

Restart Load

You can use the restart load function to resume load functions that terminated abnormally. If the load function terminates before the work file has been processed completely, with the restart load you can continue from the point of termination.

The restart load requires that restart information is written to Work File 6 or a specified restart file in accordance with the selection criteria, options and parameter settings specified for the load.

▶ To set up the environment during the load

1. On the **Load Options** screen:
 - Mark the **Write restart information** option.
 - In the **Restart file** field, enter the name of the file to which the restart information data is written.

The **Load Options** screen is described in *Work File and Report Options* in the section *Settings*.

2. Execute the load function.

▶ To execute the restart load after an interrupted load

1. In the Command line of the Object Handler screen, enter the following command:

```
GO RESTART
```

The **Restart Options** screen appears, where you can specify a file by entering a name in the **Restart file** field.

Or:

Use the following direct command:

```
RESTART
```

The syntax of RESTART is shown in the section *Basic Command Syntax*.
