TITLE Option:** This option can be used to specify a title which is to be written to the new page generated. The *title-definition* is specified using the same syntax as described for the WRITE TITLE statement, except that the SKIP clause is not allowed in a NEWPAGE WITH TITLE *title-definition* statement.

Example

```
** Example 'NWPEX1': NEWPAGE
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 NAME
  2 SALARY    (1)
  2 CURR-CODE (1)
END-DEFINE
*
```

```
LIMIT 15
READ EMPLOY-VIEW BY CITY FROM 'DENVER'
  DISPLAY CITY (IS=ON) NAME SALARY (1) CURR-CODE (1)
  AT BREAK OF CITY
    SKIP 1
    /*
    NEWPAGE WHEN LESS THAN 10 LINES LEFT
    WRITE '****************************************'
      /   'SUMMARY FOR ' OLD(CITY)
      /   '****************************************'
      /   '****************************************'
      /   'SUM OF SALARIES:' SUM(SALARY(1))
      /   'AVG OF SALARIES:' AVER(SALARY(1))
      /   '****************************************'
    NEWPAGE
    /*
  END-BREAK
END-READ
END
```

Output of Program NWPEX1 - Page 1:

```
Page      1                                               05-01-18  10:01:45

        CITY                 NAME           ANNUAL   CURRENCY

87 OBTAIN

- Function 560
- Restriction 560
- Syntax Description 561
- Examples 565

```
OBTAIN  operand1 ...
```

Function

The `OBTAIN` statement is used in reporting mode to cause one or more fields to be read from a file. The `OBTAIN` statement does not generate any executable code in the Natural object program. It is primarily used to read a range of values of a multiple-value field or a range of occurrences of a periodic group so that portions of these ranges may be subsequently referenced in the program.

An `OBTAIN` statement is *not* required for each database field to be referenced in the program since Natural automatically reads each database field referenced in a subsequent statement (for example, a `DISPLAY` or `COMPUTE` statement).

When multiple-value or periodic-group fields in the form of an array are referenced, the array must be defined with an `OBTAIN` statement to ensure that it is built for all occurrences of the fields. If individual multiple-value or periodic-group fields are referenced before the array is defined, the fields will not be placed within the array and will exist independent of the array. The fields will contain the same value as the corresponding occurrence within the array.

Individual occurrences of multiple-value or periodic-group fields or subarrays can be held within a previously defined array if the array dimensions of the second individual occurrence or array are contained within the initial array.

References to multiple-value or periodic-group fields with unique variable index cannot be contained in an array of values. If indvidual occurrences of an array are to be processed with a variable index, the index expression must be prefixed with the unique variable index to denote the individual array.

Restriction

The `OBTAIN` statement is for reporting mode only.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G		A	U	N	P	I	F	B	D	T	L				yes	yes

Syntax Element Description:

Syntax Element	Description
operand1	**Fields to be Read:** With *operand1* you specify the field(s) to be made available as a result of the OBTAIN statement.

Examples:

```
READ FINANCE OBTAIN CREDIT-CARD (1-10)
DISPLAY CREDIT-CARD (3-5) CREDIT-CARD (6-8)
SKIP 1 END
```

The above example results in the first 10 occurrences of the field CREDIT-CARD (which is contained in a periodic group) being read and occurrences 3-5 and 6-8 being displayed where the subsequent subarrays will reside in the initial array (1-10).

```
READ FINANCE
MOVE 'ONE' TO CREDIT-CARD (1)
DISPLAY CREDIT-CARD (1) CREDIT-CARD (1-5)
```

Output:

```
    CREDIT-CARD       CREDIT-CARD
------------------ ----------------

ONE                 DINERS CLUB
                    AMERICAN EXPRESS

ONE                 AVIS
                    AMERICAN EXPRESS
```

```

ONE                HERTZ
                   AMERICAN EXPRESS

ONE                UNITED AIR TRAVEL
```

The first reference to `CREDIT-CARD (1)` is not contained within the array. The array which is defined after the reference to the unique occurrence (1) cannot retroactively include a unique occurrence or an array which is shorter than the one being defined.

```
READ FINANCE
OBTAIN CREDIT-CARD (1-5)
MOVE 'ONE' TO CREDIT-CARD (1)
DISPLAY CREDIT-CARD (1) CREDIT-CARD (1-5)
```

Output:

```
    CREDIT-CARD      CREDIT-CARD
------------------ ----------------

ONE                ONE
                   AMERICAN EXPRESS

ONE                ONE
                   AMERICAN EXPRESS

ONE                ONE
                   AMERICAN EXPRESS

ONE                ONE
```

The individual reference to `CREDIT-CARD (1)` is contained within the array defined in the `OBTAIN` statement.

```
MOVE (1) TO INDEX
READ FINANCE
DISPLAY CREDIT-CARD (1-5) CREDIT-CARD (INDEX)
```

Output:

```
    CREDIT-CARD      CREDIT-CARD
------------------- ----------------

DINERS CLUB         DINERS CLUB
AMERICAN EXPRESS

AVIS                AVIS
AMERICAN EXPRESS

HERTZ              HERTZ
AMERICAN EXPRESS

UNITED AIR TRAVEL  UNITED AIR TRAVEL
```

The reference to `CREDIT-CARD` using the variable index notation is not contained within the array.

```
RESET A(A20) B(A20) C(A20)
MOVE 2 TO I (N3)
MOVE 3 TO J (N3)
READ FINANCE
 OBTAIN CREDIT-CARD (1:3) CREDIT-CARD (I:I+2) CREDIT-CARD (J:J+2)
 FOR K (N3) = 1 TO 3
  MOVE CREDIT-CARD (1.K) TO A
  MOVE CREDIT-CARD (I.K) TO B
  MOVE CREDIT-CARD (J.K) TO C
  DISPLAY A B C
 LOOP /* FOR
LOOP / * READ
END
```

Output:

```
         A                   B                   C
------------------- ------------------- -------------------
CARD 01             CARD 02             CARD 03
CARD 02             CARD 03             CARD 04
CARD 03             CARD 04             CARD 05
```

The three arrays may be accessed individually by using the unique base index as qualifier for the index expression.

Invalid Example 1

```
READ FINANCE
OBTAIN CREDIT-CARD (1-10)
FOR I 1 10
MOVE CREDIT-CARD (I) TO A(A20)
WRITE A
END
```

The above example will produce error message NAT1006 (value for variable index = 0) because, at the time the record is read (READ), the index I still contains the value 0.

In any case, the above example would not have printed the first 10 occurrences of CREDIT-CARD because the individual occurrence with the variable index cannot be contained in the array and the variable index (I) is only evaluated when the next record is read.

The following is the correct method of performing the above:

```
READ FINANCE
OBTAIN CREDIT-CARD (1-10)
FOR I 1 10
MOVE CREDIT-CARD (1.I) TO A (A20)
WRITE A
END
```

Invalid Example 2

```
READ FINANCE
FOR I 1 10
WRITE CREDIT-CARD (I)
END
```

The above example will produce error message NAT1006 because the index I is zero when the record is read in the READ statement.

The following is the correct method of performing the above:

```
READ FINANCE
FOR I 1 10
GET SAME
WRITE CREDIT-CARD (0030/I)
END
```

The `GET SAME` statement is necessary to reread the record after the variable index has been updated in the `FOR` loop.

Examples

- Example 1 - OBTAIN Statement
- Example 2 - OBTAIN Statement with Multiple Ranges

Example 1 - OBTAIN Statement

```
** Example 'OBTEX1': OBTAIN
************************************************************************
RESET #INDEX (I1)
*
LIMIT 5
READ EMPLOYEES BY CITY
  OBTAIN SALARY (1:4)
  /*
  IF SALARY (4) GT 0 DO
    WRITE '=' NAME / 'SALARIES (1:4):' SALARY (1:4)
    FOR #INDEX 1 TO 4
      WRITE 'SALARY' #INDEX  SALARY (1.#INDEX)
    LOOP
    SKIP 1
  DOEND
LOOP
*
END
```

Output of Program OBTEX1:

```
Page      1                                                  05-02-08  13:37:48

SALARIES (2-5):      29900      28100      26600      25200

SALARY 3:      28100
SALARY 3:      28100
SALARY 4:      26600
```

For further examples of using the `OBTAIN` statement, see *Referencing a Database Array* in the *Programming Guide*.

88 ON ERROR

- Function 570
- Restriction 570
- Syntax Description 571
- ON ERROR Processing within Objects on Different Levels 571
- System Variables 571
- Example 572

Structured Mode Syntax

```
ON ERROR
 statement ...
END-ERROR
```

Reporting Mode Syntax

```
ON ERROR  { statement ...                }
          { DO statement ... DOEND       }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: DECIDE FOR | DECIDE ON | IF | IF SELECTION

Function

The ON ERROR statement is used to intercept execution time errors which would otherwise result in a Natural error message, followed by termination of Natural program execution, and a return to command input mode.

When the ON ERROR statement block is entered for execution, the normal flow of program execution has been interrupted and cannot be resumed except for Natural error 3145 (record requested in hold), in which case a RETRY statement will cause processing to be resumed exactly where it was suspended.

This statement is non-procedural (that is, its execution depends on an event, not on where in a program it is located).

Restriction

Only one ON ERROR statement is permitted in a Natural object.

Syntax Description

Syntax Element	Description
statement...	**Defining the ON ERROR Processing:** To define the processing that shall take place when an ON ERROR condition has been encountered, you can specify one or multiple statements. **Exiting from an ON ERROR Block:** An ON ERROR block may be exited by using a FETCH, STOP, TERMINATE, RETRY or ESCAPE ROUTINE statement. If the block is not exited using one of these statements, standard error message processing is performed and program execution is terminated.
END-ERROR	**End of ON ERROR Statement Block:** The Natural reserved word END-ERROR must be used to end an ON ERROR statement block.

ON ERROR Processing within Objects on Different Levels

In an object call hierarchy created by means of CALLNAT, PERFORM or FETCH RETURN statements, each object may contain an ON ERROR statement.

When an error occurs, Natural will trace back the call hierarchy and select the first ON ERROR statement encountered in an object for execution.

For further information, see *Processing of Application Errors* in the *Programming Guide*.

System Variables

The following Natural system variables can be used in conjunction with the ON ERROR statement (as shown in the **Example** below):

System Variable	Explanation
*ERROR-NR	Contains the number of the error detected by Natural.
*ERROR-LINE	Contains the line number of the statement which caused the error.
*PROGRAM	Contains the name of the Natural object that is currently being executed.

Example

```
** Example 'ONEEX1': ON ERROR
**
**
CAUTION: Executing this example will modify the database records!
***********************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 CITY
*
1 #NAME (A20)
1 #CITY (A20)
END-DEFINE
*
REPEAT
  INPUT 'ENTER NAME:' #NAME
  IF #NAME = ' '
    STOP
  END-IF
  FIND EMPLOY-VIEW WITH NAME = #NAME
    INPUT (AD=M) 'ENTER NEW VALUES:' ///
                 'NAME:' NAME /
                 'CITY:' CITY
    UPDATE
    END TRANSACTION
    /*
    ON ERROR
      IF *ERROR-NR = 3009
        WRITE 'LAST TRANSACTION NOT SUCCESSFUL'
            / 'HIT ENTER TO RESTART PROGRAM'
        FETCH 'ONEEX1'
      END-IF
      WRITE 'ERROR' *ERROR-NR 'OCCURRED IN PROGRAM' *PROGRAM
            'AT LINE' *ERROR-LINE
      FETCH 'MENU'
    END-ERROR
    /*
  END-FIND
END-REPEAT
END
```

89 OPEN CONVERSATION

- Function 574
- Syntax Description 574
- Further Information and Examples 575

```
OPEN CONVERSATION USING [SUBPROGRAMS] {operand1} ...
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: CLOSE CONVERSATION | DEFINE DATA CONTEXT

Belongs to Function Group: *Natural Remote Procedure Call*

Function

The statement OPEN CONVERSATION is used in conjunction with the Natural Remote Procedure Call (RPC). It allows the RPC Client to open a conversation and specify the remote subprograms to be included in the conversation.

When the OPEN CONVERSATION statement is executed, it assigns a unique ID identifying the conversation to the system variable *CONVID.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A			A													yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Subprogram Names:** As *operand1* you specify the names of the remote subprograms to be included in the conversation. The name of a subprogram can be specified either as a constant of 1 to 8 characters, or as an alphanumeric variable of length 1 to 8.

Further Information and Examples

See the following sections in the *Natural Remote Procedure Call (RPC)* documentation:

- *Natural RPC Operation in Conversational Mode*
- *Using a Conversational RPC*

90 OPTIONS

- Function 578

```
OPTIONS parameter ...
```

Function

The `OPTIONS` statement can be used to specify compilation options as parameters for the current Natural programming object. These are the same options that can be specified within a Natural session with the `COMPOPT` system command.

Note: No mainframe-specific options are available. For compatibility reasons, for example, when programming a cross-platform application, such options are ignored during compile time.

91 PARSE XML

- Function 580
- Syntax Description 581
- Examples 584

```
PARSE XML operand1 [INTO [PATH operand2] [NAME operand3] [VALUE operand4]]
 [[NORMALIZE] NAMESPACE operand5 PREFIX operand6]
   statement...
END-PARSE                             (structured mode only)
[LOOP]                                (reporting mode only)
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Internet and XML***

Function

The PARSE XML statement allows you to parse XML documents from a Natural program. See also *Statements for Internet and XML Access* in the *Programming Guide*.

It is recommended that you use dynamic variables when using the PARSE statement, because it is impossible to determine the length of a static variable. Using static variables could in turn lead to the truncation of the value that is to be written into the variable.

For information on Unicode support, see PARSE XML in the *Unicode and Code Page Support* documentation.

Mark-Up

The following are markings used in path strings to represent the different data types in an XML document (on ASCII-based systems):

Marking	XML Data	Location in Path String
?	Processing instruction (except for <?XML...?>)	end
!	Comment	end
C	CDATA section	end
@	Attribute (on mainframes: § or @, depending on session code page and terminal emulation)	before the attribute name
/	Closing tag and/or parent name separator in a path	end or between parent names
$	Parsed data - character data string	end

By using this additional markup in the path string, one can more easily identify the different elements of the XML document in the output document.

Global Namespace

To specify the global namespace, use a colon (:) as prefix and an empty URI.

Related System Variables

The following Natural system variables are automatically created for each PARSE XML statement issued:

- *PARSE-TYPE
- *PARSE-LEVEL
- *PARSE-ROW
- *PARSE-COL
- *PARSE-NAMESPACE-URI

The notation (*r*) after *PARSE-TYPE, *PARSE-LEVEL, *PARSE-ROW, *PARSE-COL and *PARSE-NAMESPACE-URI is used to indicate the label or statement number of the statement in which the PARSE was issued. If (*r*) is not specified, the corresponding system variable represents the system variable of the XML data currently being processed in the active PARSE processing loop.

For more information on these system variables, see the *System Variables* documentation.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A	U	B											yes	no
operand2		S				A	U	B											yes	yes
operand3		S				A	U	B											yes	yes
operand4		S				A	U	B											yes	yes
operand5		S	A			A	U	B											yes	yes
operand6		S	A			A	U	B											yes	yes

Syntax Element Description:

Syntax Element	Description
operand1	**XML Document:** *operand1* represents the XML document in question. The XML document may not be changed while it is being parsed. If you try to change the XML document during parsing (by writing into it, for example), an error message will be displayed.
operand2	**Path:** *operand2* represents the PATH of the data in the XML document. The PATH contains the name of the identified XML part, the names of all parents, as well as the type of the XML part. **Note:** The information given with PATH can be used to easily fill a tree view. See also ***Example 1 - Using** operand2*.
operand3	**Data Element Name:** *operand3* represents the NAME of a data element in the XML document. If NAME has no value, then the dynamic variable associated with it will be set to *length()=0, which is a static variable filled with a blank. See also ***Example 2 - Using** operand3*.
operand4	**Data Element Content:** *operand4* represents the content (VALUE) of a data element in the XML document. If there is no value, a given dynamic variable will be set to *length()=0, which is a static variable filled with a blank. See also ***Example 3 - Using** operand4*.
operand5 and *operand6* NORMALIZE NAMESPACE PREFIX	**Namespace URI and Prefix:** The NAMESPACE URI or Uniform Resource Identifier (*operand5*) and the namespace PREFIX (*operand6*) are copied during runtime. Therefore, modifying the namespace mapping arrays inside the PARSE XML loop will not affect the parser. *operand5* and *operand6* are one-dimensional arrays with an equal number of occurrences.

Syntax Element	Description

	Namespace normalization is a feature of the PARSE statement. XML is capable of defining namespaces for the element names:
	`<myns:myentity xmlns:myns="http://myuri" />`
	The NAMESPACE definition consists of two parts:
	■ a namespace PREFIX (which is, in this case, myns) and
	■ a URI (myuri) to define the namespace.
	The namespace PREFIX is part of the element name. This means, that for the PARSE statement, and especially for *operand2*, the generated PATH strings depend on the namespace PREFIX. If the path inside a Natural program is used to indicate specific tags, then this will fail if an XML document uses the correct NAMESPACE (URI), but with a different PREFIX.
	With namespace normalization, all namespace PREFIXes can be set to defaults which have been defined in the NAMESPACE clause. The first entry will be the one used if a URI is specified more than once. If more than one PREFIX is used in the XML document, then only the first one will be taken into account for the output. The rest will be ignored.
	The NAMESPACE clause contains pairs of namespace URIs and prefixes. For example:
	`uri(1) := 'http://namespaces.softwareag.com/natural/demo'`
	`pre(1) := 'nat:'`
	If NAMESPACE is defined inside an XML document, the parser checks to see if that namespace (URI) exists in the normalization table. The prefix of the normalization table is used for all output data from the PARSE statement, instead of the namespace defined in the XML document.
	See also:
	■ *Example 4 - Using operand5 and operand6*
	■ *Example 5 - Using operand5 and operand6 with Namespace Normalization*

	Additional Information Concerning PREFIX: In addition, the following applies to the prefix definition: ■ The prefix definition in the namespace normalization array always has to end in a colon (:), since this is the string that will be replaced. ■ A PREFIX or a URI may only occur once in a namespace normalization array. ■ If a PREFIX or the NAMESPACE URI contains trailing blanks (e.g. when using a static variable), the trailing blanks will be removed before the external parser is called. ■ If the PREFIX definition at the namespace normalization only contains a colon (:), then the NAMESPACE PREFIX will be deleted.

Examples

- Example 1 - Using operand2
- Example 2 - Using operand3
- Example 3 - Using operand4
- Example 4 - Using operand5 and operand6
- Example 5 - Using operand5 and operand6 with Namespace Normalization

Example 1 - Using operand2

The following XML code

```
myxml := '<?xml version="1.0" encoding="ISO-8859-1" ?>'-
         '<employee personnel-id="30016315" >'-
         '<full-name>'-
         '<!--this is just a comment-->'-
         '<first-name>RICHARD</first-name>'-
         '<name>FORDHAM</name>'-
         '</full-name>'-
         '</employee>'
```

processed by the following Natural code:

```
PARSE XML myxml INTO PATH mypath
  PRINT mypath
END-PARSE
```

produces the following output:

```
employee
employee/@personnel-id
employee/full-name
employee/full-name/!
employee/full-name/first-name
employee/full-name/first-name/$
employee/full-name/first-name//
employee/full-name/name
employee/full-name/name/$
employee/full-name/name//
employee/full-name//
employee//
```

Example 2 - Using operand3

The following XML code

```
myxml := '<?xml version="1.0" encoding="ISO-8859-1" ?>'-
         '<employee personnel-id="30016315" >'-
         '<full-name>'-
         '<!--this is just a comment-->'-
         '<first-name>RICHARD</first-name>'-
         '<name>FORDHAM</name>'-
         '</full-name>'-
         '</employee>'
```

processed by the following Natural code:

```
PARSE XML myxml INTO PATH mypath NAME myname
  DISPLAY (AL=39) mypath myname
END-PARSE
```

Note: produces the following output:

```
              MYPATH                                  MYNAME
---------------------------------    ---------------------------------- 

employee                             employee
employee/@personnel-id               personnel-id
employee/full-name                   full-name
employee/full-name/!
employee/full-name/first-name        first-name
employee/full-name/first-name/$
employee/full-name/first-name//      first-name
employee/full-name/name              name
employee/full-name/name/$
employee/full-name/name//            name
employee/full-name//                 full-name
employee//                           employee
```

Example 3 - Using operand4

The following XML code

```
myxml := '<?xml version="1.0" encoding="ISO-8859-1" ?>'-
         '<employee personnel-id="30016315" >'-
         '<full-name>'-
         '<!--this is just a comment-->'-
         '<first-name>RICHARD</first-name>'-
         '<name>FORDHAM</name>'-
         '</full-name>'-
         '</employee>'
```

processed by the following Natural code:

```
PARSE XML myxml INTO PATH mypath VALUE myvalue
  DISPLAY (AL=39) mypath myvalue
END-PARSE
```

produces the following output:

```
               MYPATH                                  MYVALUE
----------------------------------    -----------------------------------

employee
employee/@personnel-id                30016315
employee/full-name
employee/full-name/!                  this is just a comment
employee/full-name/first-name
employee/full-name/first-name/$       RICHARD
employee/full-name/first-name//
employee/full-name/name
employee/full-name/name/$             FORDHAM
employee/full-name/name//
employee/full-name//
employee//
```

Example 4 - Using operand5 and operand6

The following XML code

```
myxml := '<?xml version="1.0" encoding="ISO-8859-1" ?>'-
         '<nat:employee nat:personnel-id="30016315"'-
         ' xmlns:nat="http://namespaces.softwareag.com/natural/demo">'-
         '<nat:full-Name>'-
         '<nat:first-name>RICHARD</nat:first-name>'-
         '<nat:name>FORDHAM</nat:name>'-
         '</nat:full-Name>'-
         '</nat:employee>'
```

processed by the following Natural code:

```
PARSE XML myxml INTO PATH mypath
  PRINT mypath
END-PARSE
```

produces the following output:

```
nat:employee
nat:employee/@nat:personnel-id
nat:employee/@xmlns:nat
nat:employee/nat:full-Name
nat:employee/nat:full-Name/nat:first-name
nat:employee/nat:full-Name/nat:first-name/$
nat:employee/nat:full-Name/nat:first-name//
nat:employee/nat:full-Name/nat:name
nat:employee/nat:full-Name/nat:name/$
nat:employee/nat:full-Name/nat:name//
nat:employee/nat:full-Name//
nat:employee//
```

Example 5 - Using operand5 and operand6 with Namespace Normalization

Using `NORMALIZE NAMESPACE`, the same XML document as in Example 4 with a different `NAMESPACE PREFIX` would produce exactly the same output.

XML code:

```
myxml := '<?xml version="1.0" encoding="ISO-8859-1" ?>'-
         '<natural:employee natural:personnel-id="30016315"'-
         ' xmlns:natural="http://namespaces.softwareag.com/natural/demo">'-
         '<natural:full-Name>'-
         '<natural:first-name>RICHARD</natural:first-name>'-
         '<natural:name>FORDHAM</natural:name>'-
         '</natural:full-Name>'-
         '</natural:employee>'
```

Natural code:

```
uri(1) := 'http://namespaces.softwareag.com/natural/demo'
pre(1) := 'nat:'
*
PARSE XML myxml INTO PATH mypath NORMALIZE NAMESPACE uri(*) PREFIX pre(*)
  PRINT mypath
END-PARSE
```

Output of above program:

```
nat:employee
nat:employee/@nat:personnel-id
nat:employee/@xmlns:nat
nat:employee/nat:full-Name
nat:employee/nat:full-Name/nat:first-name
nat:employee/nat:full-Name/nat:first-name/$
nat:employee/nat:full-Name/nat:first-name//
nat:employee/nat:full-Name/nat:name
nat:employee/nat:full-Name/nat:name/$
nat:employee/nat:full-Name/nat:name//
nat:employee/nat:full-Name//
nat:employee//
```

92 PASSW

- Function 590
- Syntax Description 590

```
PASSW=operand1
```

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | HISTOGRAM | GET | GET SAME | GET TRANSACTION | LIMIT | PERFORM BREAK PROCESSING | READ | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The PASSW statement is used to specify a default password for access to Adabas or VSAM files which have been password-protected.

Note: This password can be overwritten using the PASSWORD clause of the database access statements FIND, GET, HISTOGRAM, READ, STORE.

Natural Security Considerations

In the security profile of a library, you can specify a default Adabas password (as described in the *Natural Security* documentation); this password applies to all database access statements for which neither an individual password is specified nor a PASSW statement applies. It applies within the library in whose security profile it is specified, and also remains in effect in other libraries you subsequently log on to and in whose security profiles no password is specified.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Password:** The password (*operand1*) may be specified as an alphanumeric constant or the content of an alphanumeric variable. It may consist of up to 8 characters, and must not contain special characters or embedded blanks. If the password is specified as a constant, it must be enclosed in apostrophes. The password specified with the PASSW statement applies to all database access statements (FIND, GET, HISTOGRAM, READ, STORE) for which no individual password is specified. It remains in effect until another password is specified in the execution of a subsequent PASSW statement or the Natural session is terminated. A password specified with a specific database access statement applies only to that statement, not to any subsequent statement.

93 PERFORM

- Function 594
- Syntax Description 594
- Examples 597

```
                        [ operand2  [ (AD= { M } ) ] ]
PERFORM                 [                  { O }     ]
subroutine-name         [                  { A }     ]
                        [ nX                         ] ...
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: `CALL` | `CALL FILE` | `CALL LOOP` | `CALLNAT` | `DEFINE SUBROUTINE` | `ESCAPE` | `FETCH`

Belongs to Function Group: *Invoking Programs and Routines*

Function

The `PERFORM` statement is used to invoke a Natural **subroutine**.

Nested PERFORM Statements

The invoked subroutine may contain a `PERFORM` statement to invoke another subroutine (the number of nested levels is limited by the size of the required memory).

A subroutine may invoke itself (recursive subroutine). If database operations are contained within an external subroutine that is invoked recursively, Natural will ensure that the database operations are logically separated.

Parameter Transfer with Dynamic Variables

See the statement `CALLNAT`.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand2	C	S	A	G		A	U	N	P	I	F	B	D	T	L	C	G	O	yes	yes

Syntax Element Description:

Syntax Element	Description
subroutine-name	**Subroutine to be Invoked:** For a subroutine name (maximum 32 characters), the same naming conventions apply as for user-defined variables. The subroutine name is independent of the name of the module in which the subroutine is defined (it may but need not be the same). The subroutine to be invoked must be defined with a DEFINE SUBROUTINE statement. It may be an inline or external subroutine (see DEFINE SUBROUTINE statement). Within one object, no more than 50 external subroutines may be referenced. **Data Available in a Subroutine** - **Inline Subroutines** No explicit parameters can be passed from the invoking object to an inline subroutine. An inline subroutine has access to the currently established global data area as well as the local data area defined within the same object module. - **External Subroutines** An external subroutine has access to the currently established global data area. Moreover parameters can be passed with the PERFORM statement from the invoking object to the external subroutine (see *operand2*); thus, you may reduce the size of the global data area.
operand2	**Parameters to be Passed:** When an external subroutine is invoked with the PERFORM statement, one or more parameters (*operand2*) can be passed with the PERFORM statement from the invoking object to the external subroutine. For an inline subroutine, *operand2* cannot be specified. If parameters are passed, the structure of the parameter list must be defined in a DEFINE DATA statement. By default, the parameters are passed “by reference”, that is, the data are transferred via address parameters, the parameter values themselves are not moved. However, it is also possible to pass parameters “by value”, that is, pass the actual parameter values. To do so, you define these fields in the DEFINE DATA PARAMETER statement of the subroutine with the option BY VALUE or BY VALUE RESULT. - If parameters are passed “by reference” the following applies: The sequence, format and length of the parameters in the invoking object must match exactly the sequence, format and length of the DEFINE DATA PARAMETER structure of the invoked subroutine. The names of the variables in the invoking object and the subroutine may be different.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>

- If parameters are passed "by value" the following applies: The sequence of the parameters in the invoking object must match exactly the sequence in the `DEFINE DATA PARAMETER` structure of the invoked subroutine. Formats and lengths of the variables in the invoking object and the subroutine may be different; however, they have to be data transfer compatible. The names of the variables in the invoking object and the subroutine may be different. If parameter values that have been modified in the subroutine are to be passed back to the invoking object, you have to define these fields with `BY VALUE RESULT`. With `BY VALUE` (without `RESULT`) it is not possible to pass modified parameter values back to the invoking object (regardless of the `AD` specification; see also **below**).

Note: With `BY VALUE`, an internal copy of the parameter values is created. The subroutine accesses this copy and can modify it, but this will not affect the original parameter values in the invoking object. With `BY VALUE RESULT`, an internal copy is likewise created; however, after termination of the subroutine, the original parameter values are overwritten by the (modified) values of the copy.

For both ways of passing parameters, the following applies:

- In the parameter data area of the invoked subroutine, a redefinition of groups is only permitted within a `REDEFINE` block.
- If an array is passed, its number of dimensions and occurrences in the subroutine's parameter data area must be same as in the `PERFORM` parameter list.

Note: If multiple occurrences of an array that is defined as part of an indexed group are passed with the `PERFORM` statement, the corresponding fields in the subroutine's parameter data area must not be redefined, as this would lead to the wrong addresses being passed.

</td></tr>
<tr><td>AD=</td><td>

Attributes:

If *operand2* is a variable, you can mark it in one of the following ways:

<table>
<tr><td>AD=O</td><td>Non-modifiable, see session parameter AD=O.

Note: Internally, AD=O is processed in the same way as BY VALUE (see Note under operand2).</td></tr>
<tr><td>AD=M</td><td>Modifiable, see session parameter AD=M.

This is the default setting.</td></tr>
<tr><td>AD=A</td><td>Input only, see session parameter AD=A.</td></tr>
</table>

If *operand2* is a constant, `AD` cannot be explicitly specified. For constants, `AD=O` always applies.

</td></tr>
<tr><td>nX</td><td>

Parameters to be Skipped:

With the notation *n*`X` you can specify that the next *n* parameters are to be skipped (for example, `1X` to skip the next parameter, or `3X` to skip the next three parameters); this means that for the next *n* parameters no values are passed to the external subroutine.

</td></tr>
</table>

Syntax Element	Description
	A parameter that is to be skipped must be defined with the keyword OPTIONAL in the subroutine's DEFINE DATA PARAMETER statement. OPTIONAL means that a value can - but need not - be passed from the invoking object to such a parameter.

Examples

- Example 1 - PERFORM as Inline Subroutine
- Example 2 - PERFORM as External Subroutine

Example 1 - PERFORM as Inline Subroutine

```
** Example 'PEREX1': PERFORM   (as inline subroutine)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE  (A20/2)
  2 PHONE
*
1 #ARRAY    (A75/1:4)
1 REDEFINE #ARRAY
  2 #ALINE  (A25/1:4,1:3)
1 #X        (N2) INIT <1>
1 #Y        (N2) INIT <1>
END-DEFINE
*
LIMIT 5
FIND EMPLOY-VIEW WITH CITY = 'BALTIMORE'
  MOVE NAME            TO #ALINE (#X,#Y)
  MOVE ADDRESS-LINE(1) TO #ALINE (#X+1,#Y)
  MOVE ADDRESS-LINE(2) TO #ALINE (#X+2,#Y)
  MOVE PHONE           TO #ALINE (#X+3,#Y)
  IF  #Y = 3
    RESET INITIAL #Y
    /*
    PERFORM PRINT
    /*
  ELSE
    ADD 1 TO #Y
  END-IF
  AT END OF DATA
    /*
    PERFORM PRINT
    /*
  END-ENDDATA
END-FIND
```

```
*
DEFINE SUBROUTINE PRINT
  WRITE NOTITLE (AD=OI) #ARRAY(*)
  RESET #ARRAY(*)
  SKIP 1
END-SUBROUTINE
*
END
```

Output of Program PEREX1:

```
JENSON                   LAWLER                   FORREST
2120 HASSELL             4588 CANDLEBERRY AVE     37 TENNYSON DRIVE
 #206                    BALTIMORE                BALTIMORE
998-5038                 629-0403                 881-3609

ALEXANDER                NEEDHAM
409 SENECA DRIVE         12609 BUILDERS LANE
BALTIMORE                BALTIMORE
345-3690                 641-9789
```

Example 2 - PERFORM as External Subroutine

Program containing PERFORM statement:

```
** Example 'PEREX2': PERFORM (as external subroutine)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 ADDRESS-LINE  (A20/2)
  2 PHONE
*
1 #ALINE   (A25/1:4,1:3)
1 #X       (N2)            INIT <1>
1 #Y       (N2)            INIT <1>
END-DEFINE
*
LIMIT 5
*
FIND EMPLOY-VIEW WITH CITY = 'BALTIMORE'
  MOVE NAME            TO #ALINE (#X,#Y)
  MOVE ADDRESS-LINE(1) TO #ALINE (#X+1,#Y)
  MOVE ADDRESS-LINE(2) TO #ALINE (#X+2,#Y)
  MOVE PHONE           TO #ALINE (#X+3,#Y)
  IF  #Y = 3
    RESET INITIAL #Y
    /*
    PERFORM PEREX2E #ALINE(*,*)
    /*
```

```
  ELSE
    ADD 1 TO #Y
  END-IF
  AT END OF DATA
    /*
    PERFORM PEREX2E #ALINE(*,*)
    /*
  END-ENDDATA
END-FIND
*
END
```

External subroutine PEREX3 with parameters called by program PEREX2:

```
** Example 'PEREX3': SUBROUTINE (external subroutine with parameters)
************************************************************************
DEFINE DATA
PARAMETER
1 #ALINE  (A25/1:4,1:3)
END-DEFINE
*
DEFINE SUBROUTINE PEREX2E
  WRITE NOTITLE (AD=OI) #ALINE(*,*)
  RESET #ALINE(*,*)
  SKIP 1
END-SUBROUTINE
*
END
```

Output of Program PEREX2:

```
JENSON                    LAWLER                    FORREST
2120 HASSELL              4588 CANDLEBERRY AVE      37 TENNYSON DRIVE
 #206                     BALTIMORE                 BALTIMORE
998-5038                  629-0403                  881-3609

ALEXANDER                 NEEDHAM
409 SENECA DRIVE          12609 BUILDERS LANE
BALTIMORE                 BALTIMORE
345-3690                  641-9789
```

94 PERFORM BREAK PROCESSING

- Function 602
- Syntax Description 602
- Example 603

```
PERFORM BREAK [PROCESSING] [(r)]
  AT BREAK statement ...
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | READ | RETRY | STORE | UPDATE

Belongs to Function Group: *Database Access and Update*

Function

The PERFORM BREAK PROCESSING statement is used to establish break processing in loops created by FOR, REPEAT, CALL LOOP and CALL FILE statements where no automatic break processing is established, or whenever a user-initiated break processing is desired. Unlike automatic break processing which is executed immediately after the record is read, the PERFORM BREAK PROCESSING statement is executed when it is encountered in the normal flow of the program.

This statement causes a check for a break processing condition (based on the value of a control field) and also results in the evaluation of Natural system functions. This check and system function evaluation are performed each time the statement is encountered for execution. This statement may be executed depending on a condition specified in an IF statement.

Syntax Description

Syntax Element	Description
(*r*)	**Statement Reference Notation:** By default, the final PERFORM BREAK condition is true at the end of execution of the program, subprogram or subroutine. The notation (*r*) may be used to relate the final processing of a PERFORM BREAK to a specific loop. In this case the PERFORM BREAK is executed in the loop end handling of this loop; after the final automatic BREAK processing and before the AT END OF DATA statements are executed.
AT BREAK *statement...*	See the syntax of the AT BREAK statement.

Example

```
** Example 'PBPEX1S': PERFORM BREAK PROCESSING  (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 #INDEX (N2)
1 #LINE  (N2) INIT <1>
END-DEFINE
*
FOR #INDEX 1 TO 18
  PERFORM BREAK PROCESSING
  /*
  AT BREAK OF #INDEX /1/
    WRITE NOTITLE / 'PLEASE COMPLETE LINES 1-9 ABOVE' /
    RESET INITIAL #LINE
  END-BREAK
  /*
  WRITE NOTITLE '_' (64) '=' #LINE
  ADD 1 TO #LINE
END-FOR
*
END
```

Output of Program PBPEX1S:

```
________________________________________________________________ #LINE:   1
________________________________________________________________ #LINE:   2
________________________________________________________________ #LINE:   3
________________________________________________________________ #LINE:   4
________________________________________________________________ #LINE:   5
________________________________________________________________ #LINE:   6
________________________________________________________________ #LINE:   7
________________________________________________________________ #LINE:   8
________________________________________________________________ #LINE:   9

PLEASE COMPLETE LINES 1-9 ABOVE

________________________________________________________________ #LINE:   1
________________________________________________________________ #LINE:   2
________________________________________________________________ #LINE:   3
________________________________________________________________ #LINE:   4
________________________________________________________________ #LINE:   5
________________________________________________________________ #LINE:   6
________________________________________________________________ #LINE:   7
________________________________________________________________ #LINE:   8
________________________________________________________________ #LINE:   9

PLEASE COMPLETE LINES 1-9 ABOVE
```

Equivalent reporting-mode example: `PBPEX1R`.

95 PRINT

- Function 606
- Syntax Description 607
- Example 612

```
PRINT [(rep)] [NOTITLE] [NOHDR] [(statement-parameters)]
{ [ { nX } ]     { 'text' ' [(attributes)]           } }
{ [ { nT } ] ... { 'c'(n) [(attributes )]            } }
{ [ { /  } ]     { ['='] operand1 [(parameters)]     } } ...
```

For an explanation of the symbols used in the syntax diagram, see **Syntax Symbols**.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The PRINT statement is used to produce output in free format.

The PRINT statement differs from the WRITE statement in the following aspects:

- The output for each operand is written according to the value content rather than the length of the operand. Leading zeros for numeric values and trailing blanks for alphanumeric values are suppressed. The session parameter AD defines whether numeric values are printed left or right justified. With AD=L, the trailing blanks of a numeric value are suppressed. With AD=R, the leading blanks of a numeric value are printed.
- If the resulting output exceeds the current line size (LS parameter), the output is continued on the next line as follows: An alphanumeric constant or the content of an alphanumeric variable (without edit mask) is split at the rightmost blank or character which is neither a letter nor a numeric character contained on the current line. The first part of the split value is output to the current line, and the second part is written to the next line. Leading blanks in the second part are removed. As a consequence, empty lines are suppressed.

  For all other operands, the entire value is written to the next line.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G	N	A	U	N	P	I	F	B	D	T	L		G	O	yes	no

Syntax Element Description:

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the PRINT statement is applicable. A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified. If (*rep*) is not specified, the PRINT statement will apply to the first report (Report 0). If this printer file is defined to Natural as PC, the report will be downloaded to the PC, see ***Example 2***. For information on how to control the format of an output report created with Natural, see *Controlling Data Output* (in the *Programming Guide*).
NOTITLE	**Default Page Title Suppression:** Natural generates a single title line for each page resulting from a PRINT statement. This title contains the page number, the time of day, and the date. Time of day is set at the beginning of the session (TP mode) or at the beginning of the job (batch mode). This default title line may be overridden by using a WRITE TITLE statement, or it may be suppressed by specifying the NOTITLE clause in the PRINT statement. Examples:

Syntax Element	Description

	■ Default title will be produced:
	
	`PRINT NAME`
	
	■ User title will be produced:
	
	`PRINT NAME WRITE TITLE 'user-title'`
	
	■ No title will be produced:
	
	`PRINT NOTITLE NAME`
	
	If the `NOTITLE` option is used, it applies to all `DISPLAY`, `PRINT` and `WRITE` statements within the same object which write data to the same report.

`NOHDR`	**Column Header Suppression:** The `PRINT` statement itself does not produce any column headers. However, if you use the `PRINT` statement in conjunction with a `DISPLAY` statement, you can use the `NOHDR` option of the `PRINT` statement to suppress the column headers generated by the `DISPLAY` statement. The `NOHDR` option only takes effect if the execution of the `PRINT` statement causes a new page to be output. Without the `NOHDR` option, the column headers (if any) of the `DISPLAY` statement would be output on this new page; with `NOHDR` they will not.
statement-parameters	**Parameter Definition at Statement Level:** One or more parameters, enclosed within parentheses, may be specified at statement level, that is, immediately after the `PRINT` statement or an element being displayed. Each parameter specified in this manner will override any previous parameter specified in a `GLOBALS` command, `SET GLOBALS` (in Reporting Mode only) or `FORMAT` statement. If more than one parameter is specified, the parameters must be separated from one another by one or more blanks. A parameter entry must not be split between two statement lines. The parameter settings applied here will only be regarded for variable fields, but they have no effect on text-constants. If you would like to set field attributes for a text-constant, they have to be set explicitly for this element, see *Parameter Definition at Element (Field) Level*. See also: ■ *List of Parameters* ■ *Example of Parameter Usage at Statement and Element (Field) Level*
*n*X, *n*T, /	**Field Positioning, Text, Attribute Assignment:**

Syntax Element	Description
	See ***Field Positioning, Text, Attribute Assignment*** below.

List of Parameters

Parameters that can be specified with the PRINT statement		Specification (S = at statement level, E = at element level)
AD	Attribute Definition	SE
AL	Alphanumeric Length for Output	SE
CD	Color Definition	SE
CV	Control Variable	SE
DF	Date Format	SE
DL	Display Length for Output	SE
DY	Dynamic Attributes	SE
EM	Edit Mask	SE
EMU	Unicode Edit Mask	E
FL	Floating Point Mantissa Length	SE
MC	Multiple-Value Field Count	S
MP	Maximum Number of Pages of a Report	S
NL	Numeric Length for Output	SE
PC	Periodic Group Count	S
PM	Print Mode	SE
SG	Sign Position	SE
ZP	Zero Printing	SE

The individual session parameters are described in the *Parameter Reference*.

Example of Parameter Usage at Statement and Element (Field) Level

Field Positioning, Text, Attribute Assignment

```
{ [ nX ]       { 'text' [(attributes)]                    } }
{ [ nT ]       { 'c' (n) [(attributes)]                   } }
{ [ /  ] ...   { ['='] operand1  [(parameters)]           } } ...
```

Field Positioning Notations

Syntax Element	Description
*n*X	**Column Spacing:** This notation inserts *n* spaces between columns. `PRINT NAME 5X SALARY`
*n*T	**Tab Setting:** The *n*T notation causes positioning (tabulation) to print position *n*. Backward positioning results in a line advance. In the following example, NAME is printed beginning in position 25, and SALARY is printed beginning in position 50: `PRINT 25T NAME 50T SALARY`
/	**Line Advance - Slash Notation:** When placed between fields or text elements, a slash (/) causes positioning to the beginning of the next print line. `PRINT NAME / SALARY`

Text/Attribute Assignment

Syntax Element	Description
'*text*'	**Text Assignment:** The character string enclosed by single quotes is displayed. `PRINT 'EMPLOYEE' NAME 'MARITAL/STATUS' MAR-STAT`

Syntax Element	Description
'c' (n)	**Character Repetition:** The character *c* enclosed by single quotes is displayed *n* times immediately before the field value. `PRINT '*' (5) '=' NAME`
'='	**Field Content Positioned behind Field Heading:** When placed before a field, the equal sign '=' results in the display of the field heading (as defined in the DEFINE DATA statement or in the DDM) followed by the field contents. `PRINT '=' NAME`
operand1	**Field to be Printed:** As *operand1* you specify the field to be printed.
parameters	**Parameter Definition at Element (Field) Level:** One or more parameters (see **table** above), enclosed within parentheses, may be specified immediately after *operand1*. Each parameter specified in this manner will override any previous parameter specified **at statement level** or in a GLOBALS command, SET GLOBALS (in Reporting Mode only) or FORMAT statement. If more than one parameter is specified, one or more blanks must be placed between each entry. An entry must not be split between two statement lines. See also: ■ *Statement Parameters* ■ *Example of Parameter Usage at Statement and Element (Field) Level*

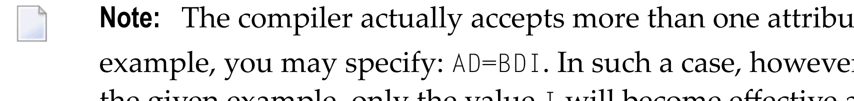
Output Attributes

attributes indicates the output attributes to be used for text display. Attributes may be:

```
{ { AD=AD-value ... }     }
{ { CD=CD-value ... }     }
{ { PM=PM-value ... } ... }
{                         }
{ { AD-value ...    }     }
{ { CD-value ...    } ... }
```

For the possible session parameter values, refer to the corresponding sections in the *Parameter Reference*:

- *AD - Attribute Definition*, section *Field Representation*
- *CD - Color Definition*
- *PM - Print Mode*



Note: The compiler actually accepts more than one attribute value for an output field. For example, you may specify: `AD=BDI`. In such a case, however, only the last value applies. In the given example, only the value `I` will become effective and the output field will be displayed intensified.

Example

- Example 1 - PRINT Statement
- Example 2 - PRINT Statement with Report to be Downloaded to the PC

Example 1 - PRINT Statement

```
** Example 'PRTEX1': PRINT
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 CITY
  2 JOB-TITLE
  2 ADDRESS-LINE (2)
END-DEFINE
*
LIMIT 1
READ EMPLOY-VIEW BY CITY
  /*
  WRITE NOTITLE 'EXAMPLE 1:'
             // 'RESULT OF WRITE STATEMENT:'
  WRITE       /  NAME  ',' FIRST-NAME ':' JOB-TITLE '*' (30)
  WRITE       / 'RESULT OF PRINT STATEMENT:'
  PRINT       /  NAME  ',' FIRST-NAME ':' JOB-TITLE '*' (30)
  /*
  WRITE      // 'EXAMPLE 2:'
             // 'RESULT OF WRITE STATEMENT:'
  WRITE       /  NAME 60X ADDRESS-LINE (1:2)
  WRITE       / 'RESULT OF PRINT STATEMENT:'
  PRINT       /  NAME 60X ADDRESS-LINE (1:2)
  /*
```

```
END-READ
END
```

Output of Program PRTXEX1:

```
EXAMPLE 1:

RESULT OF WRITE STATEMENT:

SENKO                , WILLIE              : PROGRAMMER
******************************

RESULT OF PRINT STATEMENT:

SENKO , WILLIE : PROGRAMMER ******************************

EXAMPLE 2:

RESULT OF WRITE STATEMENT:

SENKO
2200 COLUMBIA PIKE    #914

RESULT OF PRINT STATEMENT:

SENKO                                                             2200 COLUMBIA
PIKE  #914
```

Example 2 - PRINT Statement with Report to be Downloaded to the PC

```
** Example 'PCPIEX1': PRINT to PC
**
** NOTE: Example requires that Natural Connection is installed.
************************************************************************
DEFINE DATA LOCAL
01 PERS VIEW OF EMPLOYEES
  02 PERSONNEL-ID
  02 NAME
  02 CITY
END-DEFINE
*
FIND PERS WITH CITY = 'NEW YORK'                 /* Data selection
  PRINT (7) 5T CITY 20T NAME 40T PERSONNEL-ID    /* (7) designates
                                                 /* the output file
                                                 /* (here the PC).
END-FIND
END
```

96 PROCESS

- Function 616
- Restriction 616
- Syntax Description 616

```
PROCESS view-name USING operand1=operand2 [,operand1=operand2]... [GIVING operand3...]
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Function

The PROCESS statement is used in conjunction with Entire System Server. Entire System Server allows you to use various operating system facilities such as reading and writing files, VTOC and catalog management, JES queues, etc.

See the section *Getting Started* in the *Entire System Server User's Guide* for further information on the PROCESS statement and its individual clauses.

Restriction

This statement is only available with Entire System Server.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A		N	P			B							yes	no
operand2	C	S				A	U	N	P			B							yes	no
operand3		S				A		N	P			B							yes	no

Syntax Element Description:

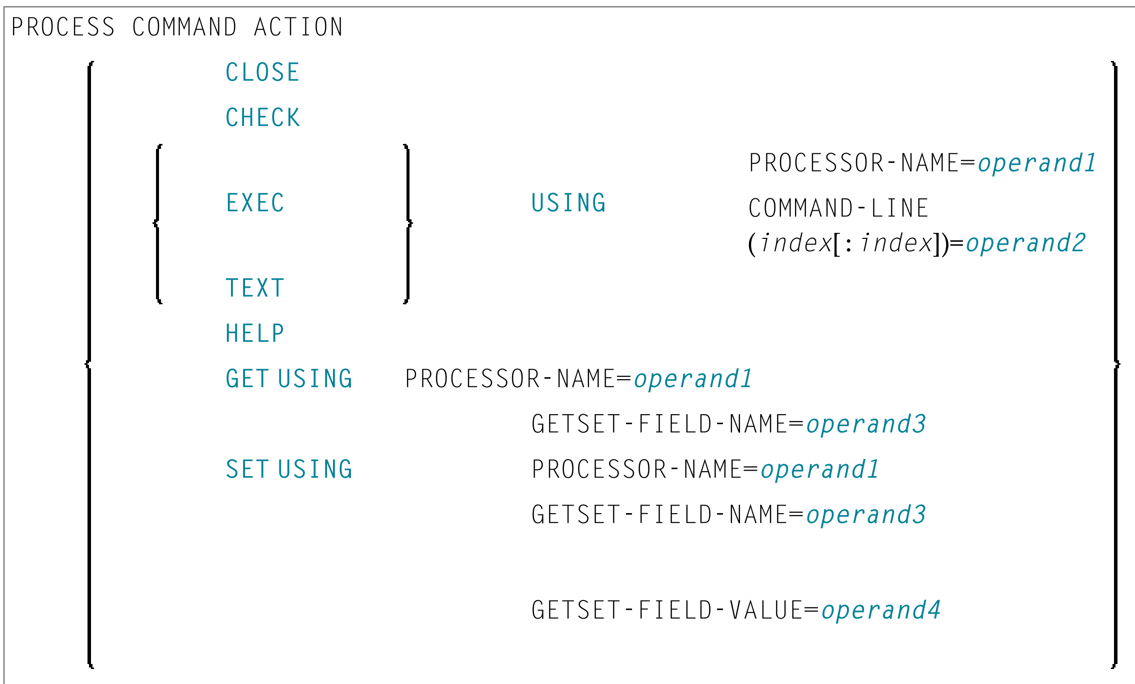
Syntax Element	Description
view-name	**View Name:** Name of the view used by Entire System Server.
USING	**USING Clause:** The USING clause is used to pass parameters to the Entire System Server processor. This is done by assigning a value (*operand2*) to a field (*operand1*) in a view defined to Entire System Server. See the Entire System Server documentation for view description.

Syntax Element	Description
	Note: Multiple specifications of *operand1*=*operand2* must be separated either by the input delimiter character (as specified with the session parameter `ID`) or by a comma. A comma must not be used for this purpose, however, if the comma is defined as decimal character (with the session parameter `DC`).
`GIVING`	**GIVING Clause:** The `GIVING` clause is used to specify the fields (*operand3*) for which values are to be returned by the Entire System Server processor. Each field must be defined in a view used by Entire System Server.

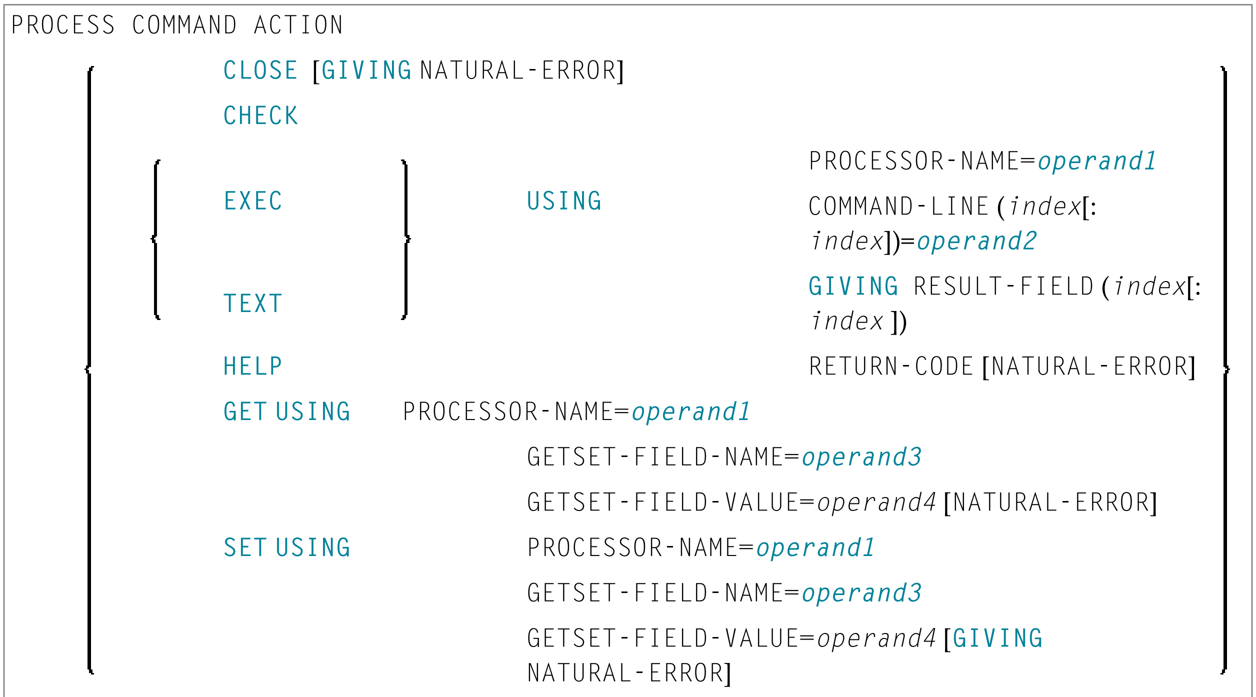
97 PROCESS COMMAND

- Function 621
- Syntax Description 621
- DDM: COMMAND 632
- Examples 633

Structured Mode Syntax



Reporting Mode Syntax



For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Belongs to Function Group: *Invoking Programs and Routines*

Function

Once a Command Processor has been created using the Natural utility `SYSNCP`, it can be invoked from a Natural program using the `PROCESS COMMAND` statement.

For details on how to create a Natural Command Processor, please refer to the *SYSNCP Utility* documentation.

Note: The word `COMMAND` in the `PROCESS COMMAND` statement is in fact the name of a view. The name of the view that is used need not necessarily be `COMMAND`; however, we recommend the use of `COMMAND` because there exists a **DDM with the same name**. This DDM must be referenced within the `DEFINE DATA` statement, for example`COMMAND VIEW OF COMMAND`.

Security Considerations

With Natural Security, it is possible to restrict the usage of certain keywords and/or functions which are defined in a Command Processor. Keywords and/or functions can be allowed/disallowed for a specific user or group of users. See the *Natural Security* documentation for details.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													no	no
operand2	C	S	A	G		A		N											no	no
operand3	C	S				A		N											no	no
operand4	C	S				A		N	P	I									no	no

Syntax Element Description:

Syntax Element	Description
`CLOSE`	`CLOSE` terminates the use of the command processor and releases the command processor buffer. When the command processor is used during a session and is not released with `CLOSE`, then there exists a buffer named `NCPWORK` in your thread. The runtime part of the command processor requires this buffer; it can be released using the statement `PROCESS COMMAND ACTION CLOSE`.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>If any PROCESS COMMAND statement follows this statement, then the command processor buffer will be opened again.

See also Example 1 - PROCESS COMMAND ACTION CLOSE.</td></tr>
<tr><td>CHECK</td><td>CHECK is used as a precautionary measure to determine if a command is executable with the statement PROCESS COMMAND EXEC. It works as follows: for the given processor name, a runtime check is performed in two steps:

■ It is checked whether the processor exists in the current library or one of its steplibs;
■ The content of the command line COMMAND-LINE (1) is analyzed to determine whether it is acceptable.

In addition, the runtime action definitions R, M and 1-9 are written into RESULT-FIELD (1:9).

If the field NATURAL-ERROR is specified in the view or in the GIVING clause, it returns the error code. If this field is not available and the command analysis fails, a Natural system error occurs.

Note: As the function of the CHECK option is also performed as part of the EXEC option, it is not necessary to use CHECK before every EXEC.</td></tr>
<tr><td>EXEC</td><td>EXEC works exactly the same as CHECK with the addition that the runtime actions are executed as specified in the runtime action editor.

Only COMMAND-LINE (1) is needed. You can use up to 9 occurrences of RESULT-FIELD (however, for optimum performance, you should not use more occurrences than you really need).

Note: EXEC is the only option which can be used to leave the currently active program. This is the case when the runtime action definition contains a FETCH or STOP statement.

See also Example 2 - PROCESS COMMAND ACTION EXEC.</td></tr>
<tr><td>HELP</td><td>HELP returns a list of all valid keywords, synonyms, and functions for the purpose of, for example, the creation of online help windows. This list is contained in the field(s) of RESULT-FIELD. The type of help returned is dependent on the content of the command lines.

■ COMMAND-LINE (1) must contain the search criteria.
■ COMMAND-LINE (2), if specified, must contain the start value or a search value.
■ COMMAND-LINE (3), if specified, must contain a start value.

For further information, see the following sections:

■ HELP for Keywords
■ HELP for Synonyms
■ HELP for Global Functions
■ HELP for Local Functions
■ HELP for IKN</td></tr>
</table>

Syntax Element	Description
	■ *HELP for IFN* **Note:** For optimum performance, the number of occurrences of the field `RESULT-FIELD` should not exceed the number of lines to be displayed on the screen. At least one occurrence must be used.
`TEXT`	The `TEXT` option is used to deliver general information about the processor and text associated with a keyword or function. This text is the same as that entered in the keyword editor or action editor of the `SYSNCP` utilityduring command processor definition. For further information, see the following sections: ■ *TEXT for General Information* ■ *TEXT for Keyword Information* ■ *TEXT for Function Information* **Note:** To access texts for keywords and functions, you must have specified `Y` in the field `Catalog user texts` on the Processor Header Maintenance 3 screen of the `SYSNCP` utility, see the section *Miscellaneous Options - Header 3*.

HELP for Keywords

This option returns an alphabetically sorted list of keywords and/or synonyms with their internal keyword numbers (IKN).

Command Line	Contents	
1	Must begin with indicator `K`.	
	The types of keywords to be returned:	
	`*`	Keywords of all types
	`1`	Keywords with type 1
	`2`	Keywords with type 2
	`3`	Keywords with type 3
	`P`	Keywords with type P (parameter)
	Options:	
	`I`	Return IKN in addition to keywords.
	`T`	Show keyword partially in upper case (to show possible abbreviation).
	`S`	Return synonyms in addition to keywords.
	`X`	Return only synonyms of specified keywords.
	`A`	Internal keywords are also returned.

Command Line	Contents	
	+	Search does not include start value.
2	Start value for the keyword search (optional). By default, the search begins with the start value. However, if you specify the plus (+) option, the search does not include the start value itself, but begins with the next higher value.	

The field `RESULT-FIELD (1:n)` returns the specified list.

Examples:

```
Command Line 1:    K*X     Returns all synonyms of all keyword types.
```

```
Command Line 1:   K123S   Returns all keywords of type 1, 2 and 3 including synonyms.
```

HELP for Synonyms

For a given IKN, this option returns the original keyword and all synonyms.

Command Line	Contents	
1	Must begin with the indicator `S`.	
	Option:	
	T	Shows keyword partially in upper case (to show possible abbreviation).
2	Internal Keyword Number (IKN) of the keyword in format N4.	

The field `RESULT-FIELD (1)` returns the original keyword. The fields `RESULT-FIELD (2:n)` return associated synonyms for this keyword.

Example:

Input:	Output:

`Command Line 1:    S`
`Command Line 2:    1003`
	`Result-Field 1:    Edit`
	`Result-Field 2:    Maintain`
	`Result-Field 3:    Modify`

HELP for Global Functions

This option returns a list of all global functions.

Command Line	Contents	
1	Must begin with the indicator `G`.	
	Options:	
	I	Internal Function Number (IFN) is also returned.
	T	Shows keyword partially in upper case (to show possible abbreviation).
	S	The keywords returned in `RESULT-FIELD` will be aligned in columns.
	A	Internal keywords are also returned.
	1	Only functions containing the given keyword of type 1 are to be returned.
	2	Only functions containing the given keyword of type 2 are to be returned.
	3	Only functions containing the given keyword of type 3 are to be returned.
	+	Search does not include start value.
2	Start value for global function search. Keywords must be given in sequence `123`. By default, the search begins with the start value. However, if you specify the plus (+) option, the search does not include the start value itself, but begins with the next higher value.	
3	Must be blank.	
4	To search only for global functions with a specific keyword, you specify the keyword here. If you specify a keyword, you also have to specify the keyword type (1, 2 or 3) as option (see above).	

The field `RESULT-FIELD (1:n)` returns the specified list.

Example:

Input:	Output:

`Command Line 1:    G`
`Command Line 2:    ADD`
	`Result-Field 1:    ADD CUSTOMER`
	`Result-Field 2:    ADD FILE`
	`Result-Field 3:    ADD USER`

HELP for Local Functions

This option returns a list of all local functions for a specified location.

<table>
<tr><th>Command Line</th><th colspan="2">Contents</th></tr>
<tr><td rowspan="11">1</td><td colspan="2">Must begin with the indicator L.</td></tr>
<tr><th colspan="2">Options:</th></tr>
<tr><td>I</td><td>Internal Function Number (IFN) is also returned.</td></tr>
<tr><td>T</td><td>Shows keyword partially in upper case (to show possible abbreviation).</td></tr>
<tr><td>S</td><td>The keywords returned in RESULT-FIELD will be aligned in columns.</td></tr>
<tr><td>A</td><td>Internal keywords are also returned.</td></tr>
<tr><td>1</td><td>Only functions containing given keyword of type 1 are to be returned.</td></tr>
<tr><td>2</td><td>Only functions containing given keyword of type 2 are to be returned.</td></tr>
<tr><td>3</td><td>Only functions containing given keyword of type 3 are to be returned.</td></tr>
<tr><td>C</td><td>Only those functions are returned which are defined for the current location (command line 3 is ignored).</td></tr>
<tr><td>F</td><td>Invoke “recursive” listing of local functions; that is, all local commands that lead to the current/specified location will be returned.</td></tr>
<tr><td>2</td><td colspan="2">Start value for local function search (optional).

Keywords must be given in sequence 123.</td></tr>
<tr><td>3</td><td colspan="2">The location for which the list is to be returned.

Keywords must be given in sequence 123.

If no location is specified, the current location of the command processor will be used.</td></tr>
<tr><td>4</td><td colspan="2">Keyword restriction (optional):

If you specify a keyword, or an IKN with the format N4, only functions with this keyword will be returned.</td></tr>
</table>

The field `RESULT-FIELD (1:n)` returns the specified list.

HELP for IKN

For any given internal keyword numbers (IKN), this option returns the original keyword.

<table>
<tr><th>Command Line</th><th colspan="2">Contents</th></tr>
<tr><td rowspan="4">1</td><td colspan="2">Must start with IKN.</td></tr>
<tr><td colspan="2">Options:</td></tr>
<tr><td>A</td><td>The internal keyword will be shown.</td></tr>
<tr><td>T</td><td>Shows keyword partially in upper case (to show possible abbreviation).</td></tr>
<tr><td>2</td><td colspan="2">The IKN to be translated, in format N4.</td></tr>
</table>

The field `RESULT-FIELD (1)` returns the keyword.

Example:

Input:	Output:
`Command Line 1: IKN` `Command Line 2: 0000002002`	`Result-Field 1: CUSTOMER`

HELP for IFN

For any given internal function numbers (IFN), this option returns the keywords of a function.

<table>
<tr><th>Command Line</th><th colspan="2">Contents</th></tr>
<tr><td rowspan="3">1</td><td colspan="2">Must start with IFN.</td></tr>
<tr><td colspan="2">Option:</td></tr>
<tr><td>A</td><td>Functions with internal keywords will not be suppressed.</td></tr>
<tr><td>2</td><td colspan="2">The IFN to be translated, in format N10.</td></tr>
<tr><td rowspan="5">3</td><td colspan="2">Further options:</td></tr>
<tr><td>S</td><td>Keywords belonging to the IFN will be returned in RESULT-FIELD (1:3).</td></tr>
<tr><td>T</td><td>Shows keywords partially in upper case (to show possible abbreviations).</td></tr>
<tr><td>L</td><td>IFN will be returned if IFN is used as a location.</td></tr>
<tr><td>C</td><td>IFN will be returned if IFN is used as a command.</td></tr>
</table>

The field `RESULT-FIELD(1)` returns the function; if option `S` is used, the function is returned in `RESULT-FIELD (1:3)`.

Example:

Input:	Output:
`Command Line 1:    IFN` `Command Line 2:    0001048578`	`Result-Field 1:    DISPLAY INVOICE`

TEXT for General Information

For general information, `COMMAND-LINE (*)`; that is, all command lines, must be blank. Up to nine fields of `RESULT-FIELD` are returned containing the following information:

RESULT-FIELD	Contents	Format
1	Header 1 for User Text	Text (A40)
2	Header 2 for User Text	Text (A40)
3	"First Entry used as" text	Text (A16)
4	"Second Entry used as" text	Text (A16)
5	"Third Entry used as" text	Text (A16)
6	Number of Entry 1 Keywords	Numeric (N3)
7	Number of Entry 2 Keywords	Numeric (N3)
8	Number of Entry 3 Keywords	Numeric (N3)
9	Number of Cataloged Functions	Numeric (N7)

TEXT for Keyword Information

For keyword information, `COMMAND-LINE (1)` must contain the corresponding keyword; `COMMAND-LINE (2)` can optionally contain the keyword type (1, 2, 3 or P); `COMMAND-LINE (3:6)` must be empty.

RESULT-FIELD	Contents	Format
1	Keyword comment text	Text (A40)
2	Keyword in full length	Text (A16)
3	Keyword in unique short form	Text (A16)
4	"Keyword used as" entry	Text (A16)
5	Internal keyword number (IKN)	Numeric (N4)
6	Minimum length of keyword	Numeric (N2)
7	Maximum length of keyword	Numeric (N2)
8	Keyword type (1, 2, 3, 1S, 2S, 3S, P)	Text (A2)

TEXT for Function Information

For function information, COMMAND-LINE (1:3) must contain the keywords which specify the wanted location. COMMAND-LINE (4:6) contains the keywords which specify the wanted function. For example, if information about the global command ADD USER is to be returned, the command lines 1, 2, 3, and 6 must be blank; the command line 4 must contain ADD, and the command line 5 must contain USER.

RESULT-FIELD	Contents	Format
1	Text as defined with the option T in runtime action definition.	Text (A40)
2	Internal function number (IFN) of the specified location.	Numeric (N10)
3	Internal function number (IFN) of the specified function.	Numeric (N10)

GET Option

The GET option is used to read internal command processor information and current command processor settings from the dynamically allocated buffer NCPWORK. The following fields are used:

Field Name	Contents
GETSET-FIELD-NAME (A32)	The name of the variable to be read.
GETSET-FIELD-VALUE (A32)	The value of the specified variable after PROCESS COMMAND ACTION GET is performed.

For a list of possible values for GETSET-FIELD-NAME, see **below**.

SET Option

The SET option is used to modify internal command processor settings in the buffer NCPWORK.

Field Name	Contents
GETSET-FIELD-NAME (A32)	The name of the variable to be modified.
GETSET-FIELD-VALUE (A32)	The value which is to written to the specified variable.

Possible values for GETSET-FIELD-NAME:

Field Name	Format	G/S*	Content
NAME	A8	G	Name of current processor.
LIBRARY	A8	G	Loaded from library.
FNR	N10	G	Loaded from file.
DBID	N10	G	Loaded from database.
TIMESTMP	A8	G	Time stamp of the current processor.
COUNTER	N10	G	Access counter.
BUFFER-LENGTH	N10	G	Bytes allocated for NCPWORK.
C-DELIMITER	A1	G/S	Multiple command delimiter.
DATA-DELIMITER	A1	G	Delimiter to precede data.
PF-KEY	A1	G/S	PF key may be command (Y/N).
UPPER-CASE	A1	G	Keywords in upper case (Y/N).
UQ-KEYWORDS	A1	G	Keywords unique (Y/N).
IMPLICIT-KEYWORD	A1	G/S	Identifier for implicit keyword entry.
MIN-LEN	N10	G	Minimum length of keywords.
MAX-LEN	N10	G	Maximum length of keywords.
KEYWORD-SEQ	A8	G/S	Keyword sequence.
ALT-KEYWORD-SEQ	A8	G/S	Alternative keyword sequence.
USER-SEQUENCE	A1	G	User may override KEYWORD-SEQ (Y/N).
CURR-LOCATION	N10	G/S	Current location (IFN).
CURR-IKN1	N10	G/S	IKN1 of current location.
CURR-IKN2	N10	G/S	IKN2 of current location.
CURR-IKN3	N10	G/S	IKN3 of current location.
CHECK-LOCATION	N10	G	Last checked location (IFN).
CHECK-IKN1	N10	G	IKN1 of CHECK-LOCATION.
CHECK-IKN2	N10	G	IKN2 of CHECK-LOCATION.
CHECK-IKN3	N10	G	IKN3 of CHECK-LOCATION.
TOP-IKN1	N10	G	IKN1 of topmost keyword.
TOP-IKN2	N10	G	IKN2 of topmost keyword.
TOP-IKN3	N10	G	IKN3 of topmost keyword.
KEY1-TOTAL	N10	G	Number of keywords of type 1.
KEY2-TOTAL	N10	G	Number of keywords of type 2.
KEY3-TOTAL	N10	G	Number of keywords of type 3.
FUNCTIONS-TOTAL	N10	G	Number of cataloged functions.
LOCAL-GLOBAL-SEQ	A8	G/S	Local/global function validation.

Field Name	Format	G/S*	Content
ERROR-HANDLER	A8	G/S	General error program.
SECURITY	A1	G	Natural Security installed (Y/N).
SEC-PREFETCH	A1	G	Natural Security data are to be read (Y/N) or have been read (D = done).
PREFIX1	A1	G	Corresponds to the field Prefix Character 1 on the Processor Header Maintenance 2 screen of the SYSNCP utility, see the section *Keyword Editor Options - Header 2*.
PREFIX2	A1	G	Corresponds to the field Prefix Character 2 on the Processor Header Maintenance 2 screen.
HEX1	A1	G	Corresponds to the field Hex. Replacement 1 on the Processor Header Maintenance 2 screen.
HEX2	A1	G	Corresponds to the field Hex. Replacement 2 on the Processor Header Maintenance 2 screen.
DYNAMIC	A32	G	Dynamic part (:*n*:) of last error message.
LAST	-	G	Last command placed on top of stack as data.
LAST-ALL	-	G	Last commands placed on top of stack as data.
LAST-COM	-	G	Last command moved to *COM.
MULTI	-	G	Places the last of multiple commands as data on top of the stack.
MULTI-COM	-	G	Places the last of multiple commands in the system variable *COM.

*G = Can be used with the GET **Option**.

*S = Can be used with the SET **Option**.

USING Clause

The contents of the fields in the USING clause specify, for example, the processor name and the command line.

Specified in the USING clause are fields to be sent to the command processor.

Option	Field Name			
	PROCESSOR-NAME	COMMAND-LINE	GETSET-FIELD-NAME	GETSET-FIELD-VALUE
CLOSE				
CHECK	mandatory	mandatory		
EXEC	mandatory	mandatory		
TEXT	mandatory	mandatory		
HELP	mandatory	mandatory		
GET	mandatory		mandatory	
SET	mandatory		mandatory	mandatory

GIVING Clause

Note: This clause can only be used in reporting mode.

Specified in the GIVING clause are fields to be filled by the command processor as a result of the processing of any option.

Option	Field Name			
	NATURAL-ERROR	RETURN-CODE	RESULT-FIELD	GETSET-FIELD-VALUE
CLOSE	recommended			
CHECK	recommended	mandatory	mandatory	
EXEC	recommended	mandatory	mandatory	
TEXT	recommended	mandatory	mandatory	
HELP	recommended	mandatory	mandatory	
GET	recommended			mandatory
SET	recommended			

Note: The GIVING clause is not available in structured mode, because there exists an implicit GIVING clause made up of all fields specified in the DEFINE DATA statement, which are usually referenced in the GIVING clause for reporting mode. This means that in structured mode all fields that are marked as "mandatory" in the table above must be defined in the DEFINE DATA statement.

DDM: COMMAND

The data definition module (DDM) COMMAND has been created specifically for use in conjunction with the PROCESS COMMAND statement:

```
DB:    1 File:    1 - COMMAND                          Default Sequence: ?

  TYL  DB  NAME                             F LENG  S D   REMARKS
  ---  --  -------------------------------- - ----  - -  ------------------------
    1  AA  PROCESSOR-NAME                   A    8  N D DE    USING
  M 1  AB  COMMAND-LINE                     A   80  N D MU/DE USING
    1  AF  GETSET-FIELD-NAME                A   32  N D DE    USING
    1  BA  NATURAL-ERROR                    N  4.0  N         GIVING
    1  BB  RETURN-CODE                      A    4  N         GIVING
  M 1  BC  RESULT-FIELD                     A   80  N   MU    GIVING
    1  BD  GETSET-FIELD-VALUE               A   32  N D       USING; GIVING
  ***** DDM OUTPUT TERMINATED ******
```

Note: To avoid possible compilation or runtime errors, please make sure that the DDM named COMMAND is cataloged as type C (field DDM Type on the SYSDDM Menu) before you use it. (If you re-catalog the DDM, any DBID/FNR specification in the SYSDDM utility will be ignored.)

The DDM COMMAND contains the following fields:

DDM Field	Explanation
PROCESSOR-NAME	The name of the command processor for which the PROCESS COMMAND statement is issued. The command processor specified must be cataloged.
COMMAND-LINE	The command line to be processed by the command processor (options CHECK, EXEC), or the keyword/command for which user text or help text is to be returned to the program (options TEXT, HELP). Note that this field may extend beyond one line.
GETSET-FIELD-NAME	This field is used with the options GET and SET and is used to specify the name of a constant or variable which is to be read (GET) or written (SET).
RETURN-CODE	This field contains the return code of an action resulting from the option EXEC or CHECK as specified within a Runtime Actions definition (see the Natural SYSNCP utility).
NATURAL-ERROR	This field is used in conjunction with all options. When the field is used in DEFINE DATA, then it returns the Natural error code for the command processor. When the field is absent, Natural runtime error processing is triggered if an error occurs.
RESULT-FIELD	This field contains information resulting from the use of various options as specified within a runtime action definition (see Runtime Actions in the Natural SYSNCP utility). Please note that this field may be more than one line.
GETSET-FIELD-VALUE	This field is used with the options GET and SET and contains the value of the constant or variable which is specified in the field GETSET-FIELD-NAME.

Examples

- Example 1 - PROCESS COMMAND ACTION CLOSE

- Example - PROCESS COMMAND ACTION EXEC2

Example 1 - PROCESS COMMAND ACTION CLOSE

```
/* EXAM-CLS - Example for PROCESS COMMAND ACTION CLOSE (Structured Mode)
/**********************************************************************
DEFINE DATA LOCAL
  01 COMMAND VIEW OF COMMAND
END-DEFINE
/*
PROCESS COMMAND ACTION CLOSE
/*
DEFINE WINDOW CLS
INPUT WINDOW = 'CLS'
  'NCPWORK has just been released.'
/*
END
```

Example - PROCESS COMMAND ACTION EXEC2

```
/* EXAM-EXS - Example for PROCESS COMMAND ACTION EXEC (Structured Mode)
/*********************************************************************
DEFINE DATA LOCAL
  01 COMMAND VIEW OF COMMAND
     02 PROCESSOR-NAME
     02 COMMAND-LINE (1)
     02 NATURAL-ERROR
     02 RETURN-CODE
     02 RESULT-FIELD (1)
  01 MSG (A65) INIT <'Please enter a command.'>
END-DEFINE
/*
REPEAT
  INPUT (AD=MIT' ' IP=OFF) WITH TEXT MSG
    'Example for PROCESS COMMAND ACTION EXEC (Structured Mode)' (I)
  / 'Command ==>' COMMAND-LINE (1) (AL=64)
  /*******
 PROCESS COMMAND ACTION EXEC
    USING
      PROCESSOR-NAME = 'DEMO'
      COMMAND-LINE (1) = COMMAND-LINE (1)
  /*******
  COMPRESS 'NATURAL-ERROR =' NATURAL-ERROR TO MSG
END-REPEAT
END
```

Note: You will find other example programs in the library `SYSNCP`. These programs all begin with `EXAM`.

98 PROCESS PAGE

- Function 636
- Syntax 1 - PROCESS PAGE 636
- Syntax 2 - PROCESS PAGE USING 639
- Syntax 3 - PROCESS PAGE UPDATE 642
- Syntax 4 - PROCESS PAGE MODAL 645
- Examples 647

Function

The `PROCESS PAGE` statement constitutes a general interface description to an external rendering engine, such as Natural for Ajax, thus linking the Natural internal data representation with an external data representation. Via this link, data and events, but no rendering information, are sent to and returned from an external, browser-based application.

For further information, refer to the *Natural for Ajax* documentation.

Syntax 1 - PROCESS PAGE

```
PROCESS PAGE [(parameter)] operand1
 [WITH PARAMETERS
  {[NAME] operand3 [VALUE] operand4 [(parameters)]} ...
 END-PARAMETERS]
 [GIVING operand11]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Screen Generation for Interactive Processing***

Syntax Description - Syntax 1

Syntax 1 of the `PROCESS PAGE` statement is normally only used inside a Natural adapter. An adapter is a Natural object that forms the interface between Natural application code and web page. It is automatically created/updated by Natural for Ajax when the layout is saved.

Note:

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A	U												yes	no
operand2		S	A													C			no	no
operand3	C	S				A	U												yes	no
operand4	C	S	A			A	U	N	P	I	F	B	D	T	L				yes	yes
operand5		S	A													C			no	no
operand11		S								I4									yes	yes

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td><code>parameter</code></td><td>Attribute Control Variable(s):
The parameter <code>CV</code>, enclosed within parentheses, may be specified to reference one or more attribute control variables as specified in <code>operand2</code>:

<code>(CV=operand2)</code>

See also Logical Condition Criteria, MODIFIED Option - Check whether Field Content has been Modified in the Programming Guide.</td></tr>
<tr><td><code>operand1</code></td><td>External Page Layout Name:
<code>operand1</code> contains the name of the external page layout.</td></tr>
<tr><td><code>operand2</code></td><td><code>operand2</code> contains the name of the attribute control variable, must be of format C and must be either a scalar or a single array occurrence.</td></tr>
<tr><td><code>operand3</code></td><td>Name of Attribute Control Variable(s):
<code>operand3</code> contains the name(s) of the external data field(s) <code>operand4</code> will be transferred to/from.</td></tr>

</table></td></tr>
<tr><td><code>operand5</code></td><td>Name of Attribute Control Variable:
<code>operand5</code> contains the name of the attribute control variable. The variable must be of format C.

If <code>operand4</code> is a scalar or a single array occurrence, <code>operand5</code> must be
a scalar
or a single array occurrence.</td></tr>
</table>

Syntax Element	Description
	If *operand4* is the full range of an array of dimension 1, *operand5* must be ■ a scalar ■ or a single array occurrence ■ or the full range of an array of dimension 1 with the same size. If *operand4* is the full range of an array of dimension 2, *operand5* must be ■ a scalar ■ or a single array occurrence ■ or the full range of an array of dimension 2 with the same size in both dimensions ■ or the full range of an array of dimension 1 with the same size that *operand4* has in dimension 1. If *operand4* is the full range of an array of dimension 3, *operand5* must be ■ a scalar ■ or a single array occurrence ■ or the full range of an array of dimension 3 with the same size in all three dimensions ■ or the full range of an array of dimension 2 with the same size that *operand4* has in dimension 1 and 2 ■ or the full range of an array of dimension 1 with the same size that *operand4* has in dimension 1.
GIVING *operand11*	**GIVING Clause:** *operand11* contains the Natural error if the request could not be performed.

Example of an adapter which has been created by Natural for Ajax:

```
* PAGE1: PROTOTYPE       --- CREATED BY Natural for Ajax ---
* PROCESS PAGE USING 'XXXXXXXX' WITH
* INFOPAGENAME RESULT YOURNAME
DEFINE DATA PARAMETER
1 INFOPAGENAME (U) DYNAMIC
1 RESULT (U) DYNAMIC
1 YOURNAME (U) DYNAMIC
END-DEFINE
*
PROCESS PAGE U'/njxdemos/helloworld' WITH
PARAMETERS
 NAME U'infopagename'
  VALUE INFOPAGENAME
 NAME U'result'
  VALUE RESULT
 NAME U'yourname'
```

```
  VALUE YOURNAME
END-PARAMETERS
*
*  TODO: Copy to your calling program and implement.
/*/*( DEFINE EVENT HANDLER
* DECIDE ON FIRST *PAGE-EVENT
*  VALUE U'nat:page.end'
*   /* Page closed.
*   IGNORE
*  VALUE U'onHelloWorld'
*   /* TODO: Implement event code.
*   PROCESS PAGE UPDATE FULL
*  NONE VALUE
*   /* Unhandled events.
*   PROCESS PAGE UPDATE
* END-DECIDE
/*/*) END-HANDLER
*
END
```

Syntax 2 - PROCESS PAGE USING

```
PROCESS PAGE USING operand6
    [ {   WITH {operand7} ...  }   ]
          NO PARAMETER
 [GIVING operand11]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Screen Generation for Interactive Processing***

Syntax Description - Syntax 2

This syntax is used to perform rich GUI input/output processing using an object of type adapter that has been generated from a page layout created with Natural for Ajax or a similar tool.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand6	C	S				A													yes	no
operand7		S	A	G		A	U	N	P	I	F	B	D	T	L	C			yes	yes
operand11		S								I4									yes	yes

Syntax Element Description:

Syntax Element	Description
`USING` *operand6*	**Adapter Name:** Invokes an adapter definition which has been previously stored in a Natural system file. See also *Processing a Rich GUI Page - Adapter* in the *Programming Guide*. The adapter name (*operand4*) may be a 1 to 8 character alphanumeric constant or user-defined variable. If a variable is used, it must have been defined previously. The adapter name may contain an ampersand (&); at execution time, this character will be replaced by the current value of the Natural system variable `*LANGUAGE`. This feature is provided for historical reasons. If you need multi-lingual adapters, use the capability of the external rendering system (for example, Natural for Ajax). **Note:** New applications do not need the ampersand feature to be multilingual. Pages designed, for example, using Natural for Ajax, can hold multilingual information as part of the layout design. See *Multi Language Management* in the *Natural for Ajax* documentation.
operand7	**Field Specification:** A list of database fields and/or user-defined variables, all of which must have been defined previously. The fields must agree in number, sequence, format, length and (for arrays) number of occurrences with the fields in the referenced adapter; otherwise, an error occurs. When the content of a database field is modified as a result of `PROCESS PAGE` processing, only the value as contained in the data area is modified. In order to change the content of the database, appropriate database `UPDATE`/`STORE` statements must be used. See ***PROCESS PAGE USING Fields Defined in the Program***.
`NO PARAMETER`	**NO PARAMETER Option:** See ***PROCESS PAGE USING without Parameter List***.
`GIVING` *operand11*	**GIVING Clause:** *operand11* contains the Natural error if the request could not be performed.

Syntax Element	Description
	Note: The GIVING clause interrupts the common Natural error handling, if an error occurs while the adapter object is being activated or executed. Instead of back-tracking the Natural modules in order to find an ON ERROR clause, the Natural error code is passed to a variable (*operand9*) and execution is continued with the next statement.

PROCESS PAGE USING without Parameter List

The following requirements must be met when PROCESS PAGE USING is used without parameter list:

- The adapter name (*operand7*) must be specified as an alphanumeric constant (up to 8 characters).
- The adapter used in this manner must have been created prior to the compilation of the program which references the adapter.
- The names of the fields to be processed are taken dynamically from the adapter source definition at compilation time. The field names used in both program and adapter must be identical.
- All fields to be referenced in the PROCESS PAGE statement must be accessible at that point.
- In structured mode, fields must have been defined previously (database fields must be properly referenced to processing loops or views).
- When the page layout is changed, the programs using the adapter need not be recataloged. However, when array structures or names, formats/lengths of fields are changed, or fields are added/deleted in the adapter, the programs using the adapter must be recataloged.
- The adapter source must be available at program compilation; otherwise, the PROCESS PAGE USING statement cannot be compiled.

> **Note:** If you wish to compile the program even if the adapter is not yet available, specify NO PARAMETER. The PROCESS PAGE USING statement can then be compiled even if the adapter is not yet available.

PROCESS PAGE USING Fields Defined in the Program

By specifying the names of the fields to be processed within the program (*operand7*), it is possible to have the names of the fields in the program differ from the names of the fields in the adapter.

The sequence of fields in the program must match the sequence in the adapter. If you use Natural maps as adapter objects, note that the map editor sorts the fields as specified in the map in alphabetical order by field name. For more information, see the map editor description in your *Editors* documentation.

The program editor line command .I(*adaptername*) can be used to obtain a complete PROCESS PAGE USING statement with a parameter list derived from the fields defined in the specified adapter.

When the layout of the adapter is changed, the program using the adapter does not need to be recataloged. However, when field names, field formats/lengths, or array structures in the adapter are changed or fields are added or deleted in the adapter, the program must be recataloged.

A check is made at execution time to ensure that the format and length of the fields as specified in the program match the fields as specified in the adapter. If both layouts do not agree, an error message is produced.

Syntax 3 - PROCESS PAGE UPDATE

```
PROCESS PAGE UPDATE [FULL] []
 event-option[GIVING operand11]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Screen Generation for Interactive Processing***

Syntax Description - Syntax 3

The PROCESS PAGE UPDATE statement is used to return to and re-execute a PROCESS PAGE statement. It is generally used to return from event processing that the data input processing of the preceding PROCESS PAGE statement was incomplete.

Note: No INPUT, WRITE, PRINT or DISPLAY statements may be executed between a PROCESS PAGE statement and its corresponding PROCESS PAGE UPDATE statement.

The PROCESS PAGE UPDATE statement, when executed, repositions the program status regarding subroutine, special condition and loop processing as it existed when the PROCESS PAGE statement was executed (as long as the status of the PROCESS PAGE statement is still active). If the loop was initiated after the execution of the PROCESS PAGE statement and the PROCESS PAGE UPDATE statement is within this loop, the loop will be discontinued and then restarted after the PROCESS PAGE statement has been reprocessed as a consequence of the PROCESS PAGE UPDATE statement.

If a hierarchy of subroutines was invoked after the execution of the PROCESS PAGE statement, and the PROCESS PAGE UPDATE is performed within a subroutine, Natural will trace back all subroutines automatically and reposition the program status to that of the PROCESS PAGE statement.

It is not possible, however, to have a PROCESS PAGE statement positioned within a loop, a subroutine or a special condition block, and then execute the PROCESS PAGE UPDATE statement when the status under which the PROCESS PAGE statement was executed has already been terminated. An error message will be produced and program execution terminated when this error condition is detected.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand11		S								I4									yes	yes

Syntax Element Description:

Syntax Element	Description
`FULL`	**FULL Option:** If you specify the `FULL` option in a `PROCESS PAGE UPDATE` statement, the corresponding `PROCESS PAGE` statement will be re-executed fully: ■ With an ordinary `PROCESS PAGE UPDATE` statement (without `FULL` option), the contents of variables that were changed between the `PROCESS PAGE` and `PROCESS PAGE UPDATE` statement will not be displayed; that is, all variables on the screen will show the contents they had when the `PROCESS PAGE` statement was originally executed. ■ With a `PROCESS PAGE UPDATE FULL` statement, all changes that have been made after the initial execution of the `PROCESS PAGE` statement will be applied to the `PROCESS PAGE` statement when it is re-executed; that is, all variables on the screen contain the values they had when the `PROCESS PAGE UPDATE` statement was executed.
event-option	**EVENT Option:** See ***EVENT Option*** below.
`GIVING` (*operand11*)	**GIVING Clause:** *operand11* contains the Natural error if the request could not be performed.

Example User Program Fragment:

```
PROCESS PAGE USING "HELLOW-A"
*
/*( DEFINE EVENT HANDLER
DECIDE ON FIRST *PAGE-EVENT
 VALUE U'nat:page.end'
  /* Page closed.
  IGNORE
 VALUE U'onHelloWorld'
  COMPRESS "HELLO WORLD" YOURNAME INTO RESULT
  PROCESS PAGE UPDATE FULL
 NONE VALUE
  /* Unhandled events.
  PROCESS PAGE UPDATE
```

```
END-DECIDE
/*) END-HANDLER
```

EVENT Option

```
AND SEND EVENT operand8
 [WITH PARAMETERS

  {[NAME] operand9 [VALUE] operand10 [ { (EMU=value) } ]}...
                                       { (EM=value)  }

 END-PARAMETERS]
```

With this option, you can advise the external I/O system to run specific functions. These functions are part of the external I/O system or implement special functions regarding the output processing as setting of focus, displaying message boxes, etc.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand8	C	S				A	U												yes	no
operand9	C	S				A	U												yes	no
operand10	C	S	A			A	U	N	P	I	F	B	D	T	L				yes	yes

Syntax Element Description:

Syntax Element	Description
`AND SEND EVENT operand8`	**Event Requested from the External I/O System:** Depending on the implementation of the external I/O system, events are available, refer to *Sending Events to the User Interface* in the *Natural for Ajax* documentation.
`WITH PARAMETERS`	**WITH PARAMETERS Clause:** With this clause, you can specify the following:
`NAME operand9`	**External Data Field Name:** *operand9* contains the external name of the data fields *operand10* will be transferred to/from.
`VALUE operand10`	**Natural Data Fields:** *operand10* contains the Natural data fields which will be transferred.
`EMU=` `EM=`	**Edit Mask:** Edit mask used during data transfer.

Syntax Element	Description
	For details on edit masks, see the session parameter EM in the *Parameter Reference*. For details on Unicode edit masks, see the session parameter EMU in the *Parameter Reference*.
END-PARAMETERS	**End of WITH PARAMETERS Clause:** The Natural reserved word END-PARAMETERS must be used to end the WITH PARAMETERS clause.

Syntax 4 - PROCESS PAGE MODAL

```
PROCESS PAGE MODAL
  statement ...
END-PROCESS
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ESCAPE | PROCESS PAGE

Belongs to Function Group:

- **Loop Execution**
- **Screen Generation for Interactive Processing**

Syntax Description - Syntax 4

The PROCESS PAGE MODAL statement is used to initiate a processing block and to control the lifetime of a modal rich GUI window.

Note: The PROCESS PAGE MODAL statement is not valid in batch mode.

When the PROCESS PAGE MODAL statement block is entered, data from Report 0 which is not displayed yet will be displayed first.

The system variable *PAGE-LEVEL is incremented and the opening of a modal page is prepared. The physical opening of the modal page will be performed with the next PROCESS PAGE USING '*adapter*' WITH statement.

Note: No PRINT, WRITE, INPUT or DISPLAY statements referring to Report 0 may be executed between a PROCESS PAGE MODAL statement and its corresponding END-PROCESS statement.

Leaving the `PROCESS PAGE MODAL` statement block causes the following actions to be performed:

- if a modal page has been opened for this level, the modal page will be closed;
- the system variable `*PAGE-LEVEL` is decremented and the system variable `*PAGE-EVENT` is set back to the value it had before the statement block was entered.

Syntax Element Description:

Syntax Element	Description
statement	**Statement(s) to be Executed:** In place of *statement*, you must supply one or several suitable statements, depending on the situation. If you do not want to supply a specific statement, you may insert the `IGNORE` statement.
`END-PROCESS`	**End of PROCESS PAGE MODAL Statement:** The Natural reserved word `END-PROCESS` must be used to end the `PROCESS PAGE MODAL` statement.

Example:

```
* Name: First Demo/Open modal!
*
PROCESS PAGE USING "EMPTY-A"
*
/*( DEFINE EVENT HANDLER
DECIDE ON FIRST *PAGE-EVENT
  VALUE U'nat:page.end', U'onClose'
    /* Page closed.
    IGNORE
  VALUE U'onNextLevel'
    PROCESS PAGE MODAL
      FETCH RETURN "EMPTY-P"
    END-PROCESS
    PROCESS PAGE UPDATE
  NONE VALUE
    PROCESS PAGE UPDATE
END-DECIDE
/*) END-HANDLER
END
```

Examples

Further examples of using the `PROCESS PAGE` statement are contained in library `SYSEXNJX`.

99 PROPERTY

- Function 650
- Syntax Description 650
- Example 651

```
PROPERTY property-name
  OF [INTERFACE] interface-name
  IS operand
END-PROPERTY
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CREATE OBJECT | DEFINE CLASS | INTERFACE | METHOD | SEND METHOD

Belongs to Function Group: ***Component Based Programming***

Function

The PROPERTY statement assigns an object data variable operand as the implementation to a property, outside an interface definition.

It is used if the interface definition in question is included from a copycode and is to be implemented in a class-specific way.

It may only be used within the DEFINE CLASS statement and after the interface definitions.

The interface and property names specified must be defined in the INTERFACE clause of the DEFINE CLASS statement.

Syntax Description

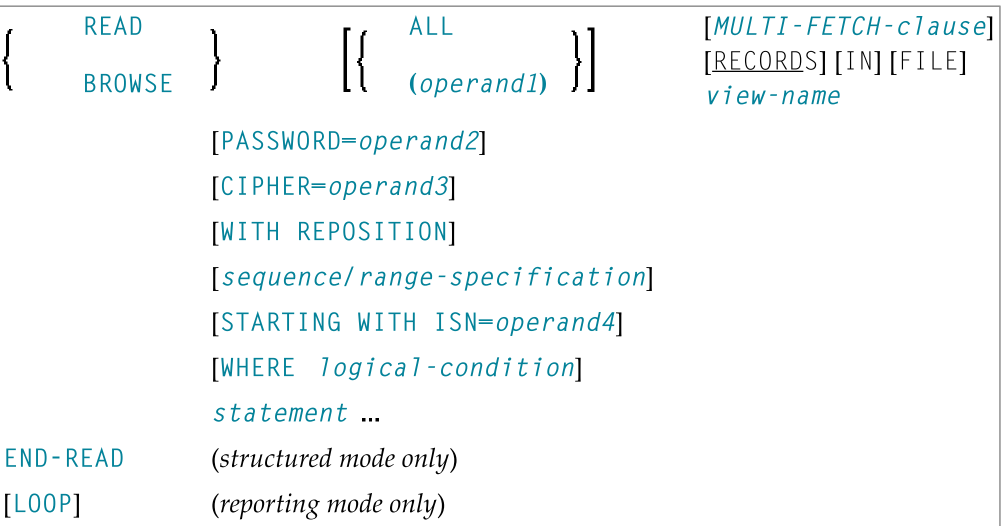
Syntax Element	Description
property-name	**Property Name:** This is the name assigned to the property.
OF *interface-name*	**Interface Name:** This is the name assigned to the interface.
IS *operand*	**IS Clause:** The *operand* in the IS clause assigns an object data variable as the place to store the property value.
END-PROPERTY	**End of PROPERTY Statement:** The Natural reserved word END-PROPERTY must be used to end the PROPERTY statement.

Example

The **example** contained in the documentation of the `METHOD` statement shows how the same interface is implemented differently in two classes, and how the `PROPERTY` statement and the `METHOD` statement are used to achieve this.

100 READ

- Function 654
- Syntax Description 655
- System Variables Available with READ 664
- Examples 665



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | GET TRANSACTION DATA | DELETE | END TRANSACTION | FIND | HISTOGRAM | GET | GET SAME | LIMIT | PASSW | PERFORM BREAK PROCESSING | RETRY | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The READ statement is used to read records from a database. The records can be retrieved in physical sequence, in Adabas ISN sequence, or in the value sequence of a descriptor (key) field.

This statement causes a processing loop to be initiated.

See also *READ Statement* in the *Programming Guide*.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S						N	P	I		B *							yes	no
operand2	C	S				A													yes	no
operand3	C	S						N											yes	no
operand4	C	S						N	P	I		B *							yes	no

[*] Format B of *operand1* and *operand4* may be used with a length of less than or equal to 4.

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>operand1</td><td>
Number of Records to be Read:

The number of records to be read may be limited by specifying operand1 (enclosed in parentheses, immediately after the keyword READ) - either as a numeric constant (0 - 4294967295) or as a variable, enclosed within parentheses, immediately after the keyword READ. For example:

READ (5) IN EMPLOYEES ...

MOVE 10 TO CNT(N2)
READ (CNT) EMPLOYEES ...

For this statement, the specified limit has priority over a limit set with a LIMIT statement.

If a smaller limit is set with the profile or session parameter LT, the LT limit applies.

Note:

1. If you wish to read a 4-digit number of records, specify it with a leading zero: (0nnnn); because Natural interprets every 4-digit number enclosed in parentheses as a line-number reference to a statement.
2. operand1 is evaluated when the READ loop is entered. If the value of operand1 is modified within the READ loop, this does not affect the number of records read.
</td></tr>
</table>

Syntax Element	Description
`ALL`	**ALL Option:** To emphasize that *all* records are to be read, you can optionally specify the keyword `ALL`.
`MULTI-FETCH-clause`	**MULTI-FETCH Clause:** See ***MULTI-FETCH Clause*** below.
`view-name`	**View Name:** As *`view-name`*, you specify the name of a view, which must have been defined either within a `DEFINE DATA` statement or outside the program in a global or local data area. In reporting mode, *`view-name`* is the name of a DDM if no `DEFINE DATA LOCAL` statement is used.

`PASSWORD`
 	
`CIPHER`
	PASSWORD and CYPHER Clauses:
	
	These clauses are applicable only to Adabas databases. They cannot be used with Entire System Server.
	
	The `PASSWORD` clause is used to provide a password when retrieving data from a file which is password-protected.
	
	The `CIPHER` clause is used to provide a cipher key when retrieving data from a file which is enciphered.
	
	See the statements `FIND` and `PASSW` for further information.

`WITH REPOSITION`	**WITH REPOSITION Option:** This option is used to make the `READ` statement sensitive for repositioning events. See ***WITH REPOSITION Option***.
`sequence/range-specification`	**Sequence/Range Specification:** This option specifies the sequence and/or the range of retrieval. See ***Sequence/Range Specification***.
`STARTING WITH ISN=`*`operand4`*	**STARTING WITH ISN Clause:** This clause applies only to Adabas databases. **Access to Adabas** This clause can be used in conjunction with a `READ` statement in physical or in logical (ascending/descending) sequence. The value supplied (*`operand4`*) represents an Adabas ISN (Internal Sequence Number) and is used to specify a definite record where to start the `READ` loop.

Syntax Element	Description
	■ **Logical Sequence** Even if documented with an equal character (=), the READ statement does not return only those records with exactly the start value in the corresponding descriptor field, but starts a logical browse in ascending or descending order, beginning with the start value supplied. If some records have the same contents in the descriptor field, they will be returned in an ISN-sorted sequence. The STARTING WITH ISN clause is some kind of a “second level” selection criterion that applies only if the start value matches the descriptor value for the first record. All records with a descriptor value that is the same as the start value and an ISN that is “less equal”(“greater equal” for a descending READ) than the start ISN are ignored by Adabas. The first record returned in the READ loop is either ■ the first record with descriptor = start value and an ISN “greater” (“less” for a descending READ) than the start ISN, ■ or if such a record does not exist, the first record with a descriptor “greater” (“less” for a descending READ) than the start value. ■ **Physical Sequence** The records are returned in the order in which they are physically stored. If a STARTING WITH ISN clause is specified, Adabas ignores all records until the record with the ISN that is the same as the start ISN is reached. The first record returned is the next record following the ISN=start ISN record. **Examples** This clause may be used for repositioning within a READ loop whose processing has been interrupted, to easily determine the next record with which processing is to continue. This is particularly useful if the next record cannot be identified uniquely by any of its descriptor values. It can also be useful in a distributed client/server application where the reading of the records is performed by a server program while further processing of the records is performed by a client program, and the records are not processed all in one go, but in batches. For an example, see the program REASISND below.
WHERE *logical-condition*	**WHERE Clause** See ***WHERE Clause*** below.
END-READ	**End of READ Statement:** The Natural reserved keyword END-READ must be used to end the READ statement.

MULTI-FETCH Clause

Note: This clause can only be used for Adabas databases.

```
[ MULTI-FETCH { ON                      } ]
              { OFF                     }
              { OF multi-fetch-factor   }
```

Note: `[MULTI-FETCH OF multi-fetch-factor]` is not evaluated for database types `ADA` and `ADA2`. The default processing mode is applied; see profile parameter `MFSET`. When used in conjunction with database type `ADA2`, the Multi-Fetch Clause is ignored completetly; see *Database Management System Assignments* in the *Configuration Utility* documentation.

For more information, see the section *Multi-Fetch Clause* (Adabas) in the *Programming Guide*.

WITH REPOSITION Option

Note: This option can only be applied if the underlying database is Adabas.

With a `WITH REPOSITION` option, you can make a `READ` statement sensitive for repositioning events. This allows you to reposition to another start value within an active `READ` loop. Processing of the `READ` statement then continues with the new start value.

A repositioning event is triggered by one of two ways when you use a `READ` statement with the `WITH REPOSITION` option:

1. When an `ESCAPE TOP REPOSITION` statement is executed. At execution of an `ESCAPE TOP REPOSITION` statement, Natural makes an instant branch to the loop begin and performs a restart; that is, the database repositions to a new record in the file according to the current content of the search value variable. At the same time, the loop-counter `*COUNTER` is reset to zero.
2. When a `READ` loop tries to fetch the next record from the database and the value of the system variable `*COUNTER` is `0`.

   Note: If `*COUNTER` is set to `0` within the active `READ` loop, processing of the current record is continued; no instant branch to the loop begin is performed.You cannot trigger a reposition event in this fashion on Natural for Windows, UNIX and OpenVMS. This functionality has only been retained for compatibility reasons with Natural Version 3.1 for Mainframes. Therefore, it is not recommended that you use this process.

Functional Considerations

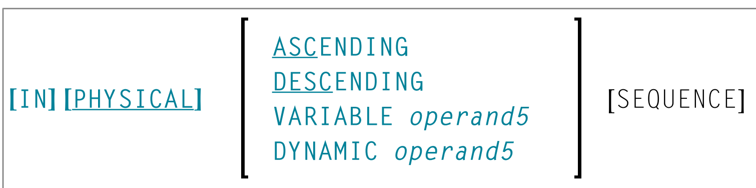
- If the `READ` statement has a loop-limit (e.g. `READ (10) EMPLOYEES WITH REPOSITION ..`) and a restart event was triggered, the loop gets another 10 new records, no matter how many records where already processed until the repositioning takes place.

- If an ESCAPE TOP REPOSITION statement is executed, but the innermost loop is not capable of repositioning (since the WITH REPOSITION keyword is not set in the READ statement or the posted loop statement is anything else but a READ), a corresponding runtime error is issued.
- Since the ESCAPE TOP statement does not allow a reference, you can only initiate a reposition event if the innermost processing loop is a READ ..WITH REPOSITION statement.
- A reposition event does not trigger the execution of the AT START OF DATA section, nor does it trigger the re-evaluation of the loop-limit operand (if it is a variable).
- If the search value was not altered, the loop repositions to the same record like at initial loop start.

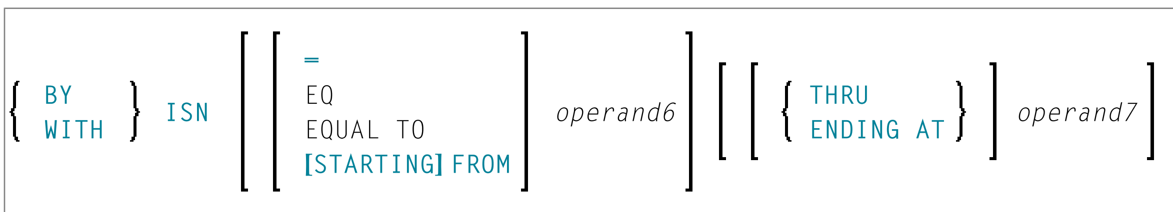
Sequence/Range Specification

Three syntax options are available to specify the sequence and/or the range of retrieval.

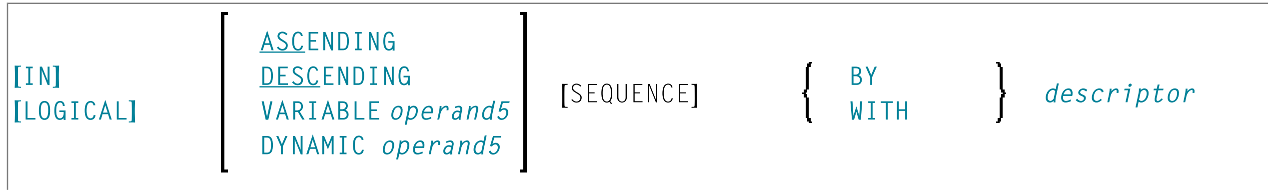
Syntax Option 1:

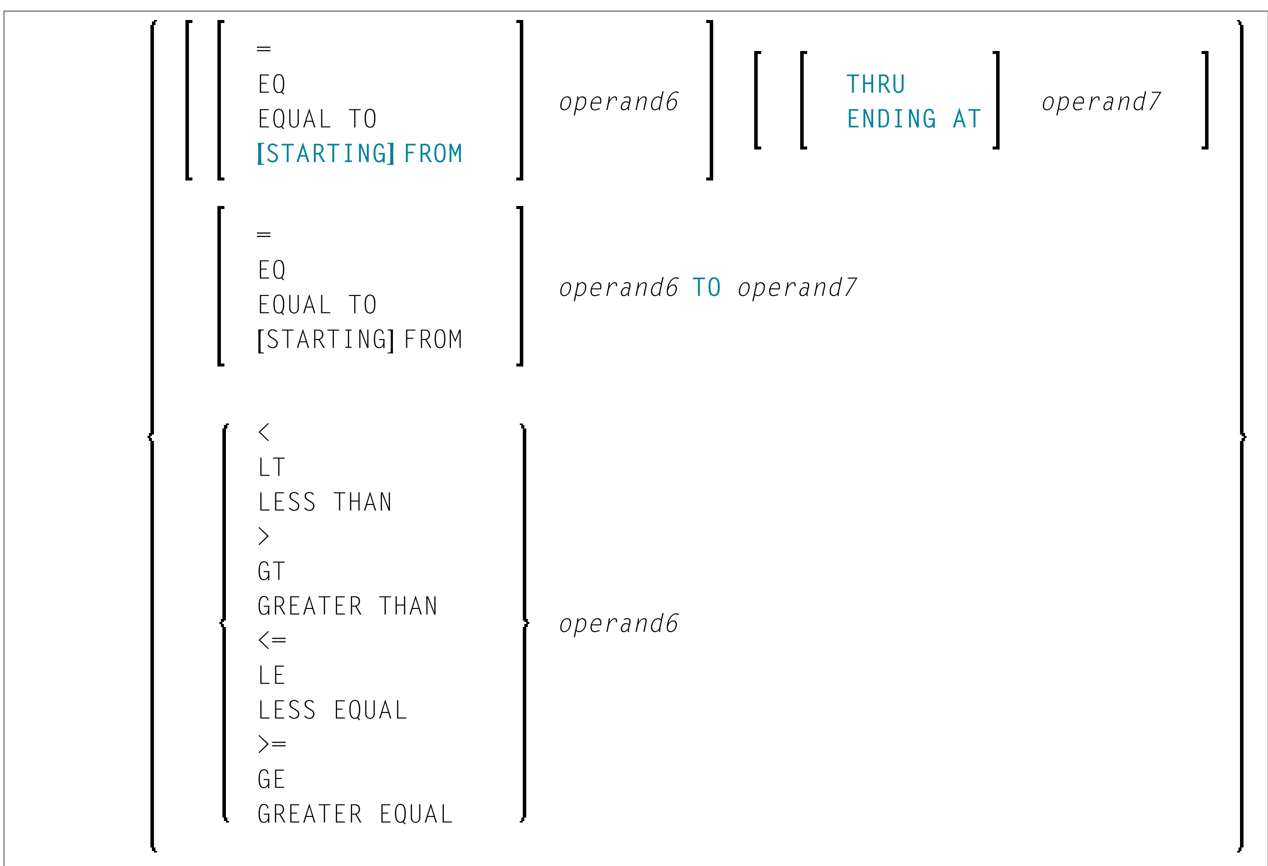


Syntax Option 2:



Syntax Option 3:





Notes:

1. The syntax options [2] and [3] are not available with Entire System Server.
2. If the comparators of Diagram 3 are used, the options `ENDING AT`, `THRU` and `TO` may not be used. These comparators are also valid for the `HISTOGRAM` statement.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand5		S				A													yes	no
operand6	C	S				A		N	P	I	F	B *	D	T	L				yes	no
operand7	C	S				A		N	P	I	F	B *	D	T	L				yes	no

* Format B of *operand6* and *operand7* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
READ IN PHYSICAL SEQUENCE	**Read in Physical Sequence:** This option is used to read records in the order in which they are physically stored in a database. PHYSICAL is the default sequence.
READ BY ISN	**Read by ISN:** This option is used to read records in the order of Adabas ISNs (internal sequence numbers). (Instead of using the keyword BY, you may specify the keyword WITH, which would have the same effect). READ BY ISN can only be used for Adabas databases. **Note:** For XML databases: READ BY ISN is used to read XML objects according to the order of Tamino object IDs.
READ IN LOGICAL SEQUENCE	**Read in Logical Sequence:** This option is used to read records in the order of the values of a descriptor (key) field. If you specify a descriptor, the records will be read in the value sequence of the descriptor. A descriptor, subdescriptor, superdescriptor or hyperdescriptor may be used for sequence control. A phonetic descriptor, a descriptor within a periodic group, or a superdescriptor which contains a periodic-group field cannot be used. If you do not specify a descriptor, the default descriptor as specified in the DDM (field Default Sequence) will be used. If the descriptor used for sequence control is defined with null-value suppression (Adabas only), any record which contains a null value for the descriptor will not be read. If the descriptor is a multiple-value field (Adabas only), the same record will be read multiple times depending on the number of values present. **Note:** READ IN LOGICAL SEQUENCE is also discussed in the *Programming Guide*; see *Statements for Database Access*, *READ Statement*.
ASCENDING | DESCENDING | VARIABLE | DYNAMIC SEQUENCE	**Ascending/Descending Order:** This clause only applies to Adabas, XML databases and SQL databases. In a READ PHYSICAL statement, it can only be applied to DB2 databases. With this clause, you can determine whether the records are to be read in ascending sequence or in descending sequence. ■ The default sequence is ascending (which may, but need not, be explicitly specified by using the keyword ASCENDING).

Syntax Element	Description

	■ If the records are to be read in descending sequence, you specify the keyword `DESCENDING`.
	■ If, instead of determining it in advance, you want to have the option of determining at runtime whether the records are to be read in ascending or descending sequence, you either specify the keyword `VARIABLE` or `DYNAMIC`, followed by a variable (*operand5*). *operand5* has to be of format/length A1 and can contain the value `A` (for "ascending") or `D` (for "descending").
	  ■ If keyword `VARIABLE` is used, the reading direction (value of *operand5*) is evaluated at start of the `READ` processing loop and remains the same until the loop is terminated, regardless if the *operand5* field is altered in the `READ` loop or not.
	  ■ If keyword `DYNAMIC` is used, the reading direction (value of *operand5*) is evaluated before every record fetch in the `READ` processing loop and may be changed from record to record. This allows to change the scroll sequence from ascending to descending (and vice versa) at any place in the `READ` loop.
	Note:
	1. For XML databases: `DYNAMIC SEQUENCE` is not available.

`STARTING FROM ... ENDING AT/TO`	**STARTING FROM/ENDING AT Clauses:** The `STARTING FROM` and `ENDING AT` clauses are used to limit reading to a set of records based on a user-specified range of values. The `STARTING FROM` clause (= or `EQ` or `EQUAL TO` or `[STARTING] FROM`) determines the starting value for the read operation. If a starting value is specified, reading will begin with the value specified. If the starting value does not exist in the file, the next higher (or lower for a `DESCENDING` read) value will be used. If no higher (or lower for `DESCENDING`) value exists, the loop will not be entered. In order to limit the records to an end-value, you may specify an `ENDING AT` clause with the terms `THRU`, `ENDING AT` or `TO`, that imply an inclusive range. Whenever the read descriptor field exceeds the end-value specified, an automatic loop termination is performed. Although the basic functionality of the `TO`, `THRU` and `ENDING AT` keywords looks quite similar, internally they differ in how they work.
`THRU/ENDING AT`	**THRU/ENDING AT Option:** If `THRU` or `ENDING AT` is used, only the start-value is supplied to the database, but the end-value check is performed by the Natural runtime system, after the record is returned by the database. If the read direction is `ASCENDING`, you have to supply the lower value as the start-value and the higher-value as the end-value, since the start-value represents the value (and record) returned first in the `READ` loop. However, if you invoke a backwards read (`DESCENDING`), the higher value has to appear in the start-value and the lower-value in the end-value. Internally, to determine the end of the range to be read, Natural reads one record beyond the end-value. If you have left the `READ` loop because the end-value has been reached,

Syntax Element	Description
	be aware that this last record is in fact not the last record within the demanded range, but the first record beyond that range (except if the file does not contain a further record after the last result record). The THRU and ENDING AT clauses can be used for all databases which support the READ or HISTOGRAM statements.
TO	**TO Option:** If the keyword TO is used, both the start-value and the end-value are sent to the database, and Natural does not perform checks for value ranges. If the end-value is exceeded, the database reacts the same as when "end-of-file" is reached, and the database loop is exited. Since the complete range checking is done by the database, the lower-value (of the range) is always supplied in the start-value and the higher-value filled into the end-value, regardless if you are browsing in ASCENDING or DESCENDING order. The TO option is only applicable if the underlying database is Adabas Version 3.1.1 on UNIX, OpenVMS or Windows, Adabas Version 7 (or above) on mainframes, Tamino or an SQL database.

Notes on Functional Differences between THRU/ENDING AT and TO

The following list describes the functional differences between the usage of the THRU/ENDING AT and TO options.

THRU/ENDING AT	TO
When the READ loop terminates because the end-value has been reached, the view contains the first record "out-of-range".	When the READ loop terminates because the end-value has been reached, the view contains the last record of the specified range.
If a end-value variable is modified during the READ loop, the new value will be used for end-value check on next record being read.	The end-value variable will only be evaluated at READ loop start. All further modifications during the READ loop have no effect.
An incorrect range (for example, READ .. = 'B' THRU 'A') does not cause a database error, but just returns no record.	An incorrect range results in a database error (for example, Adabas RC=61), because a value range must not be supplied in descending order.
If a READ .. DESCENDING is used with start- and end-value, the start value is used to position in the file, whereas the end-value is used by Natural to check for "end-of-range". Therefore the start-value is higher than (or equal to) the end-value.	Since both values are passed to the database, they have to appear in ascending order. In other words, the start-value is lower than (or equal to) the end-value, no matter if you are reading in ascending or descending order.
In order to check for range overflow, the descriptor value has to appear in the underlying database view; that is, it must be returned in the record buffer.	The descriptor is not required in the record fields returned.
The end-value check for an Adabas multi-value field (MU-field) or a sub-/super-/hyper-descriptor is not	You may specify an end-value for MU-fields and sub-/super-/hyper-descriptors.

THRU/ENDING AT	TO
possible and leads to syntax error NAT0160 at program compilation.	
Can be used for all databases.	Can only be used for Adabas Version 3.1.1 on Windows, UNIX or OpenVMS, Adabas Version 7 (or above) on mainframes, Tamino or an SQL database.

WHERE Clause

```
WHERE logical-condition
```

The WHERE clause may be used to specify an additional selection criterion (*logical-condition*) which is evaluated *after* a value has been read and *before* any processing is performed on the value (including the AT BREAK evaluation).

The syntax for a *logical-condition* is described in the section *Logical Condition Criteria* in the *Programming Guide*.

If a LIMIT statement or a processing limit is specified in a READ statement containing a WHERE clause, records which are rejected as a result of the WHERE clause are not counted against the limit.

System Variables Available with READ

The Natural system variables *ISN and *COUNTER are available with the READ statement.

The format/length of these system variables is P10. This format/length cannot be changed.

The usage of the system variables is illustrated below.

*ISN	The system variable *ISN contains the Adabas ISN of the record currently being processed.
*COUNTER	The system variable *COUNTER contains the number of times the processing loop has been entered.

Examples

- Example 1 - READ Statement
- Example 2 - READ WITH REPOSITION
- Example 3 - Combining READ and FIND Statements
- Example 4 - DESCENDING Option
- Example 5 - VARIABLE Option
- Example 6 - DYNAMIC Option
- Example 7 - STARTING WITH ISN Clause

Example 1 - READ Statement

```
** Example 'REAEX1S': READ (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
1 VEHIC-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
  2 MAKE
END-DEFINE
*
LIMIT 3
*
WRITE 'READ IN PHYSICAL SEQUENCE'
READ EMPLOY-VIEW IN PHYSICAL SEQUENCE
  DISPLAY NOTITLE PERSONNEL-ID NAME *ISN *COUNTER
END-READ
*
WRITE / 'READ IN ISN SEQUENCE'
READ EMPLOY-VIEW BY ISN STARTING FROM 1 ENDING AT 3
  DISPLAY         PERSONNEL-ID NAME *ISN *COUNTER
END-READ
*
WRITE / 'READ IN NAME SEQUENCE'
READ EMPLOY-VIEW BY NAME
  DISPLAY         PERSONNEL-ID NAME *ISN *COUNTER
END-READ
*
WRITE / 'READ IN NAME SEQUENCE STARTING FROM ''M'''
READ EMPLOY-VIEW BY NAME STARTING FROM 'M'
  DISPLAY         PERSONNEL-ID NAME *ISN *COUNTER
END-READ
*
END
```

Output of Program REAEX1S:

```
PERSONNEL         NAME              ISN         CNT
   ID
--------- -------------------- ----------- -----------

READ IN PHYSICAL SEQUENCE
50005800  ADAM                           1           1
50005600  MORENO                         2           2
50005500  BLOND                          3           3

READ IN ISN SEQUENCE
50005800  ADAM                           1           1
50005600  MORENO                         2           2
50005500  BLOND                          3           3

READ IN NAME SEQUENCE
60008339  ABELLAN                      478           1
30000231  ACHIESON                     878           2
50005800  ADAM                           1           3

READ IN NAME SEQUENCE STARTING FROM 'M'
30008125  MACDONALD                    923           1
20028700  MACKARNESS                   765           2
40000045  MADSEN                       508           3
```

Equivalent reporting-mode example: **REAEX1R**.

Example 2 - READ WITH REPOSITION

```
DEFINE DATA LOCAL
1 MYVIEW VIEW OF ...
  2 NAME
1 #STARTVAL (A20) INIT <'A'>
1 #ATTR     (C)
END-DEFINE
...
SET KEY PF3
...
READ MYVIEW WITH REPOSITION BY NAME = #STARTVAL
INPUT (IP=OFF AD=O) 'NAME:' NAME /
    'Enter new start value for repositioning:' #STARTVAL (AD=MT CV=#ATTR) /
    'Press PF3 to stop'
  IF *PF-KEY = 'PF3'
    THEN STOP
  END-IF
  IF #ATTR MODIFIED
    THEN ESCAPE TOP REPOSITION
  END-IF
```

```
END-READ
...
```

```
DEFINE DATA LOCAL
1 MYVIEW VIEW OF ...
  2 NAME
1 #STARTVAL (A20) INIT <'A'>
1 #ATTR     (C)
END-DEFINE
...
SET KEY PF3
...
READ MYVIEW WITH REPOSITION BY NAME = #STARTVAL
  INPUT (IP=OFF AD=O) 'NAME:' NAME /
    'Enter new start value for repositioning:' #STARTVAL (AD=MT CV=#ATTR) /
    'Press PF3 to stop'
  IF *PF-KEY = 'PF3'
    THEN STOP
  END-IF
  IF #ATTR MODIFIED
    THEN RESET *COUNTER
  END-IF
END-READ
...
```

Example 3 - Combining READ and FIND Statements

The following program reads records from the EMPLOYEES file in logical sequential order based on the values of the descriptor NAME. A FIND statement is then issued to the VEHICLES file using the personnel number from the EMPLOYEES file as search criterion. The resulting report shows the name (read from the EMPLOYEES file) of each person read and the model of automobile (read from the VEHICLES file) owned by this person. Multiple lines with the same name are produced if the person owns more than one automobile.

```
** Example 'REAEX2': READ and FIND combination
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 FIRST-NAME
  2 NAME
  2 CITY
1 VEH-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
  2 MAKE
END-DEFINE
*
LIMIT 10
*
RD. READ EMPLOY-VIEW BY NAME STARTING FROM 'JONES'
```

```
  SUSPEND IDENTICAL SUPPRESS
  FD. FIND VEH-VIEW WITH PERSONNEL-ID = PERSONNEL-ID (RD.)
    IF NO RECORDS FOUND
      ENTER
    END-NOREC
    DISPLAY NOTITLE (ES=OFF IS=ON ZP=ON AL=15)
            PERSONNEL-ID (RD.)
            FIRST-NAME (RD.)
            MAKE (FD.) (IS=OFF)

  END-FIND
END-READ
END
```

Output of Program REAEX2:

```
PERSONNEL      FIRST-NAME         MAKE
      ID
--------------- --------------- ---------------

20007500        VIRGINIA        CHRYSLER
20008400        MARSHA          CHRYSLER
                                CHRYSLER
20021100        ROBERT          GENERAL MOTORS
20000800        LILLY           FORD
                                MG
20001100        EDWARD          GENERAL MOTORS
20002000        MARTHA          GENERAL MOTORS
20003400        LAUREL          GENERAL MOTORS
30034045        KEVIN           DATSUN
30034233        GREGORY         FORD
11400319        MANFRED
```

Example 4 - DESCENDING Option

```
** Example 'READSCND': READ (with DESCENDING SEQUENCE)
************************************************************************
DEFINE DATA LOCAL
1 EMPL VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 BIRTH
END-DEFINE
*
READ (10) EMPL IN DESCENDING SEQUENCE BY NAME FROM 'ZZZ'
  DISPLAY *ISN NAME FIRST-NAME BIRTH (EM=YYYY-MM-DD)
END-READ
END
```

Example 5 - VARIABLE Option

```
** Example 'REAVSEQ':  READ  (with VARIABLE SEQUENCE)
************************************************************************
DEFINE DATA LOCAL
1 EMPL VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 BIRTH
*
1 #DIR        (A1)
1 #STARTVALUE (A20)
END-DEFINE
*
SET KEY PF7 PF8
*
INPUT 'Select READ direction'
   // 'Press' 08T 'PF7' (I)                  21T 'to read backward'
    /         08T 'PF8' (I) 'or' 'ENTER' (I) 21T 'to read forward'
*
IF *PF-KEY = 'PF7'

  MOVE 'ZZZ' TO #STARTVALUE
ELSE
  MOVE 'A' TO #DIR
  MOVE 'A' TO #STARTVALUE
END-IF
*
READ (10) EMPL IN VARIABLE #DIR SEQUENCE
               BY NAME FROM #STARTVALUE
  DISPLAY *ISN NAME FIRST-NAME BIRTH (EM=YYYY-MM-DD)
END-READ
END
```

Example 6 - DYNAMIC Option

```
DEFINE DATA LOCAL
1 #DIRECTION (A1) INIT <'A'>   /* 'A' = ASCENDING
1 #EMPVIEW VIEW OF EMPLOYEES
2 NAME
...
END-DEFINE
...
READ #EMPVIEW IN DYNAMIC #DIRECTION SEQUENCE BY NAME = 'SMITH'
   INPUT (AD=O) NAME
       / 'Press PF7 to scroll in DESCENDING sequence'
       / 'Press PF8 to scroll in ASCENDING  sequence'
   ..
   IF *PF-KEY = 'PF7' THEN MOVE 'D' TO #DIRECTION END-IF
   IF *PF-KEY = 'PF8' THEN MOVE 'A' TO #DIRECTION END-IF
```

```
END-READ
...
```

Example 7 - STARTING WITH ISN Clause

```
** Example 'REASISND': READ  (with STARTING WITH ISN)
************************************************************************
DEFINE DATA LOCAL
1 EMPL VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME

END
```

101 READ WORK FILE

- Function 674
- Syntax Description 675
- Field Lengths 678
- Handling of Large and Dynamic Variables 679
- Example 679

Structured Mode Syntax

```
READ  WORK [FILE] work-file-number [ONCE]
       {  RECORD  operand1                                                    }
       {  [AND] [SELECT]       { [ OFFSET  n   ]...  operand2 }...            }
       {                       { [ FILLER  nX  ]               }               }
       [GIVING LENGTH operand3]
       [   AT [END] [OF] [FILE]  ]
       [   statement ...         ]
       [   END-ENDFILE           ]
END-WORK
```

Reporting Mode Syntax

```
READ   WORK [FILE] work-file-number [ONCE]
       {  RECORD {operand1 [FILLER  nX]} ...                                  }
       {  [AND]  [SELECT]      { [ OFFSET  n   ]...  operand2  }...           }
       {                       { [ FILLER  nX  ]               }               }
       [GIVING  LENGTH  operand3]
       [    AT [END] [OF] [FILE] { statement                                  }]
       [                         { DO statement ...   DOEND                   }]
[LOOP]
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: CLOSE WORK FILE | DEFINE WORK FILE | WRITE WORK FILE

Belongs to Function Group: *Control of Work Files / PC Files*

Function

The READ WORK FILE statement is used to read data from a non-Adabas physical sequential work file. The data is read sequentially from the work file. How it is read is independent of how it was written to the work file.

READ WORK FILE initiates and executes a processing loop for reading of all records on the work file. Automatic break processing may be performed within a READ WORK FILE loop.

Notes:

1. When an end-of-file condition occurs during the execution of a `READ WORK FILE` statement, Natural automatically closes the work file.
2. For Entire Connection: If an Entire Connection work file is read, no I/O statement may be placed within the `READ WORK FILE` processing loop.
3. For Unicode and code page support, see *Work Files and Print Files on Windows, UNIX and OpenVMS Platforms* in the *Unicode and Code Page Support* documentation.

If an ASCII work file is read, it is possible that an empty record is returned as the last record after the last physical record. This is due to the fact that Natural does not read individual records, but reads larger blocks of the work file in order to optimize file-access performance.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G		A	U	N	P	I	F	B	D	T	L	C	G		yes	yes
operand2		S	A	G		A	U	N	P	I	F	B	D	T	L	C			yes	yes
operand3		S								I									yes	yes

When using the work file types `ENTIRECONNECTION` or `TRANSFER`, *operand2* may not be of format C.

See also ***Field Lengths***.

Syntax Element Description:

Syntax Element	Description
work-file-number	**Work File Number:** The number of the work file (as defined to Natural) to be read. **Variable Index Range:**

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>When reading an array from a work file, you can specify a variable index range for the array. For example:

<code>READ WORK FILE work-file-number #ARRAY (I:J)</code></td></tr>
<tr><td><code>ONCE</code></td><td>ONCE Option:

<code>ONCE</code> is used to indicate that only one record is to be read. No processing loop is initiated (and therefore the loop-closing keyword <code>END-WORK</code> or <code>LOOP</code> must not be specified). If <code>ONCE</code> is specified, the <code>AT END OF FILE</code> clause should also be used.

If a <code>READ WORK FILE</code> statement specified with the <code>ONCE</code> option is controlled by a user-initiated processing loop, an end-of-file condition may be detected on the work file before the loop ends. All fields read from the work file still contain the values from the last record read. The work file is then repositioned to the first record which will be read upon the next execution of <code>READ WORK FILE ONCE</code>.</td></tr>
<tr><td><code>RECORD operand1</code>
<code>FILLER nX</code></td><td>RECORD Option:

If <code>RECORD</code> is specified, all fields in each record read are made available for processing. An operand list (<code>operand1</code>) corresponding to the layout of the record must be provided.

A <code>FILLER nX</code> entry indicates n bytes are to be skipped in the input record. The record as defined in the <code>RECORD</code> clause must be in contiguous storage. <code>FILLER</code> is not permitted in structured mode.

In structured mode, or if the record to be used is defined using a <code>DEFINE DATA</code> statement, only one field (or group) may be used. <code>FILLER</code> is not permitted in this case.

No checking and no conversion is performed by Natural on the data contained in the record. It is the user's responsibility to describe the record layout correctly in order to avoid program abends caused by non-numeric data in numeric fields. Because no checking is performed by Natural, this option is the fastest way to process records from a sequential file. The record area defined by <code>operand1</code> is filled with blanks before the record is read. Thus, an end-of-file condition will return a cleared area. Short records will have blanks appended.

See Overview of RECORD Option Usage below.</td></tr>
<tr><td><code>SELECT</code></td><td>SELECT Option (Default):

If <code>SELECT</code> is specified, only the fields specified in the operand list (<code>operand2</code>) will be made available. The position of the field in the input record may be indicated with an <code>OFFSET</code> and/or <code>FILLER</code> specification.<table><tr><td><code>OFFSET n</code></td><td><code>OFFSET 0</code> indicates the first byte of the record.</td></tr><tr><td><code>FILLER nX</code></td><td>Indicates that n bytes are to be skipped in the input record.</td></tr></table></td></tr>
</table>

Syntax Element	Description
	Natural will assign the selected values to the individual fields and check that numeric fields as selected from the record actually contain valid numeric data according to their definition. Because checking of selected fields is performed by Natural, this option results in more overhead for the processing of a sequential file. If a record does not fill all fields specified in the `SELECT` option, the following applies: ■ For a field which is only partially filled, the section which has not been filled is reset to blanks or zeros. ■ Fields which are not filled at all still have the contents they had before. If the file type CSV is read, the `OFFSET` option are ignored.
`GIVING LENGTH` *`operand3`*	**GIVING LENGTH Clause:** This clause can be used to retrieve the actual length of the record being read. The length (number of bytes) is returned in *`operand3`*. *`operand3`* must be defined with format/length I4. If the work file is defined as `TYPE UNFORMATTED`, the length returned indicates the number of bytes read from the byte-stream, including bytes skipped using the `FILLER` operand. If the `GIVING LENGTH` clause is used with work file type `CSV`, the operand specified with `GIVING LENGTH` returns the number of fields in the record (not the length of the record).
`AT END OF FILE`	**AT END OF FILE Clause:** This clause can only be used in conjunction with the `ONCE` option. If the `ONCE` option is used, this clause should be specified to indicate the action to be taken when an end-of-file condition is detected. If the `ONCE` option is not used, an end-of-file condition is handled like a normal processing loop termination.
`END-WORK`	**End of READ WORK FILE Statement:** The Natural reserved word `END-WORK` must be used to end the `READ WORK FILE` statement.

Overview of RECORD Option Usage

RECORD option is used with	rejected at compile time	rejected at runtime	RECORD option is ignored, processing switches to SELECT mode
work file type ENTIRECONNECTION or TRANSFER		x	
dynamic variables	x		
work file type CSV			x
work file type PORTABLE			x
work file types ASCII, ASCII-COMPRESSED, CSV, UNFORMATTED, code page is specified in Configuration Utility (conversion is necessary) or at least one Unicode field is specified (operand of format U, conversion is necessary)			x

Field Lengths

The field lengths in the ***Operand Definition Table*** are determined as follows:

Format	Length
A, B, I, F	The number of bytes in the input record is the same as the internal length definition.
N	The number of bytes in the input record is the sum of internal positions before and after the decimal point. The decimal point and sign do not occupy a byte position in the input record.
P, D, T	The number of bytes in the input record is the sum of positions before and after the decimal point plus 1 for the sign, divided by 2 rounded upwards.
L	1 byte is used. For C format fields, 2 bytes are used.

Examples of Field Lengths:

Field Definition	Input Record
#FIELD1 (A10)	10 bytes
#FIELD2 (B15)	15 bytes
#FIELD3 (N1.3)	4 bytes
#FIELD4 (N0.7)	7 bytes
#FIELD5 (P1.2)	2 bytes
#FIELD6 (P6.0)	4 bytes

See also *Format and Length of User-Defined Variables* in the *Programming Guide*.

Handling of Large and Dynamic Variables

Work File Type	Handling
ASCII ASCII-COMPRESSED SAG(binary)	The work file types ASCII, ASCII-COMPRESSED and SAG (binary) cannot handle dynamic variables and will produce an error. They can, however, handle large variables with a maximum field/record length of 32766 bytes.
TRANSFER ENTIRECONNECTION	The work file type TRANSFER can handle dynamic variables. There is no size limit here. The work file type ENTIRECONNECTION cannot handle dynamic variables. They can both, however, handle large variables with a maximum field/record length of 107341824 bytes.
PORTABLE UNFORMATTED	Large and dynamic variables can be written into work files or read from work files using the two work file types PORTABLE and UNFORMATTED. For these types, there is no size restriction for dynamic variables. However, large variables may not exceed a maximum field/record length of 32766 bytes. Reading a dynamic variable from a PORTABLE work file leads to resizing to the stored length.
CSV	The maximum field/record length is 32766 bytes for dynamic and large variables. Dynamic variables are supported. X-arrays are not allowed and will result in an error message.

Example

```
** Example 'RWFEX1': READ WORK FILE
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
*
1 #RECORD
  2 #PERS-ID (A8)
  2 #NAME    (A20)
END-DEFINE
*
FIND EMPLOY-VIEW WITH CITY = 'STUTTGART'
  WRITE WORK FILE 1
        PERSONNEL-ID NAME
END-FIND
*
* ...
*
READ WORK FILE 1 RECORD #RECORD
  DISPLAY NOTITLE #PERS-ID #NAME
```

```
END-WORK
*
END
```

Output of Program RWFEX1:

```
#PERS-ID        #NAME
-------- --------------------

11100328 BERGHAUS
11100329 BARTHEL
11300313 AECKERLE
11300316 KANTE
11500304 KLUGE
11500308 DIETRICH
11500318 GASSNER
11500343 ROEHM
11600303 BERGER
11600320 BLAETTEL
11500336 JASPER
11100330 BUSH
11500328 EGGERT
```

102 REDEFINE

- Function 682
- Restriction 682
- Syntax Description 682
- Examples 683

```
REDEFINE { operand1 ( { nX       }... ) }...
                      { operand2 }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Function

The REDEFINE statement is used to redefine a field. The resulting definition may consist of one or more user-defined variables.

With one REDEFINE statement, several fields may be redefined.

Restriction

The REDEFINE statement is only valid in reporting mode. To redefine a field in structured mode, use the REDEFINE clause of the DEFINE DATA statement.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G		A	U	N	P	I	F	B	D	T	L	C			yes	no
operand2		S	A	G		A		N	P	I	F	B	D	T	L	C			yes	yes

Syntax Element Description:

Syntax Element	Description
REDEFINE *operand1* *operand2*	**Method of Redefinition:** The byte positions of *operand1* are redefined from left to right regardless of format. The format of *operand2* may be different from the format of *operand1*. The bytes as specified in the REDEFINE statement must positionally match the data contained in the field being redefined. If an alphanumeric field is redefined as numeric and does not contain numeric data according to the format specification, an abnormal termination may result when it is used.

Syntax Element	Description
	Further Redefinition: Fields defined using a REDEFINE statement may be subsequently redefined with another REDEFINE statement.
*n*X	**Filler Notation:** The *n*X notation is used to denote filler bytes within the field/variable being redefined. Any trailing *n*X notation is optional.

Examples

- Example 1
- Example 2
- Example 3
- Example 4

Example 1

The user-defined variable #A (format/length A10) contains the value 123ABCDEFG.

```
REDEFINE #A (#A1(N3) #A2(A7))
```

The value in #A1 is 123. The value in #A2 is ABCDEFG.

Example 2

The user-defined variable #B (format/length A10) contains the value (shown in hexadecimal format) 12345CC1C2C3C4C5C6C7.

```
REDEFINE #B (#B1(P4) #B2(A7))
```

The value in #B1 is 12345C (in hexadecimal format).

The value in #B2 is C1C2C3C4C5C6C7 (in hexadecimal format).

```
REDEFINE #B (#BB1(B2)8X)) or REDEFINE #B(#BB1(B2))
```

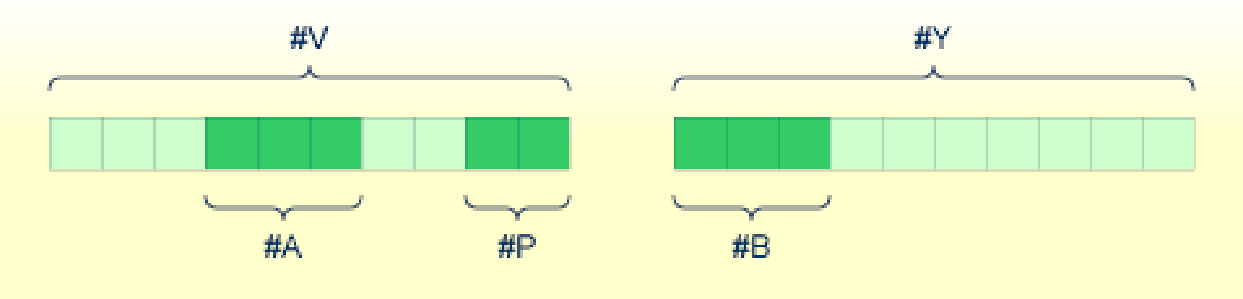
The value in #BB1 is 1234 (in hexadecimal format).

Note: For packed data (Format P), the number of decimal positions required must be specified. The following formula can be used to determine the number of bytes that the packed number occupies:

Number of bytes = (number of decimal positions + 1) / 2, rounded upwards to full bytes.

Example 3

```
COMPUTE #V (N8.2) = #Y (N10) = ...
REDEFINE #V (3X  #A(N3)  2X  #P (N2))  #Y (#B(N3)  7X)
```



Example 4

This example redefines the value of the system variable *DATN, which is in the form YYYYMMDD, and displays the result as three separate fields in the order "day/month/year":

```
MOVE *DATN TO #DATINT (N8)
REDEFINE #DATINT (#YEAR (N4) #MONTH (N2) #DAY (N2))
DISPLAY NOTITLE #DATINT #DAY #MONTH #YEAR
END
```

Output:

```
#DATINT  #DAY #MONTH #YEAR
  --------- ---- ------ -----

   19950108   8    1      1995
```

103 REDUCE

- Function ... 688
- Syntax Description ... 688

```
REDUCE { dynamic-clause } [GIVING operand5]
       { array-clause   }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related statements: EXPAND | RESIZE

Belongs to Function Group: *Memory Management Control for Dynamic Variables or X-Arrays*.

Function

The REDUCE statement is used to reduce:

- the allocated length of a dynamic variable (*dynamic-clause*), or
- the number of occurrences of X-arrays (*array-clause*).

For further information, see also the sections *Using Dynamic Variables*, *X-Arrays*, *Storage Management of X-Group Arrays* in the *Programming Guide*.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A			A	U					B							no	no
operand2	C	S								I									no	no
operand3			A	G		A		N	P	I	F	B	D	T	L	C	G	O	yes	no
operand4	C	S					U	N	P	I									no	no
operand5		S								I4									no	yes

Syntax Element Description:

Syntax Element	Description
dynamic-clause	**Dynamic Clause:** The `REDUCE DYNAMIC VARIABLE` statement reduces the allocated length of a dynamic variable (*operand1*) to the length specified (*operand2*). For further information, see ***Dynamic Clause*** below.
operand1	**Dynamic Variable:** *operand1* is the dynamic variable for which the length is to be reduced.
operand2	**Target Length of Dynamic Variable:** *operand2* is used to specify the length to which the dynamic variable is to be reduced. The value specified must be a non-negative integer constant or a variable of type Integer4 (I4).
array-clause	**Array Clause:** The `REDUCE ARRAY` statement reduces the number of occurrences of the X-array (*operand3*) to the upper and lower bound specified with `(dim[,dim[,dim]])`. For further information, see ***Array Clause*** below.
operand3	**X-Array:** *operand3* is the X-array. The occurrences of the X-array can be reduced. The index notation of the array is optional. As index notation only the complete range notation * is allowed for each dimension.
dim *operand4*	**Dimension:** The lower and upper bound notation (*operand4* or asterisk) to which the X-array should be reduced is specified here. If the current value of the upper or lower bound should be used, an asterisk (*) must be specified instead of *operand4*. For further information, see ***Dimension*** below.
GIVING *operand5*	**GIVING Clause:** If the `GIVING` clause is not specified, Natural runtime error processing is triggered if an error occurs. If the `GIVING` clause is specified, *operand5* contains the Natural message number if an error occurred, or zero upon success.

Dynamic Clause

```
[SIZE OF] DYNAMIC [VARIABLE] operand 1 TO operand2
```

The `REDUCE DYNAMIC VARIABLE` statement reduces the allocated length of a dynamic variable (*operand1*) to the length specified (*operand2*). The allocated memory of the dynamic variable which is beyond the given length is released immediately, i.e., when the statement is executed.

If the currently allocated length (`*LENGTH`) of the dynamic variable is greater than the given length, `*LENGTH` is set to the given length and the content of the variable is truncated (but not modified). If the given length is larger than the currently allocated length of the dynamic variable, the statement will be ignored.

Array Clause

```
[OCCURRENCES OF] ARRAY operand3 TO { 0                    }
                                   { (dim[,dim[,dim]])    }
```

The `REDUCE ARRAY` statement reduces the number of occurrences of the X-array (*operand3*) to the upper and lower bound specified with `TO (dim[,dim[,dim]])`.

If `REDUCE TO 0` (zero) is specified, all occurrences of the X-array are released. In other words, the whole array is reduced.

An upper or lower bound used in a `REDUCE` statement must be exactly the same as the corresponding upper or lower bound defined for the array.

Example:

```
DEFINE DATA LOCAL
1 #a(I4/1:*)
1 #g(1:*)
  2 #ga(I4/1:*)

1 #i(i4)
END-DEFINE
...

*/ reducing #a (1:10)

REDUCE ARRAY #a TO (1:10)       /* #a is reduced
REDUCE ARRAY #a TO (*:10)       /* to 10 occurrences.

*/ reducing #ga (1:10,1:20)
```

```
REDUCE ARRAY #g TO (1:10)       /* 1st dimension is set to (1:10)
REDUCE ARRAY #ga TO (*:*,1:20)  /* 1st dimension is dependent and
                                /* therefore kept with (*:*)
                                /* 2nd dimension is set to (1:20)

REDUCE ARRAY #a TO (5:10)       /* This is rejected because the lower index
                                /* must be 1 or *
REDUCE ARRAY #a TO (#i:10)      /* This is rejected because the lower index
                                /* must be 1 or *

REDUCE ARRAY #ga TO (1:10,1:20) /* (1:10) for the 1st dimension is rejected
                                /* because the dimension is dependent and
                                /* must be specified with (*:*).
```

For further information, see

- *Storage Management of X-Arrays*
- *Storage Management of X-Group Arrays*

Dimension

```
{ *                                      }
{ { *         }   :   { *         }      }
{ { operand4  }       { operand4  }      }
```

The lower and upper bound notation (*operand4* or asterisk) to which the X-array should be reduced is specified here. If the current value of the upper or lower bound should be used, an asterisk (*) may be specified in place of *operand4*. In place of `*:*`, you may also specify a single asterisk.

The number of dimensions (*dim*) must exactly match the defined number of dimensions of the X-array (1, 2 or 3).

When using the `REDUCE` statement, it is only possible to decrease the number of occurrences. If the requested number is larger than the currently allocated number of occurrences, it will simply be ignored.

104 REINPUT

- Function 694
- Syntax Description 695
- Examples 701

```
REINPUT   [FULL] [(statement-parameters)] { USING HELP      }
                                          { WITH-TEXT-option }
          [MARK-option]
          [ALARM-option]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: DEFINE WINDOW | INPUT | SET WINDOW

Belongs to Function Group: ***Screen Generation for Interactive Processing***

Function

The REINPUT statement is used to return to and re-execute an INPUT statement. It is generally used to display a message indicating that the data input as a result of the previous INPUT statement were invalid. See ***Example 1***.

No WRITE or DISPLAY statements may be executed between an INPUT statement and its corresponding REINPUT statement. The REINPUT statement is not valid in batch mode.

The REINPUT statement, when executed, repositions the program status regarding subroutine, special condition and loop processing as it existed when the INPUT statement was executed (as long as the status of the INPUT statement is still active). If the loop was initiated after the execution of the INPUT statement and the REINPUT statement is within this loop, the loop will be discontinued and then restarted after the INPUT statement has been reprocessed as a result of REINPUT.

If a hierarchy of subroutines was invoked after the execution of the INPUT statement, and the REINPUT is performed within a subroutine, Natural will trace back all subroutines automatically and reposition the program status to that of the INPUT statement.

It is not possible, however, to have an INPUT statement positioned within a loop, a subroutine or a special condition block, and then execute the REINPUT statement when the status under which the INPUT statement was executed has already been terminated. An error message will be produced and program execution terminated when this error condition is detected.

Note: The execution of a REINPUT statement (without FULL option) does not reset the MODIFIED status of an attribute control variable used in the corresponding INPUT statement. To check if an attribute control variable has been assigned the status MODIFIED, use the MODIFIED option.

Syntax Description

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>REINPUT FULL</td><td>
FULL Option:

If you specify the FULL option in a REINPUT statement, the corresponding INPUT statement will be re-executed fully:

With an ordinary REINPUT statement (without FULL option), the contents of variables that were changed between the INPUT and REINPUT statement will not be displayed; that is, all variables on the screen will show the contents they had when the INPUT statement was originally executed.
With a REINPUT FULL statement, all changes that have been made after the initial execution of the INPUT statement will be applied to the INPUT statement when it is re-executed; that is, all variables on the screen contain the values they had when the REINPUT statement was executed.

Note: The contents of input-only fields (AD=A) will be deleted again by REINPUT FULL.

Another characteristic of the REINPUT FULL statement is that the status of attribute control variables is reset to NOT MODIFIED. This is not done with the ordinary REINPUT statement. To check if an attribute control variable has been assigned the status MODIFIED, use the MODIFIED option.

See also Example 3 - REINPUT FULL WITH MARK POSITION.
</td></tr>
<tr><td>statement-parameters</td><td>
Parameters:

Parameters specified in a REINPUT statement will be applied to all fields specified in the statement.

Any parameter specified at element (field) level (see MARK Option) will override any corresponding parameter at statement level.
<table>
<tr><td colspan="2">Parameters that can be specified with the REINPUT statement:</td><td>Specification (S = at statement level, E = at element level)</td></tr>
<tr><td>AD</td><td>Attribute Definition *</td><td>SE</td></tr>
<tr><td>CD</td><td>Color Definition</td><td>S</td></tr>
<tr><td colspan="3">* If AD=P is specified at statement level, all fields - except those used in the MARK option - are protected.</td></tr>
</table>
The individual session parameters are described in the Parameter Reference.
</td></tr>
<tr><td>USING HELP</td><td>
USING HELP Option:

This option causes the helproutine defined for the INPUT map to be invoked.
</td></tr>
</table>

Syntax Element	Description
	USING HELP used in combination with the MARK option causes the helproutine defined for the first field specified in the MARK option to be invoked. If no helproutine is defined for that field, the helproutine for the map will be invoked. Example: `REINPUT USING HELP MARK 3` As a result, the helproutine defined for the third field in the INPUT map will be invoked.
WITH-TEXT-option	**WITH TEXT Option:** The WITH TEXT option is used to provide text which is to be displayed in the message line. See ***WITH TEXT Option*** below.
MARK-option	**MARK Option** With the MARK option, you can mark a specific field, that is, specify a field in which the cursor is to be placed when the REINPUT statement is executed. See ***MARK Option*** below.
ALARM-option	**ALARM Option:** This option causes the sound alarm feature of the terminal to be activated when the REINPUT statement is executed. See ***ALARM Option*** below.

WITH TEXT Option

WITH TEXT is used to provide text which is to be displayed in the message line. This is usually a message indicating what action should be taken to process the screen or to correct an error.

```
[WITH] [TEXT] { * operand1 } [(attributes)] [,operand3]...7
              {   operand2 }
```

Operand Definition Table:

Operand	Possible Structure			Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C	S		N P I B*	yes	no
operand2	C	S		A U	yes	no
operand3	C	S		A U N P I F B D T L	yes	no

* Format B of *operand1* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
operand1	**Message Text from Natural Message File:** *operand1* represents the number of a message text that is to be retrieved from a Natural message file. You can retrieve either user-defined messages or Natural system messages: - If you specify a positive value of up to four digits (for example: `954`), you will retrieve user-defined messages. - If you specify a negative value of up to four digits (for example: `-954`), you will retrieve Natural system messages. See also ***Example 4 - WITH TEXT Options***. Natural message files are created and maintained with the `SYSERR` utility as described in the relevant documentation.
operand2	**Message Text:** *operand2* represents the message to be placed in the message line. See also ***Example 4 - WITH TEXT Options***.
attributes	It is possible to assign various output attributes for *operand1*/*operand2*. These attributes and the syntax that may be used are described in the section ***Output Attributes*** below.
operand3	**Dynamic Replacement of Message Text:** *operand3* represents a numeric or text constant or the name of a variable. The values provided are used to replace parts of a message text that are either specified with *operand1* or *operand2*. The notation `:n:` is used within the message text as a reference to *operand3* contents, where *n* represents the occurrence (1 - 7) of *operand3*. See also ***Example 4 - WITH TEXT Options***.

Syntax Element	Description
	Note: Multiple specifications of *operand3* must be separated from each other by a comma. If the comma is used as a decimal character (as defined with the session parameter DC) and numeric constants are specified as *operand3*, put blanks before and after the comma so that it cannot be misinterpreted as a decimal character. Alternatively, multiple specifications of *operand3* can be separated by the input delimiter character (as defined with the session parameter ID); however, this is not possible in the case of ID=/ (slash). Leading zeros or trailing blanks will be removed from the field value before it is displayed in a message.

Output Attributes

attributes indicates the output attributes to be used for text display. Attributes may be:

```
{ AD=AD-value ... }
{ CD=CD-value ... } ...
```

For the possible session parameter values, refer to the corresponding sections in the *Parameter Reference* documentation:

- *AD - Attribute Definition*, section *Field Representation*
- *CD - Color Definition*

Note: The compiler actually accepts more than one attribute value for an output field. For example, you may specify: AD=BDI. In such a case, however, only the last value applies. In the given example, only the value I will become effective and the output field will be displayed intensified.

MARK Option

With the MARK option, you can mark a specific field, that is, specify a field in which the cursor is to be placed when the REINPUT statement is executed. You can also mark a specific position within a field. Moreover, you can make fields input-protected, and change their display and color attributes.

```
MARK [POSITION operand4 [IN]] [FIELD] { { operand5   } [(attributes)] } ...
                                        { *fieldname }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand4	C	S						N	P	I									yes	no
operand5	C	S	A					N	P	I									yes	no

Syntax Element Description:

Syntax Element	Description

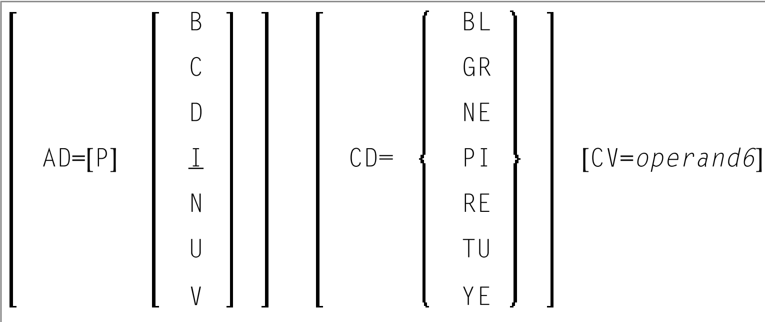
operand5	**Field to be Marked:**
	
	All AD=A or AD=M (that is, non-protected) fields specified in an INPUT statement are sequentially numbered (beginning with 1) by Natural. *operand5* represents the number of the field in which the cursor is to be positioned.
	
	The **fieldname* notation is used to position to a field (as used in the INPUT statement) using the name of the field as a reference.
	
	If the corresponding INPUT field is an array, a unique index or an index range may be used to reference one or more occurrences of the array.
	
	`INPUT #ARRAY (A1/1:5)`
	`...`
	`REINPUT (AD=P) 'TEXT' MARK *#ARRAY (2:3)`
	
	If *operand5* is also an array, the values in *operand5* are used as field numbers for the INPUT array.
	
	`RESET #X(N2/1:2)`
	`INPUT #ARRAY ...`
	`...`
	`REINPUT (AD=P) 'TEXT' MARK #X (1:2)`

MARK POSITION	**MARK POSITION Option:** With this option, you can have the cursor placed at a specific position - as specified with *operand4* - within a field. See also ***Example 3 - REINPUT FULL WITH MARK POSITION***.
operand4	**Cursor Position:** *operand4* specifies the cursor position. *operand4* must not contain decimal digits.
attributes	**Attribute Assignments:**

Syntax Element	Description
	See *Attribute Assignments* below.

Attribute Assignments

With explicit attributes, you can define the display presentation and color of the `WITH TEXT` message and also the layout of the `MARK` field (which is positioned by the `REINPUT` statement).



Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand6		S														C			no	no

With the attribute `AD=P`, you can make an input field (`AD=A` or `AD=M`) input-protected.

Note: You cannot use an attribute to make output-only fields (`AD=O`) available for input.

For information on the attributes `AD`, `CD` and `CV`, refer to the *Parameter Reference*.

The attributes for the `WITH TEXT` and `MARK` fields need not be specified in a fixed manner, but can also be assigned dynamically by means of a control variable which is referenced in a `(CV=)` clause. If both an `AD` and a `CV` option are specified for the same field, the attributes from the `AD` option are completely ignored, except `(AD=P)` which remains in effect.

If a `CD` and a `CV` option are specified for the same field, the color from the `CV` option is used. If the `CV` variable contains no color specification, the color from the `CD` option is applied to that field.

If `AD=P` is specified at statement level, all fields except those specified in the `MARK` option are input-protected.

ALARM Option

```
[AND] [SOUND] ALARM
```

This option causes the sound alarm feature of the terminal to be activated when the REINPUT statement is executed. The appropriate hardware must be available to be able to use this feature.

Examples

- Example 1 - REINPUT Statement
- Example 2 - REINPUT with Attribute Assignment
- Example 3 - REINPUT FULL with MARK POSITION
- Example 4 - WITH TEXT Options
- Example 5 - REINPUT with Attribute Assignment Using a Control Variable

Example 1 - REINPUT Statement

```
** Example 'REIEX1': REINPUT
************************************************************************
DEFINE DATA LOCAL
1 #FUNCTION (A1)
1 #PARM     (A1)
END-DEFINE
*
INPUT #FUNCTION #PARM
*
DECIDE FOR FIRST CONDITION
  WHEN #FUNCTION = 'A' AND #PARM = 'X'
    REINPUT 'Function A with parameter X selected.'
            MARK *#PARM
  WHEN #FUNCTION = 'C' THRU 'D'
    REINPUT 'Function C or D selected.'
  WHEN #FUNCTION = 'X'
    STOP
  WHEN NONE
    REINPUT 'Please enter a valid function.'
            MARK *#FUNCTION
END-DECIDE
*
END
```

Output of Program REIEX1:

```
#FUNCTION A #PARM Y
```

And after pressing ENTER:

```
PLEASE ENTER A VALID FUNCTION
#FUNCTION A #PARM Y
```

Example 2 - REINPUT with Attribute Assignment

```
** Example 'REIEX2': REINPUT  (with attributes)
************************************************************************
DEFINE DATA LOCAL
1 #A (A20)
1 #B (N7.2)
1 #C (A5)
1 #D (N3)
END-DEFINE
*
INPUT (AD=A) #A  #B  #C  #D
*
IF #A = ' ' OR #B = 0
  REINPUT (AD=P) 'RETYPE VALUES'
                 MARK *#A (AD=I CD=RE)    /* put cursor on first field
                      *#B (AD=U CD=PI)    /* and change colours
END-IF
*
END
```

Example 3 - REINPUT FULL with MARK POSITION

```
** Example 'REIEX3': REINPUT  (with FULL and POSITION option)
************************************************************************
DEFINE DATA LOCAL
1 #A (A20)
1 #B (N7.2)
1 #C (A5)
1 #D (N3)
END-DEFINE
*
INPUT (AD=M) #A  #B  #C  #D
*
IF #A = ' '
  COMPUTE #B = #B + #D
  RESET #D
END-IF
*
IF #A = SCAN 'TEST' OR = ' '
```

```
REINPUT FULL 'RETYPE VALUES' MARK POSITION 5 IN *#A
END-IF
*
END
```

Output of Program REIEX3:

```
RETYPE VALUES
#A                      #B         0.00 #C        #D    0
```

Example 4 - WITH TEXT Options

```
** Example 'REIEX4': REINPUT (with TEXT option)
************************************************************************
DEFINE DATA LOCAL
01 #NAME   (A8)
01 #TEXT   (A20)
END-DEFINE
*
*
INPUT WITH TEXT 'Enter a program name.' 'Program name:' #NAME
*
IF #NAME = ' '
  REINPUT WITH TEXT 'Input missing. Enter a name.'
END-IF
*
IF #NAME NE MASK (A)
  MOVE 'Invalid input.' TO #TEXT
  REINPUT WITH TEXT ':1: Name must start with a letter.',#TEXT
ELSE
  /* Using Natural error message 7600 for demonstration
  COMPRESS *INIT-USER 'on' *DAT4I INTO #TEXT
  INPUT WITH TEXT *-7600,#NAME,#TEXT 'Input accepted.'
END-IF
END
```

Example 5 - REINPUT with Attribute Assignment Using a Control Variable

```

DEFINE DATA LOCAL
1 #HELLO (A5)  INIT <'HELO'>
1 #VAR   (A20) INIT <'Enter "HELLO"'>
1 #CV (C)
END-DEFINE
*
INPUT (IP=OFF) #HELLO (AD=M)
*
IF #HELLO NE 'HELLO' THEN
  MOVE (AD=U CD=RE) TO #CV
  REINPUT FULL WITH TEXT #VAR (CD=YE)
```

```
               MARK *#HELLO   (CV=#CV)
END-IF
END
```

105 REJECT

For more information about this statement, see the statement `ACCEPT/REJECT`.

106 RELEASE

- Function 708
- Syntax Description 708
- Example 709

```
RELEASE  { STACK                }
         { SETS [set-name...]   }
         { VARIABLES            }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `STACK` | `FIND` **with** `RETAIN` **option** | `DEFINE DATA GLOBAL`

Function

The `RELEASE` statement is used to:

- delete the entire contents of the Natural stack;
- release sets of ISNs retained via a `FIND` statement that contained a `RETAIN` clause (applicable to Adabas databases only);
- reset global and application-independent variables.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
set-name	C	S				A												no	no

Syntax Element Description:

Syntax Element	Description
`RELEASE STACK`	Causes all data/commands currently in the Natural stack to be deleted.
`RELEASE SETS`	Is applicable to Adabas databases only. If only `RELEASE SETS`, without a *set-name*, is specified, all ISN sets retained with a `FIND` statement with a `RETAIN` clause will be released.

Syntax Element	Description

`RELEASE SETS` *set-name*	Causes a specific single ISN set to be released.
	`RELEASE SET 'CITY-SET'`
	
	`MOVE 'CITY-SET' TO #SET(A32)`
	`RELEASE SET #SET`

`RELEASE VARIABLES`	Causes all variables defined in the current global data area to be reset to their initial values. Also, it eliminates all application-independent variables (AIVs), thus making them no longer available.

Example

```
** Example 'RELEX1': FIND (with RETAIN clause and RELEASE statement)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 BIRTH
  2 NAME
*
1 #BIRTH (D)
END-DEFINE
*
MOVE EDITED '19400101' TO #BIRTH (EM=YYYYMMDD)
*
FIND NUMBER EMPLOY-VIEW WITH BIRTH GT #BIRTH
     RETAIN AS 'AGESET1'
IF *NUMBER = 0
  STOP
END-IF
*
FIND EMPLOY-VIEW WITH 'AGESET1' AND CITY = 'NEW YORK'
  DISPLAY NOTITLE NAME CITY BIRTH (EM=YYYY-MM-DD)
END-FIND
*
RELEASE SET 'AGESET1'
*
END
```

Output of Program RELEX1:

```
NAME                 CITY            DATE
                                       OF
                                     BIRTH
-------------------- -------------------- ----------

RUBIN                NEW YORK             1945-10-27
WALLACE              NEW YORK             1945-08-04
```

107 REPEAT

- Function 712
- Syntax Description 712
- Examples 713

Related Statements: FOR | ESCAPE

Belongs to Function Group: ***Loop Execution***

Function

The REPEAT statement is used to initiate a processing loop.

Syntax Description

Two different structures are possible for this statement.

- **Syntax 1** - Statements are executed one or more times
- **Syntax 2** - Statements are executed zero or more times

The placement of the logical condition (either at the beginning or at the end of the loop) determines when it is to be evaluated.

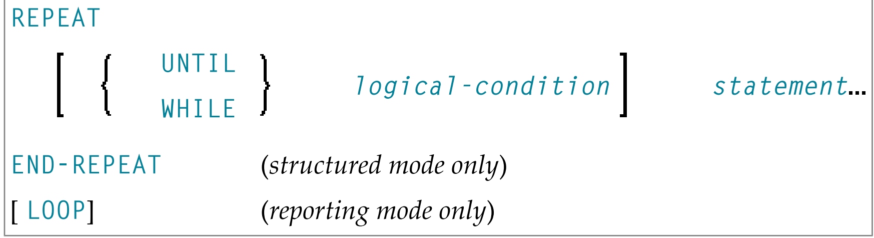
For further information on logical conditions, see the section *Logical Condition Criteria* in the *Programming Guide*.

For an explanation of the symbols used in the syntax diagrams, see ***Syntax Symbols***.

Syntax 1:

```
REPEAT
  statement ...      [ { UNTIL } logical-condition ]
                       { WHILE }
END-REPEAT           (structured mode only)
[ LOOP ]             (reporting mode only)
```

Syntax 2:



Syntax Element Description:

Syntax Element	Description
UNTIL	**UNTIL Option:** The processing loop will be continued until the logical condition becomes true.
WHILE	**WHILE Option:** The processing loop will be continued as long as the logical condition is true.
logical-condition	**Logical Condition:** If a logical condition is specified, the condition determines when the execution of the loop is to be terminated. If no logical condition is specified, the loop must be exited by an ESCAPE, STOP or TERMINATE statement specified within the loop. The syntax for a logical condition is described in the section *Logical Condition Criteria* in the Programming Guide.
END-REPEAT	**End of REPEAT Statement:** The Natural reserved word END-REPEAT must be used to end the REPEAT statement.

Examples

- Example 1 - REPEAT

- Example 2 - Using WHILE and UNTIL Options

Example 1 - REPEAT

```
** Example 'RPTEX1S': REPEAT (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
*
1 #PERS-NR (A8)
END-DEFINE
*
REPEAT
  INPUT 'ENTER A PERSONNEL NUMBER:' #PERS-NR
  IF #PERS-NR = ' '
    ESCAPE BOTTOM
  END-IF
  /*
  FIND EMPLOY-VIEW WITH PERSONNEL-ID = #PERS-NR
    IF NO RECORD FOUND
      REINPUT 'NO RECORD FOUND'
    END-NOREC
    DISPLAY NOTITLE NAME
  END-FIND
END-REPEAT
*
END
```

Output of Program RPTEX1S:

```
ENTER A PERSONNEL NUMBER: 11500304
```

After entering and confirming personnel number:

```
        NAME
--------------------

KLUGE
```

Equivalent reporting-mode example: **RPTEX1R**.

Example 2 - Using WHILE and UNTIL Options

```
** Example 'RPTEX2S': REPEAT (with WHILE and UNTIL option)
************************************************************************
DEFINE DATA LOCAL
1 #X (I1) INIT <0>
1 #Y (I1) INIT <0>
END-DEFINE
*
REPEAT WHILE #X <= 5
  ADD 1 TO #X
  WRITE NOTITLE '=' #X
END-REPEAT
*
SKIP 3
REPEAT
  ADD 1 TO #Y
  WRITE '=' #Y
  UNTIL #Y = 6
END-REPEAT
*
END
```

Output of Program RPTEX2S:

```
#X:     1
#X:     2
#X:     3
#X:     4
#X:     5
#X:     6

#Y:     1
#Y:     2
#Y:     3
#Y:     4
#Y:     5
#Y:     6
```

Equivalent reporting-mode example: **RPTEX2R**.

108 REQUEST DOCUMENT

- Function 718
- Syntax Description 719
- Encoding of Incoming/Outgoing Data 727
- Examples 728

```
REQUEST DOCUMENT FROM operand1
[          WITH                                                                    ]
[          [ USER operand2]                                                        ]
[          [PASSWORD operand3]                                                     ]
[          [HEADER[[NAME] operand4 [VALUE] operand5]}...]                          ]
[ [        DATA    {         ALL operand6 [ENCODED [[IN] CODEPAGE operand7]] }   ] ]
[ [                {         {[NAME] operand8 [VALUE] operand9}...           }   ] ]

[  RETURN                                                                          ]
[  HEADER [ALL operand10] [[NAME] operand11 [VALUE] operand12]...                  ]
[                                                                                  ]
[  [PAGE operand13 [ENCODED [[FOR TYPES[S] operand14...] [IN] CODEPAGE operand15]]] ]
[                                                                                  ]
   RESPONSE operand16
[GIVING operand17]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Internet and XML***

Function

The REQUEST DOCUMENT statement gives you the means to access an external system, see *Statements for Internet and XML Access* in the *Programming Guide*.

For information on Unicode support, see *Statements* in the *Unicode and Code Page Support* documentation.

Restrictions for Cookies

Under the HTTP Protocol, a server uses cookies to maintain state information on the client workstation.

REQUEST DOCUMENT is implemented using internet option settings. This means that, depending on the security settings, cookies will be used.

If the internet option setting Disabled is set, no cookies will be sent, even if a cookie header (*operand4*/*operand5*) is sent.

For server environments, do not use the internet option setting Prompt. This setting leads to a “hanging” server, because no client will be able to answer the prompt.

In mainframe environments, cookies are not supported and are ignored.

The following profile parameters have to be considered: `NOPROX`, `PROXPORT`, `PROX`, `SSLPRX`, `SSLPRXPT`, `NOSSLPRX`. For information on these profile parameters, refer to the *Parameter Reference*.

For HTTPS, OpenSSL must be installed.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													no	yes
operand2	C	S				A													no	yes
operand3	C	S				A													no	yes
operand4	C	S				A													no	yes
operand5	C	S				A		N	P	I	F		D	T	L				no	yes
operand6	C	S				A	U	N	P	I	F	B	D	T	L				no	yes
operand7	C	S				A													no	yes
operand8	C	S				A													no	yes
operand9	C	S				A		N	P	I	F		D	T	L				no	yes
operand10		S				A													no	yes
operand11	C	S				A													no	yes
operand12		S				A		N	P	I	F	B	D	T	L				no	yes
operand13		S				A	U					B							no	yes
operand14	C	S				A													no	yes
operand15	C	S				A													no	yes
operand16		S								I4									no	yes
operand17		S								I4									no	no

Syntax Element Description:

Syntax Element	Description
`DOCUMENT FROM` *operand1*	**Location of Document:** *operand1* is the URL to access a document. **Note:** The information below is only valid if *operand1* begins with `http://` or `https://`.
`WITH`	**WITH Clause:** This clause may be used to specify optional user/password, header and data details for the request.
`USER` *operand2*	**User Name:** *operand2* is the name of the user that will be used for the request.
`PASSWORD` *operand3*	**User Password:** *operand3* is the password of the user that will be used for the request.
`HEADER {[[NAME]` *operand4* `[VALUE]` *operand5*`]}...`	**Header Clause:** *operand4* and *operand5* can only be used in conjunction with each other: ■ *operand4* is the name of a `HEADER` variable sent with this request. ■ *operand5* is the value of a `HEADER` variable sent with this request. **Note:** **Header Name for *operand4*:** Header names must not contain a carriage return (CR), a line feed (LF) or a colon (:). This will not be checked by the `REQUEST DOCUMENT` statement. For valid header names, please see the HTTP specifications. For compatibility with the web interface, header names can be written with underscore (_) instead of a dash (-). (Internally, the underscore is replaced by a dash). **Header Value for *operand5*:** Header values are not allowed to contain CR/LF. This will not be checked by the `REQUEST DOCUMENT` statement. For valid header values and formats, please see the HTTP specifications. **General Information on Headers:** For a HTTP request, some headers are required, for example: Request-Method or Content-Type. These headers will be automatically generated depending on the parameters given with the `REQUEST DOCUMENT` statement. See also ***Automatically Generated Headers***.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td><code>DATA</code></td><td>DATA Clause:

You may specify either a specific <code>DATA</code> variable name and value (see operand8 and operand9 below) or the complete document (see DATA ALL Clause below).</td></tr>
<tr><td><code>ALL</code> operand6</td><td>operand6 is a complete document that is to be sent. This value is needed for the HTTP request method <code>PUT</code> (see Automatically Generated Headers).

See Encoding of Incoming/Outgoing Data, DATA ALL Clause.</td></tr>
<tr><td><code>[ENCODED [[IN] CODEPAGE</code> operand7<code>]</code></td><td>operand6 will be encoded from the default code page (value of the system variable <code>*CODEPAGE</code>) to the code page given in operand7.

See Encoding of Incoming/Outgoing Data, DATA ALL Clause.</td></tr>
<tr><td><code>{[NAME]</code> operand8 <code>[VALUE]</code> operand9<code>}...</code></td><td>DATA Variable Name and Value:

operand8 and operand9 can only be used in conjunction with each other:
operand8 is the name of a <code>DATA</code> variable to be sent with this request. This value is needed for the HTTP request method <code>POST</code> (URL-encoding necessary, especially ampersand (&), equal sign (=), percent sign (%) characters.
operand8 is the name of a <code>DATA</code> variable to be sent with this request. This value is needed for the HTTP request method <code>POST</code> (URL-encoding necessary, especially ampersand (&), equal sign (=), percent sign (%) characters.
Restriction:

If operand8/operand9 is given, and the communication is <code>http://</code> or <code>https://</code> by default, the request method <code>POST</code> (see Automatically Generated Headers) with content type <code>application/x-www-form-urlencoded</code> is used. During the request, operand8/operand9 will be separated by equal sign (=) and ampersand (&) characters. Therefore the operands are not allowed to contain equal sign (=), ampersand (&) and, because of URL-encoding, percent sign (%) characters. These characters are considered “unsafe” and need to be encoded as:
<table><tr><th>Character</th><th>URL-Encoding Syntax</th></tr><tr><td>%</td><td>%25</td></tr><tr><td>&</td><td>%26</td></tr><tr><td>=</td><td>%3D</td></tr></table>See also General Note for URL-Encoding.</td></tr>
<tr><td><code>RETURN</code></td><td>RETURN Clause:

This clause can be used to specify the <code>HEADER</code> and/or <code>PAGE</code> return information.</td></tr>
<tr><td><code>HEADER [ALL</code> operand10<code>]</code></td><td>RETURN HEADER ALL Clause:

When this clause is specified, operand10 contains all header values delivered with the HTTP response.</td></tr>
</table>

Syntax Element	Description
	The first line contains the status information and all following lines contain the headers as pairs of name and value. The names always end in a colon (:) and the values end in a linefeed (LF). Internally, all carriage returns/line feeds (CR/LF) are transformed into line feeds (LF).
`HEADER [[NAME] operand11] [VALUE] operand12]...`	**RETURN HEADER NAME/VALUE Clause:** When this clause is specified, only specific header information is returned. *operand11* and *operand12* can only be used in conjunction with each other: - *operand11* is the name of a `HEADER` received with this request. The `HEADER` is needed for HTTP. - *operand12* is the value of a `HEADER` received with this request. The `HEADER` is needed for HTTP. Return Header Name for *operand11*: For compatibility with the web interface, header names can be written with underscore (_) instead of dash (-) characters. Internally, the underscore is replaced by a dash. If *operand11* is a blank string, the status information is returned. `HTTP/1.0 200 OK`
`RETURN PAGE`	**RETURN PAGE Clause:** You can use the `PAGE` clause if you want to have the incoming data encoded in a specific code page. See *Encoding of Incoming/Outgoing Data*, ***RETURN PAGE Clause*** below.
`PAGE operand13`	*operand13* is the document returned for this request. See *Encoding of Incoming/Outgoing Data*, ***RETURN PAGE Clause*** below.
`[ENCODED [[FOR TYPE[S] operand14...] [IN] CODEPAGE operand15]]`	*operand14* is the list of mime-types for which an encoding of the returned document in *operand13* will be performed. See *Encoding of Incoming/Outgoing Data*, ***RETURN PAGE Clause*** below.
	operand15 is the code page which, if necessary, will be used for the encoding of *operand13*. If the value of *operator15* is blank, no conversion occurs. *operand13* is then encoded in the default code page (profile parameter `CP` in the Configuration Utility). See *Encoding of Incoming/Outgoing Data*, ***RETURN PAGE Clause*** below.
`RESPONSE operand16`	**RESPONSE Clause:** The `RESPONSE` clause is used to display the response code number of the request.

Syntax Element	Description
	operand16 is the response code number of the request, for example: 200 (Request Completed). See also ***Overview of Response Numbers for HTTP Requests***.
GIVING *operand17*	**GIVING Clause:** *operand17* contains the Natural error if the request could not be performed.

Automatically Generated Headers (operand4/5)

Request-Method

The following values are supported for *operand5*: HEAD, POST, GET, and PUT.

The following table shows the automatic calculation of Request-Method depending on the given operands:

Operand	Request Method			
	HEAD	**POST**	**GET**	**PUT**
WITH HEADER (*operand4*/ *operand5*)	optional	optional	optional	optional
WITH DATA (*operand7*/ *operand8*)	not specified	specified	not specified	only with option ALL (*operand6*)
RETURN HEADER (*operand10* **to** *operand12*)	specified	optional	optional	optional
RETURN PAGE (*operand13*)	not specified	specified	specified	optional

Content-Type

If the request method is `POST`, a content-type header has to be delivered with the HTTP request. If no content-type is set explicitly, the automatically generated value of *`operand5`* is:

```
application/x-www-form-urlencoded
```

Note: It is possible to overwrite the automatically generated headers. Natural will not check them for errors. Unexpected errors may occur.

General Note for URL-Encoding

When sending `POST` data with the content type `application/x-www-form-urlencoded`, certain characters must be represented by means of URL-encoding, which means substituting the character with %*`hexadecimal-character-code`*. The full details of when and why URL-encoding is necessary are discussed in RFC 1630, RFC 1738 and RFC 1808. Some basic details are given here. All non-ASCII characters (that is, valid ISO 8859/1 characters that are not also ASCII characters) must be URL-encoded, for example, the file `köln.html` would appear in an URL as `k%F6ln.html`.

Some characters are considered to be “unsafe” when web pages are requested by e-mail.

These characters are:

Character	URL-Encoding Syntax
the tab character	%09
the space character	%20
[	%5B
\	%5C
]	%5D
^	%5E
`	%60
{	%7B
|	%7C
}	%7D
~	%7E

When writing URLs, you should URL-encode these characters.

Some characters have special meanings in URLs, such as the colon (:) that separates the URL scheme from the rest of the URL, the double slash (//) that indicates that the URL conforms to the Common Internet Scheme syntax and the percent sign (%). Generally, when these characters appear as parts of file names, they must be URL-encoded to distinguish them from their special meaning in URLs (this is a simplification, read the RFCs for full details).

These characters are:

Character	URL-Encoding Syntax
"	%22
#	%23
%	%25
&	%26
+	%2B
,	%2C
/	%2F
:	%3A
<	%3C
=	%3D
>	%3E
?	%3F
@	%40

Overview of Response Numbers for HTTP Requests

Status	Value	Response
`STATUS CONTINUE`	`100`	OK to continue with request
`STATUS SWITCH_PROTOCOLS`	`101`	Server has switched protocols in upgrade header
`STATUS OK`	`200`	Request completed
`STATUS CREATED`	`201`	Object created, reason = new URL
`STATUS ACCEPTED`	`202`	Async completion (TBS)
`STATUS PARTIAL`	`203`	Partial completion
`STATUS NO_CONTENT`	`204`	No info to return
`STATUS RESET_CONTENT`	`205`	Request completed, but clear form
`STATUS PARTIAL_CONTENT`	`206`	Partial `GET` fulfilled
`STATUS AMBIGUOUS`	`300`	Server could not decide what to return
`STATUS MOVED`	`301`	Object permanently moved
`STATUS REDIRECT`	`302`	Object temporarily moved
`STATUS REDIRECT_METHOD`	`303`	Redirection w/o new access method
`STATUS NOT_MODIFIED`	`304`	If-modified-since was not modified
`STATUS USE_PROXY`	`305`	Redirection to proxy, location header specifies proxy to use
`STATUS REDIRECT_KEEP_VERB`	`307`	HTTP/1.1: keep same verb
`STATUS BAD_REQUEST`	`400`	Invalid syntax

Status	Value	Response
STATUS DENIED	401	Access denied
STATUS PAYMENT_REQ	402	Payment required
STATUS FORBIDDEN	403	Request forbidden
STATUS NOT_FOUND	404	Object not found
STATUS BAD_METHOD	405	Method is not allowed
STATUS NONE_ACCEPTABLE	406	No response acceptable to client found
STATUS PROXY_AUTH_REQ	407	Proxy authentication required
STATUS REQUEST_TIMEOUT	408	Server timed out waiting for request
STATUS CONFLICT	409	User should resubmit with more info
STATUS GONE	410	The resource is no longer available
STATUS LENGTH_REQUIRED	411	The server refused to accept request w/o a length
STATUS PRECOND_FAILED	412	Precondition given in request failed
STATUS REQUEST_TOO_LARGE	413	Request entity was too large
STATUS URL_TOO_LONG	414	Request URL too long
STATUS UNSUPPORTED_MEDIA	415	Unsupported media type
STATUS SERVER_ERROR	500	Internal server error
STATUS NOT_SUPPORTED	501	“Required” not supported
STATUS BAD_GATEWAY	502	Error response received from gateway
STATUS SERVICE_UNAVAIL	503	Temporarily overloaded
STATUS GATEWAY_TIMEOUT	504	Timed out waiting for gateway
STATUS VERSION_NOT_SUP	505	HTTP version not supported

Response 301 - 303 (Redirection)

Redirection means that the requested URL has moved. As a response, the Return Header with the name `LOCATION` will be displayed. This header contains the URL where the requested page has moved to. A new `REQUEST DOCUMENT` request can be used to retrieve the page moved.

HTTP browsers redirect automatically to the new URL, but the `REQUEST DOCUMENT` statement does not handle redirection automatically.

Response 401 (Denied)

The response `Access Denied` means that the requested page can only be accessed if a valid user ID and password are provided with the request. As a response, the Return Header with the name `WWW-AUTHENTICATE` will be delivered with the realm needed for this request.

HTTP browsers normally display a dialog with user ID and password, but with the `REQUEST DOCUMENT` statement, no dialog is displayed.

Encoding of Incoming/Outgoing Data

Data transfer with the REQUEST DOCUMENT statement normally does not involve any code page conversion. If you want to have the outgoing and/or incoming data encoded in a specific code page, you can use the DATA ALL clause and/or the RETURN PAGE clause to specify this.

- DATA ALL Clause
- RETURN PAGE Clause

DATA ALL Clause

For the encoding of outgoing data, the DATA ALL clause is used:

```
ALL operand6 [ENCODED [[IN] CODEPAGE operand7]]
```

Syntax Element Description:

Syntax Element	Description
ALL *operand6*	*operand6* is a complete document that is to be sent. This value is normally needed for the automatically HTTP request method PUT (see ***Automatically Generated Headers***).
[ENCODED [[IN] CODEPAGE *operand7*]]	*operand6* will be encoded from the default code page (value of system variable *CODEPAGE) to the code page given in *operand7*.

RETURN PAGE Clause

For the encoding of incoming data, the RETURN PAGE clause is used:

```
[PAGE operand13 [ENCODED [[FOR TYPE[S] operand14...] [IN] CODEPAGE operand15]]]
```

As a response of an HTTP/HTTPS request, incoming data may contain binary data (for example, image/gif) or character data (for example, text/html). Together with the response, the REQUEST DOCUMENT statement receives a parameter which specifies the type of content of the requested document (mime-type). This parameter may contain information about the code page in which the document is encoded.

This clause provides an automatic conversion to the default code page (value of system variable *CODEPAGE) of the Natural session.

Syntax Element Description:

Syntax Element	Description
RETURN PAGE *operand13*	No encoding at all of the returned page will be done; that is, the page will remain encoded as delivered from the http server.
RETURN PAGE *operand13* ENCODED	If the returned mime-type contains an encoding, *operand13* will be encoded from this code page to the default code page (A/B) or (U). See note below.
RETURN PAGE *operand13* ENCODED [IN] CODEPAGE *operand15*	If the returned mime-type does not contain an encoding, then *operand13* will be encoded from the code page defined with *operand15* to the default code page (value of system variable `*CODEPAGE`) (A/B) or (U).
RETURN PAGE *operand13* [ENCODED [[FOR TYPE[S] *operand14*...] [IN] CODEPAGE *operand15*]]	If the returned mime-type does not contain an encoding, then an additional check is performed if the returned mime-type matches one of the types given with *operand14*. If a match occurs, *operand13* will be encoded from the code page defined with *operand15* to the default code page (A/B) or (U).

Note: "Returned mime-type contains an encoding" means that the http server returns a content-type header with a `charset=` clause, for example: `charset=ISO-8859-1`.

Examples

- Example 1 - General Request
- Example 2 - Simple Get Request (no data)
- Example 3 - Simple Head Request (no return page)
- Example 4 - Simple Post Request (default)
- Example 5 - Simple Put Request (with data all)

Note: There is an example dialog `V5-RDOC` for this statement in the example library `SYSEXV`.

Example 1 - General Request

```
REQUEST DOCUMENT FROM "http://bolsap1:5555/invoke/sap.demo/handle_RFC_XML_POST"
  WITH
    USER #User PASSWORD #Password
    DATA
    NAME 'XMLData'       VALUE #Queryxml
    NAME 'repServerName' VALUE 'NT2'
  RETURN
    PAGE #Resultxml
RESPONSE #rc
```

Example 2 - Simple Get Request (no data)

```
REQUEST DOCUMENT FROM "http://pcnatweb:8080"
  RETURN
    PAGE #Resultxml
RESPONSE #rc
```

Example 3 - Simple Head Request (no return page)

```
REQUEST DOCUMENT FROM "http://pcnatweb"
RESPONSE #rc
```

Example 4 - Simple Post Request (default)

```
REQUEST DOCUMENT FROM "http://pcnatweb/cgi-bin/nwwcgi.exe/sysweb/nat-env"
  WITH
    DATA
    NAME 'XMLData'       VALUE #Queryxml
    NAME 'repServerName' VALUE 'NT2'
  RETURN
    PAGE #Resultxml
RESPONSE #rc
```

Example 5 - Simple Put Request (with data all)

```
REQUEST DOCUMENT FROM "http://pcnatweb/test.txt"
  WITH
    DATA ALL     #document
  RETURN
    PAGE #Resultxml
RESPONSE #rc
```

109 RESET

- Function 732
- Syntax Description 732
- Example 733

```
RESET [INITIAL] operand1 ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ADD | COMPRESS | COMPUTE | DIVIDE | EXAMINE | MOVE | MOVE ALL | MULTIPLY | SEPARATE | SUBTRACT

Belongs to Function Group: ***Arithmetic and Data Movement Operations***

Function

The RESET statement is used to reset the value of a field:

- RESET (without INITIAL) sets the content of each specified field to its **default initial value** depending on its format.
- RESET INITIAL sets each specified field to the initial value as defined for the field in the DEFINE DATA statement. For a field declared without INIT clause in the DEFINE DATA statement, RESET INITIAL has the same effect as RESET (without INITIAL).

Notes:

1. A field declared with a CONSTANT clause in the DEFINE DATA statement may not be referenced in a RESET statement, since its content cannot be changed.
2. In reporting mode, the RESET statement may also be used to define a variable, provided that the program contains no DEFINE DATA LOCAL statement.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G	M	A	U	N	P	I	F	B	D	T	L	C	G	O	yes	yes

Syntax Element Description:

Syntax Element	Description
RESET *operand1*	**Reset to Null Value:** RESET (without INITIAL) sets the content of each specified field (*operand1*) to its **default initial value**. If *operand1* is a dynamic variable, it will be reset to a null value with the length the variable currently has at the time the RESET statement is executed. The current length of a dynamic variable can be ascertained by using the system variable *LENGTH. For general information on dynamic variables, see the section *Using Dynamic and Large Variables*.
RESET INITIAL *operand1*	**Reset to Initial Value:** RESET INITIAL sets each specified field (*operand1*) to the initial value as defined for the field in the DEFINE DATA statement. ■ If you specify no INIT value in the DEFINE DATA statement, a field will be initialized with a **default initial value** depending on its format. ■ If a dynamic variable is used, *LENGTH is set to zero if no initial value is defined. ■ If you apply RESET INITIAL to an array, it must be applied to the entire array (as defined in the DEFINE DATA statement); a RESET INITIAL of individual array occurrences is not possible. ■ If an X-array is used, *OCCURRENCE is set to zero. ■ RESET INITIAL of fields resulting from a redefinition is not possible either. ■ RESET INITIAL is applied to a dynamic variable. ■ RESET INITIAL cannot be applied to database fields.

Example

```
** Example 'RSTEX1': RESET (with/without INITIAL)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
1 #BINARY  (B4) INIT <1>
1 #INTEGER (I4) INIT <5>
1 #NUMERIC (N2) INIT <25>
END-DEFINE
*
LIMIT 1
READ EMPLOY-VIEW
```

```
  /*
  WRITE NOTITLE 'VALUES BEFORE RESET STATEMENT:'
  WRITE / '=' NAME '=' #BINARY '=' #INTEGER '=' #NUMERIC
  /*
  RESET NAME #BINARY #INTEGER #NUMERIC
  /*
  WRITE /// 'VALUES AFTER  RESET STATEMENT:'
  WRITE / '=' NAME '=' #BINARY '=' #INTEGER '=' #NUMERIC
  /*
  RESET INITIAL #BINARY #INTEGER #NUMERIC
  /*
  WRITE /// 'VALUES AFTER  RESET INITIAL STATEMENT:'
  WRITE / '=' NAME '=' #BINARY '=' #INTEGER '=' #NUMERIC
  /*
END-READ
END
```

Output of Program RSTEX1:

```
VALUES BEFORE RESET STATEMENT:

NAME: ADAM                 #BINARY: 00000001 #INTEGER:           5 #NUMERIC:
 25

VALUES AFTER  RESET STATEMENT:

NAME:                      #BINARY: 00000000 #INTEGER:           0 #NUMERIC:
  0

VALUES AFTER  RESET INITIAL STATEMENT:

NAME:                      #BINARY: 00000001 #INTEGER:           5 #NUMERIC:
 25
```

110 RESIZE

- Function 736
- Syntax Description 736

```
RESIZE  { dynamic-clause }  [GIVING operand5]
        { array-clause   }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: EXPAND | REDUCE

Belongs to Function Group: *Memory Management Control for Dynamic Variables or X-Arrays*.

Function

The RESIZE statement is used to adjust:

- the size of a dynamic variable (*dynamic-clause*), or
- the number of occurrences of X-arrays (*array-clause*).

For further information, see also the following sections in the *Programming Guide*:

Using Dynamic Variables
Allocating/Freeing Memory Space for a Dynamic Variable
X-Arrays
Storage Management of X-Group Arrays

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A			A	U					B							no	no
operand2	C	S								I									no	no
operand3			A	G		A		N	P	I	F	B	D	T	L	C	G	O	yes	no
operand4	C	S						N	P	I									no	no
operand5		S								I4									no	yes

Syntax Element Description:

Syntax Element	Description
dynamic-clause	The RESIZE DYNAMIC statement adjusts the allocated length of the currently allocated storage of a dynamic variable (*operand1*) to the value specified with *operand2*. For more information, see ***Dynamic Clause*** below.
operand1	*operand1* is the dynamic variable for which the length is to be adjusted.
operand2	*operand2* is used to specify the new length of the dynamic variable. The value specified must be a non-negative numeric integer constant or a variable of type Integer4 (I4).
array-clause	The RESIZE ARRAY statement adjusts the number of occurrences of the X-array (*operand3*) to the upper and lower bound specified with (*dim*[,*dim*[,*dim*]]). For more information, see ***Array Clause*** below.
operand3	*operand3* is the X-array. The occurrences of the X-array can be expanded or reduced. The index notation of the array is optional. As index notation only the complete range notation * is allowed for each dimension.
dim *operand4*	The lower and upper bound notation (*operand4* or asterisk) to which the X-array should be expanded is specified here. If the current value of the upper or lower bound should be used, an asterisk (*) must be specified in place of *operand4*. For further information, see ***Dimension*** below.
GIVING *operand5*	If the GIVING clause is not specified, Natural runtime error processing is triggered if an error occurs. If the GIVING clause is specified, *operand5* contains the Natural message number if an error occurred, or zero upon success.

Dynamic Clause

```
[SIZE OF] DYNAMIC [VARIABLE] operand1 TO operand2
```

The RESIZE DYNAMIC statement adjusts the allocated length of a dynamic variable (*operand1*) to the value specified with *operand2*.

When the RESIZE statement is used, the currently allocated storage size will be adjusted to the requested values, regardless whether it must be increased or decreased.

Array Clause

```
[AND RESET] [OCCURRENCES OF] ARRAY operand3 TO (dim[,dim[,dim]])
```

The `RESIZE ARRAY` statement adjusts the number of occurrences of the X-array (*operand3*) to the upper and lower bound specified with `(dim[,dim[,dim]])`.

The `RESET` option resets all occurrences of the resized X-array to its default zero value. By default (no `RESET` option), the actual values are kept and the resized (new) occurrences are reset.

An upper or lower bound used in an `RESIZE` statement must be exactly the same as the corresponding upper or lower bound defined for the array.

Example:

```
DEFINE DATA LOCAL
1 #a(I4/1:*)
1 #g(1:*)
  2 #ga(I4/1:*)

1 #i(i4)
END-DEFINE
...

*/ resizing #a (1:10)
RESIZE ARRAY #a TO (1:10)       /* #a is resized to
RESIZE ARRAY #a TO (*:10)       /* 10 occurrences.

/* resizing #ga (1:10,1:20)
RESIZE ARRAY #g TO (1:10)       /* 1st dimension is set to (1:10)
RESIZE ARRAY #ga TO (*:*,1:20)  /* 1st dimension is dependent and
                                /* therefore kept with (*:*)
                                /* 2nd dimension is set to (1:20)

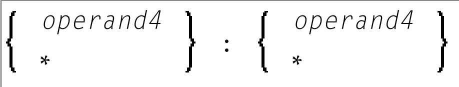
RESIZE ARRAY #a TO (5:10)       /* This is rejected because the lower index
                                /* must be 1 or *
RESIZE ARRAY #a TO (#i:10)      /* This is rejected because the lower index
                                /* must be 1 or *

RESIZE ARRAY #ga TO (1:10,1:20) /* (1:10) for the 1st dimension is rejected
                                /* because the dimension is dependent and
                                /* must be specified with (*:*).
```

For further information, see the following sections in the *Programming Guide*:

- *Storage Management of X-Arrays*
- *Storage Management of X-Group Arrays*

Dimension



The lower and upper bound notation (*operand4* or asterisk) to which the X-array should be expanded is specified here. If the current value of the upper or lower bound should be used, an asterisk (*) may be specified in place of *operand4*. In place of `*.*`, you may also specify a single asterisk.

The number of dimensions (*dim*) must exactly match the defined number of dimensions of the X-array (1, 2, or 3).

If the number of occurrences for a specified dimension is less than the number of the currently allocated occurrences, the number of occurrences is not changed for the corresponding dimension.

111 RETRY

- Function 742
- Restriction 742
- Example 742

```
RETRY
```

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | STORE | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The RETRY statement is used within an ON ERROR statement block (see ON ERROR statement). It is used to reattempt to obtain a record which is in hold status for another user.

When a record to be held is already in hold status for another user, Natural issues Error Message 3145. See also the session parameter WH (Wait for Record in Hold Status).

The RETRY statement must be placed in the object that causes the Error 3145.

For details on record hold logic, see the section *Record Hold Logic* in the *Programming Guide*.

Restriction

This statement can only be used to access Adabas databases.

Example

```
** Example 'RTYEX1': RETRY
**
** CAUTION: Executing this example will modify the database records!
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
*
1 #RETRY (A1) INIT <' '>
END-DEFINE
*
FIND EMPLOY-VIEW WITH NAME = 'ALDEN'
  /*
  DELETE
  END TRANSACTION
```

```
  /*
  ON ERROR
    IF *ERROR-NR = 3145
      INPUT NO ERASE 10/1
            'RECORD IS IN HOLD' /
            'DO YOU WISH TO RETRY?' /
            #RETRY '(Y)ES OR (N)O?'
      IF #RETRY = 'Y'
        RETRY
      ELSE
        STOP
      END-IF
    END-IF
  END-ERROR
  /*
  AT END OF DATA
    WRITE NOTITLE *NUMBER 'RECORDS DELETED'
  END-ENDDATA
END-FIND
*
END
```

112 RUN

- Function 746
- Syntax Description 746
- Dynamic Source Text Creation/Execution 747
- Example 748

RUN [REPEAT] *operand1* [*operand2* [(*parameter*)]] ... 40

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Invoking Programs and Routines***

Function

The RUN statement is used to read a Natural source program from the Natural system file and then execute it.

For Natural Remote Procedure Call (RPC): See *Notes on Natural Statements on the Server* in the *Natural Remote Procedure Call (RPC)* documentation.

Syntax Description

Operand Definition Table:

Operand	Possible Structure				Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C	S			A	yes	no
operand2	C	S	A	G	A U N P I F B D T L G	yes	no

Syntax Element Description:

Syntax Element	Description
REPEAT	**REPEAT Option:** RUN REPEAT causes the program not to prompt the user for input until the program has finished executing even if multiple output screens (produced by INPUT statements) are produced. This feature may be used if the program is to display multiple screens of information without having the user respond to each screen.
operand1	**Program Name:** As *operand1* the name of the program can be specified as an alphanumeric constant or as the content of an alphanumeric variable. If a variable is used, it must be 8 characters in length. The program may be stored in the current library or in a concatenated library (default steplib is SYSTEM). If the program is not found, an error message is issued.

Syntax Element	Description
	The program is read into the source program work area and overlays any current source program.
operand2	**Parameters:** The RUN statement may also be used to pass parameters to the program to be run. A parameter may be defined with any format. The parameters are converted to a format suitable for a corresponding INPUT field. All parameters are placed on the top of the Natural stack. The parameters can be read using an INPUT statement. The first INPUT statement issued will result in the insertion of all parameters into the fields specified in the INPUT statement. The INPUT statement must have the sign specification (session parameter SG=ON) for parameter fields defined with numeric format. If more parameters are passed than are read by the next INPUT statement, the extra parameters are ignored. The number of parameters may be obtained with the system variable *DATA. **Note:** If *operand2* is a time variable (format T), only the time component of the variable content is passed, but not the date component.
parameter	**Date Format:** If *operand2* is a date variable, you can specify the session parameter DF (described in the *Parameter Reference*) as *parameter* for this variable.

Dynamic Source Text Creation/Execution

The RUN statement may be used to dynamically compile and execute a program for which the source or parts thereof are created dynamically.

Dynamic source text creation is performed by placing source text into global variables and then referring to these variables by using an ampersand (&) instead of a plus sign (+) as the first character of the variable name in the source text. The content of the global variable will be interpreted as source text when the program is invoked using the RUN statement.

A global variable with index must not be used within a program that is invoked via a RUN statement.

It is not allowed to place a comment or an INCLUDE statement in a global variable.

Example

Program containing RUN statement:

```
** Example 'RUNEX1': RUN (with dynamic source program creation)
************************************************************************
DEFINE DATA
GLOBAL
  USING RUNEXGDA
LOCAL
1 #NAME (A20)
1 #CITY (A20)
END-DEFINE
*
INPUT 'Please specify the search values:' //
      'Name:' #NAME /
      'City:' #CITY
*
RESET +CRITERIA     /* defined in GDA 'RUNEXGDA'
*
IF #NAME = ' ' AND #CITY = ' '
  REINPUT 'Enter at least 1 value'
END-IF
*
IF #NAME NE ' '
  COMPRESS 'NAME' ' =''' #NAME '''' INTO +CRITERIA LEAVING NO
END-IF
IF #CITY NE ' '
  IF +CRITERIA NE ' '
    COMPRESS +CRITERIA 'AND' INTO +CRITERIA
  END-IF
  COMPRESS +CRITERIA ' CITY =''' #CITY '''' INTO +CRITERIA LEAVING NO
END-IF
*
RUN 'RUNEXFND'
*
END
```

Program RUNEXFND executed by RUN statement:

```
** Example 'RUNEXFND': RUN (program executed with RUN in RUNEX1)
************************************************************************
DEFINE DATA
GLOBAL
  USING RUNEXGDA
LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 CITY
```

```
END-DEFINE
*
* &CRITERIA filled with  "NAME = 'xxxxx' AND CITY = 'xxxx'"
*
FIND NUMBER EMPLOY-VIEW WITH &CRITERIA
     RETAIN AS 'EMP-SET'
DISPLAY *NUMBER
*
END
```

Global Data Area RUNEXGDA:

```
Global    RUNEXGDA  Library SYSEXSYN                      DBID    10 FNR    32
Command                                                                    > +
I T L  Name                             F Length     Miscellaneous
All -- -------------------------------- - ---------- ------------------------->
     1 +CRITERIA                        A         80
```

113 SEND METHOD

- Function 752
- Syntax Description 752
- Example 755

```
SEND [METHOD] operand1 TO [OBJECT] operand2

  [       { operand3 [ (AD= { M } ) ] }     ]
  [  WITH {                 { O }       }     ]
  [       {                 { A }       }     ]
  [       { nX                          } ... ]

[RETURN operand4]
[GIVING operand5]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: CREATE OBJECT | DEFINE CLASS | INTERFACE | METHOD | PROPERTY

Belongs to Function Group: ***Component Based Programming***

Function

The SEND METHOD statement is used to invoke a particular method of an object. See the section *NaturalX* in the *Programming Guide* for information on component-based programming.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no
operand2		S																O	no	no
operand3	C	S	A	G		A	U	N	P	I	F	B	D	T	L	C	G	O	yes	no
operand4		S	A			A	U	N	P	I	F	B	D	T	L	C	G	O	yes	no
operand5		S			N					I									yes	no

The formats C and G can only be passed to methods of local classes.

Syntax Element Description:

Syntax Element	Description

operand1	**Method-Name:**
	
	operand1 is the name of a method which is supported by the object specified in *operand2*.
	
	Since the method names can be identical in different interfaces of a class, the method name in *operand1* can also be qualified with the interface name to avoid ambiguity.
	
	In the following example, the object `#O3` has an interface `Iterate` with the method `Start`. The following statements apply:
	
	`* Specifying only the method name.`
	`SEND 'Start' TO #O3`
	`* Qualifying the method name with the interface name.`
	`SEND 'Iterate.Start' TO #O3`
	
	If no interface name is specified, Natural searches the method name in all the interfaces of the class. If the method name is found in more than one interface, a runtime error occurs.

operand2	**Object Handle:** The handle of the object to which the method call is to be sent. *operand2* must be defined as an object handle (`HANDLE OF OBJECT`). The object must already exist. To invoke a method of the current object inside a method, use the system variable `*THIS-OBJECT`.
operand3	**Parameter(s) Specific to the Method:** As *operand3* you can specify parameters specific to the method. In the following example, the object `#O3` has the method `PositionTo` with the parameter `Pos`. The method is called in the following way: `SEND 'PositionTo' TO #O3 WITH Pos` Methods can have optional parameters. Optional parameters need not to be specified when the method is called. To omit an optional parameter, use the placeholder 1X. To omit *n* optional parameters, use the placeholder *n*X.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>In the following example, the method <code>SetAddress</code> of the object <code>#O4</code> has the parameters <code>FirstName</code>, <code>MiddleInitial</code>, <code>LastName</code>, <code>Street</code> and <code>City</code>, where <code>MiddleInitial</code>, <code>Street</code> and <code>City</code> are optional. The following statements apply:
<pre>
* Specifying all parameters.
SEND 'SetAddress' TO #O4 WITH FirstName MiddleInitial LastName Street
City
* Omitting one optional parameter.
SEND 'SetAddress' TO #O4 WITH FirstName 1X LastName Street City
* Omitting all optional parameters.
SEND 'SetAddress' TO #O4 WITH FirstName 1X LastName 2X
</pre>
Omitting a non-optional (mandatory) parameter results in a runtime error.</td></tr>
<tr><td><code>AD=</code></td><td>Attribute Definition:
If operand3 is a variable, you can mark it in one of the following ways:
<table>
<tr><td><code>AD=O</code></td><td>Non-modifiable, see session parameter <code>AD=O</code>.</td></tr>
<tr><td><code>AD=M</code></td><td>Modifiable, see session parameter <code>AD=M</code>.

This is the default setting.</td></tr>
<tr><td><code>AD=A</code></td><td>Input only, see session parameter <code>AD=A</code>.</td></tr>
</table>
If operand3 is a constant, <code>AD</code> cannot be explicitly specified. For constants <code>AD=O</code> always applies.</td></tr>
<tr><td>nX</td><td>Parameter(s) to be Skipped:

With the notation nX you can specify that the next n parameters are to be skipped (for example, <code>1X</code> to skip the next parameter, or <code>3X</code> to skip the next three parameters). This means that for the next n parameters no values are passed to the method.

For a method implemented in Natural, a parameter that is to be skipped must be defined with the keyword <code>OPTIONAL</code> in the dialog's <code>DEFINE DATA PARAMETER</code> statement. <code>OPTIONAL</code> means that a value can - but need not - be passed from the invoking object to such a parameter.</td></tr>
<tr><td><code>RETURN</code> operand4</td><td>RETURN Clause:

If the <code>RETURN</code> clause is omitted and the method has a return value, the return value is discarded.

If the <code>RETURN</code> clause is specified, operand4 contains the return value of the method. If the method execution fails, operand4 is reset to its initial value.

Note: For classes written in Natural, the return value of a method is defined by entering one additional parameter in the parameter data area of the method and by marking it with <code>BY VALUE RESULT</code>. For more information, see the <code>PARAMETER</code> clause in the <code>INTERFACE</code> statement description. Therefore the parameter data area of a method that is written in Natural and that has a return value always contains one additional field next to the method parameters. This is to be considered when you call a method of a Natural written class and want to use the parameter data area of the method in the <code>SEND</code> statement.</td></tr>
</table>

Syntax Element	Description
`GIVING` *operand5*	**GIVING Clause:** If the `GIVING` clause is not specified, the Natural run time error processing is triggered if an error occurs. If the `GIVING` clause is specified, *operand5* contains the Natural message number if an error occurred, or zero on success.

Example

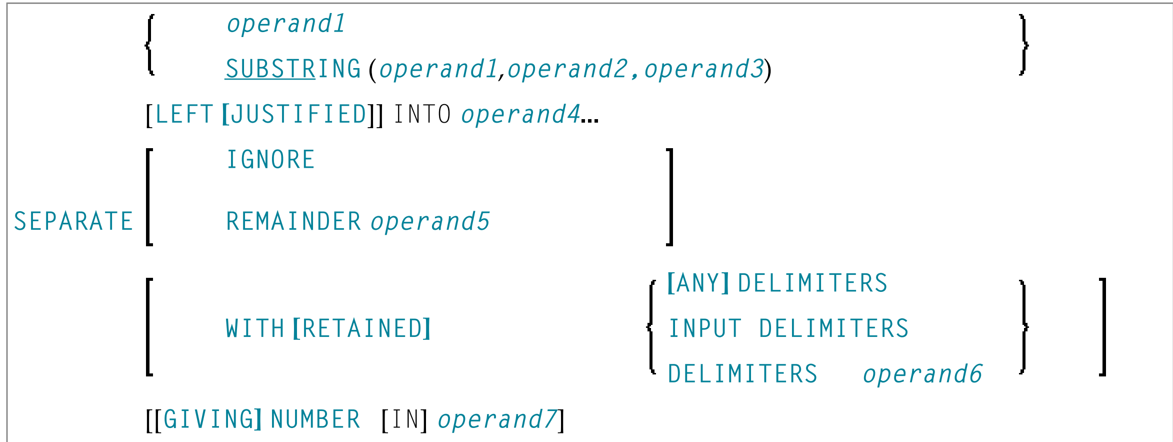
is          24
```

114 SEPARATE

- Function 764
- Syntax Description 764
- Examples 767



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: COMPRESS | COMPUTE | EXAMINE | MOVE | MOVE ALL | RESET

Belongs to Function Group: ***Arithmetic and Data Movement Operations***

Function

The SEPARATE statement is used to separate the content of an alphanumeric or binary operand into two or more alphanumeric or binary operands (or into multiple occurrences of an alphanumeric or binary array).

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A	U					B							yes	no
operand2	C	S						N	P	I		B*							yes	no
operand3	C	S						N	P	I		B*							yes	no
operand4		S	A	G		A	U					B							yes	yes
operand5		S				A	U					B							yes	yes
operand6	C	S				A	U					B							yes	no
operand7		S						N	P	I									yes	yes

* Format B of *operand2* and *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
operand1	**Source Operand:** *operand1* is the alphanumeric/binary constant or variable whose content is to be separated. Trailing blanks in *operand1* are removed before the value is processed (even if the blank is used as a delimiter character; see also the DELIMITERS option).
SUBSTRING	**SUBSTRING Option:** Normally, the whole content of a field is separated, starting from the beginning of the field. The SUBSTRING option allows you to separate only a certain part of the field. After the field name (*operand1*) in the SUBSTRING clause you specify first the starting position (*operand2*) and then the length (*operand3*) of the field portion to be separated. For example, if a field #A contained CONTRAPTION, SUBSTRING(#A,5,3) would contain RAP. **Note:** If you omit *operand2*, the starting position is assumed to be 1. If you omit *operand3*, the length is assumed to be from the starting position to the end of the field.
LEFT JUSTIFIED	**LEFT JUSTIFIED Option:** This option causes leading blanks which may occur between the delimiter character and the next non-blank character to be removed from the target operand.
operand4	**Target Operand:** *operand4* represents the target operands. If an array is specified as target operand, it is filled occurrence by occurrence with the separated values. The number of target operands corresponds to the number of delimiter characters (including trailing delimiter characters) in *operand1*, plus 1. If *operand4* is a dynamic variable, its length may be modified by the SEPARATE operation. The current length of a dynamic variable can be ascertained by using the system variable *LENGTH. For general information on dynamic variables, see the section *Using Dynamic and Large Variables*.
IGNORE / REMAINDER *operand5*	**IGNORE / REMAINDER Options:** If you do not specify enough target fields for the source value to be separated into, you will receive an appropriate error message. To avoid this, you have two options: ■ **IGNORE Option:**

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>If you specify <code>IGNORE</code>, Natural will ignore it if there are not enough target operands to receive the source value.

■ REMAINDER Option:

If you specify <code>REMAINDER operand5</code>, that section of the source value which could not be placed into target operands will be placed into operand5. You may then use the content of operand5 for further processing, for example in a subsequent <code>SEPARATE</code> statement.

See also Example 3.</td></tr>
<tr><td><code>DELIMITERS</code></td><td>DELIMITERS Option:

See DELIMITERS Option below.</td></tr>
<tr><td><code>RETAINED</code></td><td>RETAINED Option:

Normally, the delimiter characters themselves are not moved into the target operands.

When you specify <code>RETAINED</code>, however, each delimiter (that is, either default delimiters and blanks, or the delimiter specified with operand6) will also be placed into a target operand.

Example:

The following <code>SEPARATE</code> statement would place <code>150</code> into <code>#B</code>, + into <code>#C</code>, and <code>30</code> into <code>#D</code>:

<pre>...
MOVE '150+30' TO #A
SEPARATE #A INTO #B #C #D WITH RETAINED DELIMITER '+'
...</pre>
See also Example 3.</td></tr>
<tr><td><code>GIVING NUMBER</code>
operand7</td><td>GIVING NUMBER Option:

This option causes the number of filled target operands (including those filled with blanks) to be returned in operand7. The number actually obtained is the number of delimiters plus 1.

If you use the IGNORE Option, the maximum possible number returned in operand7 will be the number of target operands (operand4).

If you use the REMAINDER Option, the maximum possible number returned in operand7 will be the number of target operands (operand4) plus operand5.</td></tr>
</table>

DELIMITERS Option:

Delimiter characters within *operand1* indicate the positions at which the value is to be separated.

```
[                  { [ANY] DELIMITERS        } ]
[ WITH [RETAINED]  { INPUT DELIMITERS        } ]
[                  { DELIMITERS operand6     } ]
```

Syntax Element Description:

Syntax Element	Description
`WITH [ANY] DELIMITERS`	If you omit the `DELIMITERS` option or specify `WITH ANY DELIMITERS`, a blank and any character which is neither a letter nor a numeric character will be treated as delimiter character.
`WITH INPUT DELIMITERS`	Indicates that the blank and the default input delimiter character (as specified with the session parameter `ID`) is to be used as delimiter character.
`WITH DELIMITERS operand6`	Indicates that each of the characters specified in *operand6* is to be treated as delimiter character. If *operand6* contains trailing blanks, these will be ignored.

Examples

- Example 1 - Various Samples
- Example 2 - Using an Array
- Example 3 - Using REMAINDER/RETAINED Options

115 SET CONTROL

- Function 772
- Syntax Description 772
- Examples 772

```
SET CONTROL operand1 ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The `SET CONTROL` statement is used to perform terminal commands from within a program.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no

Syntax Element Description:

Syntax Element	Description
operand1	**Terminal Commands to be Performed:** The terminal commands are specified as *operand1* without the control character `%` (by default). They can be specified as a text constant or as the content of an alphanumeric variable. For further information on terminal commands, see the *Terminal Commands* documentation.

Examples

- Example 1 - Switching to Lower Case

■ Example 2 - Activating Hardcopy Output Destination

Example 1 - Switching to Lower Case

```
...
SET CONTROL 'L'
...
```

Switches to lower case (equivalent to the terminal command `%L`).

Example 2 - Activating Hardcopy Output Destination

```
...
SET CONTROL 'HDEST'...
```

Activates hardcopy output to destination `DEST` (equivalent to the terminal command `%H`*`destination`*).

116 SET GLOBALS

- Function 776
- Syntax Description 776
- Parameters 777
- Example 778

```
SET GLOBALS parameter=value ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The SET GLOBALS statement is used to set values for session parameters.

The parameters are evaluated either when the program that contains the SET GLOBALS statement is compiled, or when it is executed; this depends on the individual parameters.

The parameter settings specified with SET GLOBALS remain in effect until the end of the Natural session, unless they are overridden with a subsequent SET GLOBALS statement or GLOBALS system command. The statement SET GLOBALS and the system command GLOBALS offer the same parameters for modification. They can both be used in the same Natural session. Parameter values specified with a GLOBALS command remain in effect until they are overridden by a new GLOBALS command or SET GLOBALS statement, the session is terminated, or you log on to another library.

Syntax Description

Syntax Element	Description
parameter=value	**Parameter Specification(s):** In place of *parameter*, specify the name of the parameter to be set. For a list of possible parameters, see ***Parameters*** below. If you specify multiple parameters, you have to separate them from one another by one or more blanks. The parameters can be specified in any order; see also ***Example***. In place of *value*, specify a valid parameter value. For information on valid parameter values, see the descriptions of the individual parameters listed below.

Parameters

Parameters that can be specified with the SET GLOBALS statement		Evaluation (R = at runtime, C = at compilation)
CC	Conditional Program Execution	R
CF	Character for Terminal Commands	R
CO	Compiler Output	R
CPCVERR	Code Page Conversion Error	R
DC	Character for Decimal Point Notation	R
DFOUT	Date Format for Output	R
DFSTACK	Date Format for Stack	R
DFTITLE	Date Format in Default Page Title	R
DO	Display Order of Output Data	R
DU	Dump Generation	R
EJ	Page Eject	R
FCDP	Filler Character for Dynamically Protected Fields	R
FS	Format Specification	R
IA	INPUT Assign Character	R
ID	INPUT Delimiter Character	R
IM	INPUT Mode	R
LE	Limit Error Processing	C
LS	Line Size	C
LT	Limit of Records Read	R
OPF	Overwriting of Protected Fields by Helproutines	R
PD	NATPAGE Page Dataset	R
PM	Print Mode	C
PS	Page Size	RC
REINP	Internal REINPUT for Invalid Data	R
SA	Sound Terminal Alarm	R
SF	Spacing Factor	C
WH	Wait for Record in Hold Status	R
ZD	Zero Division Check	R
ZP	Zero Printing	R

The individual session parameters are described in the *Parameter Reference*.

Example

In the example below, the `SET GLOBALS` statement is used to set the maximum number of characters permitted per line to 74 and to limit the number of database records that can be read in processing loops within a Natural program to 5000.

```
SET GLOBALS LS=74 LT=5000
...
```

117 SET KEY

- Function 780
- Syntax Description 780
- Making Keys Program-Sensitive and Deactivating Keys 781
- Assigning Commands/Programs 783
- Assigning Input DATA 783
- COMMAND OFF/ON 784
- Assigning HELP 784
- DYNAMIC Option 785
- DISABLED Option 785
- SET KEY Statements on Different Program Levels 786
- Assigning Names 788
- Example 789

Function

The SET KEY statement is used to assign functions to the following types of keys:

- video terminal PA (program attention) keys,
- PF (program function) keys,
- CLEAR key.

When a SET KEY statement is executed, Natural receives control of the keys during program execution and uses the values assigned to the keys.

The Natural system variable *PF-KEY identifies which key was pressed last.

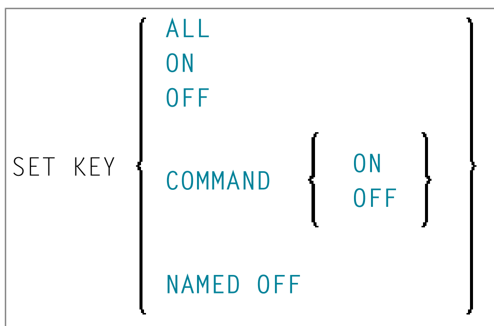
Note: If a user presses a key to which no function is assigned, either a warning message will be issued prompting the user to press a valid key, or the value ENTR will be placed into the Natural system variable *PF-KEY; that is, Natural will react as if the ENTER key had been pressed (this depends on the Natural profile parameter IKEY as set by the Natural administrator).

Syntax Description

Several structures are possible for this statement.

For an explanation of the symbols used in the syntax diagrams, see ***Syntax Symbols***.

Syntax 1 - Affecting All Keys:



Syntax 2 - Affecting Individual Keys:

```
          ⎧ ⎧                        ⎫ ⎡   ⎧ ON                    ⎫ ⎤ ⎫
          ⎪ ⎪ PAn                    ⎪ ⎢   ⎪ OFF                   ⎪ ⎥ ⎪
          ⎪ ⎪ PFn                    ⎪ ⎢   ⎪ DISABLED              ⎪ ⎥ ⎪
SET KEY   ⎨ ⎨ CLR                    ⎬ ⎢ = ⎨                       ⎬ ⎥ ⎬
          ⎪ ⎪ DYNAMIC  operand1      ⎪ ⎢   ⎪ COMMAND  { ON  }      ⎪ ⎥ ⎪
          ⎪ ⎩                        ⎭ ⎢   ⎩          { OFF }      ⎭ ⎥ ⎪
          ⎩                            ⎣                             ⎦ ⎭ ...
```

Syntax 3 - Affecting Individual Keys:

```
      ⎧  ⎧ PAn      ⎫ ⎡   ⎧ PGM      ⎫  ⎤ ⎡ NAMED { operand4 } ⎤ ⎫
      ⎪  ⎪ PFn      ⎪ ⎢ = ⎪ operand2 ⎪  ⎥ ⎣       { OFF      } ⎦ ⎪
      ⎪  ⎨ CLR      ⎬ ⎢   ⎨ HELP     ⎬  ⎥                        ⎪
      ⎪  ⎪ DYNAMIC  ⎪ ⎢   ⎪ DATA     ⎪  ⎥                        ⎪
SET   ⎨  ⎩ operand1 ⎭ ⎣   ⎩ operand3 ⎭  ⎦                        ⎬
KEY   ⎪                                                          ⎪
      ⎪  ENTR ⎡ NAMED          { operand4 } ⎤                    ⎪
      ⎩       ⎣                { OFF      } ⎦                    ⎭ ...
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S				A													yes	no
operand2	C	S				A	U												yes	no
operand3	C	S				A	U												yes	no
operand4	C	S				A	U												yes	no

Making Keys Program-Sensitive and Deactivating Keys

Making a key program-sensitive means that the key will be available for interrogation by the currently active program. If a key is made program-sensitive, pressing the key has the same effect as pressing ENTER. All data that have been entered on the screen are transferred to the program.

Note: PA keys and the CLEAR key, when made program-sensitive, do not cause any data to be transferred from the screen.

The program-sensitivity remains in effect only for the execution of the current program. See also the section *SET KEY Statements on Different Program Levels*.

Examples:

SET KEY ALL	This statement causes all keys to be made program-sensitive. All function assignments to any keys are overwritten.
SET KEY PF2 SET KEY PF2=PGM	Each of these statements causes PF2 to be made program-sensitive.
SET KEY OFF	This statement de-activates all key settings. The Natural system variable *PF-KEY contains ENTR after SET KEY OFF has been executed.
SET KEY ON	This statement re-activates the functions assigned to all keys that had an assignment and re-activates the program-sensitivity of keys that were made program-sensitive before they were de-activated.
SET KEY PF2=OFF	This statement de-activates PF2. After execution of SET KEY PF2=OFF, the Natural system variable *PF-KEY contains ENTR if it contained PF2 before.
SET KEY PF2=ON	This statement re-activates the function assigned to PF2 before it was de-activated or made program-sensitive. If no function had been assigned to PF2, it will be made program-sensitive again.

Key Program-Sensitivity and Contents of *PF-KEY

The following example shows the relation between the program-sensitivity of a key and the contents of the system variable *PF-KEY.

Assume that PF2 has been made program-sensitive by means of SET KEY PF2=PGM and an INPUT statement is executed afterwards. The table below shows how user actions and executed Natural statements influence the contents of *PF-KEY.

Sequence	Natural Statement Executed / User Action	Contents of *PF-KEY
1	User presses PF2.	PF2
2	SET KEY OFF	ENTR
3	SET KEY ON	PF2
4	SET KEY PF2=OFF	ENTR
5	SET KEY PF2=ON	PF2
6	SET KEY PF3=OFF	PF2

Assigning Commands/Programs

You can assign a command or program name to a key. When the key is pressed, the current program is terminated and the command/program assigned to the key is invoked via the Natural stack. When assigning a command/program, you can also pass parameters to the command/program (see third example below).

You can also assign a terminal command to a key. When the key is pressed, the terminal command assigned to the key is executed.

When *operand2* is specified as a constant, it must be enclosed within apostrophes.

Examples:

SET KEY PF4='SAVE'	The command SAVE is assigned to PF4.
SET KEY PF4=#XYX	The value contained in the variable #XYZ is assigned to PF4.
SET KEY PF6='LIST MAP *'	The command LIST, including the LIST parameters MAP and *, is assigned to PF6.
SET KEY PF2='%%'	The terminal command %% is assigned to PF2.

The assignment remains in effect until it is overwritten by another SET KEY statement, until the user logs on to another application, or until the end of the Natural session. See also the section *SET KEY Statements on Different Program Levels*.

Note: Before a program invoked via a key is executed, Natural internally issues a BACKOUT TRANSACTION statement.

Assigning Input DATA

You can assign a data string (*operand3*) to a key. When the key is pressed, the data string is placed into the input field in which the cursor is currently positioned, and the data are transferred to the executing program (as if ENTER had been pressed).

When *operand3* is specified as a constant, it must be enclosed within apostrophes.

Example:

```
SET KEY PF12=DATA 'YES'
```

For the validity of a DATA assignment, the same applies as for a command assignment, that is, it remains in effect until it is overwritten by another SET KEY statement, until the user logs on to another application, or until the end of the Natural session. See also the section ***SET KEY Statements on Different Program Levels***.

COMMAND OFF/ON

With COMMAND OFF, you can temporarily de-activate any function (command, program, or data) assigned to a key. If the key had been program-sensitive before the function was assigned, COMMAND OFF will make it program-sensitive again.

With a subsequent COMMAND ON, you can re-activate the assigned function again.

Examples:

SET KEY PF4=COMMAND OFF	The function that has been assigned to PF4 is temporarily de-activated; if PF4 had been program-sensitive before the function was assigned, it is now made program-sensitive again.
SET KEY PF4=COMMAND ON	The function assigned to PF4 is re-activated again.
SET KEY COMMAND OFF	All functions assigned to all keys are temporarily de-activated; those keys which had been program-sensitive before functions were assigned to them, are now made program-sensitive again.
SET KEY COMMAND ON	All functions assigned to all keys are re-activated again.

With SET KEY PF*nn*='' you can delete the function assigned to a key and at the same time deactivate the program sensitivity of the key.

Assigning HELP

You can assign HELP to a key. When the key is pressed, the helproutine assigned to the field in which the cursor is currently positioned will be invoked.

The effect is the same as when entering the help character in the field to invoke help. (The help character - default is a question mark (?) - is determined by the Natural profile parameter HI as set by the Natural administrator.)

Example:

```
SET KEY PF1=HELP
```

For the validity of a HELP assignment, the same applies as for program-sensitivity, that is, it remains in effect only for the execution of the current program. See also the section ***SET KEY Statements on Different Program Levels***.

DYNAMIC Option

Instead of specifying a specific key with the SET KEY statement, you can use the DYNAMIC option with a variable (*operand1*), and assign a value (PF*n*, PA*n*, CLR) to this variable in the program. This allows you to specify a function and make it dependent on the program logic which key this function is assigned to.

Example:

```
...
IF ...
   MOVE 'PF4' TO #KEY
ELSE
   MOVE 'PF7' TO #KEY
END-IF
...
SET KEY DYNAMIC #KEY = 'SAVE'
...
```

DISABLED Option

Graphical user interface (GUI) elements, such as push buttons, menus, and bitmaps, are implemented as PF keys. With the DISABLED option, you can disable the use the of a GUI element assigned to a PF key. Push buttons and menu items will then be displayed grey.

To cancel the effect of SET KEY PF*nn*=DISABLED, you use SET KEY PF*nn*=ON.

Example:

SET KEY PF10=DISABLED	Disables the use of the GUI element assigned to PF10.

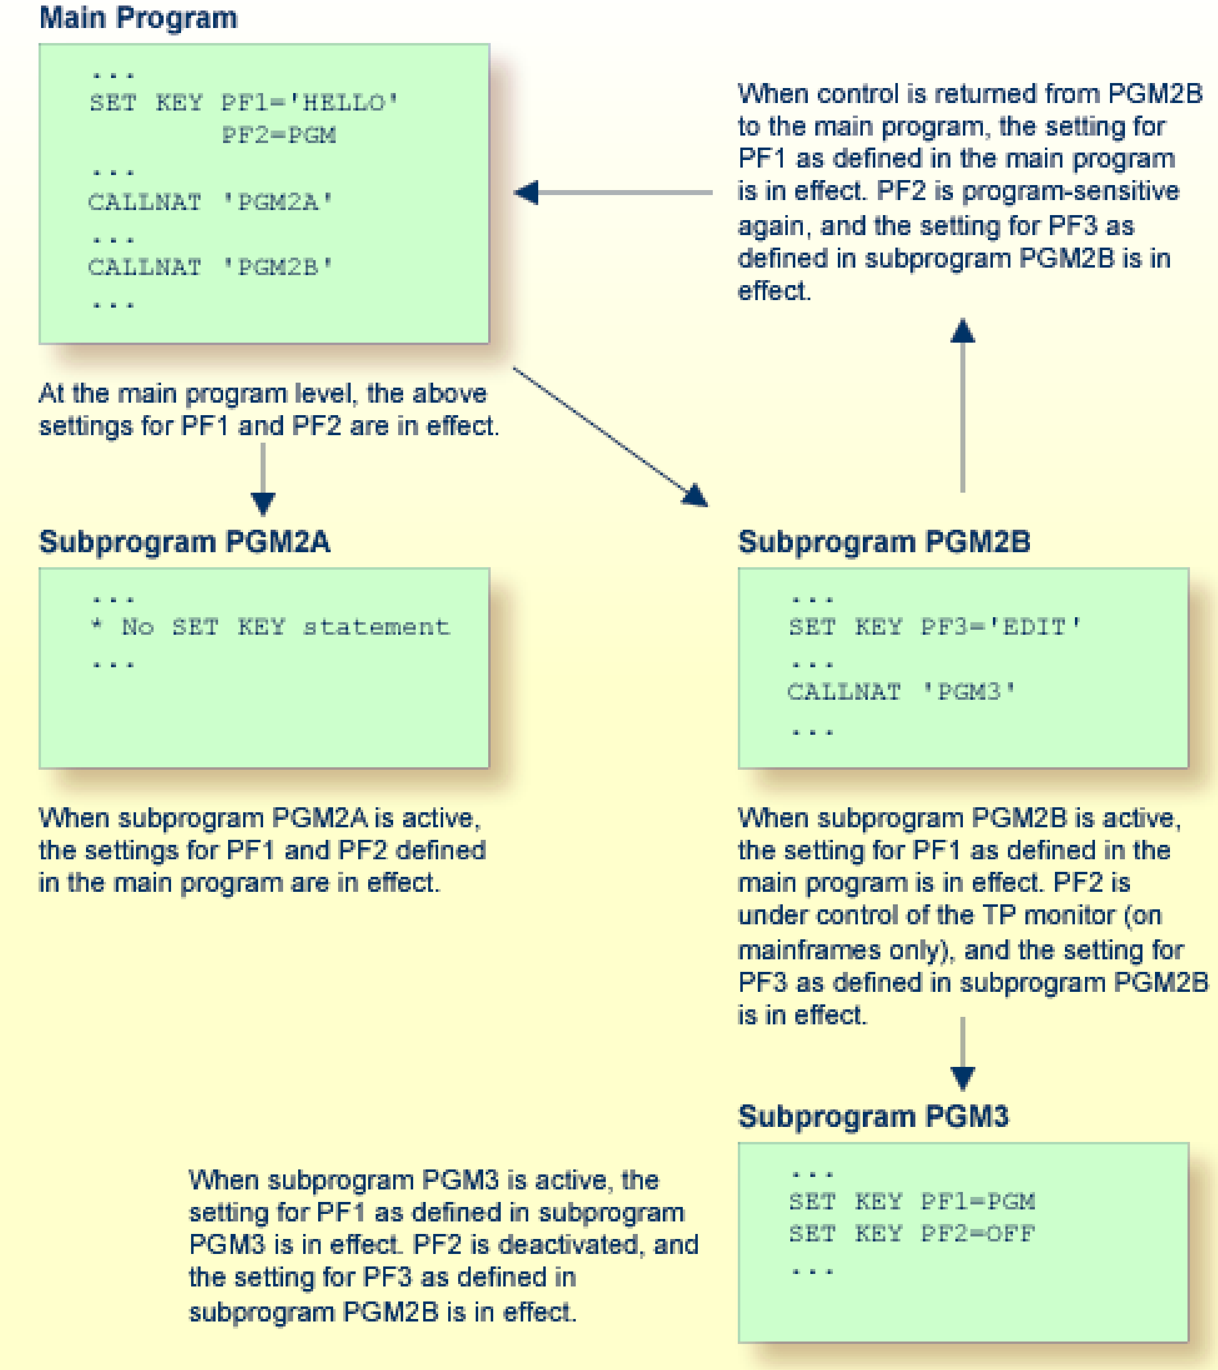
The DISABLED option can only be used within a processing rule.

SET KEY Statements on Different Program Levels

When an application contains SET KEY statements at different levels, the following applies:

- When keys are made program-sensitive, the program-sensitivity also applies to all lower level (called) programs, unless these programs contain further SET KEY statements. When control is returned to a higher level program, the SET KEY assignments made at the higher level come into effect again.
- For keys which are defined as HELP keys, the same applies as for keys which are program-sensitive.
- When a function (program, command, terminal command, or data string) is assigned to a key, this assignment is valid at all higher and lower levels - regardless of the level at what the assignment is made - until another function is assigned to the key or it is made program-sensitive, or until the user logs on to another application or the Natural session is terminated.

Example of SET KEY Statements on Different Program Levels



Assigning Names

With the `NAMED` clause, you can assign a name (*operand4*) to a key. The name will then be displayed in the PF-key lines on the screen; this allows the users to identify the functions assigned to the keys:

```
                ?   Help
              .   Exit
             ---- --------------------------------------------------
      Code ..: ?   Library ..: *_______
                   Object ...: *_______________________________________
                   DBID .....: 0__    FILENR ...: 0__

  Command ===>
 Enter-PF1---PF2---PF3---PF4---PF5---PF6---PF7---PF8---PF9---PF10--PF11--PF12---
       Help        Exit  Last        Flip                                 Canc
```

The display of the PF-key lines is activated with the session parameter `KD` (see the *Parameter Reference*). You can control the way in which the PF-key lines are displayed by using the terminal command `%Y` (see the *Terminal Commands* documentation).

The maximum length of a name to be assigned to a key is 10 characters. In normal tabular PF-key line format (`%YN`), only the first 5 characters are displayed.

When *operand4* is specified as a constant, it must be enclosed within apostrophes (see examples below).

You cannot assign a name to a key without assigning a function to it or making it program-sensitive. To the ENTER key, however, you can only assign a name, but no function.

With `NAMED OFF`, you delete the name assigned to a program-sensitive key.

Examples:

`SET KEY ENTR NAMED 'EXEC'`	The name `EXEC` is assigned to the ENTER key.
`SET KEY PF3 NAMED 'EXIT'`	PF3 is made program-sensitive, and the name `EXIT` is assigned to PF3.
`SET KEY PF3 NAMED OFF`	PF3 is made program-sensitive, and the name that has been assigned to PF3 is deleted.
`SET KEY NAMED OFF`	All names that have been assigned to any program-sensitive keys are deleted.
`SET KEY PF4='AP1' NAMED 'APPL1'`	The program `AP1` and the name `APPL1` are assigned to PF4.

When you use normal tabular PF-key line format (%YN), the following applies:

- If you omit the NAMED clause when assigning a command/program to a key, the command/program name will be displayed in the PF-key line; if the command/program name is longer than 5 characters, CMND will be displayed.
- If you omit the NAMED clause when assigning input data to a key, DATA will be displayed in the PF-key line.
- If you assign (with the NAMED clause) a name in Unicode format to a PF-key, the name might not be correctly positioned under the respective headers. This problem, however, may occur only when you are using the *Natural Web I/O Interface* and only for "wide" characters. In this case, the sequential PF-key line format (%YS or %YP) is recommended.

When you use sequential PF-key line format (%YS or %YP), only those keys to which names have been assigned will be displayed in the PF-key line; that is, if you omit the NAMED clause when assigning a command/program/data to a key, the key will not be displayed in the PF-key line.

Example

```
** Example 'SKYEX1': SET KEY
************************************************************************
DEFINE DATA LOCAL
1 #PF4 (A56)
END-DEFINE
*
MOVE 'LIST VIEW' TO #PF4
*
SET KEY PF1 PF2
SET KEY PF3 = 'MENU'
        PF4 = #PF4
        PF5 = 'LIST VIEW EMPLOYEES' NAMED 'Empl'
*
FORMAT KD=ON
INPUT ////
      10X 'The following function keys are assigned:' //
      10X 'PF1: Function for PF1      ' /
      10X 'PF2: Function for PF2      ' /
      10X 'PF3: Return to MENU program' /
      10X 'PF4: LIST VIEW             ' /
      10X 'PF5: LIST VIEW EMPLOYEES   ' ///
*
IF *PF-KEY = 'PF1'
  WRITE 'Function for PF1 executed.'
END-IF
IF *PF-KEY = 'PF2'
  WRITE 'Function for PF2 executed.'
END-IF
```

```
*
END
```

Output of Program SKYEX1:

```
The following function keys are assigned:

PF1: Function for PF1
PF2: Function for PF2
PF3: Return to MENU program
PF4: LIST VIEW
PF5: LIST VIEW EMPLOYEES
```

118 SET TIME

- Function 792
- Example 792

```
{ SET TIME }
{ SETTIME  }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Function

The SET TIME (or SETTIME) statement is used in conjunction with the Natural system variable *TIMD to measure the time it takes to execute a specific section of a program.

The SET TIME statement is placed at a specific position in the program, and *TIMD will contain the amount of time elapsed since the execution of the SET TIME statement.

*TIMD must always contain a reference to the SET TIME statement, either by using the source-code line number of the SET TIME statement or by assigning a label to the SET TIME statement, which can then be used as a reference.

Example

```
** Example 'STIEX1': SETTIME
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
END-DEFINE
*
ST. SETTIME
WRITE 10X 'START TIME:' *TIME
*
READ (100) EMPLOY-VIEW BY NAME
END-READ
*
WRITE NOTITLE 10X 'END TIME:  ' *TIME
WRITE         10X 'ELAPSED TIME TO READ 100 RECORDS'
                  '(HH:II:SS.T) :' *TIMD (ST.) (EM=99:99:99'.'9)
*
END
```

Output of Program STIEX1:

```
START TIME: 16:39:07.6
END TIME:   16:39:07.7
ELAPSED TIME TO READ 100 RECORDS (HH:MM:SS.T) : 00:00:00.1
```

119 SET WINDOW

- Function 796
- Syntax Description 796
- Example 796

```
SET WINDOW { 'window-name' }
           {     OFF       }
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Related Statements: DEFINE WINDOW | INPUT WINDOW='*window-name*' | REINPUT

Belongs to Function Group: *Screen Generation for Interactive Processing*

Function

The SET WINDOW statement is used to activate and de-activate a window.

Any SET WINDOW '*window-name*' or INPUT WINDOW='*window-name*' statement de-activates the window which has currently been active and activates the window specified in the statement. This means that only one window can be active at a time.

Note: If you use SET WINDOW to activate a window which is defined with SIZE AUTO, the data on the screen *before* the window is activated determine the size of the window.

Syntax Description

Syntax Element	Description
SET WINDOW '*window-name*'	Activates the specified window, which means that all subsequent statements refer to that window until either the window is de-activated or another window is activated. The specified window must have been defined with a DEFINE WINDOW statement.
SET WINDOW OFF	De-activates the currently active window.

Example

See DEFINE WINDOW statement.

120 SKIP

- Function 798
- Syntax Description 798
- Example 799

`SKIP [(rep)] operand1 [LINES]`

For an explanation of the symbols used in the syntax diagram, see **Syntax Symbols**.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The SKIP statement is used to generate one or more blank lines in an output report.

See also *Page Titles, Page Breaks, Blank Lines* in the *Programming Guide*.

Processing

If the execution of a SKIP statement would cause the page size to be exceeded, exceeding lines will be ignored (except in an AT TOP OF PAGE statement).

A SKIP statement is only executed if something has already been output on the page (output from an AT TOP OF PAGE statement is not taken into account here).

Syntax Description

Operand Definition Table:

Operand	Possible Structure	Possible Formats	Referencing Permitted	Dynamic Definition
operand1	C S	N P I	yes	no

Syntax Element Description:

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the SKIP statement is applicable. A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified.

Syntax Element	Description
	If `(rep)` is not specified, the `SKIP` statement will apply to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* in the *Programming Guide*.
operand1	**Number of Lines to be Skipped:** *operand1* represents the number (`1 - 250`) of blank lines to be generated. This number may be specified as a numeric constant or as the content of a numerical variable. If *operand1* exceeds the page size of the report, the `SKIP` statement will result in a newpage condition.

Example

```
** Example 'SKPEX1': SKIP
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 COUNTRY
  2 NAME
END-DEFINE
*
LIMIT 7
READ EMPL-VIEW BY CITY STARTING FROM 'W'
  AT BREAK OF CITY
    SKIP 2
  END-BREAK
  DISPLAY NOTITLE CITY (IS=ON) COUNTRY (IS=ON) NAME
  /*
END-READ
END
```

Output of Program SKPEX1:

```
        CITY         COUNTRY         NAME
-------------------- ------- --------------------

WASHINGTON           USA     REINSTEDT
                             PERRY

WEITERSTADT          D       BUNGERT
                             UNGER
                             DECKER
```

```
WEST BRIDGFORD       UK      ENTWHISTLE

WEST MIFFLIN         USA     WATSON
```

121 SORT

- Function 802
- Restrictions 803
- Syntax Description 803
- Three-Phase SORT Processing 806
- Example 807

Structured Mode Syntax

```
END-ALL
[AND]
SORT     [ THEM    ] [BY] { operand1 [ ASCENDING  ] }... 10
           RECORDS                     DESCENDING
         USING-clause
         [GIVE-clause]
         statement ...
END-SORT
```

* If a statement label is specified, it must be placed *before* the keyword `SORT`, but *after* `END-ALL` (and `AND`).

Reporting Mode Syntax

```
SORT [ THEM    ] [BY] { operand1 [ ASCENDING  ] }... 10
       RECORDS                     DESCENDING
     [USING-clause]
     [GIVE-clause]
     statement ...
[LOOP]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statement: **`FIND` with `SORTED BY` option**

Belongs to Function Group: ***Loop Execution***

Function

The `SORT` statement is used to perform a sort operation, sorting the records from all processing loops that are active when the `SORT` statement is executed.

Restrictions

- The `SORT` statement must be contained in the same object as the processing loops whose records it sorts.
- Nested `SORT` statements are not allowed.
- The total length of a record to be sorted must not exceed 10240 bytes.
- The number of sort criteria must not exceed 10.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1		S				A	N	P	I	F	B	D	T					no	no

Syntax Element Description:

Syntax Element	Description
`END-ALL`	**Closing All Currently Active Loops:** In structured mode, the `SORT` statement must be preceded by `END-ALL`, which serves to close all active processing loops. The `SORT` statement itself initiates a new processing loop, which must be closed with `END-SORT`. **Note:** For reporting mode: The `SORT` statement closes all active processing loops and initiates a new processing loop.
operand1	**Sort Criteria:** *operand1* represents the fields/variables to be used as the sort criteria. 1 to 10 database fields (descriptors and non-descriptors) and/or user-defined variables may be specified. A multiple-value field or a field contained within a periodic group may be used. A group or an array is not permitted.
`ASCENDING` `DESCENDING`	**Sort Sequence:** The default sort sequence is ascending. If you wish the values to be sorted in descending sequence, specify `DESCENDING`. `ASCENDING/DESCENDING` may be specified for each sort field.
`USING`	**USING Clause:**

Syntax Element	Description
	See *USING Clause* below.
GIVE	**GIVE Clause:** See *GIVE Clause* below.
END-SORT	**End of SORT Statement:** The Natural reserved word END-SORT must be used to end the SORT statement.

USING Clause

The USING clause indicates the fields which are to be written to intermediate sort storage. It is required in structured mode and optional in reporting mode. However, it is strongly recommended to also use it in reporting mode so as to reduce memory requirements.

```
{ USING {operand2}... }
{ USING KEYS          }
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand2		S	A			A	N	P	I	F	B	D	T	L	C			no	no

Syntax Element Description:

Syntax Element	Description
USING *operand2*	**Additional Fields:** You can specify additional fields that are to be written to the intermediate sort storage - in addition to the sort key fields (as specified with *operand1*).
USING KEYS	**Sort Key Fields Only:** Only the sort key fields, as specified with *operand1*, will be written to intermediate sort storage.

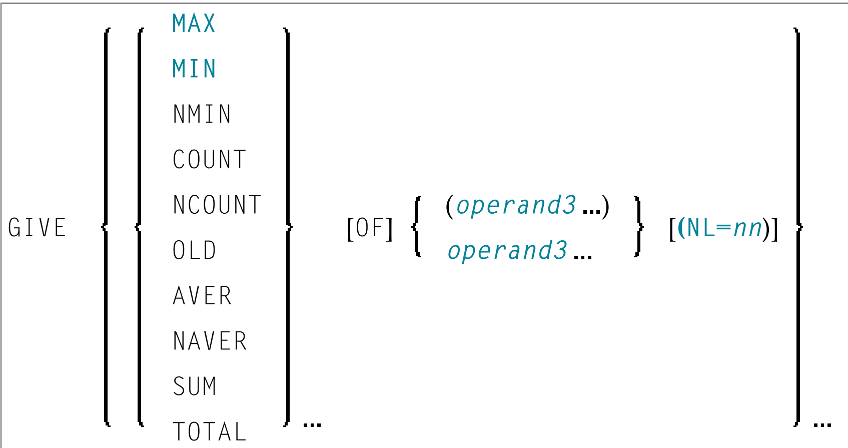
In Reporting Mode: If you omit the USING clause, all database fields of processing loops initiated before the SORT statement, as well as all user-defined variables defined before the SORT statement, will be written to intermediate sort storage.

If, after sort execution, a reference is made to a field which was not written to the sort intermediate storage, the value for the field will be the last value of the field before the sort.

GIVE Clause

The GIVE clause is used to specify Natural system functions (such as MAX, MIN) that are to be evaluated in the first phase of the SORT statement. These system functions may be referenced in the third phase (see ***SORT Statement Processing***).

A reference to a system function after the SORT statement must be preceded by an asterisk, for example, *AVER(SALARY).



Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand3		S	A			*												yes	no

* depends on function

Syntax Element Description:

Syntax Element	Description
MAX | MIN | NMIN | COUNT | NCOUNT | OLD | AVER | NAVER | SUM | TOTAL	**System Functions:** For details on the individual system functions, see the *System Functions* documentation.
operand3	**Field Name:** *operand3* is the field name.
(NL=*nn*)	**Preventing Arithmetic Overflows:** This option applies to the system functions AVER, NAVER, SUM and TOTAL only. It will be ignored for any other system function.

Syntax Element	Description
	This option may be used to prevent an arithmetic overflow during the evaluation of system functions; it is described under *Arithmetic Overflows in AVER, NAVER, SUM or TOTAL* in the *System Functions* documentation.

Three-Phase SORT Processing

A program containing a SORT statement is executed in three phases.

1st Phase - Selecting the Records to be Sorted

The statements before the SORT statement are executed. Data as described in the USING clause will be written to intermediate sort storage.

In reporting mode, any variables to be used as accumulators following the sort must not be defined before the SORT statement. In structured mode, they must not be included in the USING clause. Fields written to intermediate sort storage cannot be used as accumulators because they are read back with each individual record during the 3rd processing phase. Consequently, the accumulation function would not produce the desired result because with each record the field would be overwritten with the value for that individual record.

The number of records written to intermediate storage is determined by the number of processing loops and the number of records processed per loop. One record on the internal intermediate storage is created each time the SORT statement is encountered in a processing loop. In the case of nested loops, a record is only written to intermediate storage if the inner loop is executed. If in the example below a record is to be written to intermediate storage even if no records are found for the inner (FIND) loop, the FIND statement must contain an IF NO RECORDS FOUND clause.

```
READ ...
  ...
  FIND ...
...
END-ALL
SORT ...
  DISPLAY ...
END-SORT
...
```

2nd Phase - Sorting the Records

The records are sorted.

3rd Phase - Processing the Sorted Records

The statements after the SORT statement are executed for all records on the intermediate storage in the specified sorting sequence. Database fields to be referenced after a SORT statement must be correctly referenced using the appropriate statement label or reference number.

Example

- Example 1 - SORT
- Example 2 - SORT

Example 1 - SORT

```
** Example 'SRTEX1S': SORT (structured mode)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 CITY
  2 SALARY      (1:2)
  2 PERSONNEL-ID
  2 CURR-CODE   (1:2)
*
1 #AVG          (P11)
1 #TOTAL-TOTAL  (P11)
1 #TOTAL-SALARY (P11)
1 #AVER-PERCENT (N3.2)
END-DEFINE
*
LIMIT 3
FIND EMPL-VIEW WITH CITY = 'BOSTON'
  COMPUTE #TOTAL-SALARY = SALARY (1) + SALARY (2)
  ACCEPT IF #TOTAL-SALARY GT 0
  /*
END-ALL
AND
SORT BY PERSONNEL-ID USING #TOTAL-SALARY SALARY(*) CURR-CODE(1)
     GIVE AVER(#TOTAL-SALARY)
  /*
  AT START OF DATA
    WRITE NOTITLE '*' (40)
         'AVG CUMULATIVE SALARY:' *AVER (#TOTAL-SALARY) /
    MOVE *AVER (#TOTAL-SALARY) TO #AVG
  END-START
  COMPUTE ROUNDED #AVER-PERCENT = #TOTAL-SALARY / #AVG * 100
  ADD #TOTAL-SALARY TO #TOTAL-TOTAL
  /*
  DISPLAY NOTITLE PERSONNEL-ID SALARY (1) SALARY (2)
          #TOTAL-SALARY CURR-CODE (1)
```

```
         'PERCENT/OF/AVER' #AVER-PERCENT
  AT END OF DATA
    WRITE / '*' (40) 'TOTAL SALARIES PAID: ' #TOTAL-TOTAL
  END-ENDDATA
END-SORT
*
END
```

Output of Program SRTEX1S:

```
PERSONNEL   ANNUAL     ANNUAL   #TOTAL-SALARY CURRENCY PERCENT
    ID       SALARY     SALARY                   CODE     OF
                                                         AVER
  --------- ---------- ---------- ------------ -------- -------

  **************************************** AVG CUMULATIVE SALARY:        41900

  20007000       16000      15200        31200  USD        74.00
  20019200       18000      17100        35100  USD        83.00
  20020000       30500      28900        59400  USD       141.00

  **************************************** TOTAL SALARIES PAID:        125700
```

The previous example is executed as follows:

First Phase:

- Records with `CITY=BOSTON` are selected from the `EMPLOYEES` file.
- The first 2 occurrences of `SALARY` are accumulated in the field `#TOTAL-SALARY`.
- Only records with `#TOTAL-SALARY` greater than 0 are accepted.
- The records are written to the sort intermediate storage. The database arrays `SALARY` (first 2 occurrences) and `CURR-CODE` (first occurrence), the database field `PERSONNEL-ID`, and the user-defined variable `#TOTAL-SALARY` are written to the intermediate storage.
- The average of `#TOTAL-SALARY` is evaluated.

Second Phase:

- The records are sorted.

Third Phase:

- The sorted intermediate storage is read.
- At the at-start-of-data condition, the average of `#TOTAL-SALARY` is displayed.
- `#TOTAL-SALARY` is added to `#TOTAL-TOTAL` and the fields `PERSONNEL-ID`, `SALARY(1)`, `SALARY(2)`, `#AVER-PERCENT` and `#TOTAL-SALARY` are displayed.
- At the end-of-data condition, the variable `#TOTAL-TOTAL` is written.

Equivalent reporting-mode example: **SRTEX1R**.

Example 2 - SORT

```
** Example 'SRTEX2': SORT
************************************************************************
DEFINE DATA LOCAL
1 VEHIC-VIEW VIEW OF VEHICLES
  2 MAKE
  2 YEAR
END-DEFINE
*
LIMIT 10
*
READ VEHIC-VIEW
END-ALL
SORT BY MAKE YEAR USING KEY
  DISPLAY NOTITLE (AL=15) MAKE (IS=ON) YEAR
  AT BREAK OF MAKE
    WRITE '-' (20)
  END-BREAK
END-SORT
END
```

Output of Program SRTEX2S:

```
     MAKE       YEAR
--------------- -----

FIAT             1980
                 1982
                 1984
--------------------
PEUGEOT          1980
                 1982
                 1985
--------------------
RENAULT          1980
                 1980
                 1982
                 1982
--------------------
```

122 STACK

- Function 812
- Syntax Description 812
- Example 815

```
STACK [TOP]  { COMMAND operand1 [operand2 [(parameter)]] ...      }
             { [DATA] [FORMATTED] {operand2 [(parameter)]} ...    }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: INPUT | RELEASE

Function

The STACK statement is used to place any of the following into the Natural stack:

- the name of a Natural program or Natural system command to be executed;
- data to be used during the execution of an INPUT statement.

For further information on the stack, see *Further Programming Aspects*, *Stack* in the *Programming Guide*.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A	G	N	A													yes	yes
operand2	C	S	A	G	N	A	U	N	P	I	F	B	D	T	L		G		yes	yes

Syntax Element Description:

Syntax Element	Description
TOP	**TOP Option:** If you specify TOP, the data/program/command will be placed at the top of the Natural stack. Otherwise, they are placed at the bottom of the stack.

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>Example: The following statement causes the content of the variable #FIELDA to be placed as data on top of the stack:

<pre>STACK TOP #FIELDA</pre></td></tr>
<tr><td>DATA</td><td>DATA Option:

This option, which is also the default, causes data to be placed in the stack which are to be used as input data for an INPUT statement.

Delimiter characters or input assign characters contained within the data values will be processed as delimiters. For details on how data from the stack are processed by an INPUT statement, refer to Processing Data from the Natural Stack (in the description of the INPUT statement).

Example: The following statements cause the contents of the variables #FIELD1 and #FIELD2 to be placed in the stack:

<pre>MOVE 'ABC' TO #FIELD1
MOVE 'XYZ' TO #FIELD2
STACK #FIELD1 #FIELD2</pre>
These variables will be passed as data to the next INPUT statement in the Natural program, using delimiter mode:

<pre>INPUT #FIELD1 #FIELD2</pre>
Note: If operand2 is a time variable (Format T), only the time component of the variable content is placed in the stack, but not the date component.</td></tr>
<tr><td>FORMATTED</td><td>FORMATTED Option:

This option causes all data to be passed on a field-by-field basis to the next INPUT statement; no key assignments or delimiter characters will be interpreted.

Examples:

The following statements cause ABC,DEF to be placed in #FIELD1 and XYZ in #FIELD2:

<pre>MOVE 'ABC,DEF' TO #FIELD1
MOVE 'XYZ'   TO #FIELD2
STACK TOP DATA FORMATTED #FIELD1 #FIELD2
...
INPUT #FIELD1 #FIELD2</pre></td></tr>
</table>

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>Assuming the input delimiter character to be the comma (profile/session parameter ID=,), the following statements - without the keyword FORMATTED - cause ABC to be placed in #FIELD1 and DEF in #FIELD2:

<pre>MOVE 'ABC,DEF' TO #FIELD1
STACK TOP DATA #FIELD1
...
INPUT #FIELD1 #FIELD2</pre>
Note: The FORMATTED option should be used if the data to be passed contains delimiter, control or DBCS characters to avoid unintentional interpretation of these characters.</td></tr>
<tr><td>COMMAND
operand1</td><td>COMMAND Option:

To place a command (or program name) in the stack, you specify the keyword COMMAND followed by the command specified in operand1. Natural will execute the command instead of displaying the NEXT prompt and prompting the user for input.

Example:

The following statement causes the command RUN to be placed at the top of the stack. Natural will execute this command at the point where the NEXT prompt would normally be issued.

<pre>STACK TOP COMMAND 'RUN'</pre></td></tr>
<tr><td>COMMAND
operand1
operand2 ...</td><td>COMMAND with Data Option:

Together with a command (operand1), you may also place data (operand2) in the stack. These data will then be processed by the next INPUT statement after the command has been executed.

Data stacked with a command are always stacked unformatted.

Note: If the data to be stacked include empty alphanumeric fields (that is, blanks), these blanks will be interpreted as delimiters between values and thus not processed correctly by the corresponding INPUT statement. Therefore, if you wish to stack empty alphanumeric fields as data with a command, you have to use two STACK statements: one STACK DATA operand2 ... to stack the data, and one STACK COMMAND operand1 to stack the command.</td></tr>
<tr><td>parameter</td><td>Date Format:

If operand2 is a date variable, you can specify the session parameter DF as a parameter for this variable.</td></tr>
</table>

Example

```
** Example 'STKEX1': STACK
************************************************************************
DEFINE DATA LOCAL
1 #CODE (A1)
END-DEFINE
*
INPUT //
  10X 'PLEASE SELECT COMMAND' //
  10X 'LIST VIEW      (V)' /

```

123 STOP

- Function 818
- Example 818

```
STOP
```

Function

The STOP statement is used to terminate the execution of a program and return to the command input prompt.

One or more STOP statements may be inserted anywhere within a Natural program.

The STOP statement will terminate the execution of the program immediately. Independent of the positioning of a STOP statement in a subroutine, any end-page condition specified in the main program will be invoked for final end-page processing during execution of the STOP statement.

The STOP statement behaves in the same way as the ESCAPE ROUTINE statement during method execution. Method execution is terminated immediately without producing any return vale.

For Natural Remote Procedure Call (RPC): See *Notes on Natural Statements on the Server* in the *Natural Remote Procedure Call (RPC)* documentation.

Example

```
** Example 'STPEX1': STOP
************************************************************************
DEFINE DATA LOCAL
1 #CODE (A1)
END-DEFINE
*
INPUT //
  10X 'PLEASE SELECT COMMAND' //
  10X 'LIST VIEW      (V)' /
  10X 'LIST PROGRAM * (P)' /
  10X 'TECH INFO      (T)' /
  10X 'STOP           (.)' //
  20X 'CODE:' #CODE
*
*
DECIDE ON FIRST #CODE

STOP           (.)

          CODE:
```

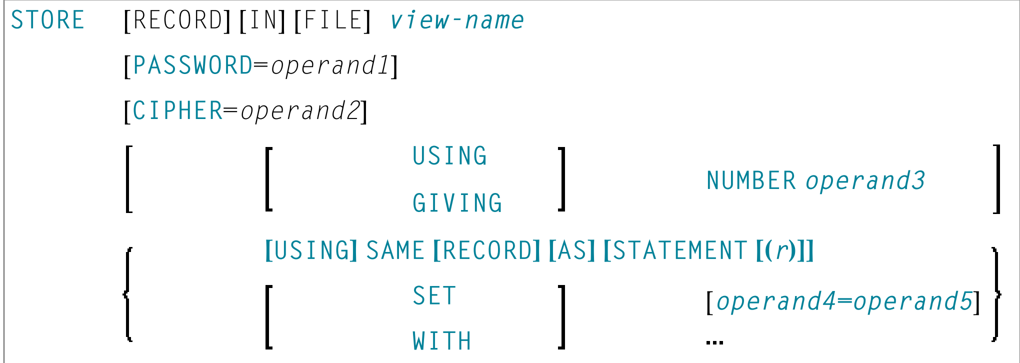
124 STORE

- Function 822
- Database-Specific Considerations 823
- Syntax Description 823
- Example 825

Structured Mode Syntax

```
STORE   [RECORD] [IN] [FILE] view-name
        [PASSWORD=operand1]
        [CIPHER=operand2]
        [   [   USING  ]  NUMBER operand3  ]
        [   [   GIVING ]                   ]
```

Reporting Mode Syntax



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | UPDATE

Belongs to Function Group: ***Database Access and Update***

Function

The STORE statement is used to add a record to a database.

Database-Specific Considerations

Adabas	The Natural system variable `*ISN` contains the Adabas ISN assigned to the new record as a result of the `STORE` statement execution. A subsequent reference to `*ISN` must include the statement number of the related `STORE` statement.
SQL	This statement may be used to add a row to a table. The `PASSWORD`, `CIPHER`, and `GIVING NUMBER` clauses cannot be used. The `STORE` statement corresponds with the SQL statement `INSERT`. The Natural system variable `*ISN` is not available.
XML	This statement may be used to add an XML object to a database. The `PASSWORD`, `CIPHER`, and `GIVING NUMBER` clauses cannot be used. For Tamino, the Natural system variable `*ISN` contains the XML object ID assigned to the new record as a result of the `STORE` statement execution. A subsequent reference to `*ISN` must include the statement number of the related `STORE` statement.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													yes	no
operand2	C	S						N											yes	no
operand3		S						N	P			B *							no	yes
operand4		S	A			A	U	N	P	I	F	B	D	T	L				no	no
operand5	C	S	A			A	U	N	P	I	F	B	D	T	L				yes	no

* Format B of *operand3* may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
view-name	**View Name:** As *view-name*, you specify the name of a view, which must have been defined either in a `DEFINE DATA` statement or outside the program in a global or local data area.

Syntax Element	Description
	In reporting mode, *view-name* is the name of a DDM if no DEFINE DATA LOCAL statement is used.
PASSWORD=*operand1*	**PASSWORD Clause:** The PASSWORD clause is applicable only for an Adabas database. This clause is used to provide a password (*operand1*) when updating data from a file which is password-protected. The password (*operand1*) may be specified as an alphanumeric constant or as an alphanumeric variable. It may consist of up to 8 characters, and must not contain special characters or embedded blanks. If the password is specified as a constant, it must be enclosed in apostrophes. For further information, see the statements FIND and PASSW.
CIPHER=*operand2*	**CIPHER Clause:** The CIPHER clause is applicable only for an Adabas database. This clause is used to provide a cipher key (*operand2*) when updating data from a file which is enciphered. The cipher key (*operand2*) may be specified as an numeric constant with 8 digits or as a user-defined variable with format/length N8. For further information, see the statement FIND.
USING NUMBER *operand3*	**USING NUMBER Clause:** This clause can only be used for an Adabas database.
GIVING NUMBER *operand3*	**GIVING NUMBER Clause:** This clause is used to store a record with a user-supplied Adabas ISN. If a record with the specified ISN already exists, an error message will be returned and the execution of the program will be terminated unless ON ERROR processing was specified.
SET/WITH *operand4=operand5*	**SET/WITH Clause:** SET/WITH can be used in reporting mode to specify the fields for which values are being provided. Any field defined in the file that is not specified in the SET clause will contain a null value in the new record. This clause is not permitted if a DEFINE DATA statement is used, because in that case the STORE statement always refers to the entire view as defined in the DEFINE DATA statement.
USING SAME (*r*)	**USING SAME Clause:** In reporting mode, this clause can be used to indicate that the same field values as read in the statement referenced by the STORE statement (FIND, GET, READ) are to be used to add a new record. The statement reference notation (*r*) may be specified as a source-code line number or as a statement label.

Syntax Element	Description
	This clause is not permitted if a DEFINE DATA statement is used, because in that case the STORE statement would always refers to the entire view, as defined in the DEFINE DATA statement.

Example

```
** Example 'STOEX1S': STORE  (structured mode)
**
** CAUTION: Executing this example will modify the database records!
************************************************************************

PERSONNEL-ID : 90001100

NAME         : JONES
FIRST-NAME   : EDWARD
```

After entering and confirming the personnel key data, additional personnel data fields are displayed for input:

```
ADDITIONAL PERSONNEL DATA

PERSONNEL-ID             : 90001100
NAME                     : JONES
FIRST-NAME               : EDWARD

MARITAL STATUS           :
DATE OF BIRTH (YYYYMMDD) :
CITY                     :
COUNTRY (3 CHARACTERS)   :

ADD THIS RECORD (Y/N)    : N
```

Equivalent reporting-mode example: **STOEX1R**.

125 SUBTRACT

- Function 830
- Syntax 1 - SUBTRACT Statement without GIVING Clause 830
- Syntax 2 - SUBTRACT Statement with GIVING Clause 831
- Example 832

Related Statements: ADD | COMPRESS | COMPUTE | DIVIDE | EXAMINE | MOVE | MOVE ALL | MULTIPLY | RESET | SEPARATE

Belongs to Function Group: *Arithmetic and Data Movement Operations*

Function

The SUBTRACT statement is used to subtract the values of two or more operands.

If a database field is used as the result field, the SUBTRACT operation only results in an update to the internal value that is used within the program. The value for the field in the database remains unchanged.

Syntax 1 - SUBTRACT Statement without GIVING Clause

```
SUBTRACT [ROUNDED] operand1 ... FROM operand2
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S	A		N		N	P	I	F		D	T					yes	no
operand2		S	A		M		N	P	I	F		D	T					yes	no

Syntax Element Description:

Syntax Element	Description
operand1 FROM *operand2*	**Operands:** *operand1* is the minuend, *operand2* is the subtrahend, hence the statement is equivalent to: `<oper2> := <oper2> - <oper1>` As for the formats of the operands, see also *Rules for Arithmetic Assignments*, *Performance Considerations for Mixed Formats* in the *Programming Guide*.
ROUNDED	**ROUNDED Option:** If you specify the keyword ROUNDED, the result will be rounded.

Syntax Element	Description
	For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.

Syntax 2 - SUBTRACT Statement with GIVING Clause

```
SUBTRACT [ROUNDED] operand1 ... FROM operand2 GIVING operand3
```

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A		N			N	P	I	F		D	T					yes	no
operand2	C	S	A		N			N	P	I	F		D	T					yes	no
operand3		S	A		M	A	U	N	P	I	F	B*	D	T					yes	yes

* Format B of `operand3` may be used only with a length of less than or equal to 4.

Syntax Element Description:

Syntax Element	Description
`GIVING`	**GIVING Clause:** When the `GIVING` clause is used, *operand2* will *not* be modified, and the result will be stored in *operand3*.
operand1 `FROM` *operand2* `GIVING` *operand3*	**Operands:** *operand2* is the minuend, *operand1* is the subtrahend, *operand3* is the result field, hence the statement is equivalent to: `<oper3> := <oper2>- <oper1>` As for the formats of the operands, see also the section *Performance Considerations for Mixed Formats* in the *Programming Guide*.
`ROUNDED`	**ROUNDED Option:** If you specify the keyword `ROUNDED`, the result will be rounded. For information on rounding, see *Rules for Arithmetic Assignment*, *Field Truncation and Field Rounding* in the *Programming Guide*.

Example

```
** Example 'SUBEX1': SUBTRACT
************************************************************************
DEFINE DATA LOCAL
1 #A (P2) INIT <50>
1 #B (P2)
1 #C (P1.1) INIT <2.4>
END-DEFINE
*
SUBTRACT 6 FROM #A
WRITE NOTITLE 'SUBTRACT 6 FROM #A              '  10X '=' #A
*
SUBTRACT 6 FROM 11 GIVING #A
WRITE         'SUBTRACT 6 FROM 11 GIVING #A    '  10X '=' #A
*
SUBTRACT 3 4 FROM #A GIVING #B
WRITE         'SUBTRACT 3 4 FROM #A GIVING #B  '  10X '=' #A '=' #B
*
SUBTRACT -3 -4 FROM #A GIVING #B
WRITE         'SUBTRACT -3 -4 FROM #A GIVING #B'  10X '=' #A '=' #B
*
SUBTRACT ROUNDED 2.06 FROM #C
WRITE         'SUBTRACT ROUNDED 2.06 FROM #C   '  10X '=' #C
*
END
```

Output of Program SUBEX1:

```
SUBTRACT 6 FROM #A                        #A:  44
SUBTRACT 6 FROM 11 GIVING #A              #A:   5
SUBTRACT 3 4 FROM #A GIVING #B            #A:   5 #B:  -2
SUBTRACT -3 -4 FROM #A GIVING #B          #A:   5 #B:  12
SUBTRACT ROUNDED 2.06 FROM #C             #C:  0.3
```

126 SUSPEND IDENTICAL SUPPRESS

- Function 834
- Syntax Description 834
- Examples 834

```
SUSPEND IDENTICAL [SUPPRESS] [(rep)]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | WRITE | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The SUSPEND IDENTICAL SUPPRESS statement is used to suspend the Natural session parameter setting IS=ON (which suppresses the output of identical field values) for the processing of one record.

See also session parameter IS in the *Parameter Reference*.

Syntax Description

Syntax Element	Description
(*rep*)	**Report Specification:** The notation (*rep*) may be used to specify the identification of the report for which the SUSPEND IDENTICAL SUPPRESS statement is applicable. A value in the range 0 - 31 or a logical name which has been assigned using the DEFINE PRINTER statement may be specified. If (*rep*) is not specified, the SUSPEND IDENTICAL SUPPRESS statement will be applicable to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* in the *Programming Guide*.

Examples

- Example 1 - Program with SUSPEND IDENTICAL SUPPRESS

- Example 2 - Same as Previous Program, but without SUSPEND IDENTICAL SUPPRESS

Example 1 - Program with SUSPEND IDENTICAL SUPPRESS

```
** Example 'SISEX1': SUSPEND IDENTICAL SUPPRESS
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 FIRST-NAME
  2 NAME
  2 CITY
1 VEH-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
  2 MAKE
END-DEFINE
*
LIMIT 15
*
RD. READ EMPLOY-VIEW BY NAME STARTING FROM 'JONES'
  /*
  SUSPEND IDENTICAL SUPPRESS
  /*
  FD. FIND VEH-VIEW WITH PERSONNEL-ID = PERSONNEL-ID (RD.)
    IF NO RECORDS FOUND
      MOVE '***NO CAR***' TO MAKE
    END-NOREC
    DISPLAY NOTITLE
            NAME (RD.) (IS=ON)
            FIRST-NAME (RD.) (IS=ON)
            MAKE (FD.)
  END-FIND
  /*
END-READ
END
```

Output of Program SISEX1:

```
        NAME                 FIRST-NAME              MAKE
-------------------- -------------------- --------------------

JONES                VIRGINIA             CHRYSLER
JONES                MARSHA               CHRYSLER
                                          CHRYSLER
JONES                ROBERT               GENERAL MOTORS
JONES                LILLY                FORD
                                          MG
JONES                EDWARD               GENERAL MOTORS
JONES                MARTHA               GENERAL MOTORS
```

```
JONES                    LAUREL                   GENERAL MOTORS
JONES                    KEVIN                    DATSUN
JONES                    GREGORY                  FORD
JONES                    EDWARD                   ***NO CAR***
JOPER                    MANFRED                  ***NO CAR***
JOUSSELIN                DANIEL                   RENAULT
JUBE                     GABRIEL                  ***NO CAR***
JUNG                     ERNST                    ***NO CAR***
JUNKIN                   JEREMY                   ***NO CAR***
```

Example 2 - Same as Previous Program, but without SUSPEND IDENTICAL SUPPRESS

```
** Example 'SISEX2': SUSPEND IDENTICAL SUPPRESS (compare with SISEX1)
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 FIRST-NAME
  2 NAME
  2 CITY
1 VEH-VIEW VIEW OF VEHICLES
  2 PERSONNEL-ID
  2 MAKE
END-DEFINE
*
LIMIT 15
RD. READ EMPLOY-VIEW BY NAME STARTING FROM 'JONES'
  /*
  /* SUSPEND IDENTICAL SUPPRESS    /* statement removed
  /*
  FD. FIND VEH-VIEW WITH PERSONNEL-ID = PERSONNEL-ID (RD.)
    IF NO RECORDS FOUND
      MOVE '***NO CAR***' TO MAKE
    END-NOREC
    DISPLAY NOTITLE
            NAME (RD.) (IS=ON)
            FIRST-NAME (RD.) (IS=ON)
            MAKE (FD.)
  END-FIND
  /*
END-READ
END
```

Output of Program SISEX2:

```
        NAME              FIRST-NAME              MAKE
-------------------- -------------------- --------------------

JONES                VIRGINIA             CHRYSLER
                     MARSHA               CHRYSLER
                                          CHRYSLER
                     ROBERT               GENERAL MOTORS
                     LILLY                FORD
                                          MG
                     EDWARD               GENERAL MOTORS
                     MARTHA               GENERAL MOTORS
                     LAUREL               GENERAL MOTORS
                     KEVIN                DATSUN
                     GREGORY              FORD
                     EDWARD               ***NO CAR***
JOPER                MANFRED              ***NO CAR***

JUNKIN               JEREMY               ***NO CAR***
```

127 TERMINATE

- Function 840
- Syntax Description 840
- Program Receiving Control after Termination 841
- Example 841

```
TERMINATE [operand1 [operand2]]
```

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

Function

The TERMINATE statement is used to terminate a Natural session. A TERMINATE statement may be placed anywhere within a Natural program. When a TERMINATE statement is executed, no end-of-page or end-loop processing will be performed.

The behaviour of the TERMINATE statement matches that of the STOP statement. Processing of return values is not supported.

For Natural Remote Procedure Call (RPC): See *Notes on Natural Statements on the Server* in the *Natural Remote Procedure Call (RPC)* documentation.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats												Referencing Permitted	Dynamic Definition
operand1	C	S					N	P	I									yes	no
operand2	C	S	A			A	U											yes	yes

Syntax Element Description:

Syntax Element	Description
operand1	*operand1* may be used to pass a return code to the program receiving control when Natural terminates. For example, a return code setting may be passed as exit code to the shell. See also *Natural Startup Errors* in the *Operations* documentation. The value supplied for *operand1* must be in the range 0 - 255.
operand2	*operand2* may be used to pass additional information to the program which receives control after the termination.

Program Receiving Control after Termination

After the termination of the Natural session, the program whose name is specified with the profile parameter `PROGRAM` will receive control.

Natural passes *operand2* and the value of the profile parameter `PRGPAR` to that program, if they are specified. The program receives these parameters in the usual way as arguments:

```
int main(int argc, char *argv[])
{
  /* Number of arguments passed. */
  printf("Number of arguments: %d\n", argc);
  /* Program name. */
  if ( argc > 0 )
    printf("Program: %s\n", argv[0]);
  /* Value of operand2 of the TERMINATE statement. */
  if ( argc > 1 )
    printf("Operand 2: %s\n", argv[1]);
  /* Value of the profile parameter PRGPAR. */
  if ( argc > 2 )
    printf("PRGPAR: %s\n", argv[2]);
  return 0;
}
```

If the `PROGRAM` parameter is not set, the UNIX command shell will receive control after the termination.

Example

```
** Example 'TEREX1': TERMINATE
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
  2 SALARY (1)
*
1 #PNUM     (A8)
1 #PASSWORD (A8)
END-DEFINE
*
INPUT 'ENTER PASSWORD:' #PASSWORD
*
IF #PASSWORD NE 'USERPASS'
  /*
```

```
  TERMINATE
  /*
END-IF
*
INPUT 'ENTER PERSONNEL NUMBER:' #PNUM
*
FIND EMPLOY-VIEW WITH PERSONNEL-ID = #PNUM
  DISPLAY NAME SALARY (1)
END-FIND
*
END
```

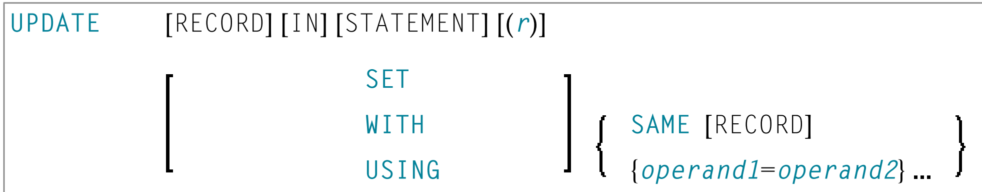
128 UPDATE

- Function 844
- Restrictions 845
- Database-Specific Considerations 845
- Syntax Description 845
- Example 846

Structured Mode Syntax

```
UPDATE [RECORD] [IN] [STATEMENT] [(r)]
```

Reporting Mode Syntax



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: ACCEPT/REJECT | AT BREAK | AT START OF DATA | AT END OF DATA | BACKOUT TRANSACTION | BEFORE BREAK PROCESSING | DELETE | END TRANSACTION | FIND | GET | GET SAME | GET TRANSACTION DATA | HISTOGRAM | LIMIT | PASSW | PERFORM BREAK PROCESSING | READ | RETRY | STORE

Belongs to Function Group: ***Database Access and Update***

Function

The UPDATE statement is used to update one or more fields of a record in a database. The record to be updated must have been previously selected with a FIND, GET or READ statement (or, for Adabas only, with a STORE statement).

Hold Status

The use of the UPDATE statement causes each record read for processing in the corresponding FIND or READ statement to be placed in hold status.

For further information, see *Record Hold Logic* (in the *Programming Guide*).

Restrictions

- The `UPDATE` statement must not be entered on the same line as the statement used to select the record to be updated.
- The `UPDATE` statement cannot be applied to Entire System Server views.

Database-Specific Considerations

SQL	The `UPDATE` statement can be used to update a row in a database table. It corresponds with the SQL statement `UPDATE WHERE CURRENT OF CURSOR` (Positioned `UPDATE`), which means that only the row which was read last can be updated. With most SQL databases, a row that was read with a `FIND SORTED BY` or with a `READ LOGICAL` statement cannot be updated.
XML	The statement cannot be used with XML databases.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A			A		N	P	I	F	B	D	T	L				no	no
operand2	C	S	A			A		N	P	I	F	B	D	T	L				yes	no

Syntax Element Description:

Syntax Element	Description
`(r)`	**Statement Reference:** The notation `(r)` is used to indicate the statement in which the record to be modified was read. *r* may be specified as a source-code line number or as a statement label. If no reference is specified, the `UPDATE` statement will reference the innermost active `READ` or `FIND` processing loop. If no `READ` or `FIND` loop is active, it will reference the last preceding `GET` (or `STORE`) statement.

Syntax Element	Description
	Note: The UPDATE statement must be placed within the READ or FIND loop it references.
USING SAME	**USING SAME Clause:** This clause is not permitted if a DEFINE DATA statement is used, because in that case the UPDATE statement always refers to the entire view as defined in the DEFINE DATA statement. The layout of the record buffer or format buffer may be declared using the OBTAIN statement. USING SAME can be used in reporting mode to indicate that the same fields as read in the statement referenced by the UPDATE statement are to be used for the update function. In this case, the most recent value assigned to each database field will be used to update the field. If no new value has been assigned, the old value will be used. If the field to be updated is an array range of a multiple-value field or periodic group and you use a variable index for this array range, the latest range will be updated. This means that if the index variable is modified after the record has been read and before the UPDATE USING SAME (reporting mode) or UPDATE (structured mode) statement respectively is executed, the range updated will not be the same as the range read.
SET/WITH *operand1*=*operand2*	**SET/WITH Clause:** This clause can be used in reporting mode to specify the fields to be updated and the values to be used. This clause is not permitted if a DEFINE DATA statement is used, because in that case the UPDATE statement always refers to the entire view as defined in the DEFINE DATA statement.

Example

```
** Example 'UPDEX1S': UPDATE (structured mode)
**
** CAUTION: Executing this example will modify the database records!
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 CITY
*
1 #NAME (A20)
END-DEFINE
```

```
*
INPUT 'ENTER A NAME:' #NAME (AD=M)
IF #NAME = ' '
  STOP
END-IF
*
FIND EMPLOY-VIEW WITH NAME = #NAME
  IF NO RECORDS FOUND
    REINPUT WITH 'NO RECORDS FOUND'  MARK 1
  END-NOREC
  INPUT 'NAME:       ' NAME (AD=O) /
        'FIRST NAME:' FIRST-NAME (AD=M) /
        'CITY:       ' CITY (AD=M)
  UPDATE
  END TRANSACTION
END-FIND
*
END
```

Output of Program SUBEX1S

```
ENTER A NAME: BROWN
```

After entering and confirming name:

```
NAME: BROWN
FIRST NAME: KENNETH
CITY: DERBY
```

Equivalent reporting-mode example: `UPDEX1R`.

129 UPLOAD PC FILE

- Function 851
- Syntax Description 851
- Example 852

Structured Mode Syntax

```
{ UPLOAD } {  PC   }   [FILE] work-file-number  [ONCE]
{ READ   } {  WORK }

           { RECORD  operand1                                                          }
           { [AND]   [SELECT]  { [ { OFFSET n  } ]...  operand2 }...                   }
                                   { FILLER nX }

           [GIVING LENGTH operand3]
           [ AT [END] [OF] [FILE]  ]
           [ statement ...         ]
           [ END-ENDFILE           ]
           statement ...
END-WORK
```

Reporting Mode Syntax

```
{ UPLOAD } {  PC    }   [FILE] work-file-number  [ONCE]
{ READ   } {  WORK  }

           { RECORD {operand1 [FILLER nX]} ...                                   }
           { [AND] [SELECT] { [ OFFSET n  ]...             operand2 }...         }
                                [ FILLER nX ]

           [GIVING LENGTH operand3]
           [  AT [END] [OF]  { statement                          }]
           [     [FILE]      { DO statement ...  DOEND            }]
           statement ...
[LOOP]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: `CLOSE PC FILE` | `DOWNLOAD PC FILE` | `READ WORK FILE`

Belongs to Function Group: ***Control of Work Files / PC Files***

Function

The `UPLOAD PC FILE` statement is used to transfer data from a PC to a UNIX platform.

See also:

- *Natural Connection* and Entire Connection documentation
- `READ WORK FILE` statement syntax description

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats											Referencing Permitted	Dynamic Definition
operand1		S	A	G		A	U	N	P	I	F	B	D	T	L	C	yes	yes
operand2		S	A	G		A	U	N	P	I	F	B	D	T	L	C	yes	yes
operand3		S								I							yes	yes

When using the work file types `ENTIRECONNECTION` or `TRANSFER`, *operand2* may not be of Format C.

Syntax Element Description:

Syntax Element	Description
work-file-number	**Work File Number:** The number of the work file to be used. This number must correspond to one of the work file numbers for the PC as defined to Natural.
operand1-2	**Field Specification:** With *operand1* and *operand2* you specify the fields to be uploaded from the PC. The fields may be database fields or user-defined variables.
statement	**Statement(s) to be Executed:** In place of *statement*, you must supply one or several suitable statements, depending on the situation. No I/O statement may be placed with the `UPLOAD PC FILE` processing.
`ONCE, SELECT, GIVING LENGTH`	**Options:**

Syntax Element	Description
RECORD	For a description of the ONCE, SELECT, GIVING LENGTH options, refer to the corresponding sections in the description of the READ WORK FILE statement. The RECORD option is not permitted for PC work files. It will be rejected at runtime. When uploading data: If you wish to define a filler, you must use a dummy variable instead of the standard filler notation.
END-WORK	**End of UPLOAD PC FILE Statement:** The Natural reserved keyword END-WORK must be used to end the UPLOAD PC FILE statement.

Example

The following program demonstrates the use of the UPLOAD PC FILE statement. The data is first uploaded from the PC and then processed on the UNIX platform.

```
** Example 'PCUPEX1': UPLOAD PC FILE
**
** NOTE: Example requires that Natural Connection is installed.
** CAUTION: Executing this example will modify the database records!
************************************************************************
DEFINE DATA LOCAL
01 EMPL VIEW OF EMPLOYEES
   02 PERSONNEL-ID
   02 INCOME
      03 SALARY (1)
*
01 #PID (A8)                                /* Personnel ID on PC
01 #NEW-INCREASE (N4)                       /* Increase for salary
END-DEFINE
*
UPLOAD PC FILE 7 #PID #NEW-INCREASE         /* Data upload
*
  FIND EMPL WITH PERSONNEL-ID = #PID        /* Data selection
    ADD #NEW-INCREASE TO SALARY (1)         /* Data update on host
    UPDATE
    END TRANSACTION
    ESCAPE BOTTOM
  END-FIND
*
END-WORK
END
```

Output of Program PCUPEX1:

When you run the program, a window appears in which you specify the name of the PC file from which the data is to be uploaded. The data is then uploaded from the PC.

130 WRITE

- Function 856
- Syntax 1 - Dynamic Formatting 856
- Syntax 2 - Using Predefined Form/Map 864
- Examples 866

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE TITLE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The WRITE statement is used to produce output in free format.

The WRITE statement differs from the DISPLAY statement in the following respects:

- Line overflow is supported. If the line width is exceeded for a line, the next field (or text) is written on the next line. Fields or text elements are not split between lines.
- No default column headers are created. The length of the data determines the number of positions printed for each field.
- A range of values/occurrences for an array is output horizontally rather than vertically.

See also the following topics in the *Programming Guide*:

- *Controlling Data Output*
- *Statements DISPLAY and WRITE*
- *Index Notation for Multiple-Value Fields and Periodic Groups*
- *Example of DISPLAY VERT with WRITE Statement*
- *Layout of an Output Page*

Syntax 1 - Dynamic Formatting

```
WRITE [(rep)] [NOTITLE] [NOHDR]
   [(statement-parameters)]
   {  [  nX             ]  { 'text' [(attributes)]              }  }
   {  [  nT             ]  { 'c'(n) [(attributes)]              }  }
   {  [  x/y            ]  { ['='] operand1 [(parameters)]      }  }
   {  [  T*field-name   ]                                          }
   {  [  P*field-name   ]                                          }
   {  [  /              ] ...                                      } ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G	N	A	U	N	P	I	F	B	D	T	L		G	O	yes	no

Syntax Element Description:

Syntax Element	Description
`(rep)`	**Report Specification:** The notation `(rep)` is used to specify the identification of the report if multiple reports are to be produced by the program. As report identification, a value in the range `0 - 31` or a logical name which has been assigned using the `DEFINE PRINTER` statement may be specified. If `(rep)` is not specified, the statement will apply to the first report (Report 0). If this printer file is defined to Natural as PC, the report will be downloaded to the PC, see ***Example 5***. For information on how to control the format of an output report created with Natural, see *Controlling Data Output* (in the *Programming Guide*).
`NOTITLE`	**Default Page Title Suppression:** Natural generates a single title line for each page resulting from a `WRITE` statement. This title contains the page number, the time of day, and the date. Time of day is set at the beginning of program execution. This default title line may be overridden by using a `WRITE TITLE` statement, or it may be suppressed by using the `NOTITLE` option in the `WRITE` statement. Examples: - Default title will be produced: `WRITE NAME`

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>

- User title will be produced:

```
WRITE NAME WRITE TITLE 'user-title'
```

- No title will be produced:

```
WRITE NOTITLE NAME
```

Note:

1. If the NOTITLE option is used, it applies to all DISPLAY, PRINT and WRITE statements within the same object which write data to the same report.
2. Page overflow is checked *before* execution of a WRITE statement. No new page with title or trailer information is generated *during* the execution of a WRITE statement.

</td></tr>
<tr><td>NOHDR</td><td>

Column Header Suppression:

The WRITE statement itself does not produce any column headers. However, if you use the WRITE statement in conjunction with a DISPLAY statement, you can use the NOHDR option of the WRITE statement to suppress the column headers generated by the DISPLAY statement. The NOHDR option only takes effect if the execution of the WRITE statement causes a new page to be output.

Without the NOHDR option, the column headers (if any) of the DISPLAY statement would be output on this new page; with NOHDR they will not.

</td></tr>
<tr><td>statement-parameters</td><td>

Parameter Definition at Statement Level:

One or more parameters, enclosed within parentheses, may be specified at statement level, that is, immediately after the WRITE statement.

Each parameter specified will override the corresponding parameter previously specified in a GLOBALS command, SET GLOBALS (in Reporting Mode only) or FORMAT statement.

If more than one parameter is specified, they must be separated by one or more blanks from one another. Each parameter specification must not be split between two statement lines.

Note: The parameter settings applied here will only be regarded for variable fields, but they have no effect on text-constants. If you would like to set field attributes for a text-constant, they have to be set explicitly for this element, see *Parameter Definition at Element (Field) Level*.

See also:

- *List of Parameters*

</td></tr>
</table>

Syntax Element	Description
	■ *Example of Parameter Usage at Statement and Element (Field) Level* ■ *Example 5 - WRITE Statement Using '=' and Parameters on Statement/Element (Field) Level*
*n*X, *n*T, *x/y*, T**field-name*, P**field-name*, '=', /	**Field Positioning Notation:** See *Field Positioning Notations* in the section *Output Format Definitions*.
'*text*', '*c*'(*n*), *attributes*, *operand1*, *parameters*	**Text/Attribute Assignment:** See *Text/Attribute Assignment* in the section *Output Format Definitions*.

List of Parameters

Parameters that can be specified with the WRITE statement		Specification (S = at statement level, E = at element level)
AD	Attribute Definition	SE
AL	Alphanumeric Length for Output	SE
CD	Color Definition	SE
CV	Control Variable	SE
DF	Date Format	SE
DL	Display Length for Output	SE
DY	Dynamic Attributes	SE
EM	Edit Mask	SE
EMU	Unicode Edit Mask	E
FL	Floating Point Mantissa Length	SE
IS	Identical Suppress	SE
LS	Line Size	S
MC	Multiple-Value Field Count	S
MP	Maximum Number of Pages of a Report	S
NL	Numeric Length for Output	SE
PC	Periodic Group Count	S
PM	Print Mode	SE
PS	Page Size *	S
SG	Sign Position	SE
UC	Underlining Character	S
ZP	Zero Printing	SE

* The PS session parameter setting is not considered if the number of occurrences of an array exceeds the PS value.

The individual session parameters are described in the *Parameter Reference*.

See also the following topics in the *Programming Guide*:

- *Centering of Column Headers - HC Parameter*
- *Width of Column Headers - HW Parameter*
- *Filler Characters for Headers - Parameters FC and GC*
- *Underlining Character for Titles and Headers - UC Parameter*

Example of Parameter Usage at Statement and Element (Field) Level

```
DEFINE DATA LOCAL
1 VARI (A4)     INIT <'1234'>                    /*    Output
END-DEFINE                                       /*    Produced
*                                                /*    ---------
WRITE           'Text'           VARI            /*    Text 1234
WRITE (AD=U)    'Text'           VARI            /*    Text 1234
WRITE           'Text' (AD=U)    VARI (AD=U)     /*    Text 1234
WRITE           'Text' (AD=U)    VARI            /*    Text 1234
END
```

See also **Example 5 - WRITE Statement Using '=' and Parameters on Statement/Element (Field) Level**.

Output Format Definitions

```
{ [ nX           ]      { 'text' [(attributes)]          } }
{ [ nT           ]      { 'c' (n) [(attributes)]         } }
{ [ x/y          ]      { ['='] operand1 [(parameters)]  } }
{ [ T*field-name ] ...                                     } ...
{ [ P*field-name ]
{ [ /            ]
```

For an explanation of the symbols used in the syntax diagram, see **Syntax Symbols**.

Field Positioning Notations

Syntax Element	Description
*n*X	**Column Spacing:** This notation inserts *n* spaces between columns. Example: `WRITE NAME 5X SALARY` See also: ■ *Example 2 - WRITE Statement Using nX, nT Notation* (below) ■ *Column Spacing - SF Parameter and nX Notation* in the *Programming Guide*
*n*T	**Tab Setting:** The *n*T notation causes positioning (tabulation) to print position *n*. Backward positioning is not permitted. In the following example, NAME is printed beginning in position 25, and SALARY is printed beginning in position 50: `WRITE 25T NAME 50T SALARY` See also: ■ *Example 2 - WRITE Statement Using nX, nT Notation* (below) ■ *Tab Setting - nT Notation* in the *Programming Guide*
x/*y*	***x*/*y* Positioning:** The *x*/*y* notation causes the next element to be placed *x* lines below the output of the last statement, beginning in column *y*. *y* must not be zero. Backward positioning in the same line is not permitted. See also *Positioning Notation x/y* (in the *Programming Guide*).
T**field-name*	**Field Related Positioning:** The notation T* is used to position to a *specific print position of a field* used in a previous DISPLAY statement. Backward positioning is not permitted. See also: ■ *Example 3 - WRITE Statement Using T* Notation* (below) ■ *Tab Notation - T*field* (in the *Programming Guide*)
P**field-name*	**Field and Line Related Positioning:**

Syntax Element	Description
	The notation `P*` is used to position to a *specific print position and line of a field* used in a previous `DISPLAY` statement. It is most often used in conjunction with vertical printing mode. Backward positioning is not permitted. See also: ■ *Example 4 - WRITE Statement Using P* Notation* (below) ■ *Tab Notation P*`field`* (in the *Programming Guide*)
`'='`	**Field Content Positioned behind Field Heading:** When placed before a field, the equal sign `'='` results in the display of the field heading (as defined in the `DEFINE DATA` statement or in the DDM) followed by the field contents. See also: ■ *Example 1 - WRITE Statement Using '=', '`text`', '/'* ■ *Example 5 - WRITE Statement Using '=' and Statement/Element Parameters*
`/`	**Line Advance - Slash Notation:** When placed between fields or text elements, a slash (/) causes positioning to the beginning of the next print line. Example: `WRITE NAME / SALARY` Multiple slash (/) notations may be used to cause multiple line advances. See also: ■ *Example 1 - WRITE Statement Using '=', '`text`', '/'* (below) ■ *Line Advance - Slash Notation* (in the *Programming Guide*) ■ *Example 2 - Line Advance in WRITE Statement* (in the *Programming Guide*)

Text/Attribute Assignments

Syntax Element	Description
`'text'`	**Text Assignment:** The character string enclosed by single quotes is displayed.

Syntax Element	Description
	Example: `WRITE 'EMPLOYEE' NAME 'MARITAL/STATUS' MAR-STAT` See also: ■ *Example 1 - WRITE Statement Using '=', 'text', '/'* (below) ■ *Text Notation, Defining a Text to Be Used with a Statement* in the *Programming Guide*

`'c'(n)`	**Character Repetition:**
	The character enclosed by single quotes is displayed *n* times immediately before the field value.
	For example:
	`WRITE '*' (5) '=' NAME`
	results in
	`***** SMITH`
	See also *Text Notation, Defining a Character to Be Displayed n Times before a Field Value* (in the *Programming Guide*).

attributes	**Field Representation and Color Attributes:**
	It is possible to assign various attributes for text/field display. These attributes and the syntax that may be used are described in the section *Output Attributes* below.
	Examples:
	`WRITE 'TEXT' (BGR)`
	`WRITE 'TEXT' (B)`
	`WRITE 'TEXT' (BBLC)`

operand1	**Field to be Written:** *operand1* specifies the field whose content is to be written in this place.
parameters	**Parameter Definition at Element (Field) Level:** One or more parameters, enclosed within parentheses, may be specified at element (field) level, that is, immediately after *operand1*. Each parameter specified in this manner will override the corresponding parameter previously specified **at statement level** or in a `GLOBALS` command, `SET GLOBALS` (in Reporting Mode only) or `FORMAT` statement. If more than one parameter is specified, one or more blanks must be placed between each entry. An entry may not be split between two statement lines.

Syntax Element	Description
	See also: ■ *List of Parameters* ■ *Example of Parameter Usage at Statement and Element (Field) Level*

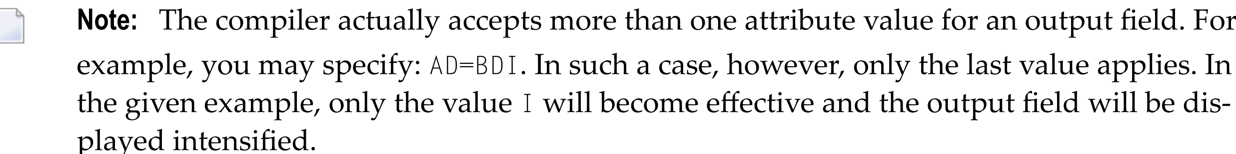
Output Attributes

`attributes` indicates the output attributes to be used for text display. Attributes may be:

```
{ { AD=AD-value ... }     }
{ { CD=CD-value ... }     }
{ { PM=PM-value ... } ... }
{                         }
{ { AD-value ... }        }
{ { CD-value ... }    ... }
```

For the possible session parameter values, refer to the corresponding sections in the *Parameter Reference* documentation:

- *AD - Attribute Definition*, section *Field Representation*
- *CD - Color Definition*
- *PM - Print Mode*



Note: The compiler actually accepts more than one attribute value for an output field. For example, you may specify: `AD=BDI`. In such a case, however, only the last value applies. In the given example, only the value `I` will become effective and the output field will be displayed intensified.

Syntax 2 - Using Predefined Form/Map

```
WRITE [(rep)] [NOTITLE] [NOHDR] [USING] { FORM } operand1 [operand2 ...]
                                        { MAP  }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S				A													no	no
operand2		S	A	G	N	A	U	N	P	I	F	B	D	T	L				yes	no

Syntax Element Description:

Syntax Element	Description
[USING] FORM [USING] MAP	**Use of Predefined Form/Map Layout:** This option may be used to indicate that a form/map layout previously defined using the Natural map editor is to be used. A map layout used in a WRITE statement does not automatically create a new page each time the map is output. For the line spacing, the LS parameter setting must be 1 byte greater than the LS setting defined in the map.
operand1	**Form/Map Name:** *operand1* is the name of the form/map to be used.
operand2	**Field to be Written:** *operand2* is the name(s) of the field(s) to be written. If *operand1* is a constant and *operand2* is omitted, the fields are taken from the map source at compilation time. The fields must agree in number, sequence, format, length and (for arrays) number of occurrences with the fields in the referenced form/map; otherwise, an error occurs.
NOTITLE/NOHDR	**Title Line/Column Header Suppression:** NOTITLE and NOHDR are described under ***Syntax 1*** of the WRITE statement.

Examples

- Example 1 - WRITE Statement Using '=', 'text', '/'
- Example 2 - WRITE Statement Using nX, nT Notation
- Example 3 - WRITE Statement Using T* Notation
- Example 4 - WRITE Statement Using P* Notation
- Example 5 - WRITE Statement Using '=' and Parameters on Statement/Element (Field) Level
- Example 6 - Report Specification with Output File Defined to Natural as PC

Example 1 - WRITE Statement Using '=', 'text', '/'

```
** Example 'WRTEX1': WRITE (with '=', 'text', '/')
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 FULL-NAME
    3 FIRST-NAME
    3 MIDDLE-I
    3 NAME
  2 CITY
  2 COUNTRY
END-DEFINE
*
LIMIT 1
READ EMPL-VIEW BY NAME
  /*
  WRITE NOTITLE
        '=' NAME '=' FIRST-NAME '=' MIDDLE-I //
        'L O C A T I O N' /
        'CITY:    ' CITY    /
        'COUNTRY:' COUNTRY //
  /*
END-READ
END
```

Output of Program WRTEX1:

```
NAME: ABELLAN                FIRST-NAME: KEPA                  MIDDLE-I:

L O C A T I O N
CITY:    MADRID
COUNTRY: E
```

Example 2 - WRITE Statement Using nX, nT Notation

```
** Example 'WRTEX2': WRITE (with nX, nT notation)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 JOB-TITLE
END-DEFINE

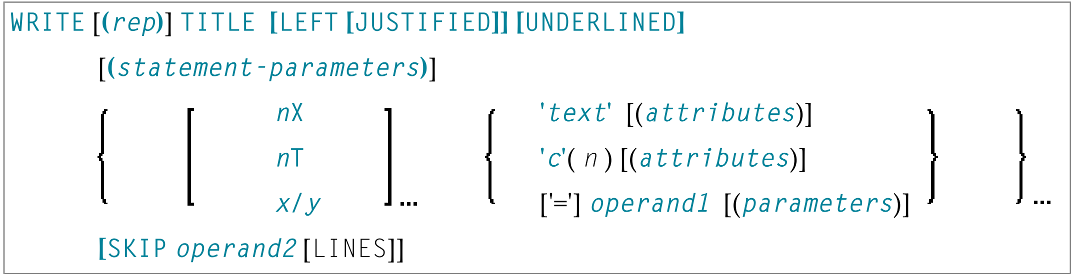
FIND PERS WITH CITY = 'NEW YORK'               /* Data selection
  WRITE (7) TITLE LEFT 'List of employees in New York' /
  DISPLAY (7)          /* (7) designates the output file (here the PC).
    'Location'  CITY
    'Surname'   NAME
    'ID'        PERSONNEL-ID
END-FIND
END
```

131 WRITE TITLE

- Function 872
- Restrictions 873
- Syntax Description 873
- Example 876



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TRAILER

Belongs to Function Group: ***Creation of Output Reports***

Function

The WRITE TITLE statement is used to override the default page title with a page title of your own. It is executed whenever a new page is initiated.

See also the following sections in the *Programming Guide*:

- *Controlling Data Output*
- *Report Specification - (rep) Notation*
- *Layout of an Output Page*
- *Page Titles, Page Breaks, Blank Lines*
- *Define Your Own Page Title - WRITE TITLE Statement*
- *Text Notation*

Processing

This statement is non-procedural, that is, its execution depends on an event, not on where in a program it is located.

If a report is produced by statements in different objects, the WRITE TITLE statement is only executed if it is contained in the same object as the statement that causes a new page to be initiated.

Restrictions

- `WRITE TITLE` may be specified only once per report.
- `WRITE TITLE` cannot be specified within a special condition statement block.
- `WRITE TITLE` cannot be specified within a subroutine.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G	N	A	U	N	P	I	F	B	D	T	L		G	O	yes	no
operand2	C	S						N	P	I		B							yes	no

Syntax Element Description:

Syntax Element	Description
(*rep*)	**Report Specification:** If multiple reports are to be produced, the notation (*rep*) may be used to specify the identification of the report for which the `WRITE TITLE` statement is applicable. As report identification, a value in the range `0 - 31` or a logical name which has been assigned using the `DEFINE PRINTER` statement may be specified. If (*rep*) is not specified, the `WRITE TITLE` statement applies to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* (in the *Programming Guide*).
`LEFT JUSTIFIED` `UNDERLINED`	**Page Title Justification and/or Underlining:** By default, page titles are centered and not underlined. `LEFT JUSTIFIED` and `UNDERLINED` may be specified to override these defaults. If `UNDERLINED` is specified, the underlining character (system default or specified with the session parameter `UC` (Underlining Character) in a `FORMAT` statement) is printed underneath the title and runs the width of the line size (see session parameter `LS`).

Syntax Element	Description
	Natural first applies all spacing or tab specifications and creates the line before centering the whole line. For example, a notation of `10T` as the first element would cause the centered header to be positioned five positions to the right.
statement-parameters	**Parameter Definition at Statement Level:** One or more parameters, enclosed within parentheses, may be specified at statement level, that is, immediately after the `WRITE TITLE` statement. Each parameter specified in this manner will override the corresponding parameter previously specified in a `GLOBALS` command, `SET GLOBALS` (in Reporting Mode only) or `FORMAT` statement. If more than one parameter is specified, one or more blanks must be present between each entry. An entry may not be split between two statement lines. **Note:** The parameter settings applied here will only be regarded for variable fields, but they have no effect on text-constants. If you would like to set field attributes for a text-constant, they have to be set explicitly for this element, see ***Parameter Definition at Element (Field) Level***. For information on which parameters may be used, see ***List of Parameters*** (in the `WRITE` statement documentation).
*n*X *n*T *x*/*y*	**Format Notation and Spacing Elements:** See ***Format Notation and Spacing Elements*** (below).
'*text*' '*c*' (*n*) *attributes*	**Text/Attribute Assignment:** See ***Text/Attribute Assignments*** (below).
operand1	**Field to Be Displayed in Title:** *operand1* represents the field(s) to be displayed within the title.
parameters	**Parameter Definition at Element (Field) Level:** One or more parameters, enclosed within parentheses, may be specified at element (field) level, that is, immediately after *operand1*. Each parameter specified in this manner will override the corresponding parameter previously specified **at statement level** or in a `GLOBALS` command, `SET GLOBALS` (in Reporting Mode only) or `FORMAT` statement. If more than one parameter is specified, one or more blanks must be present between each entry. An entry may not be split between two statement lines. For information on which parameters may be used, see ***List of Parameters*** (in the `WRITE` statement documentation).
SKIP *operand2* LINES	**Lines to Be Skipped:** `SKIP` may be used to cause lines to be skipped immediately after the title line. The number of lines to be skipped may be specified in *operand2* as a numeric constant or as the content of a numeric variable.

Syntax Element	Description
	Note: `SKIP` after `WRITE TITLE` is always interpreted as the `SKIP` clause of the `WRITE TITLE` statement, and not as an independent statement. If you wish an independent `SKIP` statement after a `WRITE TITLE` statement, use a semicolon (;) to separate the two statements from one another.

Format Notation and Spacing Elements

Syntax Element	Description
*n*X	**Column Spacing:** This notation inserts *n* spaces between columns.
*n*T	**Tab Setting:** The *n*T notation causes positioning (tabulation) to print position *n*. Backward positioning is not permitted.
x/*y*	***x*/*y* Positioning:** Causes the next element to be placed *x* lines below the output of the last statement, beginning in column *y*. *y* must not be zero. Backward positioning in the same line is not permitted.

Text/Attribute Assignments

Syntax Element	Description
'*text*'	**Text Assignment:** The character string enclosed by single quotes is displayed.
'*c*'(*n*)	**Character Repetition:** The character enclosed by single quotes is displayed *n* times immediately before the field value.

attributes	**Field Representation and Color Attributes:**
	
	It is possible to assign various attributes for text/field display. These attributes and the syntax that may be used are described in the section ***Output Attributes*** below.
	
	Examples:
	
	`WRITE TITLE 'TEXT' (BGR)`
	`WRITE TITLE 'TEXT' (B)`
	`WRITE TITLE 'TEXT' (BBLC)`

Output Attributes

attributes indicates the output attributes to be used for text display. Attributes may be:

```
{ { AD=AD-value ... }     }
{ { CD=CD-value ... }     }
{ { PM=PM-value ... } ... }
{                         }
{ { AD-value ...    }     }
{ { CD-value ...    } ... }
```

For the possible session parameter values, refer to the corresponding sections in the *Parameter Reference* documentation:

- *AD - Attribute Definition*, section *Field Representation*
- *CD - Color Definition*
- *PM - Print Mode*

Note: The compiler actually accepts more than one attribute value for an output field. For example, you may specify: `AD=BDI`. In such a case, however, only the last value applies. In the given example, only the value `I` will become effective and the output field will be displayed intensified.

Example

```
** Example 'WTIEX1': WRITE  (with TITLE option)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 CITY
  2 JOB-TITLE
END-DEFINE
*
*
FORMAT LS=70
*
WRITE TITLE LEFT JUSTIFIED UNDERLINED
      *TIME 3X 'PEOPLE LIVING IN NEW YORK CITY'
      11X 'PAGE:' *PAGE-NUMBER
SKIP 1
*
FIND EMPL-VIEW WITH CITY = 'NEW YORK'
```

```
  DISPLAY NAME FIRST-NAME 3X JOB-TITLE
END-FIND
END
```

Output of Program WTIEX1:

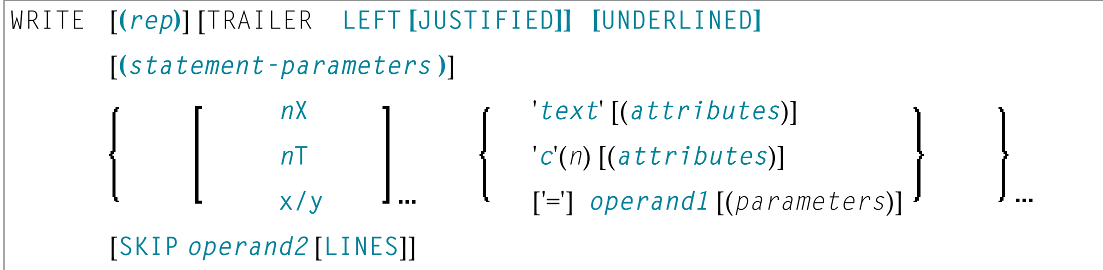
```
09:33:16.5   PEOPLE LIVING IN NEW YORK CITY           PAGE:      1
--------------------------------------------------------------------

        NAME              FIRST-NAME                 CURRENT
                                                    POSITION
-------------------- --------------------   -------------------------

RUBIN                SYLVIA                 SECRETARY
WALLACE              MARY                   ANALYST
```

132 WRITE TRAILER

- Function 880
- Restrictions 881
- Syntax Description 881
- Example 884



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: AT END OF PAGE | AT TOP OF PAGE | CLOSE PRINTER | DEFINE PRINTER | DISPLAY | EJECT | FORMAT | NEWPAGE | PRINT | SKIP | SUSPEND IDENTICAL SUPPRESS | WRITE | WRITE TITLE

Belongs to Function Group: ***Creation of Output Reports***

Function

The WRITE TRAILER statement is used to output text or the contents of variables at the bottom of a page.

See also the following sections (in the *Programming Guide*):

- *Controlling Data Output*
- *Report Specification - (rep) Notation*
- *Layout of an Output Page*
- *Page Trailer - WRITE TRAILER Statement*
- *Text Notation*

Processing

This statement is non-procedural, that is, its execution depends on an event, not on where in a program it is located.

This statement is executed when an end-of-page or end-of-data condition is detected, or when a SKIP or NEWPAGE statement causes a page advance. It is not executed as a result of an EJECT statement.

The end-of-page condition is checked only after the processing of an entire DISPLAY/WRITE statement. If a DISPLAY/WRITE statement produces multiple lines of output, overflow of the physical page may occur before the end-of-page condition is reached.

If a report is produced by statements in different objects, the `WRITE TRAILER` statement is only executed if it is contained in the same object as the statement that causes the end-of-page condition.

Logical Page Size

The logical page size (specified with the session parameter `PS`) should be less than the physical page size to ensure that the trailer information appears at the bottom of the same page.

Restrictions

- `WRITE TRAILER` may be specified only once per report.
- `WRITE TRAILER` cannot be specified within a special condition statement block.
- `WRITE TRAILER` cannot be specified within a subroutine.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1		S	A	G	N	A	U	N	P	I	F	B	D	T	L		G	O	yes	no
operand2	C	S						N	P	I		B							yes	no

Syntax Element Description:

Syntax Element	Description
`(`*rep*`)`	**Report Specification:** If multiple reports are to be produced, the notation `(`*rep*`)` may be used to specify the identification of the report for which the `WRITE TRAILER` statement is applicable. As report identification, a value in the range `0 - 31` or a logical name which has been assigned using the `DEFINE PRINTER` statement may be specified. If `(`*rep*`)` is not specified, the `WRITE TRAILER` statement applies to the first report (Report 0). For information on how to control the format of an output report created with Natural, see *Controlling Data Output* (in the *Programming Guide*).

Syntax Element	Description
LEFT JUSTIFIED UNDERLINED	**Title Justification and/or Underlining:** By default, the trailer lines are centered and not underlined. LEFT JUSTIFIED and UNDERLINED may be specified to override these defaults. If UNDERLINED is specified, the underlining character (either default or specified with the session parameter UC) is printed underneath the trailer and runs the width of the line size (session parameter LS). Natural first applies all spacing or tab specifications and creates the line before centering the whole line. For example, a notation of 10T as the first element would cause the centered header to be positioned five positions to the right.
statement-parameters	**Parameter Definition at Statement Level:** One or more parameters, enclosed within parentheses, may be specified at statement level, that is, immediately after the WRITE TRAILER statement. Each parameter specified in this manner will override the corresponding parameter previously specified in a GLOBALS command, SET GLOBALS (in Reporting Mode only) or FORMAT statement. If more than one parameter is specified, one or more blanks must be present between each entry. An entry may not be split between two statement lines. **Note:** The parameter settings applied here will only be regarded for variable fields, but they have no effect on text-constants. If you would like to set field attributes for a text-constant, they have to be set explicitly for this element, see ***Parameter Definition at Element (Field) Level***. For information on which parameters may be used, see ***List of Parameters*** (in the WRITE statement documentation).
*n*X *n*T *x*/*y*	**Format Notation and Spacing Elements:** See ***Format Notation and Spacing Elements*** (below).
'*text*' '*c*'(*n*) *attributes*	**Text/Attribute Assignments:** See ***Text/Attribute Assignments*** (below).
operand1	**Trailer Information:** *operand1* represents the field/fields to be output as trailer information.
parameters	**Parameter Definition at Element (Field) Level:** One or more parameters, enclosed within parentheses, may be specified at element (field) level, that is, immediately after *operand1*. Each parameter specified in this manner will override the corresponding parameter previously specified **at statement level** or in a GLOBALS command, SET GLOBALS (in Reporting Mode only) or FORMAT statement.

Syntax Element	Description
	If more than one parameter is specified, one or more blanks must be present between each entry. An entry may not be split between two statement lines. For information on which parameters may be used, see ***List of Parameters*** in the `WRITE` statement documentation.
`SKIP` *operand2* `LINES`	**Lines to Be Skipped:** `SKIP` may be used to cause lines to be skipped immediately after the trailer line. The number of lines to be skipped (*operand2*) may be specified as a numeric constant or as the content of a numeric variable. **Note:** `SKIP` after `WRITE TRAILER` is always interpreted as the `SKIP` clause of the `WRITE TRAILER` statement, and not as an independent statement. If you wish an independent `SKIP` statement after a `WRITE TRAILER` statement, use a semicolon (;) to separate the two statements from one another.

Format Notation and Spacing Elements

Syntax Element	Description
*n*X	**Column Spacing:** This notation inserts *n* spaces between columns.
*n*T	**Tab Setting:** The *n*T notation causes positioning (tabulation) to print position *n*. Backward positioning is not permitted.
x/*y*	***x*/*y* Positioning:** Causes the next element to be placed *x* lines below the output of the last statement, beginning in column *y*. *y* must not be zero. Backward positioning in the same line is not permitted.

Text/Attribute Assignments

Syntax Element	Description
'*text*'	**Text Assignment:** The character string enclosed by single quotes is displayed.
'*c*'(*n*)	**Character Repetition:** The character enclosed by single quotes is displayed *n* times immediately before the field value.
attributes	**Field Representation and Color Attributes:** It is possible to assign various attributes for text/field display. These attributes and the syntax that may be used are described in the section ***Output Attributes*** below.

Syntax Element	Description

	Examples:
	
	`WRITE TRAILER 'TEXT' (BGR)`
	`WRITE TRAILER 'TEXT' (B)`
	`WRITE TRAILER 'TEXT' (BBLC)`

Output Attributes

attributes indicates the output attributes to be used for text display. Attributes may be:

```
{ { AD=AD-value ...  }     }
{ { CD=CD-value ...  }     }
{ { PM=PM-value ...  } ... }
{                          }
{ { AD-value ...     }     }
{ { CD-value ...     } ... }
```

For the possible session parameter values, refer to the corresponding sections in the *Parameter Reference* documentation:

- *AD - Attribute Definition*, section *Field Representation*
- *CD - Color Definition*
- *PM - Print Mode*

Note: The compiler actually accepts more than one attribute value for an output field. For example, you may specify: AD=BDI. In such a case, however, only the last value applies. In the given example, only the value I will become effective and the output field will be displayed intensified.

Example

```
** Example 'WTLEX1': WRITE (with TRAILER option)
************************************************************************
DEFINE DATA LOCAL
1 EMPL-VIEW VIEW OF EMPLOYEES
  2 NAME
  2 FIRST-NAME
  2 CITY
  2 JOB-TITLE
END-DEFINE
*
FORMAT PS=15
```

```
WRITE TITLE LEFT JUSTIFIED UNDERLINED
      *TIME 3X 'PEOPLE LIVING IN BARCELONA'
      14X 'PAGE:' *PAGE-NUMBER
SKIP 1
*
WRITE TRAILER LEFT JUSTIFIED UNDERLINED
      / 'CITY OF BARCELONA REGISTER'
*
LIMIT 10
FIND EMPL-VIEW WITH CITY = 'BARCELONA'
  DISPLAY NAME FIRST-NAME 3X JOB-TITLE
END-FIND
END
```

Output of Program WTLEX1 - Page 1:

```
09:36:09.5   PEOPLE LIVING IN BARCELONA              PAGE:      1
--------------------------------------------------------------------------------

        NAME              FIRST-NAME                 CURRENT
                                                    POSITION

133 WRITE WORK FILE

- Function 888
- Syntax Description 888
- External Representation of Fields 889
- Handling of Large and Dynamic Variables 890
- Example 891

```
WRITE WORK [FILE] work-file-number [VARIABLE] operand1 ...
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Related Statements: DEFINE WORK FILE | READ WORK FILE | CLOSE WORK FILE | DOWNLOAD PC FILE

Belongs to Function Group: ***Control of Work Files / PC Files***

Function

The WRITE WORK FILE statement is used to write records to a physical sequential work file.

This statement can only be used in batch mode.

It is possible to create a work file in one program or processing loop and to read the same file in a subsequent independent processing loop or in a subsequent program using the READ WORK FILE statement.

Note: For Unicode and code page support, see *Work Files and Print Files on Windows, UNIX and OpenVMS Platforms* in the *Unicode and Code Page Support* documentation.

Syntax Description

Operand Definition Table:

Operand	Possible Structure					Possible Formats													Referencing Permitted	Dynamic Definition
operand1	C	S	A	G		A	U	N	P	I	F	B	D	T	L	C	G		yes	no

Note: When using the work file types ENTIRECONNECTION or TRANSFER, *operand1* may neither be of format C, nor G.

Syntax Element Description:

Syntax Element	Description
work-file-number	**Work File Number:** The work file number (as defined to Natural) to be used.
VARIABLE	**Variable Entry:** It is possible to write records with different fields to the same work file with different WRITE WORK FILE statements. In this case, the VARIABLE entry must be specified in all WRITE WORK FILE statements. The records on the external file will be written in variable format. When the operand list includes a dynamic variable (that could change in size for different executions of the WRITE WORK FILE statement), the VARIABLE entry must be specified in all WRITE WORK FILE statements. **Variable Index Range:** When writing an array to a work file, you can specify a variable index range for the array. For example: `WRITE WORK FILE work-file-number VARIABLE #ARRAY (I:J)`
operand1	**Fields to Be Written:** With *operand1* you specify the fields to be written to the work file. These fields may be database fields, user-defined variables, system variables and/or fields read from another work file using the READ WORK FILE statement. A database array may be referenced with one single range of indices which indicates the occurrences that are to be written to the work file. Groups from database files may be referenced using the group name. All fields belonging to that group will be written to the work file individually.

External Representation of Fields

Fields written with a WRITE WORK FILE statement are represented in the external file according to their internal definition. No editing is performed on the field values.

For fields of format A and B, the number of bytes in the external file is the same as the internal length definition as defined in the Natural program. No editing is performed and a decimal point is not represented in the value.

For fields of format N, the number of bytes on the external file is the sum of internal positions before and after the decimal point. The decimal point is not represented on the external file.

For fields of format P, the number of bytes on the external file is the sum of positions before and after the decimal point, plus 1 for the sign, divided by 2, rounded upward to a full byte.

Note: No format conversion is performed for fields that are written to a work file.

Examples of Field Representation:

Field Definition	Output Record
`#FIELD1 (A10)`	10 bytes
`#FIELD2 (B15)`	15 bytes
`#FIELD3 (N1.3)`	4 bytes
`#FIELD4 (N0.7)`	7 bytes
`#FIELD5 (P1.2)`	2 bytes
`#FIELD6 (P6.0)`	4 bytes

Note: When the Natural system functions `AVER`, `NAVER`, `SUM` or `TOTAL` for numeric fields (format N or P) are written to a work file, the internal length of these fields is increased by one digit (for example, `SUM` of a field of format P3 is increased to P4). This has to be taken into consideration when reading the work file.

Handling of Large and Dynamic Variables

Work File Type	Handling

`ASCII`
`ASCII-COMPRESSED`
`SAG` (binary)
	The work file types `ASCII`, `ASCII-COMPRESSED` and `SAG` (binary) cannot handle dynamic variables and will produce an error. They can, however, handle large variables with a maximum field/record length of 32766 bytes.

`TRANSFER` `ENTIRECONNECTION`	The work file type `TRANSFER` can handle dynamic variables with a maximum field/record length of 32766 bytes. The work file type `ENTIRECONNECTION` cannot handle dynamic variables. They can both, however, handle large variables with a maximum field/record length of 1073741824 bytes.
`PORTABLE` `UNFORMATTED`	Large and dynamic variables can be written into work files or read from work files using the two work file types `PORTABLE` and `UNFORMATTED`. For these types, there is no size restriction for dynamic variables. However, large variables may not exceed a maximum field/record length of 32766 bytes. For the work file type `PORTABLE`, the field information is stored within the work file. The dynamic variables are resized during `READ` if the field size in the record is different from the current size. In the `WRITE WORK FILE` statement, fields are written to the file specified with their byte length. All data types (`DYNAMIC` or not) are treated the same. No structural information is inserted. Note that Natural uses a buffering mechanism, so you can

Work File Type	Handling
	expect the data to be completely written only after a CLOSE WORK. This is especially important if the file is to be processed with another utility while Natural is running. With the READ WORK FILE statement, fields of fixed length are read with their whole length. If the end-of-file is reached, the remainder of the current field is filled with blanks. The following fields are unchanged. In the case of DYNAMIC data types, all the remainder of the file is read unless it exceeds 1073741824 bytes. If the end of file is reached, the remaining fields (variables) are kept unchanged (normal Natural behavior).
CSV	The maximum field/record length is 32766 bytes for dynamic and large variables. Dynamic variables are supported. X-arrays are not allowed and will result in an error message.

Example

```
** Example 'WWFEX1': WRITE WORK FILE
************************************************************************
DEFINE DATA LOCAL
1 EMPLOY-VIEW VIEW OF EMPLOYEES
  2 PERSONNEL-ID
  2 NAME
END-DEFINE
*
FIND EMPLOY-VIEW WITH CITY = 'LONDON'
  WRITE WORK FILE 1
        PERSONNEL-ID NAME
END-FIND
*
END
```

134 SQL Statements

In addition to the Natural DML statements, Natural also provides SQL statements for use in Natural programs so that SQL can be used directly.

The following SQL statements are available:

`CALLDBPROC` | `COMMIT` | `DELETE` | `INSERT` | `PROCESS SQL` | `READ RESULT SET` | `ROLLBACK` | `SELECT` | `UPDATE`

Note: Concerning the portability of Natural applications, please bear in mind that the Natural SQL statements can only be used for SQL-compliant database systems, whereas Natural DML statements, such as `FIND` or `READ`, can be used for all database systems supported by Natural.

This part covers the following topics:

- **Common Set and Extended Set**
- **Basic Syntactical Items**
- **Natural View Concept**
- **Scalar Expressions**
- **Search Conditions**
- **Select Expressions**
- **Flexible SQL**
- SQL Statements in Alphabetical Order

The so-called “Flexible SQL”, which is a further possibility of issuing SQL statements, enables you to use arbitrary SQL syntax.

135 Common Set and Extended Set

The SQL statements available within the Natural programming language comprise two different syntax sets:

- **Common Set**
  The Common Set basically corresponds to the standard SQL syntax definitions and is provided for each SQL-compliant database system supported by Natural. The Common Set is valid against all SQL databases.
- **Extended Set**
  The Extended Set, in addition, provides special enhancements to the Common Set to support specific features of the supported database systems. Currently, the Extended Set is partly available and is valid against DB2 databases only.

The Natural SQL statements documentation mainly describes the Natural SQL Common Set. The statement syntax adheres as far as possible to the syntax described in the relevant literature on SQL; please, refer to this literature for further details.

136 Basic Syntactical Items

- Constants 898
- Names 898
- Parameters 901
- Natural Formats and SQL Data Types 904

This chapter describes basic syntactical items, which are not explained any further within the individual SQL statement descriptions.

Constants

The constants used in the syntactical descriptions of the Natural SQL statements are:

- *constant*
- *integer*

These items are described below.

constant	The item *constant* always refers to a Natural constant.
integer	The item *integer* always represents an integer constant.

Note: If the character for decimal point notation (session parameter DC) is set to a comma (,), any specified numeric constant must not be followed directly by a comma, but must be separated from it by a blank character; otherwise an error or wrong results occur.

Invalid Syntax:	Valid Syntax:
`VALUES (1,'A')    leads to a syntax error` `VALUES (1,2,3)    leads to wrong results`	`VALUES (1 ,'A')` `VALUES (1 ,2 ,3)`

Names

The names used in the syntactical descriptions of the Natural SQL statements are:

- *authorization-identifier*
- *ddm-name*
- *view-name*
- *column-name*
- *table-name*
- *correlation-name*

These items are described below.

authorization-identifier	The item *authorization-identifier*, which is also called creator name, is used to qualify database tables and views. See also **below**.
ddm-name	The item *ddm-name* always refers to the name of a Natural data definition module (DDM) as created with the Natural utility SYSDDM.
view-name	The item *view-name* always refers to the name of a Natural view as defined in the DEFINE DATA statement.
column-name	The item *column-name* always refers to the name of a physical database column.

table-name	Syntax:
	
	[*location-name*.][*authorization-identifier*.]*ddm-name*
	
	The item *table-name* in this section is used to reference both SQL base tables and SQL viewed tables.
	
	ddm-name
	
	A Natural data definition module (DDM) must have been created for a table to be used. The name of such a DDM must be the same as the corresponding database table name or view name.
	
	location-name
	
	This optional item specifies the location of the table to be accessed.
	
	authorization-identifier
	
	There are two ways of specifying the *authorization-identifier* of a database table or view.
	
	One way corresponds to the standard SQL syntax, in which the *authorization-identifier* is separated from the table name by a period. Using this form, the name of the DDM must be the same as the name of the database table without the *authorization-identifier*.
	
	Example:
	
	`DEFINE DATA LOCAL`
	`01 PERS VIEW OF PERSONNEL`
	`   02 NAME`
	`   02 AGE`
	`END-DEFINE`
	`SELECT *`
	`  INTO VIEW PERS`
	`  FROM SQL.PERSONNEL`
	`...`

	Alternatively, you can define the *authorization-identifier* as part of the DDM name. The DDM name then consists of the *authorization-identifier* and the database table name separated by a hyphen (-). The hyphen between the *authorization-identifier* and the table name is converted internally into a period.
	
	Note: This form of DDM name can also be used with a FIND or READ statement, because it conforms to the DDM naming conventions applicable to these statements.
	
	Example:
	
	`DEFINE DATA LOCAL`
	`01 PERS VIEW OF SQL-PERSONNEL`
	`   02 NAME`
	`   02 AGE`
	`END-DEFINE`
	`SELECT *`
	`  INTO VIEW PERS`
	`  FROM SQL-PERSONNEL`
	`...`
	
	If the *authorization-identifier* has been specified neither explicitly nor within the DDM name, it is determined by the SQL database system.
	
	In addition to being used in SELECT statements, table names can also be specified in DELETE, INSERT and UPDATE statements.
	
	Examples:
	
	`...`
	`DELETE FROM SQL.PERSONNEL`
	`  WHERE AGE IS NULL`
	` ...`
	
	`...`
	`INSERT INTO SQL.PERSONNEL (NAME,AGE)`
	`  VALUES ('ADKINSON',35)`
	`...`
	
	`...`
	`UPDATE SQL.PERSONNEL`
	`SET SALARY = SALARY * 1.1`
	`WHERE AGE > 30`
	`...`

correlation-name	The item *correlation-name* represents an alias name for a *table-name*. It can be used to qualify column names; it also serves to implicitly qualify fields in a Natural view when used with the INTO clause of the SELECT statement.

	Example:
	
	`DEFINE DATA LOCAL`
	`01 PERS-NAME    (A20)`
	`01 EMPL-NAME    (A20)`
	`01 AGE          (I2)`
	`END-DEFINE`
	`...`
	`SELECT X.NAME , Y.NAME , X.AGE`
	`  INTO PERS-NAME , EMPL-NAME , AGE`
	`  FROM SQL-PERSONNEL X , SQL-EMPLOYEES Y`
	`  WHERE X.AGE = Y.AGE`
	`END-SELECT`
	`...`
	
	Although in most cases the use of *correlation-names* is not necessary, they may help to make the statement clearer.

Parameters

parameter

[:] *host-variable* [INDICATOR [:] *host-variable*] [LINDICATOR [:] *host-variable*]

The syntax items are described below:

	See also ***Natural Formats and SQL Data Types***.
host-variable	A *host-variable* is a Natural user-defined variable (no system variable) which is referenced in an SQL statement. It can be either an individual field or defined as part of a Natural view. When defined as a receiving field (for example, in the INTO clause), a *host-variable* identifies a variable to which a value is assigned by the database system. When defined as a sending field (for example, in the WHERE clause), a *host-variable* specifies a value to be passed from the program to the database system. See also ***Natural Formats and SQL Data Types***.
[:]	**Colon:** To comply with SQL standards, a host-variable can also be prefixed by a colon (:). When used with flexible SQL, host-variables must be qualified by colons.

<table>
<tr><td></td><td>
Example:

```
SELECT NAME INTO :#NAME FROM PERSONNEL
WHERE AGE = :VALUE
```

The colon is always required if the variable name is identical to an SQL reserved word. In a context in which either a host-variable or a column can be referenced, the use of a name without a colon is interpreted as a reference to a column.
</td></tr>
<tr><td>INDICATOR</td><td>

INDICATOR Clause:

The INDICATOR clause is an optional feature to distinguish between a “null” value (that is, no value at all) and the actual values 0 or “blank”.

When specified with a receiving *host-variable* (target field), the INDICATOR *host-variable* (null indicator field) serves to find out whether a column to be retrieved is “null”.

Example:

```
DEFINE DATA LOCAL
1 NAME      (A20)
1 NAMEIND   (I2)
END-DEFINE
SELECT *
  INTO NAME INDICATOR NAMEIND
...
```

In this example, NAME represents the receiving *host-variable* and NAMEIND the null indicator field.

If a null indicator field has been specified and the column to be retrieved is null, the value of the null indicator field is negative and the target field is set to 0 or “blank” depending on its data type. Otherwise, the value of the null indicator field is greater than or equal to 0.

When specified with a sending *host-variable* (source field), the null indicator field is used to designate a null value for this field.

Example:

```
DEFINE DATA LOCAL
1 NAME      (A20)
1 NAMEIND   (I2)
UPDATE ...
SET NAME = :NAME INDICATOR :NAMEIND
WHERE ...
```

In this example, :NAME represents the sending host-variable and :NAMEIND the null indicator field. By entering a negative value as input for the null indicator field, a null value is assigned to a database column.
</td></tr>
</table>

<table>
<tr><td></td><td>An <code>INDICATOR</code> <code>host-variable</code> is of format/length I2.</td></tr>
<tr><td><code>LINDICATOR</code></td><td>

LINDICATOR Clause:

The <code>LINDICATOR</code> clause is an optional feature which is used to support columns of varying lengths, for example, <code>VARCHAR</code> or <code>LONG VARCHAR</code> type.

When specified with a receiving <code>host-variable</code> (target field), the <code>LINDICATOR</code> <code>host-variable</code> (length indicator field) contains the number of characters actually returned by the database into the target field. The target field is always padded with blanks.

If the <code>VARCHAR</code> or <code>LONG VARCHAR</code> column contains more characters than fit in the target field, the length indicator field is set to the length actually returned (that is, the length of the target field) and the null indicator field (if specified) is set to the total length of this column.

Example

<pre>
DEFINE DATA LOCAL
1 ADDRESSLIND (I2)
1 ADDRESS   (A50/1:6)
END-DEFINE
SELECT *
  INTO :ADDRESS(*) LINDICATOR :ADDRESSLIND
  ...
</pre>

In this example, <code>:ADDRESS(*)</code> represents the target field which receives the first 300 bytes (if available) of the addressed <code>VARCHAR</code> or <code>LONG VARCHAR</code> column, and <code>:ADDRESSLIND</code> represents the length indicator field which contains the number of characters actually returned.

When specified with a sending <code>host-variable</code> (source field), the length indicator field specifies the number of characters of the source field which are to be passed to the database.

Example:

<pre>
DEFINE DATA LOCAL
1 NAMELIND (I2)
1 NAME   (A20)
1 AGE   (I2)
END-DEFINE
MOVE 4   TO NAMELIND
MOVE 'ABC%' TO NAME
SELECT AGE
  INTO :AGE
WHERE NAME LIKE :NAME LINDICATOR :NAMELIND
  ...
</pre>

</td></tr>
</table>

	A `LINDICATOR` *`host-variable`* is of format/length I2 or I4. For performance reasons, it should be specified immediately before the corresponding target or source field; otherwise, the field is copied to the temporary storage at runtime. If the `LINDICATOR` field is defined as an I2 field, the SQL data type `VARCHAR` is used for sending or receiving the corresponding column. If the `LINDICATOR` *`host-variable`* is specified as I4, a large object data type (CLOB/BLOB) is used. If the field is defined as `DYNAMIC`, the column is read in an internal loop up to its real length. The `LINDICATOR` field and `*LENGTH` are set to this length. In case of a fixed length field, the column is read up to the defined length. In both cases, the field is written up to the value defined in the `LINDICATOR` field. Let a fixed length field be defined with a `LINDICATOR` field specified as I2. If the `VARCHAR` column contains more characters than fit into this fixed length field, the length indicator field is set to the length actually returned and the null indicator field (if specified) is set to the total length of this column (retrieval). This is not possible for fixed length fields >= 32 KB (length does not fit into null indicator field).

Natural Formats and SQL Data Types

The Natural format of a host-variable is converted to an SQL data type according to the following table:

Natural Format/Length	SQL Data Type
A*n*	CHAR (*n*)
B2	SMALLINT
B4	INT
B*n*; *n* not equal to 2 or 4	CHAR (*n*)
F4	REAL
F8	DOUBLE PRECISION
I2	SMALLINT
I4	INT
N*nn.m*	NUMERIC (*nn*+*m*,*m*)
P*nn.m*	NUMERIC (*nn*+*m*,*m*)
T	TIME
D	DATE
G*n*; for view fields only	GRAPHIC (*n*)

Natural does not check whether the converted SQL data type is compatible to the database column. Except for fields of format N, no data conversion is done.

In addition, the following extensions to standard Natural formats are available with Natural SQL:

- A one-dimensional array of format A can be used to support alphanumeric columns longer than 253 bytes. This array must be defined beginning with index 1 and can only be referenced by using an asterisk (*) as the index. The corresponding SQL data type is `CHAR (n)`, where *n* is the total number of bytes in the array.
- A special host variable indicated by the keyword `LINDICATOR` can be used to support variable-length columns. The corresponding SQL data type is `VARCHAR (n)`; see also the `LINDICATOR` clause.
- The Natural formats date (D) and time (T) can be used with Entire Access and will be converted into the corresponding database-dependent formats (see the Entire Access documentation for details)

A sending field specified as one-dimensional array without a `LINDICATOR` field is converted into the SQL data type `VARCHAR`. The length is the total number of bytes in the array, not taking into account trailing blanks.

137 Natural View Concept

Some Natural SQL statements also support the use of Natural views.

A Natural view can be specified instead of a parameter list, where each field of the view - except group fields, redefining fields and fields prefixed with `L@` or `N@`- corresponds to one parameter (host variable).

Fields with names prefixed with `L@` or `N@` can only exist with corresponding master fields; that is, fields of the same name, where:

- `L@` fields are converted into `LINDICATOR` fields,
- `N@` fields are converted into `INDICATOR` fields.

`L@` fields should have been specified at view definition, immediately before the master fields to which they apply.

```
DEFINE DATA LOCAL
01 PERS VIEW OF SQL-PERSONNEL
  02 PERSID     (I4)
  02 NAME       (A20)
  02 N@NAME    (I2)                     /* null indicator of NAME
  02 L@ADDRESS (I2)                     /* length indicator of ADDRESS
  02 ADDRESS    (A50/1:6)
  02 N@ADDRESS (I2)                     /* null indicator of ADDRESS
01 #PERSID      (I4)
END-DEFINE
   ...
SELECT *
  INTO VIEW PERS
  FROM SQL-PERSONNEL
  WHERE PERSID = #PERSID
   ...
END-SELECT
```

The above example is equivalent to the following one:

```
...
SELECT *
  INTO PERSID,
       NAME INDICATOR N@NAME,
       ADDRESS(*)INDICATOR N@ADDRESS LINDICATOR L@ADDRESS
  FROM SQL-PERSONNEL
  WHERE PERSID = #PERSID
...
END-SELECT
```

Note: When accessing varchar data types with Natural for Windows, Natural for UNIX or Natural for OpenVMS, there must be a corresponding length indicator variable in the view.

138 Scalar Expressions

- Scalar Expression 910
- Scalar Operator 910
- Factor 910

```
[ + ] { factor              }
[ - ] { (scalar-expression) }

scalar-expression scalar-operator scalar-expression
```

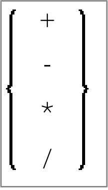
Scalar Expression

A *scalar-expression* consists of a factor or other scalar expressions including scalar operators.

Concerning reference priority, scalar expressions behave as follows:

- When a non-qualified variable name is specified in a scalar expression, the first approach is to resolve the variable name as column name of the referenced table.
- If no column with the specified name is available in the referenced table, Natural tries to resolve this variable as a Natural user-defined variable (host variable).

Scalar Operator



A *scalar-operator* can be any of the operators listed above; the minus (-) and slash (/) operators must be separated by at least one blank from preceding operators.

Factor

```
atom
column-reference
aggregate-function
special-register
```

A *factor* can consist of one of the items listed in the above diagram and described in the text below.

Atom

```
{ parameter }
{ constant  }
```

An *atom* can be either a *parameter* or a *constant* (as described in the section *Basic Syntactical Items*).

Column Reference

```
[ table-name.       ]
[ correlation-name. ]  column-name
```

A *column-reference* is a column name optionally qualified by either a *table-name* or a *correlation-name* (see also the section ***Basic Syntactical Items***). Qualified names are often clearer than unqualified names and sometimes they are essential.

Note: A table name in this context must not be qualified explicitly with an authorization identifier. Use a correlation name instead if you need a qualified table name.

If a column is referenced by a *table-name* or *correlation-name*, it must be contained in the corresponding table. If neither a *table-name* nor a *correlation-name* is specified, the respective column must be in one of the tables specified in the FROM clause (see ***Table Expression***).

Aggregate Function

```
{ COUNT        { (*)                          } }
{              { (DISTINCT column-reference)  } }
{                                               }
{ { AVG }                                       }
{ { MAX }      { (DISTINCT column-reference)  } }
{ { MIN }      { ([ALL] scalar-expression)    } }
{ { SUM }                                       }
```

SQL provides a number of special functions to enhance its basic retrieval power. The so-called SQL aggregate functions currently available and supported by Natural are:

AVG	gives the average of the values in a column
COUNT	gives the number of values in a column
MAX	gives the highest value in a column
MIN	gives the lowest value in a column
SUM	gives the sum of the values in a column

Apart from `COUNT(*)`, each of these functions operates on the collection of scalar values in an argument (that is, a single column or a *scalar-expression*) and produces a scalar value as its result.

Example:

```
DEFINE DATA LOCAL
1 AVGAGE   (I2)
END-DEFINE
...
SELECT AVG (AGE)
  INTO AVGAGE
  FROM SQL-PERSONNEL
  ...
```

In general, the argument can optionally be preceded by the keyword `DISTINCT` to eliminate redundant duplicate values before the function is applied.

If `DISTINCT` is specified, the argument must be the name of a single column; if `DISTINCT` is omitted, the argument can consist of a general *scalar-expression*.

`DISTINCT` is not allowed with the special function `COUNT(*)`, which is provided to count all rows without eliminating any duplicates.

Special Register

USER

A reference to a *special-register* returns a scalar value.

139 Search Condition

- Search Condition 914
- Predicate 914

```
{ [NOT] { predicate          }                           }
        { (search-condition) }
{ search-condition  { AND }  search-condition            }
                    { OR  }
```

Search Condition

A *search-condition* can consist of a simple *predicate* or of multiple *search-conditions* combined with the Boolean operators AND, OR and NOT, and parentheses if required to indicate a desired order of evaluation.

Example

```
DEFINE DATA LOCAL
01 NAME    (A20)
01 AGE     (I2)
END-DEFINE
...
SELECT *
  INTO NAME, AGE
  FROM SQL-PERSONNEL
  WHERE AGE = 32 AND NAME > 'K'
END-SELECT
...
```

Predicate

```
{ scalar-expression  { scalar-expression }                                     }
{ comparison         { subquery          }                                     }
{ scalar-expression  [NOT] BETWEEN scalar-expression  AND  scalar-expression   }
{ column-reference [NOT] LIKE  atom                                            }
{ column-reference IS [NOT] NULL                                               }
{ scale-expression   { subquery    }                                           }
{ [NOT] IN           { (atom, ...) }                                           }
{                    { ALL  }                                                  }
{ scalar-expression  { ANY  }                     subquery                     }
{ comparison         { SOME }                                                  }
  EXISTS subquery
```

A *predicate* specifies a condition that can be "true", "false" or "unknown".

In a *search-condition*, a *predicate* can consist of a simple or complex comparison operation or other kinds of conditions.

Example:

```
SELECT NAME, AGE
  INTO VIEW PERS
  FROM SQL-PERSONNEL
  WHERE AGE BETWEEN 20 AND 30
    OR AGE IN ( 32, 34, 36 )
    AND NAME LIKE '%er'
    ...
```

Note: The percent sign (%) may conflict with Natural terminal commands. If so, you must define a terminal command control character different from `%`; see *Changing the Terminal Command Control Character* in the *Terminal Commands* documentation.

The individual predicates are explained in the following topics (for further information on predicates, please refer to the relevant literature). According to the syntax above, they are called as follows:

- Comparison Predicate
- BETWEEN Predicate
- LIKE Predicate
- NULL Predicate
- IN Predicate
- Quantified Predicate
- EXISTS Predicate

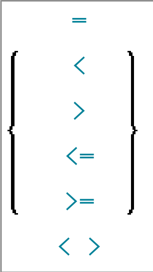
Comparison Predicate

```
scalar-expression comparison  { scalar-expression }
                              { subquery          }
```

A comparison predicate compares two values.

See information on *scalar-expression*.

Comparison



comparison can be any of the following operators:

=	equal to
<	less than
>	greater than
<=	less than or equal to
>=	greater than or equal to
<>	not equal to

Subquery

(*select-expression*)

A *subquery* is a *select-expression* that is nested inside another such expression.

Example:

```
DEFINE DATA LOCAL
1 #NAME    (A20)
1 #PERSNR  (I4)
END-DEFINE
...
SELECT NAME, PERSNR
  INTO #NAME, #PERSNR
  FROM SQL-PERSONNEL
  WHERE PERSNR IN
    ( SELECT PERSNR
        FROM SQL-AUTOMOBILES
        WHERE COLOR = 'black' )
        ...
END-SELECT
```

For further information, see ***Select Expressions***.

BETWEEN Predicate

```
scalar-expression [NOT] BETWEEN scalar-expression AND scalar-expression
```

A `BETWEEN` predicate compares a value with a range of values.

See information on *`scalar-expression`*.

LIKE Predicate

```
column-reference [NOT] LIKE atom
```

A `LIKE` predicate searches for strings that have a certain pattern.

See information on *`column-reference`* and *`atom`*.

NULL Predicate

```
column-reference IS [NOT] NULL
```

A `NULL` predicate tests for null values.

See information on *`column-reference`*.

IN Predicate

```
scalar-expression [NOT] IN { subquery ...
                             (atom)       }
```

An `IN` predicate compares a value with a collection of values.

See information on *`scalar-expression`* and *`atom`*.

See information on *`subquery`*.

Quantified Predicate

```
                                     ALL
scalar-expression  comparison      { ANY }   subquery
                                     SOME
```

A quantified predicate compares a value with a collection of values.

See information on *scalar-expression*, *comparison*, and *subquery*.

EXISTS Predicate

```
EXISTS subquery
```

An EXISTS predicate tests for the existence of certain rows.

The EXISTS predicate evaluates to true only if the result of evaluating the *subquery* is not empty; that is, if there exists at least one record (row) in the FROM table of the *subquery* satisfying the search condition of the WHERE clause of this *subquery*.

Example of EXISTS:

```
DEFINE DATA LOCAL
1 #NAME    (A20)
END-DEFINE
...
SELECT NAME
  INTO #NAME
  FROM SQL-PERSONNEL
  WHERE EXISTS
    ( SELECT *
      FROM SQL-EMPLOYEES
      WHERE PERSNR > 1000
        AND NAME < 'L' )
        ...
END-SELECT
...
```

See information on *subquery*.

140 Select Expressions

- Selection 920
- Table Expression 921

```
SELECT selection table-expression
```

A *select-expression* specifies a result table. It is used in the following Natural SQL statements: INSERT | SELECT | UPDATE

Selection

```
[ ALL      ] { {scalar-expression [[AS] correlation-name]}, ... }
[ DISTINCT ] { *                                               }
```

The *selection* specifies the items to be selected.

ALL/DISTINCT

Duplicate rows are not automatically eliminated from the result of a *select-expression*. To request this, specify the keyword DISTINCT.

The alternative to DISTINCT is ALL. ALL is assumed if neither is specified.

Scalar Expression

Instead of, or as well as, simple column names, a selection can also include general *scalar-expressions* containing scalar operators and scalar functions which provide computed values (see also the section ***Scalar Expressions***).

Example:

```
SELECT NAME, 65 - AGE
  FROM SQL-PERSONNEL
  ...
```

Correlation Name

A *correlation-name* can be assigned to a *scalar-expression* as alias name for a result column.

The *correlation-name* need not be unique. If no *correlation-name* is specified for a result column, the corresponding *column-name* will be used (if the result column is derived from a column name; if not, the result table will have no name). The name of a result column may be used, for example, as column name in the ORDER BY clause of a SELECT statement.

Asterisk Notation - *

All columns of all tables specified in the `FROM` clause are selected.

Example:

```
SELECT *
  FROM SQL-PERSONNEL, SQL-AUTOMOBILES
  ...
```

Table Expression

from-clause [*where-clause*]
[*group-by-clause*] [*having-clause*]

The *table-expression* specifies from where and according to what criteria rows are to be selected.

FROM Clause

FROM *table-reference*,...

This clause specifies from which tables the result set is built.

Table Reference

{ *table-name* [[AS] *correlation-name*]
  subquery [AS] *correlation-name*
  joined-table }

The tables specified in the `FROM` clause must contain the column fields used in the selection list.

You can either specify a single table or produce an intermediate table resulting from a subquery or a "join" operation (see below).

Since various tables (that is, DDMs) can be addressed in one `FROM` clause and since a *table-expression* can contain several `FROM` clauses if *subqueries* are specified, the database ID (DBID) of the first DDM specified in the first `FROM` clause of the whole expression is used to identify the underlying database involved.

Optionally a *correlation-clause* can be assigned to a *table-name*. For a *subquery*, a *correlation-clause* must be assigned.

Joined Table

```
{ table-reference [ { INNER        } ] JOIN table-reference ON join-condition }
{                 [ { LEFT [OUTER] } ]                                         }
{                 [ { RIGHT [OUTER]} ]                                         }
{                 [ { FULL [OUTER] } ]                                         }
{ (joined-table)                                                               }
```

A *joined-table* specifies an intermediate table resulting from a “join” operation.

The “join” can be an INNER, LEFT OUTER, RIGHT OUTER or FULL OUTER JOIN. If you do not specify anything, INNER applies.

Multiple “join” operations can be nested; that is, the tables which create the intermediate result table can themselves be intermediate result tables of a “join” operation or a *subquery*; and the latter, in turn, can also have a *joined-table* or another *subquery* in its FROM clause.

Join Condition

For INNER, LEFT OUTER, and RIGHT OUTER joins:

```
search-condition
```

For FULL OUTER joins:

```
full-join-expression = full-join-expression [AND ...]
```

Full Join Expression

```
{ column-name                            }
{ { VALUE    }  (column-name , ...)      }
{ { COALESCE }                           }
```

Within a *join-expression* only *column-names* and the *scalar-function* VALUE (or its synonym COALESCE) are allowed. See details on *column-name*.

WHERE Clause

[WHERE *search-condition*]

The WHERE clause is used a to specify the selection criteria (*search-condition*) for the rows to be selected.

Example:

```
DEFINE DATA LOCAL
01 NAME   (A20)
01 AGE    (I2)
END-DEFINE
...
SELECT *
  INTO NAME, AGE
  FROM SQL-PERSONNEL
  WHERE AGE = 32
END-SELECT
...
```

See details on *search-condition*.

GROUP BY Clause

[GROUP BY *column-reference*,...]

The GROUP BY clause rearranges the table represented by the FROM clause into groups in a way that all rows within each group have the same value for the GROUP BY columns.

Each *column-reference* in the selection list must be either a GROUP BY column or specified within an *aggregate-function*. Aggregate functions are applied to the individual groups (not to the entire table). The result table contains as many rows as groups.

See further details on *column-reference* and *aggregate-function*.

Example:

```
DEFINE DATA LOCAL
1 #AGE     (I2)
1 #NUMBER  (I2)
END-DEFINE
...
SELECT AGE , COUNT(*)
  INTO #AGE, #NUMBER
  FROM SQL-PERSONNEL
```

```
  GROUP BY AGE
  ...
```

If the GROUP BY clause is preceded by a WHERE clause, all rows that do not satisfy the WHERE clause are excluded before any grouping is done.

HAVING Clause

[HAVING *search-condition*]

If the HAVING clause is specified, the GROUP BY clause should also be specified.

Just as the WHERE clause is used to exclude rows from a result table, the HAVING clause is used to exclude groups and therefore also based on a *search-condition*. Scalar expressions in a HAVING clause must be single-valued per group.

See further details on *scalar-expression* and *search-condition*.

Example:

```
DEFINE DATA LOCAL
1 #NAME     (A20)
1 #AVGAGE   (I2)
1 #NUMBER   (I2)
END-DEFINE
...
SELECT NAME, AVG(AGE), COUNT(*)
  INTO #NAME, #AVGAGE, #NUMBER
  FROM SQL-PERSONNEL
  GROUP BY NAME
  HAVING COUNT(*) > 1
  ...
```

141 Flexible SQL

- Using Flexible SQL 926
- Specifying Text Variables in Flexible SQL 927

Using Flexible SQL

In addition to the SQL syntax described in the previous sections, flexible SQL enables you to use arbitrary SQL syntax.

Characters << and >>

Flexible SQL is enclosed in << and >> characters. It can include arbitrary SQL text and host variables. Within flexible SQL, host variables *must* be prefixed by a colon (:).

The flexible SQL string can cover several statement lines. Comments are possible, too (see also the statement `PROCESS SQL`).

Flexible SQL can be used as a replacement for any of the following syntactical SQL items:

- *atom*
- *column-reference*
- *scalar-expression*
- *predicate*

Flexible SQL can also be used between the clauses of a select expression:

```
SELECT selection
  << ... >>
  INTO ...
  FROM ...
  << ... >>
  WHERE ...
  << ... >>
  GROUP BY ...
  << ... >>
  HAVING ...
  << ... >>
  ORDER BY ...
  << ... >>
```

Note: The SQL text used in flexible SQL is not recognized by the Natural compiler. The SQL text (with replaced host variables) is simply copied into the SQL string passed to the database system. Syntax errors in flexible SQL are detected at runtime when the database executes the corresponding statement.

Example 1

```
SELECT NAME
FROM SQL-EMPLOYEES
WHERE << MONTH (BIRTH) >>  =  << MONTH (CURRENT_DATE) >>
```

Example 2:

```
SELECT NAME
FROM SQL-EMPLOYEES
WHERE << MONTH (BIRTH) = MONTH (CURRENT_DATE) >>
```

Example 3:

```
SELECT NAME
FROM SQL-EMPLOYEES
WHERE SALARY > 50000
<< INTERSECT
   SELECT NAME
   FROM SQL-EMPLOYEES
   WHERE DEPT = 'DEPT10'
>>
```

Specifying Text Variables in Flexible SQL

Within flexible SQL, you can also specify so-called “text variables”.

```
<<:T:host-variable [LINDICATOR:host-variable]>>
```

The syntax items are described below:

`:T:`	A text variable is a *host-variable* prefixed by `:T:`. It must be in alphanumeric format. At runtime, a text variable within an SQL statement will be replaced by its contents that is, the text string contained in the text variable will be inserted into the SQL string. After the replacement, trailing blanks will be removed from the inserted text string. You have to make sure yourself that the content of a text variable results in a syntactically correct SQL string. In particular, the content of a text variable must not contain *host-variables*. A statement containing a text variable will always be executed in dynamic SQL mode.
`LINDICATOR`	**LINDICATOR Option:**

	The text variable can be followed by the keyword `LINDICATOR` and a length indicator variable (that is, a *host-variable* prefixed by colon). The length indicator variable has to be of format/length I2. If no `LINDICATOR` variable is specified, the entire content of the text variable will be inserted into the SQL string. If you specify a `LINDICATOR` variable, only the first *n* characters (*n* being the value of the `LINDICATOR` variable) of the text variable content will be inserted into the SQL string. If the number in the `LINDICATOR` variable is greater than the length of the text variable content, the entire text variable content will be inserted. If the number in the `LINDICATOR` variable is negative or 0, nothing will be inserted. See general information on *host-variable*.

Example Using Text Variable

```
DEFINE DATA LOCAL
01 TEXTVAR (A200)
01 TABLES VIEW OF SYSIBM-SYSTABLES
   02 NAME
   02 CREATOR
END-DEFINE
*
MOVE 'WHERE NAME > ''SYS'' AND CREATOR = ''SYSIBM''' TO TEXTVAR
*
SELECT * INTO VIEW TABLES
  FROM SYSIBM-SYSTABLES
  << :T:TEXTVAR >>
  DISPLAY TABLES
END-SELECT
*
END
```

The generated SQL statement (as displayed with the `LISTSQL` system command) will look as follows:

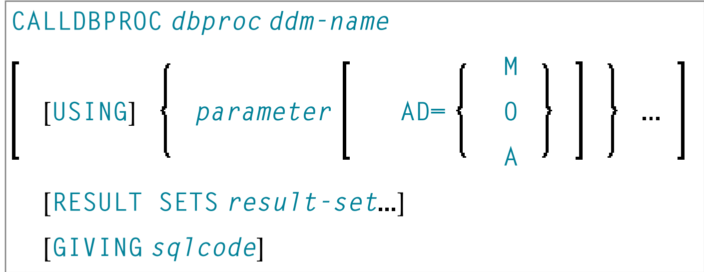
```
SELECT NAME, CREATOR FROM SYSIBM.SYSTABLES:T: FOR FETCH ONLY
```

The executed SQL statement will look as follows:

```
SELECT TABNAME, CREATOR FROM SYSIBM.SYSTABLES
  WHERE TABNAME > 'SYS' AND CREATOR = 'SYSIBM'
```

142 CALLDBPROC - SQL

- Function 930
- Syntax Description 931
- Example 932



For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Database Access and Update***

Function

The CALLDBPROC statement is used to invoke a stored procedure of the SQL database system to which Natural is connected.

The stored procedure can be either a Natural subprogram or a program written in another programming language.

In addition to the passing of parameters between the invoking object and the stored procedure, CALLDBPROC supports "result sets"; these make it possible to return a larger amount of data from the stored procedure to the invoking object than would be possible via parameters.

The result sets are "temporary result tables" which are created by the stored procedure and which can be read and processed by the invoking object via a READ RESULT SET statement.

Note: In general, the invoking of a stored procedure could be compared with the invoking of a Natural subprogram: when the CALLDBPROC statement is executed, control is passed to the stored procedure; after processing of the stored procedure, control is returned to the invoking object and processing continues with the statement following the CALLDBPROC statement.

Syntax Description

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td>dbproc</td><td colspan="2">Stored Procedure to be Invoked:

As dbproc you specify the name of the stored procedure to be invoked. The name can be specified either as an alphanumeric variable or as a constant (enclosed in apostrophes).

The name must adhere to the rules for stored procedure names of the target database system.

If the stored procedure is a Natural subprogram, the actual procedure name must not be longer than 8 characters.</td></tr>
<tr><td>ddm-name</td><td colspan="2">Name of a Natural Data Definition Module:

The name of a DDM must be specified to provide the “address” of the database which executes the stored procedure. For further information, see ddm-name.</td></tr>
<tr><td>[USING] parameter</td><td colspan="2">Parameter(s) to be Passed:

As parameter, you can specify parameters which are passed from the invoking object to the stored procedure. A parameter can be

■ a host-variable (optionally with INDICATOR and LINDICATOR clauses),
■ a constant, or
■ the keyword NULL.

See further details on host-variable.</td></tr>
<tr><td rowspan="5">AD=</td><td colspan="2">Attribute Definition:
If the parameter is a host-variable, you can mark it as follows:</td></tr>
<tr><td>AD=O</td><td>Non-modifiable, see session parameter AD=O.

(Corresponding procedure notation in DB2 for z/OS: IN.)</td></tr>
<tr><td>AD=M</td><td>Modifiable, see session parameter AD=M.

(Corresponding procedure notation in DB2 for z/OS: INOUT.)</td></tr>
<tr><td>AD=A</td><td>For input only, see session parameter AD=A.

(Corresponding procedure notation in DB2 for z/OS: OUT.)</td></tr>
<tr><td colspan="2">If the parameter is a constant, AD cannot be explicitly specified. For constants, AD=O always applies.</td></tr>
</table>

Syntax Element	Description
RESULT SETS *result-set*	**Field for Result-Set Locator Variable:** As *result-set* you specify a field in which a result-set locator is to be returned. A result set has to be a variable of format/length I4. The value of a result set variable is merely a number which identifies the result set and which can be referenced in a subsequent READ RESULT SET statement. The sequence of the *result-set* values correspond to the sequence of the result sets returned by the stored procedure. The contents of the result sets can be processed by a subsequent READ RESULT SET statement. If no result set is returned, the corresponding result-set variable will contain 0. Only one result set can be specified.
GIVING *sqlcode*	**GIVING *sqlcode* Option:** This option may be used to obtain the SQL code of the SQL CALL statement invoking the stored procedure. If this option is specified and the SQL code of the stored procedure is not 0, no Natural error message will be issued. In this case, the action to be taken in reaction to the SQL code value has to be coded in the invoking Natural object. The *sqlcode* field has to be a variable of format/length I4. If the GIVING *sqlcode* option is omitted, a Natural error message will be issued if the SQL code of the stored procedure is not 0.

Example

The following example shows a Natural program that calls the stored procedure DEMO_PROC to retrieve all names of table PERSON that belong to a given range.

Three parameter fields are passed to DEMO_PROC: the first and second parameters pass starting and ending values of the range of names to the stored procedure, and the third parameter receives a name that meets the criterion.

In this example, the names are returned in a result set that is processed using the READ RESULT SET statement.

```
DEFINE DATA LOCAL
1 PERSON VIEW OF DEMO-PERSON
  2 PERSON_ID
  2 LAST_NAME
1 #BEGIN    (A2) INIT <'AB'>
1 #END      (A2) INIT <'DE'>
1 #RESPONSE (I4)
1 #RESULT   (I4)
1 #NAME (A20)
END-DEFINE

...

CALLDBPROC 'DEMO_PROC' DEMO-PERSON #BEGIN (AD=O) #END (AD=O) #NAME (AD=A)
    RESULT SETS #RESULT
    GIVING #RESPONSE

READ RESULT SET #RESULT INTO #NAME FROM DEMO-PERSON
    GIVING #RESPONSE
  DISPLAY #NAME
END-RESULT

...

END
```

143 COMMIT - SQL

- Function 936
- Example 936

```
COMMIT
```

Belongs to Function Group: ***Database Access and Update***

Function

The SQL `COMMIT` statement corresponds to the `END TRANSACTION` statement. It indicates the end of a logical transaction and releases all data locked during the transaction. All data modifications are committed and made permanent.

Important: As all cursors are closed when a logical unit of work ends, a `COMMIT` statement must not be placed within a database modification loop; instead, it has to be placed outside such a loop or after the outermost loop of nested loops.

Example

```
...
DELETE FROM SQL-PERSONNEL WHERE NAME = 'SMITH'
COMMIT
...
```

144 DELETE - SQL

- Function 938
- Syntax 1 - Searched DELETE 938
- Syntax 2 - Positioned DELETE 939

Belongs to Function Group: ***Database Access and Update***

Function

The SQL `DELETE` statement is used to delete either rows in a table without using a cursor (**"searched" `DELETE`**) or rows in a table to which a cursor is positioned (**"positioned" `DELETE`**).

Two different structures are possible.

Syntax 1 - Searched DELETE

The "searched" `DELETE` statement is a stand-alone statement not related to any `SELECT` statement. With a single statement you can delete zero, one, multiple or all rows of a table. The rows to be deleted are determined by a *`search-condition`* that is applied to the table. Optionally, the table name can be assigned a *`correlation-name`*.

Note: The number of rows that have actually been deleted with a "searched" `DELETE` can be ascertained by using the system variable `*ROWCOUNT`; see *System Variables* documentation.

Common Set Syntax:

```
DELETE FROM table-name [(correlation-name)] [WHERE search-condition]
```

Extended Set Syntax:

```
DELETE FROM table-name [(correlation-name)]
[         { RR }   ]
[  WITH   { RS }   ]      [QUERYNO integer]
[         { CS }   ]
[WHERE  search-condition]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td><code>FROM</code> table-name</td><td colspan="2">FROM Clause:

This clause specifies the table from which the rows are to be deleted.</td></tr>
<tr><td>correlation-name</td><td colspan="2">Correlation Name:
Optionally, the table name can be assigned a correlation-name.</td></tr>
<tr><td><code>WHERE</code> search-condition</td><td colspan="2">WHERE Clause:

This clause is used to specify the selection criteria for the rows to be deleted.

If no <code>WHERE</code> clause is specified, the entire table is deleted.</td></tr>
<tr><td rowspan="4"><code>WITH</code></td><td colspan="2">WITH Isolation Level Clause:

This clause belongs to the SQL Extended Set.

This clause enables the explicit specification of the isolation level used when locating the row to be deleted.

It is only valid against DB2 databases. When used against other databases, it will cause runtime errors.</td></tr>
<tr><td><code>CS</code></td><td>Cursor Stability</td></tr>
<tr><td><code>RR</code></td><td>Repeatable Read</td></tr>
<tr><td><code>RS</code></td><td>Read Stability</td></tr>
<tr><td><code>QUERYNO</code> integer</td><td colspan="2">QUERYNO Clause:

This clause belongs to the SQL Extended Set.

This clause is not currently supported and will be ignored.</td></tr>
</table>

Syntax 2 - Positioned DELETE

The “positioned” `DELETE` statement always refers to a cursor within a database loop. Therefore the table referenced by a positioned `DELETE` statement must be the same as the one referenced by the corresponding `SELECT` statement, otherwise an error message is returned. A positioned `DELETE` cannot be used with a non-cursor selection.

The functionality of the positioned `DELETE` statement corresponds to that of the **"normal" Natural `DELETE` statement**.

```
DELETE FROM table-name WHERE CURRENT OF CURSOR [(r)]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Syntax Element Description:

Syntax Element	Description
`FROM table-name WHERE CURRENT OF CURSOR`	**FROM Clause:** This clause specifies the table from which the rows are to be deleted.
`(r)`	**Statement Reference:** The `(r)` notation is used to reference the statement which was used to select the row to be deleted. If no statement reference is specified, the `DELETE` statement is related to the innermost active processing loop in which a database record was selected.
`FOR ROW ... OF ROWSET`	**FOR ROW ... OF ROWSET Clause:** This clause belongs to the **SQL Extended Set**. The optional `FOR ROW ... OF ROWSET` clause for positioned `SQL DELETE` statements specifies which row of the current rowset has to be deleted. It should only be specified if the `DELETE` statement is related to a `SELECT` statement which uses rowset positioning and which has column arrays in its `INTO` clause, see ***INTO Clause***. If this clause is omitted, all rows of the current rowset are deleted.

145 INSERT - SQL

- Function 942
- Syntax Description 942
- Example 948

Common Set Syntax:

```
INSERT INTO table-name { (*) [VALUES-clause]              }
                       { [(column-list)] VALUE-LIST       }
```

Extended Set Syntax:

```
INSERT INTO table-name { (*) [OVERRIDING USER VALUE]  [VALUES-clause]              }
                       { [(column-list)] [OVERRIDING USER VALUE] VALUE-LIST        }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Database Access and Update***

Function

The SQL `INSERT` statement is used to add one or more new rows to a table.

Syntax Description

Syntax Element	Description
`INTO` *`table-name`*	**INTO Clause:** In the `INTO` clause, the table is specified into which the new rows are to be inserted. See further information on *`table-name`*.
`column-list`	**Column List:** Syntax: *`column-name`*`...` In the *`column-list`*, one or more *`column-names`* can be specified, which are to be supplied with values in the row currently inserted. If a *`column-list`* is specified, the sequence of the columns must match with the sequence of the values either specified in the *`insert-item-list`* or contained in the specified view (see below). If the *`column-list`* is omitted, the values in the *`insert-item-list`* or in the specified view are inserted according to an implicit list of all the columns in the order they exist in the table.

Syntax Element	Description
VALUES-clause	**Values Clause:** With the VALUES clause, you insert a *single* row into the table. See ***VALUES Clause*** below.

insert-item-list	**INSERT Single Row:**
	
	In the *insert-item-list*, you can specify one or more values to be assigned to the columns specified in the *column-list*. The sequence of the specified values must match the sequence of the columns.
	
	If no *column-list* is specified, the values in the *insert-item-list* are inserted according to an implicit list of all the columns in the order they exist in the table.
	
	The values to be specified in the *insert-item-list* can be *constants*, *parameters*, *special-registers* or NULL.
	
	See the section *Basic Syntactical Items* for information on *view-name*, *constant* and *parameter*. See also the information on *special-register*.
	
	If the value NULL has been assigned, this means that the addressed field is to receive no value (not even the value 0 or "blank").
	
	Example - INSERT Single Row:
	
	`...`
	`INSERT INTO SQL-PERSONNEL (NAME,AGE)`
	`  VALUES ('ADKINSON',35)`
	`...`

OVERRIDING USER VALUE	**OVERRIDING USER VALUE Clause:** This clause belongs to the **SQL Extended Set**. This clause is not currently supported. When used, it will cause a compiler error.

VALUES Clause

With the VALUES clause, you insert a *single* row into the table. Depending on whether an asterisk (*) or a *column-list* has been specified, the VALUES clause can take one of the following forms:

VALUES Clause with Preceding Asterisk Notation

```
VALUES (VIEW view-name)
```

If asterisk notation is specified, a view *must* be specified in the VALUES clause. With the field values of this view, a new row is inserted into the specified table using the field names of the view as column names of the row.

VALUES Clause with Preceding Column List

```
VALUES ( { VIEW view-name      } )
         { insert-item-list    }
```

If a *column-list* is specified and a view is referenced in the VALUES Clause, the number of items specified in the column list must correspond to the number of fields defined in the view within the *VALUE-LIST*.

If no *column-list* is specified, the fields defined in the view are inserted according to an implicit list of all the columns in the order they exist in the specified table.

VALUE-LIST

Common Set Syntax:

```
{ VALUES { (VIEW view-name)      } [FOR-n-ROWS-clause] }
         { (insert-item-list)    }
```

Extended Set Syntax:

```
{ VALUES  { (VIEW view-name)     }        [FOR-n-ROWS-clause]                          }
{         { (insert-item-list)   }                                                     }
{                                                                                      }
{                                                            [      { RR } ]           }
{ [WITH_CTE common-table-expression,...] select-expression  [ WITH { RS } ] [QUERYNO  }
{                                                            [      { CS } ] integer] }
```

Syntax Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>VIEW view-name</td><td>View Name:
With the field values of this view, a new row is inserted into the specified table using the field names of the view as column names of the row.</td></tr>
<tr><td>insert-item-list</td><td>INSERT Single Row:

In the insert-item-list, you can specify one or more values to be assigned to the columns specified in the column-list. The sequence of the specified values must match the sequence of the columns.

If no column-list is specified, the values in the insert-item-list are inserted according to an implicit list of all the columns in the order they exist in the table.

The values to be specified in the insert-item-list can be constants, parameters, special-registers or NULL.

See the section Basic Syntactical Items for information on view-name, constant and parameter. See also the information on special-register.

If the value NULL has been assigned, this means that the addressed field is to receive no value (not even the value 0 or blank).

Example - INSERT Single Row:

<pre>...
INSERT INTO SQL-PERSONNEL (NAME,AGE)
VALUES ('ADKINSON',35)
...</pre></td></tr>
<tr><td>FOR-n-ROWS-clause</td><td>FOR n Rows Clause:

Optional clause, see FOR-n-ROWS-Clause below.</td></tr>
<tr><td>WITH_CTE
common-table-expression</td><td>WITH_CTE Clause:

This clause belongs to the SQL Extended Set.

This optional clause permits defining a result table which can be referenced in any FROM clause of the SELECT statement that follows. Multiple common-table-expressions can be specified following the single WITH_CTE keyword. Each common-table-expression can also be referenced in the FROM clause of subsequent common-table-expression.

For more information, see WITH CTE common-table-expression,... in the section SELECT - Cursor-Oriented.</td></tr>
<tr><td>select-expression</td><td>INSERT Multiple Rows:</td></tr>
</table>

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td></td><td>This clause belongs to the SQL Extended Set.

With a <code>select-expression</code>, you insert <code>multiple</code> rows into a table. The <code>select-expression</code> is evaluated and each row of the result table is treated as if the values in this row were specified as values in a VALUES Clause of a single-row <code>INSERT</code> operation.

For further information, see Select Expressions.

Example - Insert Multiple Rows:

<pre>...
INSERT INTO SQL-RETIREE (NAME,AGE,SEX)
  SELECT LASTNAME, AGE, SEX
  FROM SQL-EMPLOYEES
  WHERE AGE > 60
...</pre>
Note: The number of rows that have actually been inserted can be ascertained by using the system variable <code>*ROWCOUNT</code>.</td></tr>
<tr><td><code>WITH RR/RS/CS</code></td><td>WITH Isolation Level Clause:

This clause belongs to the SQL Extended Set.

This clause allows the explicit specification of the isolation level used when locating the rows to be inserted. It is only valid against DB2 databases. When used against other databases, it will cause runtime errors.
<table><tr><td><code>CS</code></td><td>Cursor Stability</td></tr><tr><td><code>RR</code></td><td>Repeatable Read</td></tr><tr><td><code>RS</code></td><td>Read Stability</td></tr></table></td></tr>
<tr><td><code>QUERYNO_integer</code></td><td>QUERYNO Clause:

This clause belongs to the SQL Extended Set.

This clause is not currently supported and will be ignored.</td></tr>
</table>

FOR-*n*-ROWS-Clause

```
FOR { [:]_host-variable } ROWS [ { ATOMIC                            } ]
    { integer           }        { NOT ATOMIC CONTINUE ON SQLEXCEPTION }
```

This clause is composed of the following subclauses:

FOR [:] *hostvariable/integer* ROWS Clause

```
FOR { [:]_host-variable } ROWS
    { integer           }
```

The specification of this clause is optional. It should only be specified, if

- compiler option DB2ARRY is specifed
- and multiple rows are to be inserted from arrays specified in the *insert-item-list* of the ***VALUES Clause***.

If specified, [:]_*hostvariable/integer* determines the number of rows to be inserted into the DB2 table from the arrays specified in the *insert-item-list* of the *VALUES Clause* starting with the first occurrence.

The purpose of this clause is to improve the performance of programs inserting rows from Natural arrays in a loop. By using this clause, the rows contained in the arrays can be inserted by one SQL statement.

See example below.

ATOMIC Clause

```
{ ATOMIC                             }
{ NOT ATOMIC CONTINUE ON SQLEXCEPTION }
```

This clause specifies whether the insertion of multiple rows should be treated by DB2 as an atomic operation or not.

It should only be specified, if

- compiler option DB2ARRY is specifed
- and multiple rows are to be inserted from arrays specified in the *insert-item-list* of the ***VALUES Clause***.

Syntax Description:

Syntax Element	Description
ATOMIC	Specifies that in case of any error no row is inserted into the target table. This is the default value.
NOT ATOMIC CONTINUE ON SQLEXCEPTION	Specifies that in case of errors all rows for which no error occurred are inserted while those rows for which errors occurred are discarded by DB2.

See the *DB2 SQL REFERENCE* for sqlcodes returned in such cases.

Example

```
DEFINE DATA LOCAL
01 NAME        (A20/1:10)  INIT <'ZILLER1','ZILLER2','ZILLER3','ZILLER4'
                                 ,'ZILLER5','ZILLER6','ZILLER7','ZILLER8'
                                 ,'ZILLER9','ZILLERA'>
01 ADDRESS     (A100/1:10) INIT <'ANGEL STREET 1','ANGEL STREET 2'
                                 ,'ANGEL STREET 3','ANGEL STREET 4'
                                 ,'ANGEL STREET 5','ANGEL STREET 6'
                                 ,'ANGEL STREET 7','ANGEL STREET 8'

        :SALARY(01:10)             /* <-- ARRAY NATURAL PACKED
       )
       FOR :ROWCOUNT ROWS
SELECT * INTO VIEW V1 FROM NAT-DEMO_ID WHERE NAME > 'Z'
DISPLAY V1                         /* <-- VERIFY INSERT
END-SELECT
END
```

146 PROCESS SQL

- Function 950
- Syntax Description 950
- Entire Access Options 951
- Examples 951

PROCESS SQL *ddm-name* <<*statement-string*>>

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Database Access and Update***

Function

The PROCESS SQL statement is used to issue SQL statements to the underlying database.

Syntax Description

Syntax Element	Description
ddm-name	The name of a DDM must be specified to provide the "address" of the database which executes the stored procedure. For more information see *ddm-name*.
statement-string	The statements which can be specified in the *statement-string* are the same statements which can be issued with the SQL statement EXECUTE (see also ***Flexible SQL***). **Caution:** To avoid transaction synchronization problems between the Natural environment and the underlying database, the COMMIT and ROLLBACK statements must not be used within PROCESS SQL. The statement string can cover several statement lines without any continuation character to be specified. Comments at the end of a line as well as entire comment lines are possible. The statement string can also include parameters; see ***Parameters*** below.

Parameters

[:U / :G] :*host-variable* [INDICATOR:*host-variable*] [LINIDICATOR:*host-variable*]

Unlike with the *parameter* described, in this context *host-variables* must be prefixed by a colon (:). In addition, they can be preceded by a further qualifier (:U or :G).

See further details on *host-variable*.

Syntax Element Description:

Syntax Element	Description
`:U:host-variable`	The prefix `:U` qualifies the host variable as a so-called “Using” variable. Such a variable indicates that its value is to be *passed to* the database. `:U` is the default specification.
`:G:host-variable`	The prefix `:G` qualifies the host variable as a so-called “Giving” variable. Such a variable indicates that it is to *receive* a value *from* the database.

Entire Access Options

With Entire Access, you can also specify the following as *statement-string*:

- SET SQLOPTION *option* = *value*
- SQLCONNECT *option* = *value*
- SQLDISCONNECT

These options are only possible with Entire Access, and are described in the section *Accessing Data in an SQL Database* (in the *Programming Guide*).

Examples

Example for Adabas D:

```
PROCESS SQL ADABAS_D_DDM << LOCK TABLE EMPLOYEES IN SHARE MODE >>
```

Example of Calling a Procedure Stored in Adabas D:

The called procedure computes the sum of two numbers.

```
...
COMPUTE #N1 = 1
COMPUTE #N2 = 2
COMPUTE #SUM = 0
...
PROCESS SQL ADABAS_D_DDM << DBPROCEDURE DEMO.SUM (:#N1, :#N2, :G:#SUM) >>
...
WRITE #N1 '+' #N2 ' =' #SUM
...
```

147 READ RESULT SET - SQL

- Function 954
- Syntax Description 954
- Example 955

Common Set Syntax:

```
READ [(limit)] RESULT SET result-set INTO { VIEW view-name } FROM ddm-name
                                          { parameter      }
 [GIVING [:] sql-code]
END-RESULT
```

Extended Set Syntax:

```
READ [(limit)] RESULT SET result-set { VIEW view-name }  FROM ddm-name
INTO                                 { parameter      }
  [WITH INSENSITIVE SCROLL [:] scroll-hv]
 [GIVING [:] sql-code]
                                       integer
END-RESULT
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Database Access and Update***

Function

The SQL statement `READ RESULT SET` can only be used in conjunction with a `CALLDBPROC` statement. It is used to read a result set which was created by a stored procedure that was invoked by a previous `CALLDBPROC` statement.

Syntax Description

Syntax Element	Description
limit	**Limit Option:** You can limit the number of rows to be read. You can specify the limit either as a numeric constant (`0 - 4294967295`) or as a variable of format N, P or I.
result-set	**Result Set:** As result-set you specify a result-set locator variable filled by a preceding `CALLDBPROC` statement. Result-set has to be a variable of format/length I4.

Syntax Element	Description
	Note: If a syncpoint operation takes place between the CALLDBPROC statement and the READ RESULT SET statement, the result sets can no longer be accessed by the READ RESULT SET statement.
FROM *ddm-name*	**DDM Name:** As *ddm-name* you specify the name of the DDM which is used to "address" the database executing the stored procedure. For further information, see *ddm-name*.
WITH INSENSITIVE SCROLL [:] *scroll_hv*	**WITH INSENSITIVE SCROLL Clause:** This clause belongs to the **SQL Extended Set**. This clause is not currently supported. When used, it will cause a compiler error.
GIVING *sqlcode*	**GIVING *sqlcode* Clause:** This clause may be used to obtain the SQL code of the SQL "fetch" operation used to process the result set. If this clause is specified and the SQL code of the SQL operation is not 0, no Natural error message will be issued. In this case, the action to be taken in reaction to the SQL code value has to be coded in the invoking Natural object. The *sqlcode* field has to be a variable of format/length I4. If the GIVING *sqlcode* clause is omitted, a Natural error message will be issued if the SQL code is not 0.
END-RESULT	**End of READ RESULT SET Statement:** The Natural reserved keyword END-RESULT must be used to end the READ RESULT SET statement.

Example

See the **example** in the CALLDBPROC statement.

148 ROLLBACK - SQL

- Function 958
- Consideration for Non-Natural Programs 958
- Example 958

```
ROLLBACK
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Database Access and Update***

Function

The SQL statement `ROLLBACK` corresponds to the Natural statement `BACKOUT TRANSACTION`. It undoes all database modifications made since the beginning of the last recovery unit. A recovery unit may start either after the beginning of a session or after the last `SYNCPOINT`, `COMMIT`, `END TRANSACTION` or `BACKOUT TRANSACTION` statement. This statement also releases all records held during the transaction.

If a program tries to backout updates which have already been committed by a terminal I/O, a corresponding Natural error message (NAT3711) is returned.

Caution: As all cursors are closed when a logical unit of work ends, a `ROLLBACK` statement must not be placed within a database modification loop; instead, it has to be placed outside such a loop or after the outermost loop of nested loops.

Consideration for Non-Natural Programs

If an external program written in another standard programming language is called from a Natural program, this external program should not contain its own `ROLLBACK` statement if the Natural program issues database calls, too. The calling Natural program should issue the `ROLLBACK` statement on behalf of the external program.

Example

```
...
DELETE FROM SQL-PERSONNEL WHERE NAME = 'SMITH'
ROLLBACK
...
```

149 SELECT - SQL

- Function 960
- Syntax 1 - Cursor-Oriented Selection 960
- Syntax 2 - Non-Cursor Selection 970
- Join Queries 979

Belongs to Function Group: *Database Access and Update*

Function

The SELECT statement supports both the **cursor-oriented selection** that is used to retrieve an arbitrary number of rows and the **non-cursor selection** (singleton SELECT) that retrieves at most one single row. With the SELECT ... END-SELECT construction, Natural uses the same database loop processing as with the FIND statement.

Two different structures are possible.

Syntax 1 - Cursor-Oriented Selection

Like the Natural FIND statement, the cursor-oriented SELECT statement is used to select a set of rows (records) from one or more DB2 tables, based on a search criterion. Since a database loop is initiated, the loop must be closed by a LOOP (reporting mode) or END-SELECT statement. With this construction, Natural uses the same loop processing as with the FIND statement.

In addition, no cursor management is required from the application program; it is automatically handled by Natural.

Common Set Syntax:

```
                               { parameter,...                  }
SELECT  selection INTO         { VIEW {view-name                }      table-expression
                               { [correlation-name]},...        }

[        {  UNION      }
[        {  EXCEPT     }  [ALL] [(]SELECT  selection  table-expression[)]                ]
[        {  INTERSECT  }                                                                  ]

                               { integer           }
ORDER BY                       { column-reference  }     [                 ASC  ]
                               { expression        }     [                 DESC ]

statement ...

         END-SELECT
{        (structured mode only)          }
         LOOP     (reporting mode only)
```

Extended Set Syntax:

```
[WITH_CTE common-table-expression,...]
SELECT selection INTO { parameter,...
                        VIEW {view-name [correlation-name]},... }
[ { UNION | EXCEPT | INTERSECT } [DISTINCT | ALL] [(]SELECT selection table-expression[)] ]
ORDER BY Clause
[OPTIMIZE FOR integer ROWS]
[ WITH { CS | RR | UR | RS | RS KEEP UPDATE LOCKS | RR KEEP UPDATE LOCKS } ]
QUERYNO integer
[ FETCH FIRST [ { 1 | integer } ] { ROW | ROWS } ONLY ]
[WITH HOLD]
[WITH RETURN]
[ WITH { ASENSITIVE SCROLL | INSENSITIVE SCROLL | SENSITIVE STATIC SCROLL | SENSITIVE DYNAMIC SCROLL } [:]scroll_hv [GIVING [:] sqlcode] ]
[ WITH ROWSET POSITIONING FOR { [:] row_hv | integer } ROWS [ ROWS_RETURNED [:] ret_row ] ]
[IF-NO-RECORDS-FOUND-clause]
statement ...
{ END-SELECT (structured mode only)
  LOOP (reporting mode only) }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Syntax Element Description - Syntax 1:

Similar to the `FIND` statement, a cursor-oriented selection is used to select a set of rows (records) from one or more database tables, based on a search criterion. In addition, no cursor management is required from the application program; it is automatically handled by Natural.

Syntax Element	Description
`INTO`	**INTO Clause:** The `INTO` clause is used to specify the target fields in the program which are to be filled with the result of the selection. For further information and examples, see ***INTO Clause*** below.
`VIEW`	**VIEW Clause:** If one or more views are referenced in the `INTO` clause, the number of items specified in the *`selection`* must correspond to the number of fields defined in the view(s) (not counting group fields, redefining fields and indicator fields). For further information and examples, see ***VIEW Clause*** below.
`table-expression`	**Table Expression:** A *`table-expression`* consists of a `FROM` clause and an optional `WHERE` clause. For further information and examples, see *`table-expression`* below.
`UNION`	**Query Involving UNION Clause:** `UNION` unites the results of two or more select expressions. For further information and an example, see ***Query Involving UNION*** below.
`ALL`	**Including Redundant Rows:** Specifies the result set contains redundant (duplicate) rows.
`ORDER BY`	**ORDER BY Clause:** The `ORDER BY` clause arranges the result of a `SELECT` statement in a particular sequence. For further information and examples; see ***ORDER BY Clause*** below.
`IF NO RECORDS FOUND`	**IF NO RECORDS FOUND Clause:** The `IF NO RECORDS FOUND` clause is used to initiate a processing loop if no records meet the selection criteria specified in the preceding `SELECT` statement. For further information, see ***IF NO RECORDS FOUND Clause*** below.
`END-SELECT`	The Natural reserved keyword `END-SELECT` must be used to end the `SELECT` statement.

The following syntax elements belong to the **SQL Extended Set**:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>WITH_CTE
common-table-expression,...</td><td>WITH_CTE Clause:

This optional clause allows you to define a result table which can be referenced in any FROM clause of the SELECT that follows. Multiple common-table-expressions can be specified following the single WITH_CTE keyword. Each common-table-expression can also be referenced in the FROM clause of a subsequent common-table-expression.

For further information, see WITH CTE common-table-expression,... below.</td></tr>
<tr><td>OPTIMIZE FOR</td><td>OPTIMIZE FOR Clause:

This clause is only valid against DB2 databases. When used against other databases, it will cause runtime errors.</td></tr>
<tr><td>WITH CS/RS/UR/...</td><td>WITH CS/RS/UR/... Clause:

This clause is only valid against DB2 databases. When used against other databases, it will cause runtime errors.<table><tr><td>CS</td><td>Cursor Stability</td></tr><tr><td>RR</td><td>Repeatable Read</td></tr><tr><td>RS</td><td>Read Stability</td></tr></table></td></tr>
<tr><td>QUERYNO</td><td>QUERYNO Clause:

The QUERYNO clause specifies the number to be used for this SQL statement in EXPLAIN output and trace records.</td></tr>
<tr><td>FETCH FIRST</td><td>FETCH FIRST Clause:

This clause is only valid against DB2 databases. When used against other databases, it will cause runtime errors.</td></tr>
<tr><td>WITH HOLD</td><td>WITH HOLD Clause:

This clause is not currently supported. When used, it will cause a compiler error.</td></tr>
<tr><td>WITH RETURN</td><td>WITH RETURN Clause:

This clause is not currently supported. When used, it will cause a compiler error.</td></tr>
<tr><td>WITH ... SCROLL</td><td>WITH ... SCROLL Clause:

RDBMS scrollable cursors are enabled with this clause. Scrollable cursors can be ASENSITIVE, INSENSITIVE, SENSITIVE STATIC or SENSITIVE DYNAMIC.</td></tr>
</table>

Syntax Element	Description
	Note: Not all SQL database systems support all options. - WITH ASENSITIVE SCROLL specifies that the cursor is either INSENSITIVE or SENSITIVE DYNAMIC. This is determined by the database at open time of the cursor, depending on the read-only property of the cursor: If the cursor is read-only, the cursor will become INSENSITIVE. If the cursor is not read-only, the cursor will become SENSITIVE DYNAMIC. This is supported for DB2 databases. - WITH INSENSITIVE SCROLL specifies that the cursor is insensitive for updates, deletes and inserts executed against the base table, after the cursor has been updated. Positioned updates and deletes are not allowed against INSENSITIVE SCROLL cursors. This is supported for Oracle, Adabas D, Informix, MS SQL Server ODBC and DB2 databases. - WITH SENSITIVE STATIC specifies that the cursor is sensitive for updates and deletes against the base table, but not against inserts, after the cursor has been opened. Positioned updates and deletes are allowed against SENSITIVE STATIC SCROLL cursors. This is supported for Adabas D, MS SQL Server ODBC and DB2 databases. - WITH SENSITIVE DYNAMIC specifies that the cursor is sensitive for updates, deletes and inserts against the base table, after the cursor has been opened. Positioned updates and deletes are allowed against SENSITIVE DYNAMIC SCROLL cursors. This is supported for Adabas D, MS SQL Server ODBC and DB2 databases. Scrollable cursors allow the application to position any row in the cursor at any time as long as the cursor is open. Scrollable cursors are not supported for Sybase databases at all. Scrollable cursors are not supported for the MS SQL Server DBLIB interface, but only for the MS SQL Server ODBC interface. The positioning is performed depending on the content of the *scroll_hv*. The content is evaluated each time a FETCH against the database is executed.
WITH ROWSET POSITIONING FOR … ROWS	**WITH ROWSET POSITIONING FOR … ROWS Clause:** This clause enables DB2 rowset processing, which corresponds to Natural native DML multifetch processing. [:] *row_hv* (I4) or *integer* determines the maximal number of rows returned from DB2 to Natural. The number determines either the size of the Natural multifetch buffer used for standard multiple row processing or the maximal number of rows returned from DB2 into the Natural program for advanced multiple row processing.
ROWS_RETURNED [:] *ret_row*	**ROWS_RETURNED [:] *ret_row* Clause:**

Syntax Element	Description
	This clause specifies an I4 variable which will receive the number of rows returned by DB2 on behalf of the last executed DB2 fetch operation for advanced multiple row processing.

WITH_CTE common-table-expression,...

This clause permits to define result tables that can be referenced in any `FROM` clause of the `SELECT` statement that follows.

The Natural specific keyword `WITH_CTE` corresponds to the SQL keyword `WITH`. `WITH_CTE` will be translated into the SQL keyword `WITH` by the Natural compiler.

Each common-table-expression has to obey the following syntax:

```
[common-table-expression-name [(column-name,...)] AS (fullselect) ]
```

Syntax Element Description:

Syntax Element	Description
common-table-expression-name	Has to be an unqualified SQL identifier and must be different from any other common-table-expression-name specified in the same statement. Each *common-table-expression-name* can be specified in the `FROM` clause of any *common-table-expression-name* following or in the `FROM` clause of the `SELECT` statement following.
column-name	Has to be an unqualified SQL identifier and must be unique within one *common-table-expression-name*.
AS (*fullselect*)	The number of *column-names* must match the number of columns of the *fullselect*.

A common-table-expression can be used

- in place of a view to avoid creating the view;
- when the same result table needs to be shared in a *fullselect*;
- when the result needs to be derived using recursion.

Queries using recursion are useful in applications such as bill of material.

Example:

```
WITH_CTE
 RPL (PART,SUBPART,QUANTITY) AS
 (SELECT ROOT.PART,ROOT.SUBPART,ROOT.QUANTITY
    FROM HGK-PARTLIST ROOT
   WHERE ROOT.PART ='01'
  UNION ALL
  SELECT CHILD.PART,CHILD.SUBPART,CHILD.QUANTITY
    FROM  RPL PARENT, HGK-PARTLIST CHILD
    WHERE PARENT.SUBPART = CHILD.PART
  )
SELECT DISTINCT PART,SUBPART,QUANTITY
  INTO VIEW V1
  FROM RPL
  ORDER BY PART,SUBPART,QUANTITY
END-SELECT
```

OPTIMIZE FOR integer ROWS

```
[OPTIMIZE FOR integer ROWS]
```

The `OPTIMIZE FOR integer ROWS` clause is used to inform DB2 in advance of the number (*integer*) of rows to be retrieved from the result table. Without this clause, DB2 assumes that all rows of the result table are to be retrieved and optimizes accordingly.

This optional clause is useful if you know how many rows are likely to be selected, because optimizing for *integer* rows can improve performance if the number of rows actually selected does not exceed the *integer* value (which can be in the range from `0` to `2147483647`).

Example:

```
SELECT name INTO
#name FROM table WHERE AGE = 2 OPTIMIZE FOR 100 ROWS
```

WITH - Isolation Level

```
[      { CS                   } ]
[      { RR                   } ]
[      { RR KEEP UPDATE LOCK  } ]
[ WITH { RS                   } ]
[      { RS KEEP UPDATE LOCKS } ]
[      { UR                   } ]
```

This WITH clause allows you to specify an explicit isolation level with which the statement is to be executed. The following options are provided:

Option	Meaning
CS	Cursor Stability
RR	Repeatable Read
RS	Read Stability
RS KEEP UPDATE LOCKS	Only valid if a FOR UPDATE OF clause is specified. Read Stability and retaining update locks.
RR KEEP UPDATE LOCKS	Only valid if a FOR UPDATE OF clause is specified. Repeatable Read and retaining update locks.
UR	Uncommitted Read

WITH UR can only be specified within a SELECT statement and when the table is read-only. The default isolation level is determined by the isolation of the package or plan into which the statement is bound. The default isolation level also depends on whether the result table is read-only or not. To find out the default isolation level, refer to the IBM literature.

Note: This option also works for non-cursor selection.

FETCH FIRST

```
[ FETCH FIRST { 1       } { ROWS } ONLY ]
              { integer } { ROW  }
```

The FETCH FIRST clause limits the number of rows to be fetched. It improves the performance of queries with potentially large result sets if only a limited number of rows is needed.

WITH INSENSITIVE/SENSITIVE

```
[        ASENSITIVE SCROLL                                               ]
[ WITH { INSENSITIVE SCROLL        } [:] scroll_hv  [GIVING  [:] sqlcode] ]
[      { SENSITIVE STATIC SCROLL   }                                     ]
[        SENSITIVE DYNAMIC SCROLL                                        ]
```

Natural supports SQL scrollable cursors by using the clauses WITH ASENSITIVE SCROLL, WITH SENSITIVE STATIC SCROLL and SENSITVE DYNAMIC SCROLL. Scrollable cursors allow Natural applications to position randomly any row in a result set. With non-scrollable cursors, the data can only be read sequentially, from top to bottom.

ASENSITIVE scrollable cursors are either INSENSITIVE - if the cursor is READ-ONLY - or SENSITIVE DYNAMIC - if the cursor is not READ-ONLY.

INSENSITIVE and SENSITIVE STATIC scrollable cursors use temporary result tables and require a TEMP database in DB2 (see the relevant DB2 literature by IBM).

INSENSITIVE SCROLL refers to a cursor that cannot be used in Positioned UPDATE or Positioned DELETE operations. In addition, once opened, an INSENSITIVE SCROLL cursor does not reflect UPDATE, DELETE or INSERT operations against the base table, after the cursor was opened.

SENSITIVE STATIC SCROLL refers to a cursor that can be used for Positioned UPDATEs or Positioned DELETE operations. In addition, a SENSITIVE STATIC SCROLL cursor reflects UPDATEs, DELETEs of base table rows. The cursor does not reflect INSERT operations.

SENSITIVE DYNAMIC scrollable cursors reflect UPDATEs, DELETEs and INSERTs against the base table while the cursor is open.

Below is information on:

- scroll_hv
- scroll_hv - Options
- GIVING [:] sqlcode

scroll_hv

The variable *scroll_hv* must be alphanumeric.

The variable *scroll_hv* specifies which row of the result table will be fetched during one execution of the database processing loop. The contents of *scroll_hv* is evaluated each time the database processing loop cycle is executed.

```
[ { INSENSITIVE } ]   { CURRENT                                        }
[ { SENSITVE    } ]   { FIRST                                          }
                      { LAST                                           }
                      { PRIOR                                          }
                      { NEXT | N                                       }
                      {                                                }
                      { { ABSOLUTE }  [+ | - ] integer                 }
                      { { RELATIVE }                                   }
```

scroll_hv - Options

Option	Explanation
CURRENT	Fetches the current row (again).
FIRST	Fetches the first row.
LAST	Fetches the last row.
NEXT	Fetches the row after the current one. This is the default value.
PRIOR	Fetch the row before the current one.
+/- *integer*	Only applies in connection with ABSOLUTE or RELATIVE. Specifies the position of the row to be fetched ABSOLUTE or RELATIVE. Enter a plus (+) or minus (-) sign followed by an integer. The default value is a plus (+).
ABSOLUTE	Only applies in connection with +/- *integer*. Uses *integer* as the absolute position within the result set from where the row is fetched.
RELATIVE	Only applies in connection with +/- *integer*. Uses *integer* as the relative position to the current position within the result set from where the row is fetched.

There are some restrictions for special RDBMS systems:

- DB2 does not support the keyword CURRENT.
- In a SELECT FOR UPDATE loop DB2 only supports NEXT as scrolling option.
- MS SQL Server (ODBC interface) does not support the keyword CURRENT.
- Adabas D does not support RELATIVE scrolling.

GIVING [:] sqlcode

The specification of GIVING [:] *sqlcode* is optional. If specified, the Natural variable [:] *sqlcode* must be of the Format I4. The values for this variable are returned from the DB2 SQLCODE of the underlying FETCH operation. This allows the application to react to different statuses encountered while the scrollable cursor is open. The most important status codes indicated by SQLCODE are listed in the following table:

SQLCODE	Explanation
0	FETCH operation successful, data returned except for FETCH with option BEFORE or AFTER.
+100	Row not found, cursor still open, no data returned.
-1	General error while trying to FETCH a row

If you specify GIVING [:] *sqlcode*, the application must react to the different statuses. If an SQLCODE +100 is entered five times successively and without terminal I/O, the Natural for DB2 runtime will issue Natural error NAT3296 in order to avoid application looping. The application can terminate the processing loop by executing an ESCAPE statement.

If you do not specify GIVING [:] *sqlcode*, except for SQLCODE 0 and SQLCODE +100, each SQLCODE will generate Natural error NAT3700 and the processing loop will be terminated. SQLCODE +100 (row not found) will terminate the processing loop.

See also the example program DEM2SCRL supplied in the Natural system library SYSDB2.

Syntax 2 - Non-Cursor Selection

Common Set Syntax:

```
SELECT SINGLE

   selection INTO   { parameter ,...                              }  table-expression
                    { VIEW {view-name [correlation-name]}, ...    }

   [IF-NO-RECORDS-FOUND-clause]
   statement...
{  END-SELECT (structured mode only)  }
{  LOOP (reporting mode only)         }
```

Extended Set Syntax:

```
SELECT SINGLE

   selection INTO   { parameter ,...                              }  table-expression
                    { VIEW {view-name [correlation-name]}, ...    }

   [   WITH { CS }   ]
   [        { RR }   ]
   [        { UR }   ]
```

```
   [IF-NO-RECORDS-FOUND-clause]
   statement...
 { END-SELECT (structured mode only)  }
 { LOOP (reporting mode only)         }
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Syntax Element Description - Syntax 2:

The SELECT SINGLE statement supports the functionality of a non-cursor selection (singleton SELECT); that is, a select expression that retrieves at most one row without using a cursor. It cannot be referenced by a **positioned** UPDATE or a **positioned** DELETE statement.

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td>INTO</td><td colspan="2">INTO Clause:

The INTO clause is used to specify the target fields in the program which are to be filled with the result of the selection.

For further information and examples, see INTO Clause below.</td></tr>
<tr><td>VIEW</td><td colspan="2">VIEW Clause:

If one or more views are referenced in the INTO clause, the number of items specified in the selection must correspond to the number of fields defined in the view(s) (not counting group fields, redefining fields and indicator fields).

For further information and examples, see VIEW Clause below.</td></tr>
<tr><td>table-expression</td><td colspan="2">Table Expression:

The table-expression consists of a FROM clause and optionally of a WHERE clause, a GROUP BY clause and a HAVING clause. For further information, see selection and table-expression.

See also see Examples of table-expression below.</td></tr>
<tr><td rowspan="4">WITH CS/RR/UR</td><td colspan="2">WITH CS/RR/UR Clause:

This clause is only valid against DB2 databases. When used against other databases, it will cause runtime errors.</td></tr>
<tr><td>CS</td><td>Cursor Stability</td></tr>
<tr><td>RR</td><td>Repeatable Read</td></tr>
<tr><td>RS</td><td>Read Stability</td></tr>
<tr><td>IF NO RECORDS FOUND</td><td colspan="2">IF NO RECORDS FOUND Clause:

This clause is used to initiate a processing loop if no records meet the selection criteria specified in the preceding SELECT statement.

For further information, see IF NO RECORDS FOUND Clause below.</td></tr>
</table>

Syntax Element	Description
END-SELECT	**End of SELECT Statement:** The Natural reserved keyword END-SELECT must be used to end the SELECT statement.

INTO Clause

```
INTO { parameter ,...
       VIEW {view-name [correlation-name]},... }
```

The INTO clause is used to specify the target fields in the program which are to be filled with the result of the selection. The INTO clause can specify either single *parameters* or one or more views as defined in the DEFINE DATA statement.

All target field values can come either from a single table or from more than one table as a result of a join operation (see also the section ***Join Queries***).

Note: In standard SQL syntax, an INTO clause is only used in non-cursor select operations (singleton SELECT) and can be specified only if a single row is to be selected. In Natural, however, the INTO clause is used for both cursor-oriented and non-cursor select operations.

The *selection* can also merely consist of an asterisk (*). In a standard select expression, this is a shorthand for a list of all column names in the table(s) specified in the FROM clause. In the Natural SELECT statement, however, the same syntactical item SELECT * has a different semantic meaning: all the items listed in the INTO clause are also used in the selection. Their names must correspond to names of existing database columns.

Examples:

Example 1:

```
DEFINE DATA LOCAL
01 PERS VIEW OF SQL-PERSONNEL
  02 NAME
  02 AGE
END-DEFINE
...
SELECT *
  INTO NAME, AGE
```

Example 2:

```
...
SELECT *
  INTO VIEW PERS
```

These examples are equivalent to the following ones:

Example 3:

```
...
SELECT NAME, AGE
  INTO NAME, AGE
```

Example 4:

```
...
SELECT NAME, AGE
  INTO VIEW PERS
```

VIEW Clause

```
VIEW {view-name [correlation-name]}, ...
```

If one or more views are referenced in the `INTO` clause, the number of items specified in the *selection* must correspond to the number of fields defined in the view(s) (not counting group fields, redefining fields and indicator fields).

Note: Both the Natural target fields and the table columns must be defined in a Natural DDM. Their names, however, can be different, since assignment is made according to their sequence.

Example of `INTO` Clause with View:

```
DEFINE DATA LOCAL
01 PERS VIEW OF SQL-PERSONNEL
  02 NAME
  02 AGE
END-DEFINE
...
SELECT FIRSTNAME, AGE
  INTO VIEW PERS
  FROM SQL-PERSONNEL
...
```

The target fields NAME and AGE, which are part of a Natural view, receive the contents of the table columns FIRSTNAME and AGE.

Syntax Element Description:

<table>
<tr><th>Syntax Element</th><th>Description</th></tr>
<tr><td>parameter</td><td>If single parameters are specified as target fields, their number and formats must correspond to the number and formats of the columns and/or scalar-expressions specified in the corresponding selection as described above (for details, see Scalar Expressions).

Example:

<pre>DEFINE DATA LOCAL
01 #NAME   (A20)
01 #AGE   (I2)
END-DEFINE
...
SELECT NAME, AGE
  INTO #NAME, #AGE
  FROM SQL-PERSONNEL
...</pre>
The target fields #NAME and #AGE, which are Natural program variables, receive the contents of the table columns NAME and AGE.</td></tr>
<tr><td>correlation-name</td><td>If the VIEW clause is used within a SELECT * construction where multiple tables are to be joined, correlation-names are required if the specified view contains fields that reference columns which exist in more than one of these tables. In order to know which column to select, all these columns are qualified by the specified correlation-name at generation of the selection list. The correlation-name assigned to a view must correspond to one of the correlation-names used to qualify the tables to be joined. See also the section Join Queries.

Example:

<pre>DEFINE DATA LOCAL
01 PERS VIEW OF SQL-PERSONNEL
  02 NAME
  02 FIRST-NAME
  02 AGE
END-DEFINE
...
SELECT *
  INTO VIEW PERS A
  FROM SQL-PERSONNEL A, SQL-PERSONNEL B
...</pre></td></tr>
</table>

Examples of table-expression

Example 1:

```
DEFINE DATA LOCAL
01 #NAME      (A20)
01 #FIRSTNAME (A15)
01 #AGE       (I2)
...
END-DEFINE
...
SELECT NAME, FIRSTNAME, AGE
  INTO #NAME, #FIRSTNAME, #AGE
  FROM SQL-PERSONNEL
    WHERE NAME IS NOT NULL
      AND AGE > 20
...
  DISPLAY #NAME #FIRSTNAME #AGE
END-SELECT
...
END
```

Example 2:

```
DEFINE DATA LOCAL
01 #COUNT    (I4)
...
END-DEFINE
...
SELECT SINGLE COUNT(*) INTO #COUNT FROM SQL-PERSONNEL
...
```

Query Involving UNION

Note: In the following, the term “SELECT statement” is used as a synonym for the whole query-expression consisting of multiple select expressions concatenated with a Set operation (`UNION`, `EXCEPT`, `INTERSECT`).

`UNION` unites the results of two or more select-expressions. The columns specified in the individual select-expressions must be UNION-compatible; that is, matching in number, type and format.

Redundant duplicate rows are always eliminated from the result of a Set operation unless the Set operation explicitly includes the `ALL` qualifier.

Example:

```
DEFINE DATA LOCAL
01 PERS VIEW OF SQL-PERSONNEL
  02 NAME
  02 AGE
  02 ADDRESS (1:6)
END-DEFINE
...
SELECT NAME, AGE, ADDRESS
  INTO VIEW PERS
  FROM SQL-PERSONNEL
  WHERE AGE > 55
UNION ALL
SELECT NAME, AGE, ADDRESS
  FROM SQL-EMPLOYEES
  WHERE PERSNR < 100
ORDER BY NAME
...
END-SELECT
...
```

In general, any number of `select-expressions` can be concatenated with `UNION`.

The `INTO` clause must be specified with the first `select-expression` only.

ORDER BY Clause

```
ORDER BY {{ integer          }[ ASC  ]}
         {{ column-reference }[ DESC ]}
```

The `ORDER BY` clause arranges the result of a `SELECT` statement in a particular sequence.

Each `ORDER BY` clause must specify a column of the result table. In most `ORDER BY` clauses a column can be identified either by column-reference (that is, by an optionally qualified column name) or by column number. In a query involving `UNION`, a column must be identified by column number. The column number is the ordinal left-to-right position of a column within the selection, which means it is an integer value. This feature makes it possible to order a result on the basis of a computed column which does not have a name.

Example:

```
DEFINE DATA LOCAL
1 #NAME          (A20)
1 #YEARS-TO-WORK (I2)
END-DEFINE
...
SELECT NAME , 65 - AGE
  INTO #NAME, #YEARS-TO-WORK
  FROM SQL-PERSONNEL
  ORDER BY 2
  ...
```

The order specified in the `ORDER BY` clause can be either ascending (`ASC`) or descending (`DESC`). `ASC` is the default.

Example:

```
DEFINE DATA LOCAL
1 PERS VIEW OF SQL-PERSONNEL
1 NAME
1 AGE
1 ADDRESS   (1:6)
END-DEFINE
...
SELECT NAME, AGE, ADDRESS
  INTO VIEW PERS
  FROM SQL-PERSONNEL
  WHERE AGE = 55
  ORDER BY NAME DESC
  ...
```

See further information on *`integer`* values and *`column-reference`*.

IF NO RECORDS FOUND-Clause

Note: This clause actually does not belong to Natural SQL; it represents Natural functionality which has been made available to SQL loop processing.

Structured Mode Syntax

```
IF NO [RECORDS] [FOUND]
{          ENTER        }
{          statement... }
END-NOREC
```

Reporting Mode Syntax

```
IF NO [RECORDS] [FOUND]
{      ENTER                     }
{      statement                 }
{      DO statement... DOEND     }
```

The `IF NO RECORDS FOUND` clause is used to initiate a processing loop if no records meet the selection criteria specified in the preceding `SELECT` statement.

If no records meet the specified selection criteria, the `IF NO RECORDS FOUND` clause causes the processing loop to be executed once with an "empty" record. If this is not desired, specify the statement `ESCAPE BOTTOM` within the `IF NO RECORDS FOUND` clause.

If one or more statements are specified with the `IF NO RECORDS FOUND` clause, the statements are executed immediately before the processing loop is entered. If no statements are to be executed before entering the loop, the keyword `ENTER` must be used.

Note: If the result set of the `SELECT` statement consists of a single row of `NULL` values, the `IF NO RECORDS FOUND` clause is not executed. This could occur if the selection list consists solely of one of the aggregate functions `SUM`, `AVG`, `MIN` or `MAX` on columns, and the set on which these aggregate functions operate is empty. When you use these aggregate functions in the above-mentioned way, you should therefore check the values of the corresponding null-indicator fields instead of using an `IF NO RECORDS FOUND` clause.

Database Values

Unless other value assignments are made in the statements accompanying an `IF NO RECORDS FOUND` clause, Natural resets to empty all database fields which reference the file specified in the current loop.

Evaluation of System Functions

Natural system functions are evaluated once for the empty record that is created for processing as a result of the `IF NO RECORDS FOUND` clause.

Join Queries

A join is a query in which data is retrieved from more than one table. All the tables involved must be specified in the `FROM` clause.

Example:

```
DEFINE DATA LOCAL
1 #NAME     (A20)
1 #MONEY    (I4)
END-DEFINE
...
SELECT NAME, ACCOUNT
  INTO #NAME, #MONEY
  FROM  SQL-PERSONNEL P, SQL-FINANCE F
  WHERE P.PERSNR = F.PERSNR
    AND F.ACCOUNT > 10000
    ...
```

A join always forms the Cartesian product of the tables listed in the `FROM` clause and later eliminates from this Cartesian product table all the rows that do not satisfy the join condition specified in the `WHERE` clause.

Correlation names can be used to save writing if table names are rather long. Correlation names must be used when a column specified in the selection list exists in more than one of the tables to be joined in order to know which of the identically named columns to select.

150 UPDATE - SQL

- Function 982
- Syntax 1 - Searched UPDATE 982
- Syntax 2 - Positioned UPDATE 984
- Examples 985

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Belongs to Function Group: ***Database Access and Update***

Function

The SQL `UPDATE` statement is used to perform an `UPDATE` operation on either rows in a table without using a cursor (**"searched"** `UPDATE`) or columns in a row to which a cursor is positioned (**"positioned"** `UPDATE`).

Two different structures are possible.

Syntax 1 - Searched UPDATE

The "Searched" `UPDATE` statement is a stand-alone statement not related to any `SELECT` statement. With a single statement you can update zero, one, multiple or all rows of a table. The rows to be updated are determined by a *search-condition* that is applied to the table. Optionally, view and table names can be assigned a *correlation-name*.

Note: The number of rows that have actually been updated with a "searched" `UPDATE` can be ascertained by using the system variable `*ROWCOUNT`.

```
UPDATE      { view-name [correlation-name] SET *                      }
            { table-name [correlation-name] SET assignment-list       }

 [WHERE
search-condition] [ WITH { RR } ]   [QUERY NO integer]
                  [      { RS } ]
                  [      { CS } ]
```

For an explanation of the symbols used in the syntax diagram, see ***Syntax Symbols***.

Syntax Element Description - Syntax 1:

Syntax Element	Description
view-name	**View Name:** Refers to the name of a Natural view as defined in the `DEFINE DATA` statement. For further information, see *view-name* (in the section ***Basic Syntactical Items***).
correlation-name	**Correlation Name:** The item *correlation-name* represents an alias name for a *table-name*.

<table>
<tr><th>Syntax Element</th><th colspan="2">Description</th></tr>
<tr><td></td><td colspan="2">For further information, see correlation-name (in the section Basic Syntactical Items).</td></tr>
<tr><td>SET</td><td colspan="2">SET Clause:

If a view has been specified for updating, an asterisk (*) has to be specified in the SET clause, because all columns of the view must be updated.

If a table has been specified for updating, the SET clause must contain either an assignment-list or the name of the view which contains the columns to be updated.</td></tr>
<tr><td>assignment-list</td><td colspan="2">Assignment List:
See Assignment List below.</td></tr>
<tr><td>WHERE search-condition</td><td colspan="2">WHERE Clause:

This clause is used to specify the selection criteria for the rows to be updated.

If no WHERE clause is specified, the entire table is updated.</td></tr>
<tr><td rowspan="4">WITH</td><td colspan="2">WITH Clause:

This clause allows the explicit specification of the isolation level used when locating the row to be updated. For detailed information, see WITH Clause - Isolation Level in the description of the SELECT statement.

It is only valid against DB2 databases. When used against other databases, it will cause runtime errors.</td></tr>
<tr><td>CS</td><td>Cursor Stability</td></tr>
<tr><td>RR</td><td>Repeatable Read</td></tr>
<tr><td>RS</td><td>Read Stability</td></tr>
<tr><td>QUERYNO integer</td><td colspan="2">QUERYNO Clause:

This clause is not currently supported and will be ignored.</td></tr>
</table>

Assignment List

```
{ column-name = { scalar-expression } } , ...
                { NULL              }
```

In an *assignment-list*, you can assign values to one or more columns. A value can be either a *scalar-expression* or NULL. For further information, see ***Scalar Expressions***.

If the value NULL has been assigned, it means that the addressed field is to contain no value (not even the value “0” or “blank”).

Syntax Element Description:

Syntax Element	Description
column-name	**Column Name:** Specifies the name of a column of the result table of the MERGE statement that is not the same name as another include column or a column in the target table.
NULL	**NULL Option:** Specifies the null value as the new value of the column. If the value NULL has been assigned, it means that the addressed field is to contain no value (not even the value 0 or "blank").

Syntax 2 - Positioned UPDATE

The "positioned" UPDATE statement always refers to a cursor within a database loop. Thus, the table or view referenced by a positioned UPDATE statement must be the same as the one referenced by the corresponding SELECT statement; otherwise an error message is returned. A positioned UPDATE cannot be used with a non-cursor selection.

Common Set Syntax:

```
UPDATE { view-name  SET *                 } [WHERE CURRENT OF CURSOR (r)]
       { view-name  SET  assignment-list  }
```

Extended Set Syntax:

```
UPDATE { view-name  SET *      } [WHERE          [ FOR  { [:]host-variable } OF     ]
       { view-name  SET        }  CURRENT OF     [ ROW  { integer          } ROWSET ]
       { assignment-list       }  CURSOR (r)
```

Syntax Element Description - Syntax 2:

Syntax Element	Description
view-name	**Natural View:** Refers to the name of a Natural view as defined in the DEFINE DATA statement; see also *view-name* (in the section ***Basic Syntactical Items***).
SET * SET *assignment-list*	**SET Clause:**

Syntax Element	Description
	If a Natural view has been specified for updating, an asterisk (*) has to be specified in the SET clause, because all columns of the view must be updated. If a table has been specified for updating, the SET clause must contain either an *assignment-list* or the name of the view which contains the columns to be updated.
WHERE CURRENT OF CURSOR (*r*)	**Statement Reference:** The (*r*) notation is used to reference the statement which was used to select the row to be updated. If no statement reference is specified, the UPDATE statement is related to the innermost active processing loop in which a database record was selected.
FOR ROW … OF ROWSET	**FOR ROW … OF ROWSET Clause:** This clause belongs to the **SQL Extended Set**. The optional FOR ROW … OF ROWSET clause for positioned SQL UPDATE statements specifies which row of the current rowset has to be updated. It should only be specified if the UPDATE statement is related to a SELECT statement which uses rowset positioning and which has column arrays in the ***INTO Clause***. If this clause is omitted, all rows of the current rowset are updated by the values in the *assignment-list*. This clause cannot be specified if *view-name* SET * is specified.

Examples

- Example 1 - Searched UPDATE
- Example 2 - Searched UPDATE with assignment-list
- Example 3 - Positioned UPDATE
- Example 4 - Positioned UPDATE with assignment-list

Example 1 - Searched UPDATE

```
DEFINE DATA LOCAL
1 PERS VIEW OF SQL-PERSONNEL
2 NAME
2 AGE
...
END-DEFINE
...
ASSIGN AGE = 45
ASSIGN NAME = 'SCHMIDT'
```

```
UPDATE PERS SET * WHERE NAME = 'SCHMIDT'
...
```

Example 2 - Searched UPDATE with assignment-list

```
DEFINE DATA LOCAL
1 PERS VIEW OF SQL-PERSONNEL
2 NAME
2 AGE
...
END-DEFINE
...
UPDATE SQL-PERSONNEL SET AGE = AGE + 1 WHERE NAME = 'SCHMIDT'
...
```

Example 3 - Positioned UPDATE

```
DEFINE DATA LOCAL
1 PERS VIEW OF SQL-PERSONNEL
2 NAME
2 AGE
...
END-DEFINE
...
SELECT * INTO PERS FROM SQL_PERSONNEL WHERE NAME = 'SCHMIDT'
COMPUTE AGE = AGE + 1
UPDATE PERS SET * WHERE CURRENT OF CURSOR
END-SELECT
...
```

Example 4 - Positioned UPDATE with assignment-list

```

DEFINE DATA LOCAL
1 PERS VIEW OF SQL-PERSONNEL
2 NAME
2 AGE
...
END-DEFINE
...
SELECT * INTO PERS FROM SQL-PERSONNEL WHERE NAME = 'SCHMIDT'
UPDATE SQL-PERSONNEL SET AGE = AGE + 1 WHERE CURRENT OF CURSOR
END-SELECT
...
```

- Example Programs for System Variables 1008

This chapter contains additional example programs that are referenced in the Natural statements and system variables reference documentation. All these examples are contained in the library SYSEXSYN.

Note: Generally, the example programs shown in the statement descriptions are written in structured mode. For statements where the reporting-mode syntax differs considerably from the structured-mode syntax, references to equivalent reporting-mode examples are also provided. The example programs are available in source-code form in the Natural library SYSEXSYN. Further example programs of using Natural statements are documented in the section *Referenced Example Programs* in the *Programming Guide*. These example programs are provided in the Natural library SYSEXPG. Please ask your Natural administrator about the availability of these libraries at your site. The example programs use data from the files EMPLOYEES and VEHICLES, which are supplied by Software AG for demonstration purposes.

ASSIGN

The following example is referenced in the ASSIGN/COMPUTE statement description:

ASGEX1R - ASSIGN (reporting mode)

```
** Example 'ASGEX1R': ASSIGN (reporting mode)
************************************************************************
RESET #A (N3)
      #B (A6)
      #C (N0.3)
      #D (N0.5)
      #E (N1.3)
      #F (N5)
      #G (A25)
      #H (A3/1:3)
*
#A = 5                                  WRITE NOTITLE '=' #A
#B = 'ABC'                              WRITE '=' #B
#C = .45                                WRITE '=' #C
#D = #E = -0.12345                      WRITE '=' #D / '=' #E
ASSIGN ROUNDED #F = 199.999             WRITE '=' #F
#G = 'HELLO'                            WRITE '=' #G
*
#H (1) = 'UVW'
#H (3) = 'XYZ'                          WRITE '=' #H (1:3)
*
END
```

Output of Program AEDEX1R:

```
#A:    5
#B: ABC
#C:  .450
#D: -.12345
#E: -0.123
#F:    200
#G: HELLO
#H: UVW     XYZ
```

AT BREAK

The following examples are referenced in the AT BREAK statement description:

ATBEX1R - AT BREAK (reporting mode)

```
** Example 'ATBEX1R': AT BREAK (reporting mode)
************************************************************************
*
LIMIT 10
READ EMPLOYEES BY CITY
  AT BREAK OF CITY DO
    SKIP 1
  DOEND
  /*
  DISPLAY NOTITLE CITY (IS=ON) COUNTRY (IS=ON) NAME
LOOP
END
```

Output of Program ATBEX1R:

```
CITY         COUNTRY         NAME
-------------------- ------- --------------------

AIKEN                USA     SENKO

OCC2P - System Variable *OCCURRENCE

```
** Example 'OCC2P': *OCCURRENCE
************************************************************************
DEFINE DATA LOCAL
1 #N (N7/1:10)
1 #I (I4)
END-DEFINE
*
FOR #I=1 TO 10
  MOVE #I TO #N(#I)
END-FOR
*
WRITE 'Passing ocurrences 1:5'
CALLNAT 'OCC2N' #N(1:5)
*
WRITE 'Passing ocurrences 5:10'
CALLNAT 'OCC2N' #N(5:10)
*
END
```

Subprogram `OCC2N` Called by Program `OCC2P`:

```
** Example 'OCC2N': *OCCURRENCE (called by OCC2P)
**********************************************************************
DEFINE DATA
PARAMETER
1 #ARR (N7/1:V)
LOCAL
1 I    (N7)
END-DEFINE
*
FOR I=1 TO *OCC(#ARR)
  DISPLAY #ARR(I)
END-FOR
*
END
```

Output of Program `OCC2P`:
