SYSPROF

```
SYSPROF
```

This command is used to display the current definitions of the Natural system files.

For each system file, the following information is displayed (this corresponds to pressing PF4 when one of the pages listed below is currently shown):

- the file name

- the database ID

- the file number

- the database type

In addition, the following information can be displayed for each defined combination of database ID and file number:

- the path in the file system (when you press PF5)

- the logical file number, if assigned (when you press PF6)
