REINP - Issue Internal REINPUT Statement for Invalid Data

This Natural profile and session parameter can be used to prevent an internal `REINPUT` for invalid data.

By default, Natural automatically issues an internal `REINPUT` statement if invalid data have been entered in response to an `INPUT` statement. With this parameter, you can switch this mechanism off. This will allow you to handle such input errors yourself in your application.

Within a Natural session, the profile parameter `REINP` can be overridden by the session parameter `REINP`.

Possible settings	ON	An internal `REINPUT` statement is issued when invalid data have been entered.
	OFF	An internal `REINPUT` statement is not issued when invalid data have been entered.
Default setting	ON	
Dynamic specification	yes	
Specification within session	yes	Applicable Statements: `SET GLOBALS`
		Applicable Command: `GLOBALS`
Application Programming Interface	`USR1005N`
