

# SYSDDM

A rectangular box with a thin black border containing the text 'SYSDDM' in a bold, sans-serif font.

This command is used to invoke the DDM Services which offer functions that are needed to create and maintain Natural data definition modules (DDMs).

For further information, see *DDM Services* in the *Editors* documentation.

**Note:**

This command is not executable in batch mode.

**Note Concerning Natural Single Point of Development:**

This command is not available via Natural Studio's command line in a remote development environment, because DDMs are listed in the tree view under the node DDM and all functions of the SYSDDM utility are available via the context menu or the menu bar.
