

# SET GLOBALS

```
SET GLOBALS parameter=value ...
```

This chapter covers the following topics:

- Function
- Syntax Description
- Parameters
- Example

For an explanation of the symbols used in the syntax diagram, see *Syntax Symbols*.

---

## Function

The SET GLOBALS statement is used to set values for session parameters.

The parameters are evaluated either when the program that contains the SET GLOBALS statement is compiled, or when it is executed; this depends on the individual parameters.

The parameter settings specified with SET GLOBALS remain in effect until the end of the Natural session, unless they are overridden with a subsequent SET GLOBALS statement or GLOBALS system command. The statement SET GLOBALS and the system command GLOBALS offer the same parameters for modification. They can both be used in the same Natural session. Parameter values specified with a GLOBALS command remain in effect until they are overridden by a new GLOBALS command or SET GLOBALS statement, the session is terminated, or you log on to another library.

## Syntax Description

Syntax Element	Description
parameter=value	<p><b>Parameter Specification(s):</b></p> <p>In place of <i>parameter</i>, specify the name of the parameter to be set. For a list of possible parameters, see <i>Parameters</i> below.</p> <p>If you specify multiple parameters, you have to separate them from one another by one or more blanks. The parameters can be specified in any order; see also <i>Example</i>.</p> <p>In place of <i>value</i>, specify a valid parameter value. For information on valid parameter values, see the descriptions of the individual parameters listed below.</p>

## Parameters

Parameters that can be specified with the SET GLOBALS statement		Evaluation (R = at runtime, C = at compilation)
CF	Character for Terminal Commands	R
CPCVERR	Code Page Conversion Error	R
DC	Character for Decimal Point Notation	R
DFOUT	Date Format for Output	R
DFSTACK	Date Format for Stack	R
DFTITLE	Date Format in Default Page Title	R
DU	Dump Generation	R
EJ	Page Eject	R
FCDP	Filler Character for Dynamically Protected Fields	R
FS	Format Specification	R
IA	INPUT Assign Character	R
ID	INPUT Delimiter Character	R
IM	INPUT Mode	R
LE	Limit Error Processing	C
LS	Line Size	C
LT	Limit of Records Read	R
NC	Use of Natural System Commands	R
OPF	Overwriting of Protected Fields by Help routines	R
PM	Print Mode	C
PS	Page Size	RC
REINP	Internal REINPUT for Invalid Data	R
SA	Sound Terminal Alarm	R
SF	Spacing Factor	C
WH	Wait for Record in Hold Status	R
ZD	Zero Division Check	R
ZP	Zero Printing	R

The individual session parameters are described in the *Parameter Reference*.

## **Example**

In the example below, the SET GLOBALS statement is used to set the maximum number of characters permitted per line to 74 and to limit the number of database records that can be read in processing loops within a Natural program to 5000.

```
SET GLOBALS LS=74 LT=5000  
...
```
