SYSPROF

```
SYSPROF
```

This command is used to display the current definitions of the Natural system files.

For each system file, the following information is displayed (on the **System Files** page):

- the file name

- the database ID

- the file number

- the database type

In addition, the following information can be displayed for each defined combination of database ID and file number:

- the path in the file system (on the **Files in File System** page)

- the logical file number, if assigned (on the **All Files** page)

See also *System Files* in *Using Natural Studio*.
