Table of Contents

| | |
|--|----|
| Preface | xv |
| 1 About this Documentation | 1 |
| Document Conventions | 2 |
| Online Information and Support | 2 |
| Data Protection | 3 |
| I Using Entire Operations GUI Client | 5 |
| 2 Online Help and System Messages | 7 |
| Error Messages | 8 |
| Finding System Messages | 9 |
| Online Technical Information | 9 |
| 3 Starting and Ending an Entire Operations Session | 11 |
| 4 Logging on and off an Operating System Server Node | 15 |
| Logon Function | 16 |
| Fields: Logon Node | 17 |
| Troubleshooting Logon Errors | 18 |
| Monitoring the Node Connection Status | 18 |
| Logoff Function | 20 |
| 5 Elements of the Main Application Window | 23 |
| Object Workspace | 25 |
| Menu Bar | 28 |
| Options Menu | 29 |
| My Desktop Menu | 30 |
| Toolbar | 34 |
| Content Pane | 35 |
| Results Window | 35 |
| Command Line | 36 |
| Status Bar | 36 |
| Context Menu | 37 |
| Dockable Windows | 38 |
| 6 Common and Global Functions | 41 |
| Cancelling Reading | 42 |
| Applying Changes | 42 |
| Listing Objects | 42 |
| Refreshing Object Lists | 43 |
| Filtering Objects | 44 |
| Specifying Filter Criteria | 47 |
| Saving a List View as a Report File | 50 |
| Drag & Drop | 51 |
| Displaying Objects | 52 |
| Copying Objects | 52 |
| Pasting Objects | 53 |
| Deleting Objects | 54 |
| Importing and Exporting Objects | 54 |

| | |
|---|-----|
| Functions of the Metanode General | 55 |
| Monitor Status | 55 |
| Show Messages | 56 |
| Add to Workplan | 57 |
| Show Workplan | 58 |
| Show all Owners | 61 |
| Show linked Owners | 61 |
| Tracing | 62 |
| 7 User Language | 65 |
| Options Menu | 66 |
| System Default and User Profile | 66 |
| Natural ULANG Parameter | 66 |
| 8 Operating System Classes and Related Operating Systems | 67 |
| 9 Date and Time Formats | 69 |
| Date Display and Input Options | 70 |
| Time Display and Input Options | 71 |
| II Entire Operations and Operating System User IDs | 73 |
| 10 Entire Operations and Operating System User IDs | 75 |
| Entire Operations User IDs | 76 |
| Operating System User IDs | 76 |
| III Activation of Networks or Jobs | 79 |
| 11 Activation of Networks or Jobs | 81 |
| Terminology | 82 |
| Determination and Activation of Necessary Symbol Tables | 83 |
| Manual Activation | 83 |
| Activating a Job Network Manually | 85 |
| Activating a Single Job Manually | 88 |
| Automatic (Scheduled) Activation | 91 |
| Start of Job Activation | 91 |
| Run Number | 92 |
| Cleanup of the Active Database | 93 |
| Cleanup of the Active Database in Batch Mode | 93 |
| IV Prerequisite Check before Job Submission | 97 |
| 12 Prerequisite Check before Job Submission | 99 |
| Order of Prerequisite Checking | 100 |
| Passive Wait | 101 |
| Prerequisite Check according to the Round-Robin Procedure | 103 |
| V Entire Operations Utilities | 105 |
| 13 Entire Operations Utilities | 107 |
| Introduction | 108 |
| Extract Log Data to Log Selection File | 110 |
| Delete Old Data in Log Selection File | 111 |
| Print Account Information from Entire Operations Log | 112 |
| Mass Change of Network / Symbol Table Version | 112 |
| Monitor or Task Wait Time Modification | 113 |

| | |
|---|-----|
| Monitor Shutdown | 114 |
| Monitor Start | 114 |
| BS2000 Jobs | 114 |
| List or Delete TO-ACTIVATE Command Records | 115 |
| Check the Existence of Symbol Table Definitions | 116 |
| Mass Change of the Owner and Owner Deletion | 117 |
| Mass Change of Access Rights Granted to Networks | 119 |
| User ID Mass Update in Network and Job Definitions | 121 |
| Mass Update for User Access to Nodes | 122 |
| Mass Change of Node Numbers | 123 |
| Mass Logon Processing in Batch Mode | 124 |
| Bulk Execution of MACRO Commands | 126 |
| Data Migration to the current Entire Operations Version | 128 |
| VI Using Entire Operations in Batch Mode | 129 |
| 14 Using Entire Operations in Batch Mode | 131 |
| Files Needed to Start Entire Operations in Batch | 195 |
| Files Needed to Start the Batch Command Client | 137 |
| Command Syntax for the Batch Command Client | 139 |
| Commands for the Batch Command Client | 144 |
| VII Overview of Objects Available for Maintaining Job Networks | 167 |
| 15 Overview of Objects Available for Maintaining Job Networks | 169 |
| VIII Using Owners | 171 |
| 16 Using Owners | 173 |
| Available Functions: Owner | 174 |
| Listing Owners | 175 |
| Owner at Logon | 176 |
| Linking Additional Owners | 177 |
| Owners Granted Access to Individual Networks | 177 |
| Adding and Removing an Owner | 180 |
| IX Network Maintenance | 181 |
| 17 Use of Job Networks | 183 |
| 18 Maintaining Job Network Definitions | 185 |
| Listing all Network Definitions | 186 |
| Available Functions: Network Master | 187 |
| Displaying a Network Definition | 189 |
| Modifying a Network Definition | 189 |
| Adding a Network Definition | 191 |
| Fields: Network Definition | 191 |
| OS Specials - Operating System and Environment Defaults | 195 |
| Specifying Recipients for Network Messages | 199 |
| Granting Definition: Authorizing Other Users or Owners to Access a Network | 200 |
| Long Description - Documenting Your Networks | 203 |
| Deleting a Job Network | 206 |
| 19 Maintaining Job Network Versions | 207 |

| | |
|--|-----|
| Versioning of Job Networks | 208 |
| Using Network Versions for Activations | 209 |
| Handling Network Version Usage Definitions | 211 |
| 20 Copying Job Network Definitions | 215 |
| Fields: Paste Data Network Master | 217 |
| 21 Viewing and Maintaining a Job Network Diagram | 219 |
| Explanations of Diagram Symbols | 220 |
| Maintenance Functions for Diagrams | 224 |
| Editing and Navigating in the Network Diagram | 229 |
| Examples of Diagrams | 232 |
| 22 Checking for a Loop in a Job Network | 237 |
| 23 Applying Network Defaults to Jobs (Mass Update) | 239 |
| Columns: Application of Network Defaults to Jobs/Copy Defaults | 242 |
| Functions: Application of Network Defaults to Jobs/Copy Defaults | 243 |
| 24 Defining Monitor Start Networks | 245 |
| Monitor Start Network | 246 |
| Day Start Network | 247 |
| Common Start Network Considerations | 248 |
| X Job Maintenance Defining and Managing End-of-Job (EOJ) Checking and Actions | 249 |
| 25 Use of Jobs | 251 |
| 26 Defining and Managing Jobs | 253 |
| Listing Jobs | 254 |
| Available Functions: Job Master | 256 |
| Displaying and Modifying a Job Definition | 258 |
| Creating a Job Definition | 265 |
| Writing and Viewing Online Documentation for a Job | 267 |
| Deleting a Job Definition | 269 |
| Displaying Job Dependencies | 269 |
| Defining Job-Specific Log Information | 270 |
| 27 Defining Job Types and Job Execution Features | 275 |
| Available Job Types | 276 |
| Defining Job Type Specific Execution Features | 278 |
| Defining Operating System Specific Execution Features | 281 |
| 28 Executing a Job as Dummy or Including Epilog Scripts | 287 |
| Job Execution as a Dummy Job | 288 |
| Job Execution Including an Epilog Script (UNIX and Windows) | 288 |
| 29 Using a Dummy Job | 289 |
| Permanent Dummy Jobs | 290 |
| Temporary Dummy Jobs | 290 |
| Excluding a Job from Actual Execution | 291 |
| Supervision of Running Jobs | 292 |
| 30 Defining a Subnetwork | 293 |
| Link to the Main Network | 295 |
| Subnetwork Activation and Execution | 296 |

| | |
|--|-----|
| Restrictions for Subnetworks | 297 |
| Adding or Modifying a Subnetwork Definition | 298 |
| Listing Jobs of a Subnetwork | 300 |
| 31 Defining Parameters for an FTP Job | 301 |
| Adding an FTP Parameter Definition | 302 |
| JCL Generation for FTP Jobs | 304 |
| 32 Defining and Managing JCL for a Job | 307 |
| Using Job Control in Entire Operations | 308 |
| Dynamic JCL Generation (JCL Location MAC) | 309 |
| Job Control for Jobs under BS2000 | 314 |
| Job Control for Jobs under UNIX | 314 |
| Job Control for Jobs under Windows | 314 |
| Defining Master JCL for a Job | 318 |
| Displaying Master JCL | 321 |
| JCL Locations | 322 |
| Defining Operating System Dependent JCL Specifications | 326 |
| Handling JCL during Job Submission | 327 |
| Symbol Replacement in JCL | 330 |
| Pregenerating Active JCL | 330 |
| 33 Editing Master JCL and Natural Sources | 333 |
| General Editing Considerations | 334 |
| UNIX and Windows: Handling of Tab Characters (H'09') within JCL Lines | 336 |
| Starting an Edit Session | 337 |
| Handling Macro Sources for Dynamic JCL Generation | 341 |
| Usage of Text Objects in JCL | 347 |
| Locking of Natural Sources | 350 |
| 34 Defining and Managing Job Conditions | 351 |
| Use of Input and Output Conditions | 352 |
| Listing Input Conditions | 354 |
| Adding and Modifying a Master Input Condition | 357 |
| Accessing another Network Defined for an Input Condition | 362 |
| Input Condition References | 362 |
| Global Conditions | 365 |
| Input Condition with User Exit | 366 |
| Input Condition: Multiple Suffixes | 369 |
| Input Condition: File Existence | 370 |
| Input Condition: Mailbox | 373 |
| Input Condition: Symbol Value | 374 |
| Input Condition: BS2000 User Switch | 377 |
| Input Condition: BS2000 Job Variable | 378 |
| Listing Jobs Linked to an Input Condition | 380 |
| Deleting an Input Condition Definition | 382 |
| 35 Handling Prerequisite Resources for a Job | 383 |
| Use of Resources and Resource Allocation | 384 |

| | |
|---|-----|
| Listing Prerequisite Resources Defined for a Job | 388 |
| Viewing the Usage of a Prerequisite Resource | 389 |
| Displaying, Modifying and Adding a Prerequisite Resource Definition | 390 |
| Columns and Fields: Prerequisite Resource Definitions | 391 |
| Deleting a Prerequisite Resource Definition | 392 |
| 36 Defining and Managing End-of-Job (EOJ) Checking and Actions | 393 |
| Events | 394 |
| Event Check Method | 395 |
| Possible End-of-Job Actions | 396 |
| Displaying End-of-Job Events and Actions | 397 |
| Adding and Modifying an Event Definition | 401 |
| Deleting an Event Definition | 409 |
| Operating System Dependent Defaults for Event Checking | 409 |
| Creating and Viewing Online Documentation for Events | 412 |
| Examples of Event Definitions | 413 |
| Handling End-of-Job Actions | 420 |
| End-of-Job Actions after Execution as a Temporary Dummy Job | 424 |
| Defining Output Condition Actions | 425 |
| Defining Actions for Symbol Value Modification | 429 |
| Defining Actions for Modifying Job Variable Values | 432 |
| Defining Action User Exits | 434 |
| Defining Other Actions: Deactivate Job Automatically | 436 |
| Defining Network and Job Activation Actions | 437 |
| Defining Recovery Actions | 439 |
| Defining SYSOUT Actions | 444 |
| Defining Notification Messages | 445 |
| Defining Release Actions for Kept Resources | 455 |
| 37 Viewing Job/Network Accounting Information | 457 |
| Displaying Accounting Data | 458 |
| Fields: Range Specification for Accounting Data | 460 |
| XI Maintaining Active Jobs and Networks | 461 |
| 38 Maintaining Active Job Networks | 463 |
| Available Functions: Network Active | 464 |
| Listing Active Job Networks | 464 |
| Deactivating Active Job Networks | 465 |
| Viewing the Execution History of a Network Active | 467 |
| Maintaining Active Runs | 468 |
| 39 Maintaining Active Jobs | 473 |
| Available Functions: Job Active | 474 |
| Listing Active Jobs | 476 |
| Listing Jobs of an Active Subnetwork | 481 |
| Adding a New Job to the Active Network | 482 |
| Modifying the Latest Start Time for an Active Job | 484 |
| Choosing the Job ID of a Job for Logging | 485 |
| Cancelling, Holding and Releasing Active Jobs | 486 |

| | |
|---|-----|
| Resubmitting an Active Job | 488 |
| Deactivating a Job in an Active Network | 490 |
| Reactivating an Active Job | 493 |
| Displaying and Modifying an Active Job Definition | 493 |
| Modifying EOJ Checking and Actions | 496 |
| Viewing Long Descriptions of Active Jobs | 496 |
| Displaying Prerequisites for Active Jobs: Waiting for | 497 |
| Viewing and Modifying Resources Used by Active Jobs | 499 |
| Browsing Active Job SYSOUT | 500 |
| 40 Maintaining Active Job Conditions | 507 |
| Available Functions: Condition Active | 508 |
| Listing Active Conditions | 509 |
| Viewing an Active Condition and Changing Its Status | 511 |
| Adding an Active Condition | 511 |
| Using Global Active Conditions | 512 |
| Displaying Conditions for an Active Job | 516 |
| Viewing Job Usage of an Active Condition | 516 |
| 41 Maintaining Active JCL (Job Control Language) | 519 |
| Browsing Active JCL | 520 |
| Editing Active JCL | 521 |
| Viewing the Extended Log with Active JCL Changes | 522 |
| Exchanging Active JCL | 523 |
| Regenerating Active JCL | 524 |
| XII Schedule Maintenance | 527 |
| 42 General Scheduling Considerations | 529 |
| Use of Schedules | 530 |
| Possible Schedule Definitions | 530 |
| Schedule Extraction Times | 532 |
| Manual and Automatic Activations on the Same Day | 532 |
| Multiple Network Activations | 532 |
| Influence of Deactivations on Schedules | 532 |
| Imported Schedules | 533 |
| Schedule Dependencies across the Turn of the Year | 533 |
| Using Calendars | 533 |
| 43 Maintaining a Schedule Master | 535 |
| Listing Schedules | 536 |
| Displaying, Adding or Modifying a Schedule | 537 |
| Deleting a Schedule | 548 |
| 44 Scheduling a Network | 551 |
| Viewing a Network Schedule Definition | 552 |
| Defining a Network Schedule | 553 |
| Processing of Time Frame Definitions | 557 |
| Defining and Deleting Time Frames for a Network | 558 |
| Defining Dates for Explicit Network Execution | 561 |
| Defining Multiple Network Activations | 565 |

| | |
|---|-----|
| Viewing a Network Schedule Definition as a Calendar | 568 |
| Producing a Network Start Summary | 570 |
| Displaying Next Network Starts - Next Activations | 570 |
| Displaying the Network Execution History | 575 |
| Deleting a Scheduling Definition for a Single Network | 576 |
| 45 Scheduling a Job | 579 |
| Defining Scheduling Parameters for a Job | 580 |
| Maintaining Schedule Dependencies for a Job | 584 |
| Sending a Late Message to One or More Users | 589 |
| XIII Calendar Maintenance | 591 |
| 46 Calendar Maintenance | 593 |
| General Rules and Restrictions | 594 |
| Available Functions: Calendar | 595 |
| Listing Calendars | 596 |
| Displaying, Modifying or Adding a Calendar Definition | 597 |
| Defining Workdays and Holidays | 599 |
| Where Used - Listing Schedules Using a Calendar | 600 |
| Deleting a Calendar Definition | 601 |
| XIV Working with Mailboxes | 603 |
| 47 Working with Mailboxes | 605 |
| Concept of Single or Multiple Mailbox Users | 606 |
| Listing and Maintaining Mailboxes | 607 |
| Viewing Mailbox Messages | 607 |
| Handling Messages and Requests | 610 |
| XV Log Information | 613 |
| 48 Log Information | 615 |
| Displaying Logged Information - Browse Log Function | 616 |
| Monitoring Entire Operations Activities | 621 |
| XVI Symbol Table and Symbol Maintenance | 625 |
| 49 Purpose and Use of Symbol Tables and Symbols | 627 |
| Symbol Tables | 628 |
| Symbols | 630 |
| Subnetworks and Recovery Jobs | 631 |
| User Exits for User-Specific Symbol Maintenance Tasks | 631 |
| 50 Adding and Maintaining Symbol Tables | 633 |
| Available Functions: Symbol Table Master | 634 |
| Listing Symbol Table Masters | 635 |
| Versioning of Symbol Tables | 636 |
| Displaying a Symbol Table Master | 640 |
| Adding a Symbol Table Master | 641 |
| Modifying a Symbol Table Master | 644 |
| Maintaining the Usage of Symbol Table Versions | 646 |
| Saving Symbol Tables as Files | 649 |
| Using Active Symbol Tables | 650 |
| Deleting a Symbol Table Master | 653 |

| | |
|---|-----|
| 51 Finding Symbol Tables Associated with Jobs and Networks | 655 |
| Listing Usable Symbol Tables | 656 |
| Listing Jobs and Networks that Use a Symbol Table Master | 657 |
| 52 Defining Symbols and Symbol Values | 661 |
| Available Functions: Symbol Master | 662 |
| Listing Symbol Masters | 663 |
| Viewing a Symbol Master Definition | 663 |
| Modifying a Symbol Master | 664 |
| Adding a Symbol Master | 665 |
| Maintaining a Symbol Active | 665 |
| Defining Multiple Symbol Values | 669 |
| Specifying a Range Check for Numeric Symbol Values | 671 |
| Reserved Symbols | 672 |
| Predefined Symbols | 677 |
| Symbols in Node Definitions | 683 |
| Validating Symbol Values with a User Exit | 684 |
| Global Symbol Modification Exit | 685 |
| Symbol Setting triggered by the SYSOUT of a Job | 685 |
| Deleting a Symbol from a Symbol Table | 686 |
| 53 Symbol Replacement | 689 |
| Symbol Escape Characters | 690 |
| Symbol Prompting during Network or Job Activation | 693 |
| Specifying User Exits for Symbol Modification | 695 |
| Rules and Restrictions for Symbol Replacement | 698 |
| 54 Functions for Symbol Replacement | 705 |
| Results Returned by a Symbol Function | 706 |
| Function !D or ?D - Date Calculation and Date Formatting | 707 |
| Function !E or ?E - Date from Date Calculation | 713 |
| Functions !MV or ?MV and !MM or ?MM - Access to Multiple-Value Symbols | 714 |
| Function !TIMN or ?TIMN - Constant Time Values | 716 |
| XVII Reporting | 719 |
| 55 Reporting | 721 |
| Report Types | 722 |
| Viewing the Report Status List | 725 |
| Generating or Regenerating Online Reports | 726 |
| Viewing Report Properties and Deleting a Report | 728 |
| Fields and Columns: Reporting | 729 |
| Determination Date for Report Data | 733 |
| Report Output Options | 734 |
| Using Reports with Bar Charts | 735 |
| Using Reports with Monitor Task Time Tables | 737 |
| User Restrictions for Reports | 739 |
| Retention Period for Reports from Entire Operations GUI Client | 740 |
| Examples of Reports | 740 |

| | |
|--|-----|
| Generating Batch Reports | 754 |
| XVIII Cross-References | 755 |
| 56 Cross-References | 757 |
| Types of Cross-Reference Reports | 758 |
| Generating Cross-Reference Reports Online | 759 |
| Fields and Columns: Cross-References | 768 |
| Examples of Cross-Reference Reports | 773 |
| Generating Cross-Reference Reports in Batch | 776 |
| XIX API Routines | 777 |
| 57 Purpose and Use of Entire Operations APIs | 779 |
| Features Provided by Entire Operations APIs | 780 |
| Locating and Implementing an API | 780 |
| API Usage Rules and Restrictions | 781 |
| Testing Available API Routines | 782 |
| API-specific Parameter Definitions | 783 |
| 58 Available Entire Operations API Routines | 785 |
| EORUCB1N: Check Use of BS2000 User IDs | 786 |
| NOPFB2-N: Generate SYSOUT File Names for BS2000 | 786 |
| NOPMLA1N: Start and Stop the Monitor Activity Log | 789 |
| NOPU--1N: Read Network Available to a Specific User | 790 |
| NOPU--2N: Return all Usable Symbol Tables for a Network | 791 |
| NOPU--3N: Get Correlation ID for an Activated Network | 792 |
| NOPU--4N: Store New Event in Entire Operations System File | 792 |
| NOPUAC5N: Activate Job Networks or Jobs | 793 |
| NOPUAS1N: Retrieve Numbers of Active Jobs in Defined Status Ranges | 797 |
| NOPUCN3N: Access Entire Operations Conditions | 798 |
| NOPUCS1N: Access Calendars and Schedules | 799 |
| NOPUJI4N: Import Operating System Jobs into the Active Queue | 803 |
| NOPUJS2N: Job Schedule Inquiry and Modification | 804 |
| NOPULW9N: Write Messages to System Automation Tools Log | 806 |
| NOPUMI1N: Set/Reset Text Milestones in Master and Active Jobs | 807 |
| NOPUMT3N: Expand Message Texts | 809 |
| NOPUNI1N: Invalidate Entire System Server Node Table Entries | 810 |
| NOPUNX1N: Entire System Server Calls to Access UNIX and Windows Files | 811 |
| NOPURE2N: Handle Resource Allocations | 821 |
| NOPURS1N: Access Entire Operations Resource Masters | 824 |
| NOPUSN2N: Inquire Calling Job or Called Network for Subnetworks | 826 |
| NOPUSP3N: Display Long Texts for Symbol Prompting | 828 |
| NOPUST3N: Inquire Network and Job Status, Symbol Table | 829 |
| NOPUSY7N: Access Entire Operations Symbols | 833 |
| NOPUVI2N: Obtain Entire Operations Version Information | 838 |
| NOPUXD1N: Maintain End-of-Job User Exits for a Network | 839 |
| NOPUXI0N: Add Input Condition to an Activated Job | 841 |

| | |

| Deleting File Definitions | 877 |
| Handing Over SYSOUT and Files to Entire Output Management | 878 |

Preface

This documentation contains all information relevant to the user of the Entire Operations system.

Before reading this document, you should be familiar with the *Concepts and Facilities* documentation, which defines and briefly describes the system entities and facilities referred to in this document.

| Basic Functions and Main System Features | |
|---|---|
| Using Entire Operations GUI Client | Describes the main functions of Entire Operations GUI Client. |
| Entire Operations and Operating System User IDs | Describes Entire Operations user ID and operating system user IDs. |
| Activation of Networks or Jobs | Describes how network and jobs are activated. |
| Prerequisite Check before Job Submission | Describes the Entire Operations procedures used to check the prerequisites required for job submission. |
| Entire Operations Utilities | Describes Entire Operations utilities. |
| Using Entire Operations in Batch Mode | Describes the files and commands required to execute Entire Operations in batch mode. |
| Maintenance Functions | |
| Overview of Objects Available for Maintaining Job Networks | Provides an overview of Entire Operations maintenance objects available for job and network maintenance. |
| Using Owners | Explains how to view and handle owners. |
| Network Maintenance | Explains how to define and maintain job networks. |
| Job Maintenance | Explains the job maintenance facility and how to define different job types and job dependencies, create and use JCL, create online documentation for jobs, define input conditions and specify resources. Explains how to define and manage End-of-Job event checking and trigger actions after a job has terminated. |
| Maintaining Active Jobs and Networks | Provides information on the maintenance functions you can perform on active jobs and networks. |
| Schedule Maintenance | Describes how to define schedule objects, and how to schedule a job network and a job. |
| Calendar Maintenance | Explains the calendar maintenance facility that can be used to create calendars which are the basis of schedules for jobs and job networks. |
| Working with Mailboxes | Describes how to display mailbox messages. |
| Log Information | Describes how to display logged information and monitor Entire Operations activities. |
| Symbol Table and Symbol Maintenance | Provides information on symbol tables, symbol maintenance and symbol replacement functions. |

| Basic Functions and Main System Features | |
|--|--|
| Reporting | Explains the Entire Operations reporting facility, which makes a number of different reports available: information at the job and event level, information on job network definitions and schedules and overviews of schedules and planned activations. |
| Cross-References | Describes functions that provide information about the use of objects in Entire Operations. |
| API Routines | Provides information on Application Programming Interfaces (APIs) supplied to access Entire Operations from other applications. |
| User Exits | Explains how to work with user exits. |
| Passing Files to Entire Output Management | Explains how to pass files to Entire Output Management for output processing. |

1 About this Documentation

- Document Conventions 2
- Online Information and Support 2
- Data Protection 3

Document Conventions

| Convention | Description |
|----------------|--|
| Bold | Identifies elements on a screen. |
| Monospace font | Identifies service names and locations in the format <code>folder.subfolder.service</code> , APIs, Java classes, methods, properties. |
| <i>Italic</i> | Identifies: Variables for which you must supply values specific to your own situation or environment. New terms the first time they occur in the text. References to other documentation sources. |
| Monospace font | Identifies: Text you must type in. Messages displayed by the system. Program code. |
| { } | Indicates a set of choices from which you must choose one. Type only the information inside the curly braces. Do not type the { } symbols. |
| | Separates two mutually exclusive choices in a syntax line. Type one of these choices. Do not type the symbol. |
| [] | Indicates one or more options. Type only the information inside the square brackets. Do not type the [] symbols. |
| ... | Indicates that you can type multiple options of the same type. Type only the information. Do not type the ellipsis (...). |

Online Information and Support

Software AG Documentation Website

You can find documentation on the Software AG Documentation website at <http://documentation.softwareag.com>. The site requires credentials for Software AG's Product Support site Empower. If you do not have Empower credentials, you must use the TECHcommunity website.

Software AG Empower Product Support Website

If you do not yet have an account for Empower, send an email to empower@softwareag.com with your name, company, and company email address and request an account.

Once you have an account, you can open Support Incidents online via the eService section of Empower at <https://empower.softwareag.com/>.

You can find product information on the Software AG Empower Product Support website at <https://empower.softwareag.com>.

To submit feature/enhancement requests, get information about product availability, and download products, go to [Products](#).

To get information about fixes and to read early warnings, technical papers, and knowledge base articles, go to the [Knowledge Center](#).

If you have any questions, you can find a local or toll-free number for your country in our Global Support Contact Directory at https://empower.softwareag.com/public_directory.asp and give us a call.

Software AG TECHcommunity

You can find documentation and other technical information on the Software AG TECHcommunity website at <http://techcommunity.softwareag.com>. You can:

- Access product documentation, if you have TECHcommunity credentials. If you do not, you will need to register and specify "Documentation" as an area of interest.
- Access articles, code samples, demos, and tutorials.
- Use the online discussion forums, moderated by Software AG professionals, to ask questions, discuss best practices, and learn how other customers are using Software AG technology.
- Link to external websites that discuss open standards and web technology.

Data Protection

Software AG products provide functionality with respect to processing of personal data according to the EU General Data Protection Regulation (GDPR). Where applicable, appropriate steps are documented in the respective administration documentation.

I Using Entire Operations GUI Client

This section provides general information on the main features provided during an Entire Operations online session when using the Entire Operations GUI Client.

[Online Help and System Messages](#)

[Starting and Ending an Entire Operations Session](#)

[Logging on and off an Operating System Server Node](#)

[Elements of the Main Application Window](#)

[Common and Global Functions](#)

[Operating System Classes and Related Operating Systems](#)

[User Language](#)

[Date and Time Formats](#)

2 Online Help and System Messages

- Error Messages 8
- Finding System Messages 9
- Online Technical Information 9

You can access the *Entire Operations GUI Client* documentation online to obtain general usage information or help on a specific function.

The *Entire Operations GUI Client* documentation (including PDF books) is also available at Software AG's Empower web site at <https://empower.softwareag.com/> (Empower login required).

➤ **To invoke online help**

- Select an Entire Operations node and choose **Contents** from the **Help** menu.

The main overview of the *Entire Operations GUI Client* documentation appears.

➤ **To invoke context-sensitive help**

- Choose the **Help** button (if available) in a window or dialog or press F1.

Or:

Select a node in the **object workspace** and press F1.

Help on the current topic appears.

Error Messages

You can use the direct command `HELP` to display the long text of an Entire Operations system error message.

For the syntax that applies to the direct command `HELP` and all options provided with the command, see the *Direct Commands* documentation.

For further information on system messages and the locations where they appear, see the section *Finding System Messages*.

Related Information:

- [Results Window](#) and [Status Bar](#)

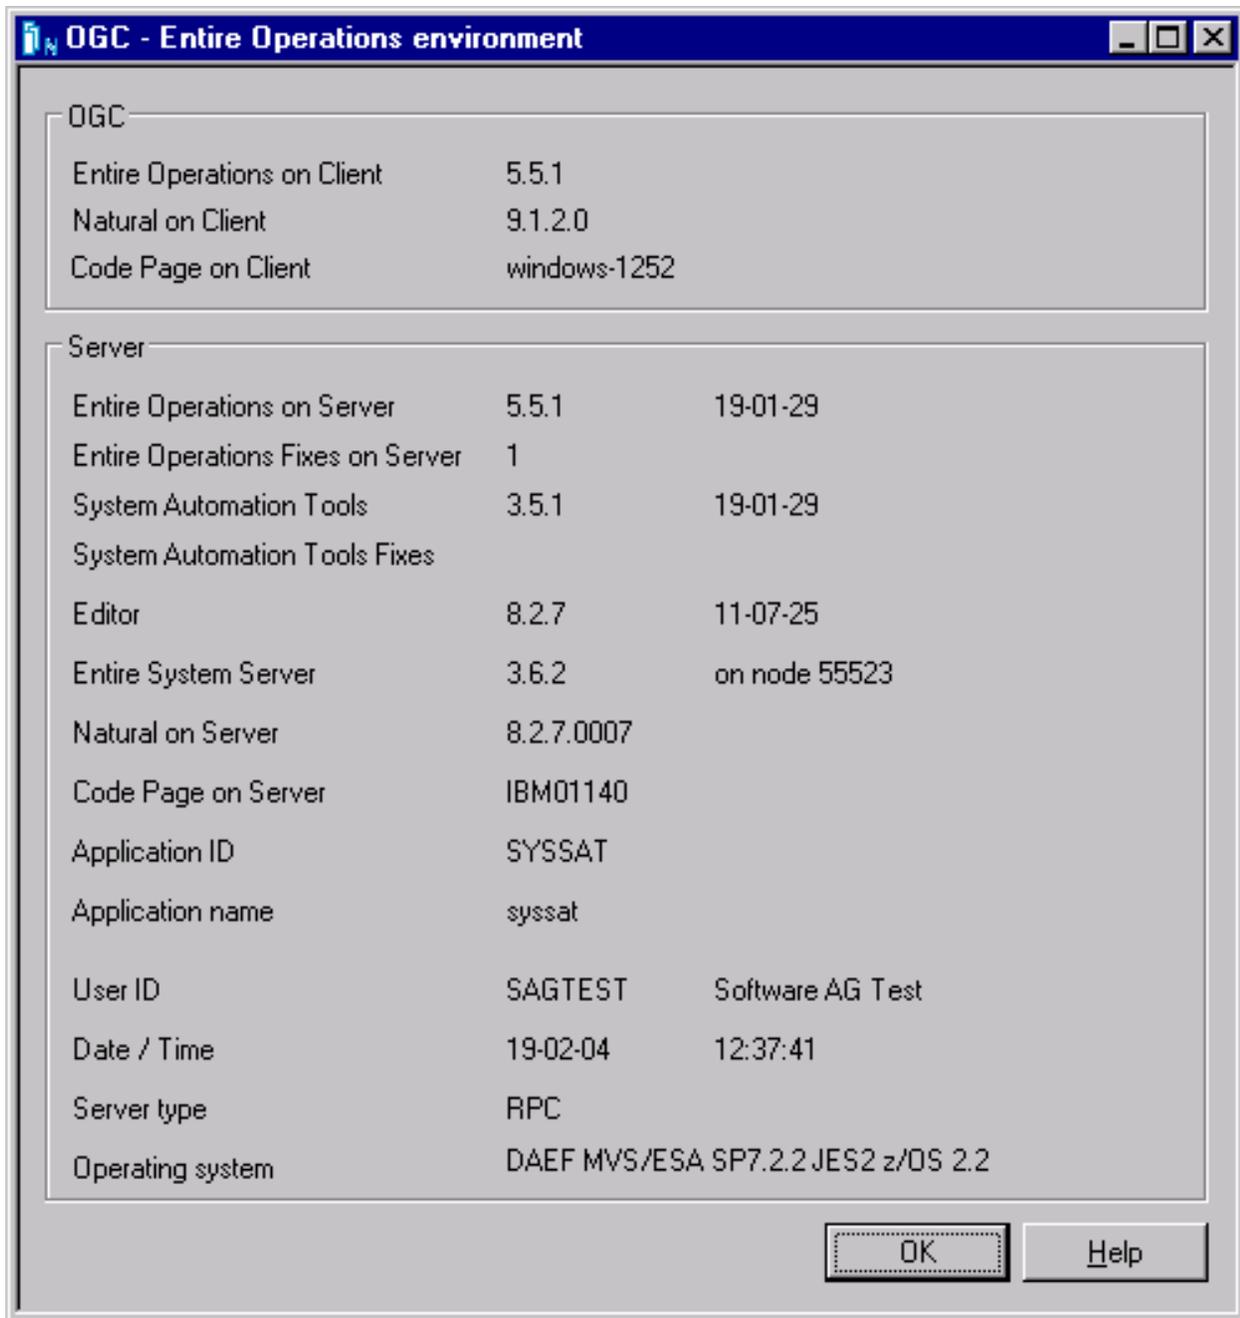

Finding System Messages

Entire Operations GUI Client displays status or error messages at the following locations:

| Location | Description |
|---|--|
| In the active window or in an additional window | If Entire Operations is used online. In many cases, additional information is written to the Entire Operations log. Subsequent to more complex errors it is recommended to have a look there. For more information, see Displaying Logged Information . |
| Message column of the List Active Jobs window | Contains the last status message or error message for the active job. For more information, see the Message column described in List Active Jobs . |
| Browse Log window | Contains all status messages and error messages. If database problems prevent you from writing to the log file, then the messages will be written to the SYSOUT of the Monitor tasks. For more information, see Displaying Logged Information . |
| Monitor tasks SYSOUT | Contains mainly start and end messages of the Monitor tasks. In this case, some other important events are also logged in addition. |

Online Technical Information

You can use the TECH direct command to display technical information on your current Entire Operations session as shown in the following example:

For further information, see *TECH* in the *Direct Commands* documentation.

3 Starting and Ending an Entire Operations Session

› To establish an Entire Operations session

- 1 On your desktop, click on the **Entire Systems Management** shortcut icon.

(A desktop icon for Entire Systems Management is generated automatically after the installation procedure.)

A **Software AG ESM Logon** dialog similar to the example below opens:

Software AG ESM Logon

Natural Security Logon to Server

User ID: SAGTEST

Password:

Change password

EntireX Communicator Broker Security Authorization

Different User ID for EntireX Broker Security

User ID: BRKSECID

Password:

Default server

Node name: DAEF:4020

Server name: QA82ROP4

Options

Restore My Desktop

OK Cancel

2 Enter your credentials:

- Natural Security user ID and password. If required, choose **Change password** to change your password (see the next step).
- (optional) EntireX user ID and password.

Select the **Restore My Desktop** check box (selected by default) if you want to restore your current desktop settings. See also *My Desktop Menu* in the *User's Guide*.

3 Choose **OK** when you are finished.

Entire Operations Client is launched if your Natural Security and EntireX (if relevant) user IDs and passwords are accepted. Otherwise, appropriate error messages occur.

If a password has expired, a dialog similar to the example prompts you for a password change:

Change NSC password

Natural Security Logon to Server

User ID: SAGTEST

Old password:

New password:

Confirm new password:

EntireX Communicator Broker Security Authorization

Different User ID for EntireX Broker Security

User ID: BRKSECID

Password:

Default server

Node name: DAEF:4020

Server name: QA82ROP4

OK Cancel

Choose **OK**.

The **Entire Systems Management** main application window (see the *User's Guide*) opens.

Information in the Main Application Window

By default, the current server name and node name are displayed at the top and at the bottom of the main application window.

In addition, you can display text information of your choice at the top or bottom of the object workspace. For this purpose, System Automation Tools provides the user exit `ESUEX02N` in the system library `SYSSAT`. With the user exit, you can specify the text to be displayed, its color and location, and also choose to display this text instead of the server name and node name at the top of the main application window. For details, see the corresponding user exit source object `ZSUEX02N` in the library `SYSSAT`.

4 Logging on and off an Operating System Server Node

- Logon Function 16
- Fields: Logon Node 17
- Troubleshooting Logon Errors 18
- Monitoring the Node Connection Status 18
- Logoff Function 20

This section provides instructions for logging on or off an Entire System Server node.

Logon Function

> To log on a node

- 1 In the **object workspace**, select a node instance and choose **Logon** from the **context menu**, or press CTRL+ALT+L.

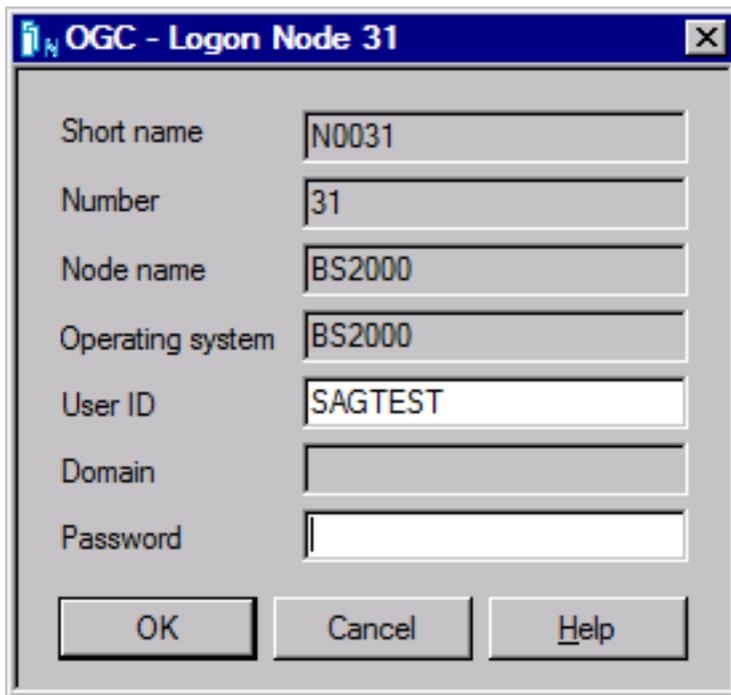

Or:

Use the direct command LOGON as described in the *Direct Commands* documentation.

Or:

From the **General** node, choose **Monitor Status** (only applies if the node is not active yet).

A **Logon Node** dialog similar to the example below opens:

| | |
|------------------|---------|
| Short name | N0031 |
| Number | 31 |
| Node name | BS2000 |
| Operating system | BS2000 |
| User ID | SAGTEST |
| Domain | |
| Password | |

OK Cancel Help

In the input fields, enter the required information. All fields are described in [Fields: Logon Node](#).

- 2 Choose **OK**.

Fields: Logon Node

The **Logon Node** window contains the following fields:

| Field | Description |
|-------------------------|---|
| Short name | Short node name. |
| Number | Node number. |
| Node name | Logical (long) node name. |
| Operating system | Operating system on node. |
| User ID | <p>Valid user ID.</p> <p>If you logon to a mainframe node, input text is converted to uppercase letters.</p> <p>If you logon to a UNIX or Windows node, input text is not converted to uppercase letters. Therefore, make sure an exact spelling in mixed case.</p> <p>See also <i>Field Defaults</i>.</p> |
| Domain | <p>Input field for Windows or UNIX nodes:</p> <p>Enter a Windows domain or UNIX group, respectively.</p> <ul style="list-style-type: none"> ■ Windows: If this field is left blank, the logon will be carried out without domain. Otherwise, this field must contain a valid domain. The default user ID and domain can be used (see the <i>Administration</i> documentation) for combinations of Entire Operations users and operating system servers (nodes). ■ UNIX: If this field is left blank, the user's default UNIX group (from <code>/etc/passwd</code>) is used. Otherwise, this field must contain one of the UNIX groups, which is visible in the output of the UNIX groups command. |
| Password | <p>Input field for the password of the user specified in the User ID field.</p> <p>Logon to BS2000 nodes:</p> <p>The password can have up to 32 characters. Input text is converted to uppercase letters.</p> <p>Logon to z/OS nodes:</p> <p>This field can be used for both a password (up to 8 characters) and a password phrase (9 to 32 characters).</p> <p>A password is converted to uppercase letters depending on the setting of the password mode for the node (see the <i>Administration</i> documentation). A password phrase is always treated as a case-sensitive text string.</p> |

| Field | Description |
|-------|---|
| | Note: You can resize the window to enter a long text string. |

Field Defaults

The default user ID - and perhaps also the group or domain - for logging on to a node can be defined for any combination of Entire Operations users and nodes (see *User Definitions and Profile Settings* in the *Administration* documentation). In this case, these values are displayed as defaults during the logon process.

They serve to simplify the logon process. If you want to logon with another user ID and/or group or domain, then these fields may simply be overwritten.

Troubleshooting Logon Errors

If a logon to a node fails, the error message returned by Entire Operations usually indicates that the data entered collides with the Entire Operations user security definitions. For example:

```
EOR0254 - Invalid User ID or Password.
```

The Entire Operations log file can contain additional error information returned from the underlying security system of an operating system, such as RACF for z/OS. For example:

```
Logon failed, Node 146 User ID SAG1  
... IRR013I VERIFICATION FAILED. INVALID PASSWORD GIVEN.
```

Monitoring the Node Connection Status

You can view a list with the current status of nodes defined in your environment. In addition, you can add a node to the list of nodes to be monitored.

➤ To monitor the node connection status

- 1 In the **object workspace**, select a **Node** metanode and choose **Show Connection Status** from the context menu.

Or:

In the **Command** line, enter the following direct command:

```
STATUS NODES
```

(See also the `STATUS` command described in the *Direct Commands* documentation.)

A **Connection Status** window similar to the example below opens:

The columns and selection options in the window are explained in *Columns and Selection Options: Node Connection Status*.

- Choose **Clear Entry** to remove the selected node status entry from the list or choose **Clear All** to remove all node status entries.

➤ To add a node to be monitored

- In the **object workspace**, select a **Node** instance and open **Add to Connection Status** from the context menu.

The node is added to the **Connection Status window**.

Note: By default, a node connection status is transient and can change when you terminate an Entire Operations session. You can save the status of all node connections for a future session by selecting the **Node Connection Status** option in the session profile described in the section *User Maintenance* in the *Administration* documentation.

For further information, see also the API `NOPUST3N` described under *Inquire Network and Job Status, Symbol Table* in the section *API Routines*.

Columns and Selection Options: Node Connection Status

The columns, selection options and output fields contained in the **Connection Status window** are described in the following table.

| Column/Section | Description |
|-------------------------------|--|
| Operating system class | In this section, check or uncheck single or multiple operating systems (BS2000, z/OS, z/VSE, Windows and UNIX) defined for the nodes or select All for all operating systems. Unknown selects all nodes for which no operating system has been defined. |
| Access mode | In this section, check or uncheck single or multiple access modes used by the nodes (network for mainframe nodes, EntireX Broker for UNIX and Windows nodes and local node) or select All for all access modes. |
| Status | Node status of last Entire System Server call, for example, active or not active. In this section, check or uncheck single or multiple status values or select All for all status values. Other selects all nodes with a status other than active or not active. |
| Number | Node number. |
| Short Name | Short node name. |
| Node Name | Logical (long) node name of the server. |
| AM | Access mode. |
| Op.Sys. | Operating system on node. |
| OS Release | Operating system release. |
| Op.Sys Class | Operating system class. |
| Version | Entire System Server version. |
| Statistics | The output fields in this section show the numbers of active and inactive nodes and the nodes where errors occurred. |

Logoff Function

➤ To log off a node

- In the **object workspace**, select the required node instance and choose **Logoff** from the context menu.

Or:

Use the direct command LOGOFF as described in the *Direct Commands* documentation.

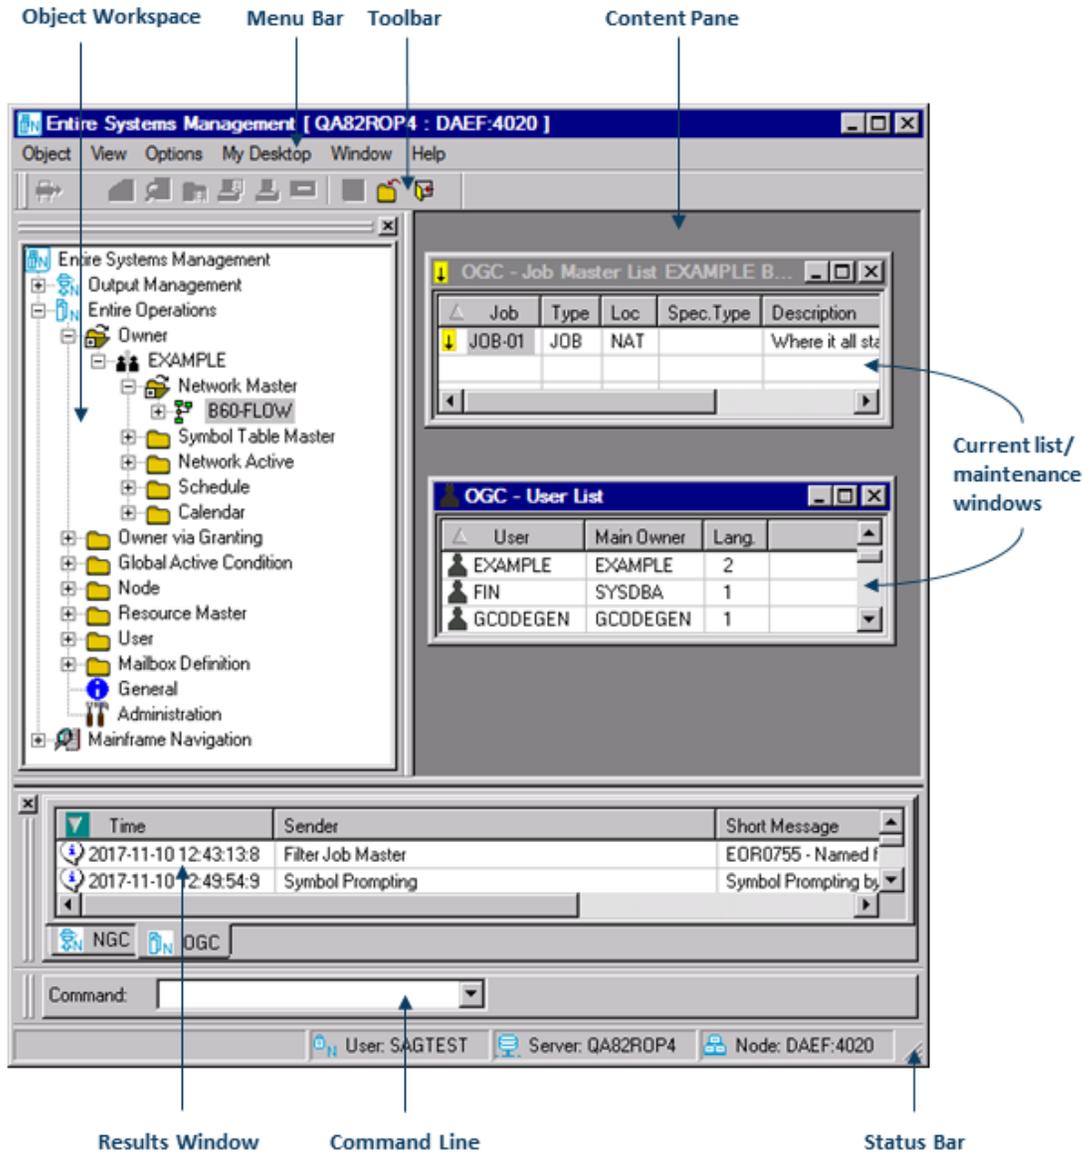

The previously selected node is now logged off.

5

Elements of the Main Application Window

| | |
|--------------------------|----|
| ▪ Object Workspace | 25 |
| ▪ Menu Bar | 28 |
| ▪ Options Menu | 29 |
| ▪ My Desktop Menu | 30 |
| ▪ Toolbar | 34 |
| ▪ Content Pane | 35 |
| ▪ Results Window | 35 |
| ▪ Command Line | 36 |
| ▪ Status Bar | 36 |
| ▪ Context Menu | 37 |
| ▪ Dockable Windows | 38 |

When you start the Entire Operations GUI Client, an **Entire Systems Management** main application window similar to the example below opens:

The main application window contains the **object workspace** with the **Entire Operations** tree view on the left and the **content pane** on the right. To modify the size of a pane, move the mouse pointer over the border separating the panes until the pointer changes, showing two arrows pointing in opposite directions . Then drag the border using the mouse until the panes have the required size.

In addition to the object workspace and the content pane, the main application window contains the **menu bar**, the **toolbar**, the **command line**, the **result list** and the **status bar**.

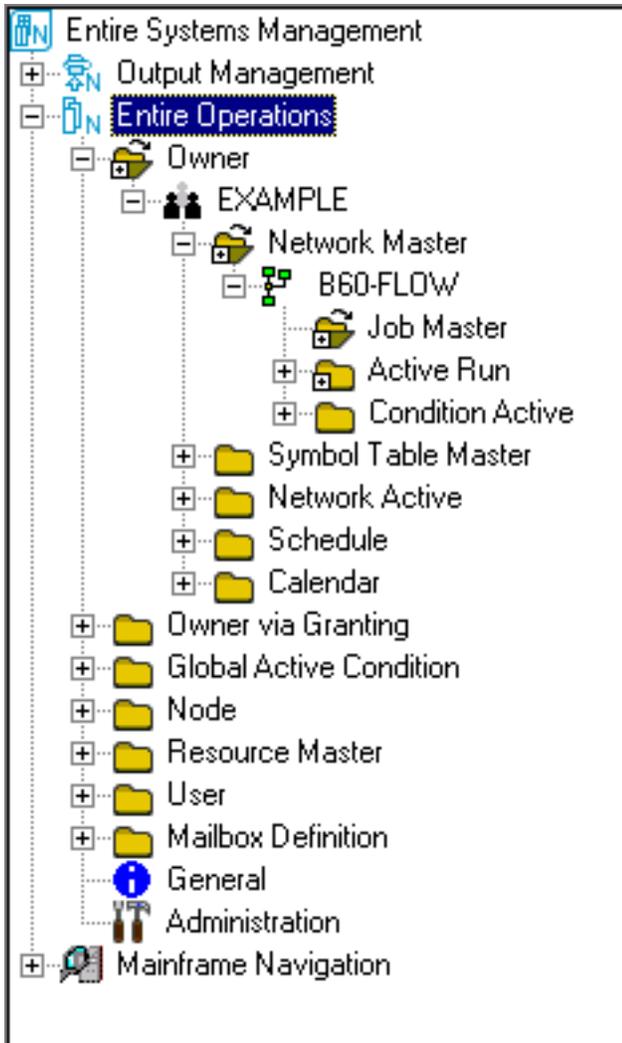

Note: You can hide application nodes that cannot be accessed for different reasons by using the ESUEX01N user exit routine for the System Automation Tools server. For details, see the source object ZSUEX01N (supplied for ESUEX01N) in the Natural SYSSAT system library.

This chapter covers the following topics:

Object Workspace

- [Expanding or Collapsing a Tree Node](#)
- [Working within the Tree View using Function Keys](#)

The Entire Operations object workspace with the tree view is on the left side of the main application window:

In the object workspace, all available Entire Operation objects are hierarchically listed as the nodes of a tree view. You can create and maintain objects by using the functions provided by the **context menu** of a selected node or subnode.

➤ **To show or hide the workspace**

- In the **View** menu, mark or unmark **Object Workspace** to show (default) or hide the object workspace respectively.

Expanding or Collapsing a Tree Node

You can expand or collapse a tree node to list and access all objects contained in a node or subnode.

➤ To expand or collapse a tree node

- With the left mouse button, click on the plus or minus sign in front of the node you want to expand or collapse respectively.

An object preceded by a minus sign is fully expanded; an object preceded by a plus sign is fully collapsed.

Or:

Use the **Expanded workspace tree** option of the menu item **My Desktop > Options** described in [My Desktop Menu](#).

Working within the Tree View using Function Keys

- [Navigation](#)
- [Executing Object Functions](#)

Navigation

➤ To navigate within the tree view

- Press UP ARROW or DOWN ARROW to move the selection up or down in the tree view or list view.

Or:

Press LEFT ARROW or RIGHT ARROW to select or collapse an object in the tree view within the same hierarchy.

Or:

Press ENTER or double-click on an object to perform the default function for the currently selected object. It also collapses or selects an object, depending on its current state.

Or:

Press HOME or END to select the first or the last object within the tree view or list view.

Executing Object Functions

> To add an object

- 1 Select an object for which the **New** function is available in the **context menu**.
- 2 Press the `INSERT` key to trigger the **New** function.

A **Create new** window opens where you can enter all definitions required to add a new object.

> To delete an object

If the **Delete** function exists for the respective object:

- 1 Select an object for which the **Delete** function is available in the context menu.
- 2 Press `DELETE`.

The selected object is deleted.

Menu Bar

The menu bar is at the top of the main application window on the left:

This section covers the following topics:

- [Choosing a Menu](#)

Choosing a Menu

> To choose a menu from the menu bar

- 1 Select the appropriate menu.
A drop-down menu of options appears.
- 2 From the drop-down menu, choose the required function and object options.

The following menus are available:

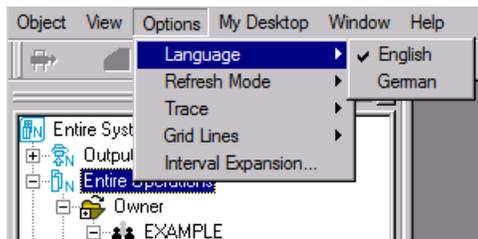

| Menu | Function |
|-------------------|--|
| Object | Filter, list, create, modify, display or perform other functions on the selected objects. Exit the Entire Operations GUI Client. |
| View | Show or hide the object workspace , command line , result list and/or status bar . |
| Options | Select either German or English, modify trace options. Select trace level and trace writing mode (continuous or overwrite), set refresh mode (current level or recursive). See Options Menu for detailed information. |
| My Desktop | Individual desktop settings described in My Desktop Menu . |
| Window | Select the next, previous or required content pane. Close all panes. |
| Help | For a selected Entire Operations node: Content: Display the main overview of the Entire Operations GUI Client documentation. See also Online Help and System Messages . About Entire Operations: Display the current version of Entire Operations. |

Options Menu

The **Options** menu provides the following:

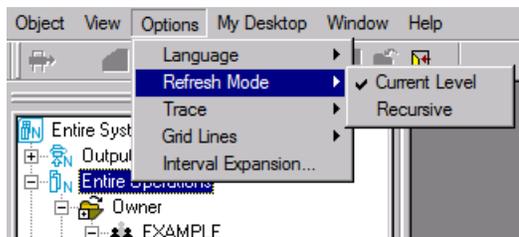

Language

Select the required language:

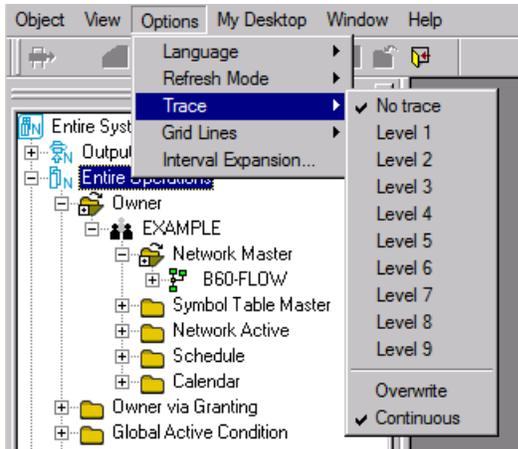

Refresh Mode

Set the refresh mode (current level or recursive):

Trace

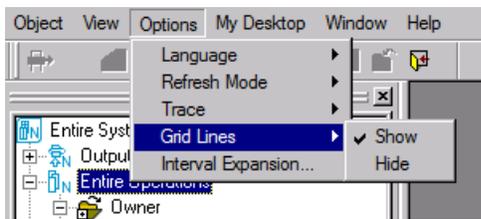

Set trace options:

See [Tracing](#) for detailed information.

Grid Lines

Display or hide grid lines for list views.

See also [Showing or Hiding Grid Lines](#).

Interval Expansion

Applies to Output Management only.

My Desktop Menu

The options and functions provided by the **My Desktop** menu are used to customize or reset your Entire Operations environment. You can save the setting of the tree view (expanded nodes, set filters) and the windows opened during a session as a default setting for future sessions.

You enable (default) or disable **My Desktop** customization settings with the **Restore My Desktop** option in the **Software AG ESM Logon** dialog at the startup of an Entire Systems Management session (see also [Starting and Ending an Entire Operations Session](#)). The **Restore My Desktop** option retrieves your latest desktop settings from your user profile.

Disabling **My Desktop** can be useful if customized desktop settings are not required for a session or if the **My Desktop** startup causes problems.

-  **Note:** The menu items **My Desktop > Catch** and **My Desktop > Reset** are only enabled when at least one option in the **My Desktop - Options** window is saved in **Catch** mode.

This section covers the following topics:

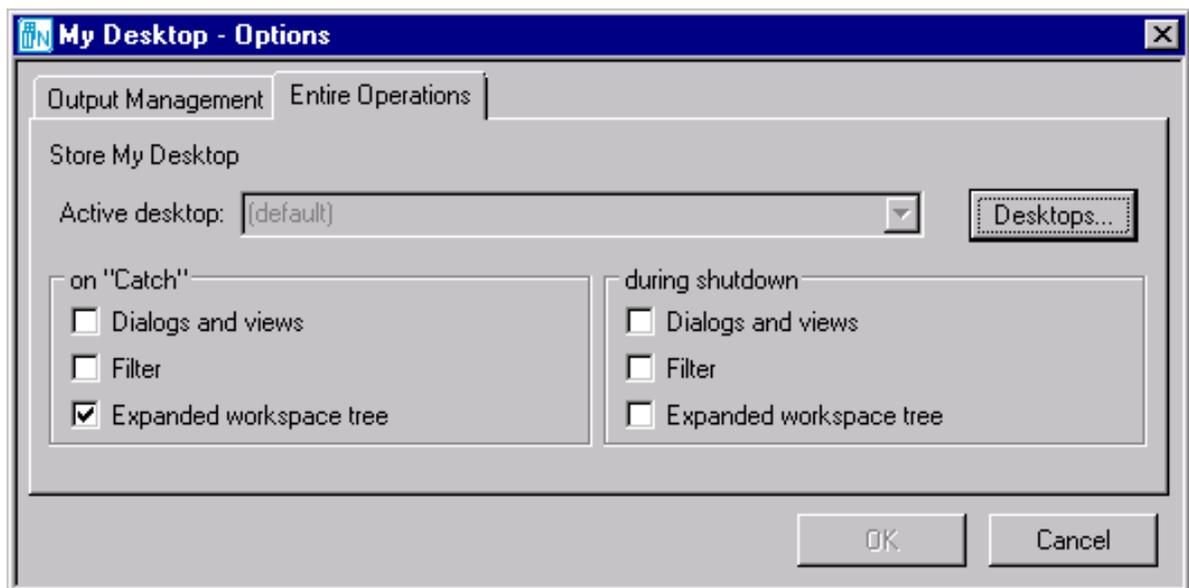

- [Customizing your Desktop](#)
- [Using Alternative Desktops](#)
- [Resetting a Desktop](#)

Customizing your Desktop

> To customize your desktop

- 1 Logon with the user ID of the user whose desktop you want to customize. Make sure that the **Restore My Desktop** option is selected in the **Software AG ESM Logon** dialog (see [Starting and Ending an Entire Operations Session](#)).
- 2 From the **My Desktop** menu, choose **Options**.

A **My Desktop - Options** dialog similar to the example below opens:

- 3 Choose **Desktops** if you want to select an alternative desktop (if available) instead of the default desktop indicated by **(default)** in the **Active desktop** field. See also [Using Alternative Desktops](#).
- 4 Select one or more options in the **on "Catch"** section if you want to save your desktop settings during the current session.

Or:

Select one or more options in the **during shutdown** section if you want to save your desktop settings when shutting down Entire Systems Management.

You cannot select the same option in both sections.

Select the settings you want to keep for a future session:

■ **Dialogs and views**

Keeps a window open if it contains one of the following:

Object list view, workplan, schedule, diagram;
Monitor status, node connection status, activity log, browse log;

List of next activations, network history, messages;
Import/export queue, report queue.

■ **Filter**

Uses all filters set by the user (see also *Filtering Objects*).

■ **Expanded workspace tree**

Keeps tree view nodes expanded in the object workspace.

5 If required, save your current desktop settings as an alternative desktop: see *Using Alternative Desktops*.

6 Choose **OK** when you are finished.

The desktop settings are stored in the user profile of the current user.

7 Choose **My Desktop > Catch** whenever you want to save the current settings during the session.

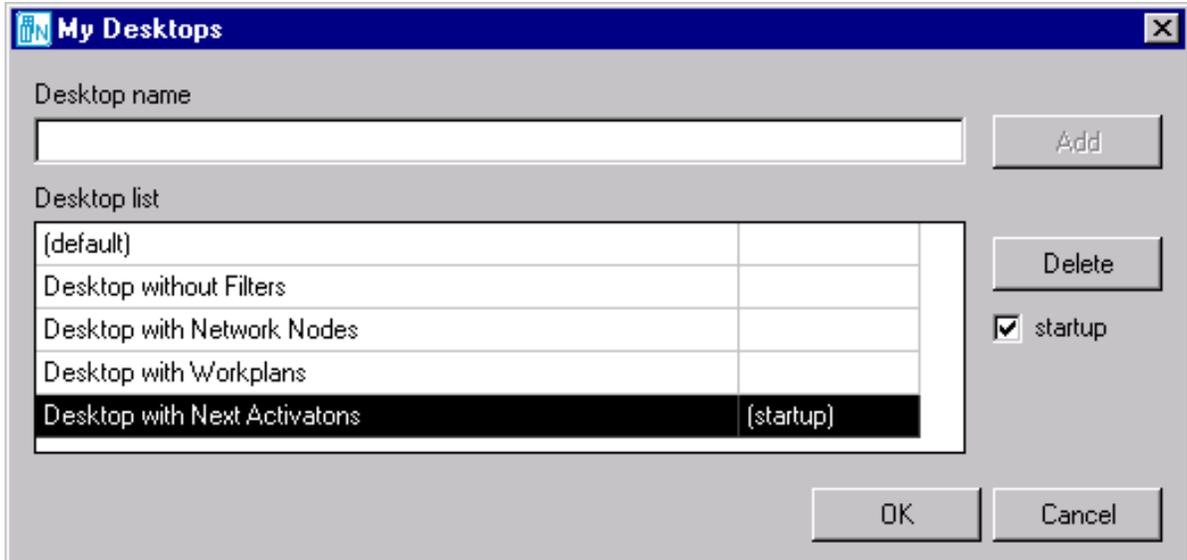

(If the **during shutdown** option is used, the settings are automatically saved when the session terminates.)

Using Alternative Desktops

» To use alternative desktops

1 In the *My Desktop - Options* dialog, select the required settings and choose **Desktops**.

A **My Desktops** dialog similar to the example below opens:

- 2 In the **Desktop name** field, enter a name of up to 32 alphanumeric characters and choose **Add**.

The specified name is added to the **Desktop list** and can be used to save your settings during **Catch** or **shutdown** operations.

You can have a maximum of 4 alternative desktops.

- 3 To set a default desktop:

From the **Desktop list**, select the desktop you want to use for future sessions and mark the **startup** check box. The selected desktop is marked with **(startup)** in the list.

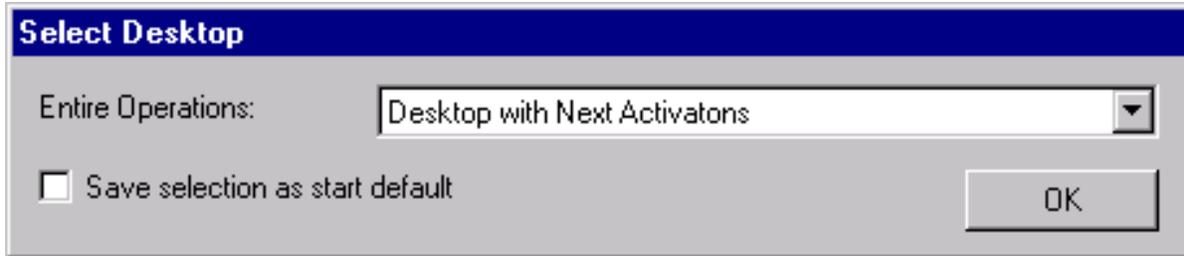

To delete a desktop:

From the **Desktop list**, select the desktop you want to remove and choose **Delete**. The selected desktop is removed from the list.

You cannot delete the (default) desktop.

- 4 Choose **OK** when you are finished.

At the next session start, a dialog similar to the following opens if at least one alternative desktop exists:

- 5 The desktop marked with **(startup)** is entered in the **Entire Operations** field by default.

If you want to use another desktop for a future session, select the required desktop from the drop-down list box and mark the **Save selection as start default**. This desktop is then marked with **(startup)** in the **Desktop list** and used at the next session start.

- 6 Choose **OK**.

The settings stored last in your user profile are loaded into your Entire Operations environment.

Resetting a Desktop

> To reset all or single desktop settings

- From the **My Desktop** menu, choose **Reset** and one of the following options:
 - **All**
 - **Dialogs and views**
 - **Filter**
 - **Expanded workspace tree**

Choose **All** if you want to reset all desktop settings, or choose the required setting.

A dimmed option indicates that no corresponding desktop setting exists.

The desktop currently active is reset.

Toolbar

The toolbar is just below the menu bar at the top of the screen.

➤ To perform a function from the toolbar

- Choose the appropriate function icon. If an icon is grayed-out, the function is not available for the selected object.

Content Pane

The content pane takes up the right side of the main application window. The appropriate list, window, diagram or dialog appears here, when you perform a function for an object.

Results Window

The **Results** window (shown by default) contains a list of messages that report hints, errors and warnings that occur during the session as a result of function processing.

| Time | Sender | Short Message | Severity |
|-----------------------|--|---|-------------|
| 2017-11-10 12:50:02:2 | Activate Network Network Master SAGNET [SAGTEST] | Activated by User ID SAGTEST | Information |
| 2017-11-10 12:50:02:2 | Activate Network Network Master SAGNET [SAGTEST] | ... Start Time is 2017-11-10 12:50 | Information |
| 2017-11-10 12:50:02:2 | Activate Network Network Master SAGNET [SAGTEST] | EOR1042 - Network SAGNET activated, Run 322 | Information |
| 2017-11-10 17:05:29:9 | Maintenance Job Master JOB-01 [EXAMPLE,B60-FLOW] | EOR2311 - Invalid Combination Job Type / JCL Location | Error |
| 2017-11-10 17:06:05:1 | Maintenance Job Master JOB-01 [EXAMPLE,B60-FLOW] | EOR1130 - Job Definition modified | Information |
| 2017-11-10 17:06:05:1 | Maintenance Job Master JOB-01 [EXAMPLE,B60-FLOW] | ... Version (unnamed) | Information |

A **context menu** is available where you can get detailed information for a specific line and can delete one or all messages in the result list.

| Time | Sender | Short Message | Severity |
|-----------------------|--|--|-------------|
| 2017-11-10 12:50:02:2 | Activate Network Network Master SAGNET [SAGTEST] | Activated by User ID SAGTEST | Information |
| 2017-11-10 12:50:02:2 | Activate Network Network Master SAGNET [SAGTEST] | ... Start Time is 2017-11-10 12:50 | Information |
| 2017-11-10 12:50:02:2 | Activate Network Network Master SAGNET [SAGTEST] | EOR1042 - Network SAGNET activated | Information |
| 2017-11-10 17:05:29:9 | Maintenance Job Master JOB-01 [EXAMPLE,B60-FLOW] | EOR2311 - Invalid Combination Job T... | Error |
| 2017-11-10 17:06:05:1 | Maintenance Job Master JOB-01 [EXAMPLE,B60-FLOW] | EOR1130 - Job Definition modified | Information |
| 2017-11-10 17:06:05:1 | Maintenance Job Master JOB-01 [EXAMPLE,B60-FLOW] | ... Version (unnamed) | Information |

Click on the **Close** button or use the **View** menu option to close the **Results** window.

Command Line

The command line is the **Command** input field shown above the **status bar**:

In the command line, you can enter an Entire Operations direct command if you want to directly execute an Entire Operations function.

From the drop-down list box, you can also select a direct command you executed previously during the current session.

For a description of all Entire Operations direct commands available and instructions on issuing a direct command, refer to the *Direct Commands* documentation.

Status Bar

The status bar is the horizontal information line at the bottom of the main application window:

It can contain the following information:

- The current user, server and node
- The total number of data records listed in an active window, for example: 7 data records received from server.

Or:

For an active editor window (example above): the current cursor position (line and column number), the total number of source lines and the edit mode (if OVR is activated, input overwrites existing text).

- For a selected item in a context menu: a brief description of the menu item, for example, the **Filter** menu item shows Store filter criteria for a list in the status bar.

Context Menu

A context menu allows you to perform a function on an object listed in the tree view of the **object workspace** or in the list or diagram view (see *Viewing and Maintaining a Job Network Diagram*) of an active window in the **content pane**.

In addition, a context menu can also be available for a name selected in the input field of an active maintenance window, for example, the name of a node, a file or a symbol table.

➤ To choose a function from the context menu

- 1 Select an object from the object workspace, open a list or diagram window, or select a name input field in a maintenance window.
- 2 Click the right mouse button.

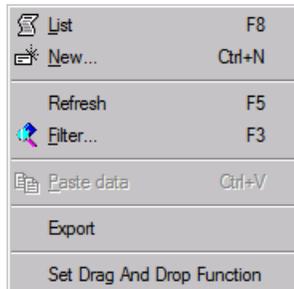

Or:

Press SHIFT+F10.

Or:

Press MENU (application key).

The context menu opens.

The example above shows the context menu for the **Network Master** metanode selected in the object workspace.

- 3 Choose the required function.

Functions that are grayed-out are not available for the selected object.

Dockable Windows

The following elements of the application window are dockable windows:

- toolbar
- object workspace
- results window

Using the mouse, you can drag a dockable window to another position so that it is shown

- at another position within the application window, or
- in a window of its own.

You can move the window freely on your screen. You can move it back to the application window (for example, back to its original position) so that it is no longer shown in a window. This process is called “docking”.

> To undock/dock a window

- Double-click the two lines which are shown for the docked window. For example:

Or:

Double-click the title bar of an undocked window.

If the window is currently docked, it is undocked. If the window is currently undocked, it is docked at its previous position.

> To drag a docked window to another position

- 1 Move the mouse pointer to the two lines which are shown for the docked window.
- 2 Press the mouse button and drag the window to another position.

An outline of the window is shown. The outline indicates the position at which the window can be docked.

- 3 If you want to prevent docking (that is, if you want to undock the window), press CTRL while dragging the window.
- 4 Release the mouse button.

➤ **To drag an undocked window back to the application window**

- 1 Move the mouse pointer to the title bar of an undocked window.
- 2 Press the mouse button and drag the window to the position at which you want to dock it.

An outline of the window is shown. The outline indicates the position at which the window can be docked.

- 3 Release the mouse button.

Note: The commands in the **Windows** menu do not apply to dockable windows.

6 Common and Global Functions

| | |
|---|----|
| ▪ Cancelling Reading | 42 |
| ▪ Applying Changes | 42 |
| ▪ Listing Objects | 42 |
| ▪ Refreshing Object Lists | 43 |
| ▪ Filtering Objects | 44 |
| ▪ Specifying Filter Criteria | 47 |
| ▪ Saving a List View as a Report File | 50 |
| ▪ Drag & Drop | 51 |
| ▪ Displaying Objects | 52 |
| ▪ Copying Objects | 52 |
| ▪ Pasting Objects | 53 |
| ▪ Deleting Objects | 54 |
| ▪ Importing and Exporting Objects | 54 |
| ▪ Functions of the Metanode General | 55 |
| ▪ Monitor Status | 55 |
| ▪ Show Messages | 56 |
| ▪ Add to Workplan | 57 |
| ▪ Show Workplan | 58 |
| ▪ Show all Owners | 61 |
| ▪ Show linked Owners | 61 |
| ▪ Tracing | 62 |

This section describes common functions of Entire Operations GUI Client that perform the same operations for different objects.

In addition, it describes the functions of the **General** metanode that perform global operations on all objects in your Entire Operations environment.

Cancelling Reading

In Entire Operations GUI Client, a long reading process can be cancelled by pressing ESC.

➤ To cancel reading

- Press ESC.

Applying Changes

All maintenance dialogs within the Entire Operations GUI Client provide an additional **Apply** button to save previously entered information without closing the maintenance dialog. The changes take effect just by selecting **Apply**.

If you create a new object and select **Apply**, this dialog changes from a **New** to a **Maintenance** behavior.

Listing Objects

➤ To view a list of objects

- 1 In the **object workspace**, select a metanode.
- 2 Open the **context menu** and choose **List**, or press F8.

Or:

Use the `LIST` direct command as described in the *Direct Commands* documentation.

A **List** window similar to the example below opens:

| Job | Type | Loc | Spec.Type | Description | File or Library | Member |
|------------|------|-----|-----------|----------------------|-----------------|----------|
| JOB-01 | JOB | NAT | | Where it all starts | SYSEXP | AAREADME |
| JOB-012 | JOB | MAC | | Depending on Job-01 | SYSEORU | B60-M01 |
| JOB-013 | JOB | MAC | | Depending on JOB-012 | SYSEORU | B60-M01 |
| JOB-014 | JOB | MAC | | Depending on JOB-013 | SYSEORU | B60-M01 |
| JOB-015 | DUM | | | Depending on JOB-014 | | |
| JOB-019 | JOB | MAC | G | Depending on JOB-01 | SYSEORU | B60-M01 |
| JOB-02 | JOB | MAC | | Dep. JOB-15, JOB-19 | SYSEORU | B60-M02 |
| JOB-03 | NAT | NAT | | Depending on JOB-02 | SYSEORU | B60-P01 |
| JOB-04 | JOB | MAC | | Depending on JOB-03 | SYSEORU | B60-M01 |
| JOB-05 | DUM | | | Depending on JOB-04 | | |
| JOB-06 | JOB | MAC | | Where it all ends | SYSEORU | B60-M02 |
| JOB-1-TEST | JOB | NAT | D | Where it all starts | SYSEXP | ACCEPX01 |

All objects of the selected metanode are listed.

In the example above, all jobs of the **Job Master** metanode are listed for the B60 - FLOW network of the owner EXAMPLE.

This section covers the following topics:

- [Showing or Hiding Grid Lines](#)

Showing or Hiding Grid Lines

The **context menu** in a **List** window provides the **Grid Lines** function with the options **Show** and **Hide** to show grid lines in the **List** window or hide them, respectively. Changes affect the view in the active **List** window only.

You can set initial values for all **List** views:

From the **Options** menu, choose **Grid Lines** and select **Show** or **Hide**. This setting is stored between sessions in user XML profile and is used as the default value for all **List** views.

Refreshing Object Lists

➤ To refresh objects listed in the object workspace

- In the **object workspace**, select a metanode and choose **Refresh** from the context menu, or press F5.

The list of objects of the selected metanode is updated immediately.

➤ **To refresh objects from an open list window**

- Open a window that contains a list of objects and press F5 or choose the **Refresh** button, if available.

The list is updated immediately.

Or:

Open a window that contains a list of objects and choose **Auto Refresh**, if available.

In the **Automatic Refresh** window that opens, select the **Automatic refresh** check box. If required, change the time interval (the default is 30 seconds) in which you want to update the list.

Choose **OK**.

The list is updated automatically in the time interval specified.

Filtering Objects

You can define a named or unnamed filter for a set of objects to be shown by default in the tree view nodes of the **object workspace** and listed in an object **List window**.

Filter Rules

The following rules apply when using a named filter:

- The default values set for **Filter** in your user profile (see the *Administration* documentation) are used.

You must have appropriate access rights to read, modify and delete a named filter.

A global filter specified in your user profile overrides any named filters set in your environment.

You cannot use a named filter if a global filter is set in your user profile.

- A named filter is in effect during the current session, or across sessions if the **Restore My Desktop** is set.

A global filter is in effect across sessions, the setting of the **Restore My Desktop** option is ignored.

- Once set, a filter becomes effective immediately. The tree view in the object workspace is rebuilt and only shows the type of objects and name ranges specified for the filter.
- A named filter that uses the selection criterion (`current`) may need a refresh of the list data if the determination date changes: see *Changes to the Determination Date*.

- If a filter is set in your environment, the icon of the folder that contains the filtered objects changes from  to  in the object workspace.

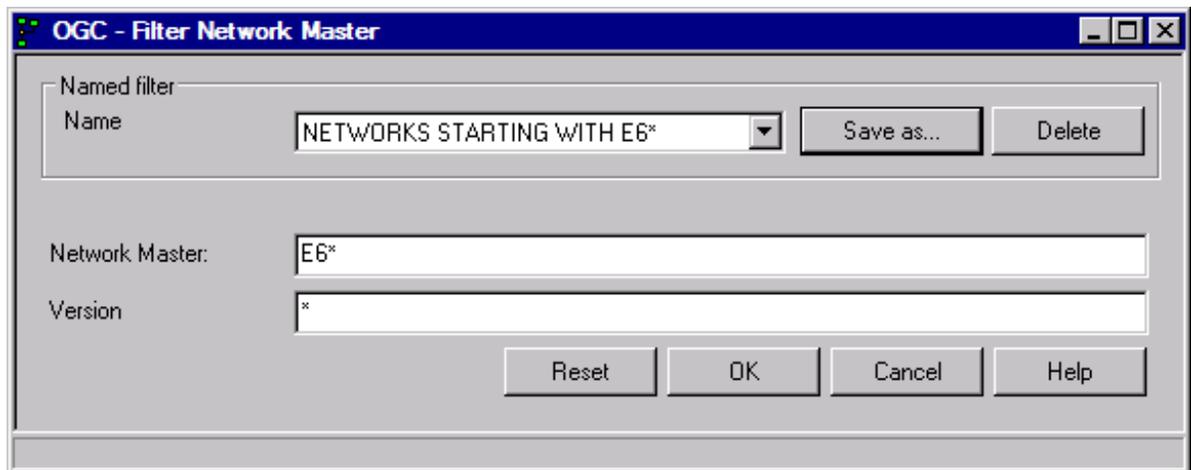

> **To filter objects**

- 1 In the **object workspace**, select a metanode.
- 2 Open the **context menu** and choose **Filter**.

Or:

Press F3.

A **Filter** window similar to the example below opens:

The input fields provided in the window depend on the type of objects contained in the selected node. For example, the field **Version** is only available for objects of the type network master and symbol table master.

The input fields are dimmed if a global filter is set. The **Name** field then contains (**Global Filter**) and the object specification fields indicate the selection criteria used by the filter. In this case, you cannot create or set a named filter.

- 3 You can create a new filter by entering a name in the **Name** field or choose a filter from the drop-down list box. Choose an option:
 - Leave the **Name** field blank and enter the required **filter criteria** in the remaining input fields.

Or:

 - From the **Name**, select the name of a filter with predefined **filter criteria**.

- From the **Name**, select the name of a filter you want to use as a template for a new filter. Change the filter criteria as required and save the filter with a new name by using the **Save as** function.

A filter name can have a maximum of 50 alphanumeric characters.

- 4 Choose **OK** when you are finished.

Now, only objects which satisfy the selection criteria are listed in the tree view and **List** window as shown in the following example:

| Network | Loop | Node | Description |
|-----------------|------|------|----------------------------------|
| E60-FLOW | | 148 | Job Flow MVS |
| E60-FLOW <v2.1> | | 148 | Job Flow MVS |
| E62-NET | | 148 | Triggers another Network |
| E62-NET-B | | 148 | Will be triggered |
| E64-MPA | | 148 | Multiple parallel job activation |

The filter criteria used for the list is indicated in the window title (here: **Filter: NetworkMasterID=E6***).

In the example above, all networks with names starting with E6 are to be selected for all network versions.

A common named filter remains active until you explicitly **Reset** it or until a global filter overrides it.

- 5 The **Filter** window provides the following functions:
 - Choose **Reset** to reset all filter criteria and deactivate a filter.
 - Choose **Save as...** to save the current filter criteria as a named filter.

A window opens where you can enter the filter name.

Choose **OK** to save the new filter.

- Choose **Delete** to remove a selected named filter.

A window prompts you to confirm the deletion.

Specifying Filter Criteria

This section describes the options provided to specify name ranges to be used as selection criteria for Entire Operations functions or drop-down list boxes.

In the following table, *value* is any combination of one or more characters.

| Input | Names Selected |
|-----------------------------|---|
| * | All names. |
| <i>value</i> * | All names that start with <i>value</i> . Example: AB* Selected: AB, AB1, ABC, ABEZ Not selected: AA1, ACB |
| <i>value</i> > | All names greater than or equal to <i>value</i> . Example: AB> Selected: AB, AB1, BBB, ZZZZZZZ Not selected: AA1, AAB |
| <i>value</i> < | All names less than or equal to <i>value</i> . Example: AX< Selected: AB, AWW, AX Not selected: AXA, AY |
| <i>value</i> ? | All names that start with <i>value</i> and end with any single character for each question mark (?) entered. Example: ABC? Selected: ABCA, ABCZ Not selected: AXC, ABCAA |
| <i>value</i> ? <i>value</i> | All names that match and <i>value</i> combined with a question mark (?) in any order. Example: A?C Selected: ABC, ACC Not selected: ABCA, AC |
| ??? | All names with an exact length of three characters. Example: ??? Selected: ABC, DEF Not selected: AC, DEFA |

- [Listing Current Network Versions Only](#)

Listing Current Network Versions Only

This option only applies to the [Filter function](#).

As an alternative to specifying a name range for a network version, you can also list only the current version for each network.

The filter selects a single network version as the current version if either of the following applies:

- The date range specified in the usage definition of a network version (see [Handling Network Version Usage Definitions](#)) matches the evaluation date. The evaluation date is either the determination date specified for a filtered [List window](#) or the current date of a filtered tree view. See also [Changes to the Determination Date](#).
- The network has one version only (a named or an unnamed version, see [Versioning of Job Networks](#)) and a usage definition does not exist for this version.

Changes to the Determination Date

The result list returned in the **List** window for a named filter that uses `(current)` depends on the [determination date](#) set. If the date changes, you need to refresh the data in an open **List** window

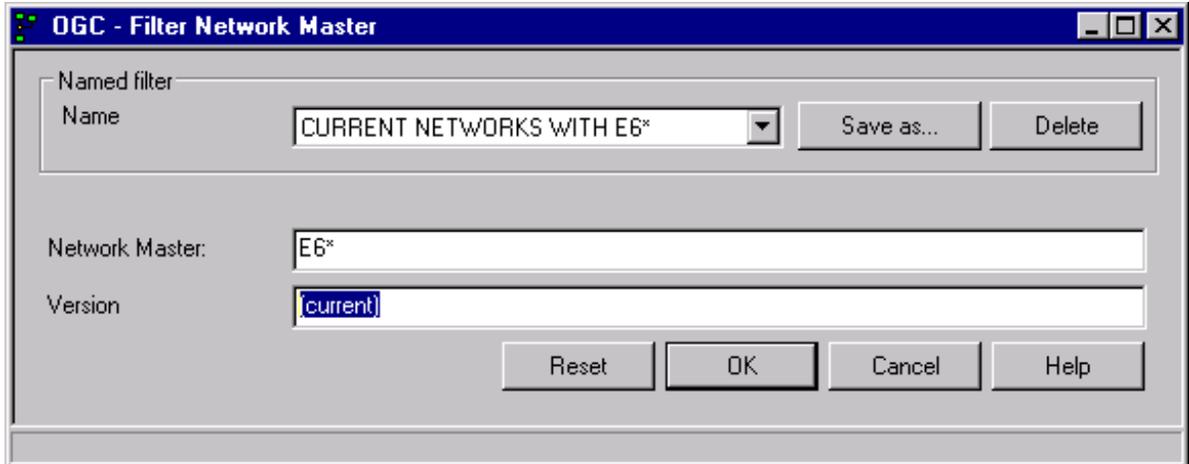

You need not refresh the data returned for an unnamed filter that uses `(current)` because it always considers the determination date.

The list of networks in the tree view returned for a filter that uses `(current)` always considers the current date; the determination date is ignored.

Possible differences in the results between the **List** window and the tree view are indicated in the following instruction.

➤ To list current network versions only

- 1 In the **Filter Network Master** window, enter `(current)` in the **Version** field as shown in the following example:

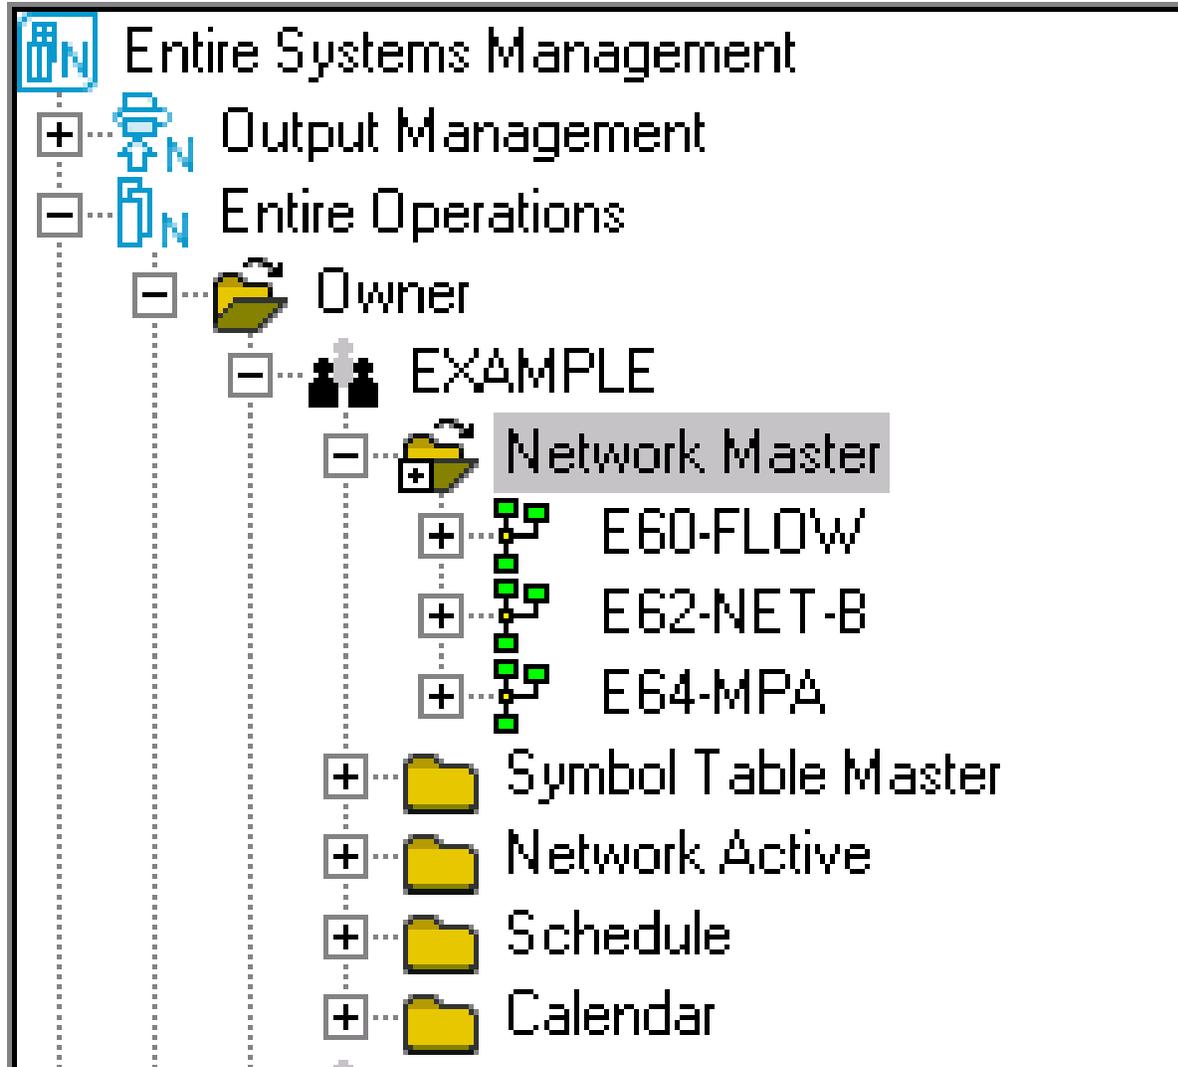

- 2 Choose **OK**.

Now, only the network version which satisfies the selection criterion (*current*) is listed for each network in the **List** window as shown in the following example:

| Network | Loop | Node | Description |
|--------------|------|------|----------------------------------|
| E60-FLOW | | 148 | Job Flow z/DS |
| E62-NET <V2> | | 148 | Triggers another Network |
| E62-NET-B | | 148 | Will be triggered |
| E64-MPA | | 148 | Multiple parallel job activation |

Version=*determination date* (here: **Version=2020-01-28**) in the window title indicates that the filter uses (*current*) for network version selection.

The list in the tree view returned for the same filter criteria is different if the current date (for example, January, 27, 2020) does not match the determination date:

E62-NET <V2> is not listed in the network tree because the usage definition for this network is not valid on the current date.

Saving a List View as a Report File

The **context menu** in a **List** window provides the **Save View as File** function to save the content of a **List** window as a report file containing columns and column headings and filter information. For detailed information, see [Report Output Options](#) in the section *Reporting*.

Drag & Drop

The drag and drop function is used to specify and perform a preferred menu function on all objects in a node or a node instance contained in the **object workspace**.

This can help perform frequently used functions more easily and avoids having to search through context menus.

➤ To execute a function with drag and drop

- 1 From the tree view in the **object workspace**, drag a node or a node instance and drop it onto the empty content pane.

Or:

Select the required node and choose **Set Drag and Drop Function** from the context menu.

If the selected node is not yet preset with a drag and drop function, a **Maintenance Drag&Drop** dialog similar to the example below opens:

The functions available for selection depend on the object type (here: Network Master) of the node selected. There are different functions available for node instances and metanodes.

Select the required function and choose **OK**.

The dialog closes.

- 2 If the selected node is already preset with a drag and drop function, the selected function is executed immediately.

If a drag and drop function cannot be performed, the function terminates with an appropriate message.

➤ **To change or reset a drag and drop function**

- 1 Open the **Maintenance Drag&Drop dialog** as described in the previous instructions.
- 2 Select the required function or select **<None>** to remove a drag and drop function and reset the function.
- 3 Choose **OK**.

Displaying Objects

The **Display** function opens a window that displays information for the currently selected item. You can only view the information, not edit it. If you want to edit the item, you have to use the **Open** function.

➤ **To display an object**

- 1 In the **object workspace**, select the object.
- 2 Open the **context menu** and choose **Display**.

Or:

Press CTRL+D.

A dialog appears that displays all available information for the selected object.

Note: For a detailed description of the displayed fields, see the description of the **Open** function for the respective object.

Copying Objects

 **Important:** Copying an object always means that the complete underlying structure is also copied into the target destination.

➤ **To copy single or multiple objects**

- 1 In the **object workspace**, select a node instance or an entire node.
Open the **context menu** and choose **Copy data**, or press CTRL+C.
- 2 Or:

In the **object workspace**, select a node for which you can choose **List** from the context menu. A **Master List** window opens.

From the list table in the **Master List** window, select single or multiple objects and choose **Copy data** from the **context menu** within the table, or press CTRL+C.

The object data is copied to the clipboard and ready to paste at the required location within the object workspace.

- 3 Proceed as described in *Pasting Objects*.

Pasting Objects

> To paste objects

- 1 In the **object workspace**, select the node where you want to place the object data **previously copied** to the clipboard.
- 2 Choose **Paste data** from the context menu, or press CTRL+V.

A **Paste data** window similar to the example below opens:

| Source object namespace: | |
|--------------------------|----------------|
| Owner | Network Master |
| EXAMPLE | B60-FLOW |

| Target object namespace: | |
|--------------------------|----------------|
| Owner | Network Master |
| DEMO | DEMO2 |

| Object name to paste | Paste | Overwrite |
|----------------------|-------------------------------------|-------------------------------------|
| JOB-03 | <input checked="" type="checkbox"/> | <input type="checkbox"/> |
| JOB-02 | <input type="checkbox"/> | <input type="checkbox"/> |
| JOB-01 | <input checked="" type="checkbox"/> | <input checked="" type="checkbox"/> |

The **Source object namespace** table indicates the source location (here: owner EXAMPLE, network B60-FLOW) that contains the objects to be copied.

The **Target object namespace** table indicates the target location (here: owner DEMO, network DEMO2) where to copy the selected objects.

The **Object name to paste** column in the right table lists the source objects selected for the copy operation (here: jobs JOB-03, JOB-02, JOB-01).

- 3 In the **Object name to paste** field, replace the object name, if required.

Select the **Paste** check box next to the object you want to copy. The check boxes are selected by default. Remove the check mark for an object you want to skip. In the example above, JOB-02 is not copied.

Select the **Overwrite** check box to replace an existing target object with the same name.

- 4 When you are finished, choose **OK**.

The objects are added to the specified target location and listed in the previously selected node in the object workspace.

Deleting Objects

The **Delete** function opens a dialog to confirm the selection for this operation.

➤ To delete an object

- 1 In the **object workspace**, select the object.
- 2 Open the **context menu** and choose **Delete**.

Or:

Press DELETE.

A dialog appears where you have to confirm the deletion.

Importing and Exporting Objects

You can import and export objects using the **Import/Export** function of the **General** metanode or the **Export** function of a selected node or node instance.

For detailed information on using the functions, see *Importing Objects* and *Exporting Objects* in the *Import/Export Functions* documentation.

Functions of the Metanode General

The **General** metanode provides menu functions that are performed on all objects available in your current Entire Operations environment:

| Function | Described in Section |
|----------------------------|--|
| Next Activations | Viewing next network activations. See Viewing and Modifying Next Network Activations in the section <i>Schedule Maintenance</i> . |
| List Active Jobs | See Listing Active Jobs in the section <i>Maintaining Active Jobs</i> . |
| Activity Log | See Monitoring Entire Operations Activities in the section <i>Log Information</i> . |
| Browse Log | See Displaying Logged Information - Browse Log Function in the section <i>Log Information</i> . |
| Monitor Status | See Monitor Status . |
| Determination Date | See Determination Date for Report Data in the section <i>Reporting</i> . |
| Reporting | See Report Types in the section <i>Reporting</i> . |
| Cross-References | See Types of Cross-References in the section <i>Cross-References</i> . |
| Import/Export | <i>Importing Objects</i> and <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Show Messages | See Show Messages . |
| Show Workplan | See Show Workplan . |
| Show all Owners | See Show all Owners |
| Show linked Owners | See Show linked Owners . |
| Set Drag And Drop Function | See Drag & Drop . |

Monitor Status

The Monitor is the heart of Entire Operations. The Monitor is a complex program that wakes up periodically and checks the definitions stored in the master database for any work to do. It activates and processes networks and jobs according to their prerequisites and controls running job networks, even if they reside on the nodes of different computers.

The **Monitor Status** function of the **General** metanode is used, for example, to start and stop the Monitor.

Before you can monitor Entire Operations activities, you may have to log on a node.

➤ **To monitor Entire Operations**

- 1 In the **object workspace**, select the **General** metanode.
- 2 Open the **context menu** and choose **Monitor Status**.

For an inactive node, a **Logon Node dialog** opens first.

The fields contained in this dialog are explained in *Fields: Logon Node*.

- 3 Enter your user ID and password and choose **OK** to log on to the specified node.

A **Monitor Status** window opens displaying all Monitor tasks.

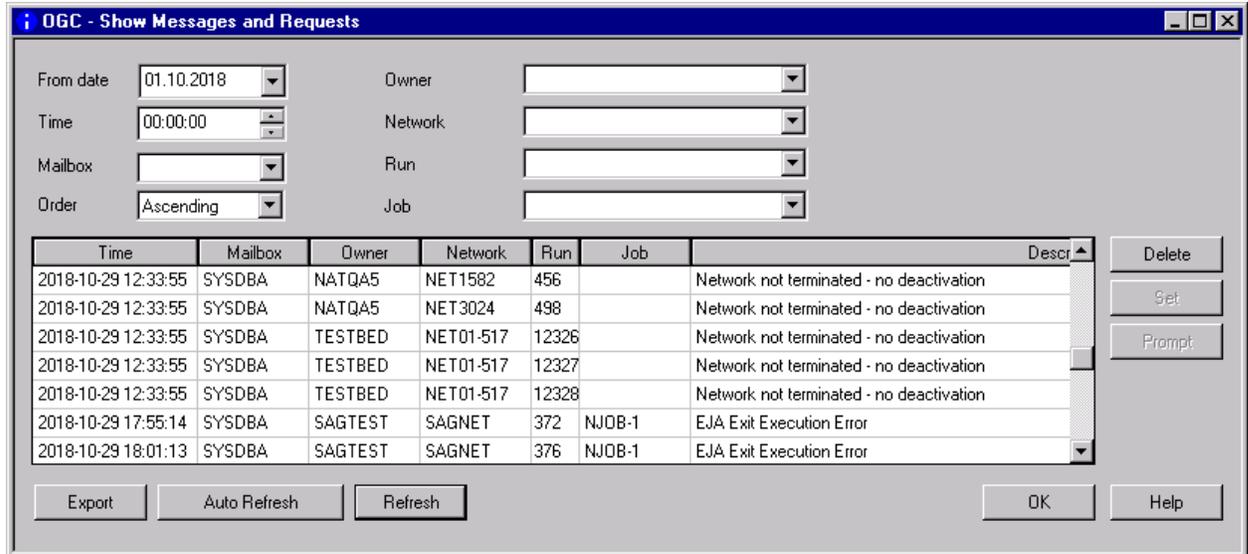

Here you can:

- Start and stop the Monitor.
- Hold or release a certain Monitor task.
- If you want to display the Monitor tasks before the dialog is automatically refreshed, you can refresh it manually by selecting the **Refresh** button.
- Select **OK**.

For detailed information, see *Status of the Entire Operations Monitor* in the *Administration* documentation.

Show Messages

The **Show Messages** function of the **General** metanode is used to list mailbox messages and requests as shown in the following example:

For explanations of this window, see *Handling Messages and Requests* in the section *Working with Mailboxes*.

Add to Workplan

The **Add to Workplan** function stores a reference to the currently selected object in a list of activities to be done.

> To add an object to the workplan

- 1 In the **object workspace**, select an object.
- 2 Open the **context menu** and choose **Add to Workplan**.

The object is listed within the workplan for further processing.

You can view all entries of your workplan by using the **Show Workplan** menu function of the **General** metanode.

Show Workplan

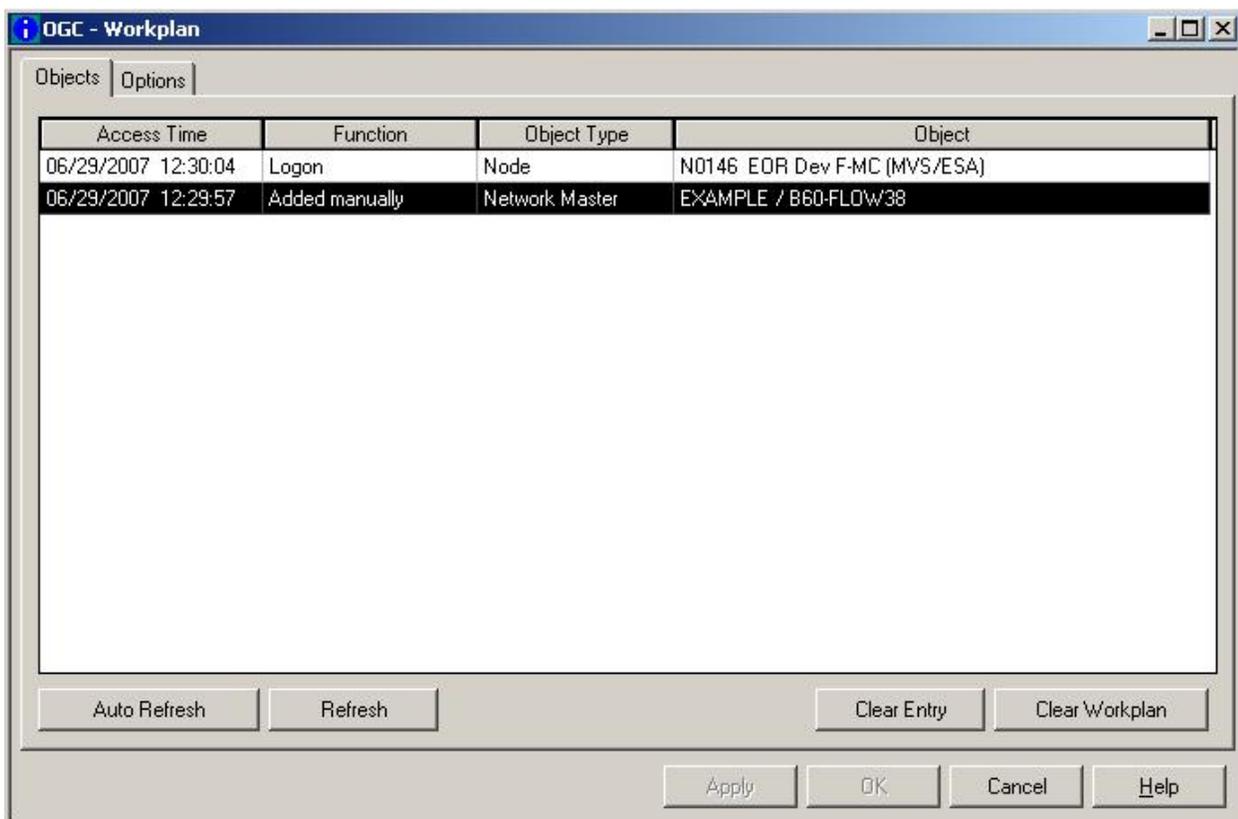

The **Show Workplan** function of the **General** metanode is used to open the workplan.

The workplan contains a list of Entire Operations objects that are accessed during the current Entire Operations GUI Client user session. This list facilitates repeated access to these objects.

- [Objects Tab](#)
- [Options Tab](#)

Objects Tab

Invoking the workplan, a **Workplan** window with an open **Objects** page is displayed first.

The list of objects contains the following columns:

| Column | Description |
|--------------------|--|
| Access Time | Date and time of the last user access to this object. See also <i>Date and Time Formats</i> . |
| Function | Name of the last function executed for this object. |
| Object Type | Type of the object. |
| Object | Name of the object including the superordinate objects that identify it unambiguously within a namespace. The single constituents of the name are separated by slash (/) characters. |

➤ To refresh the workplan

The workplan is automatically refreshed for local operating actions of users. Otherwise:

- Choose the **Refresh** button.

The workplan is now manually refreshed.

➤ To add objects to the workplan

Certain objects are inserted into the workplan during an Entire Operations session automatically if you display or change them. Otherwise:

- Choose **Add to Workplan** from the **context menu** for the required object to add it to the workplan manually.

The workplan is automatically refreshed by inserting new objects. Adding a new object to the workplan has no impact on the object itself.

➤ To clear entries in the workplan

- Choose the **Clear Entry** button to delete the selected entry from the workplan.

Or:

Choose the **Clear Workplan** button to delete all workplan entries.

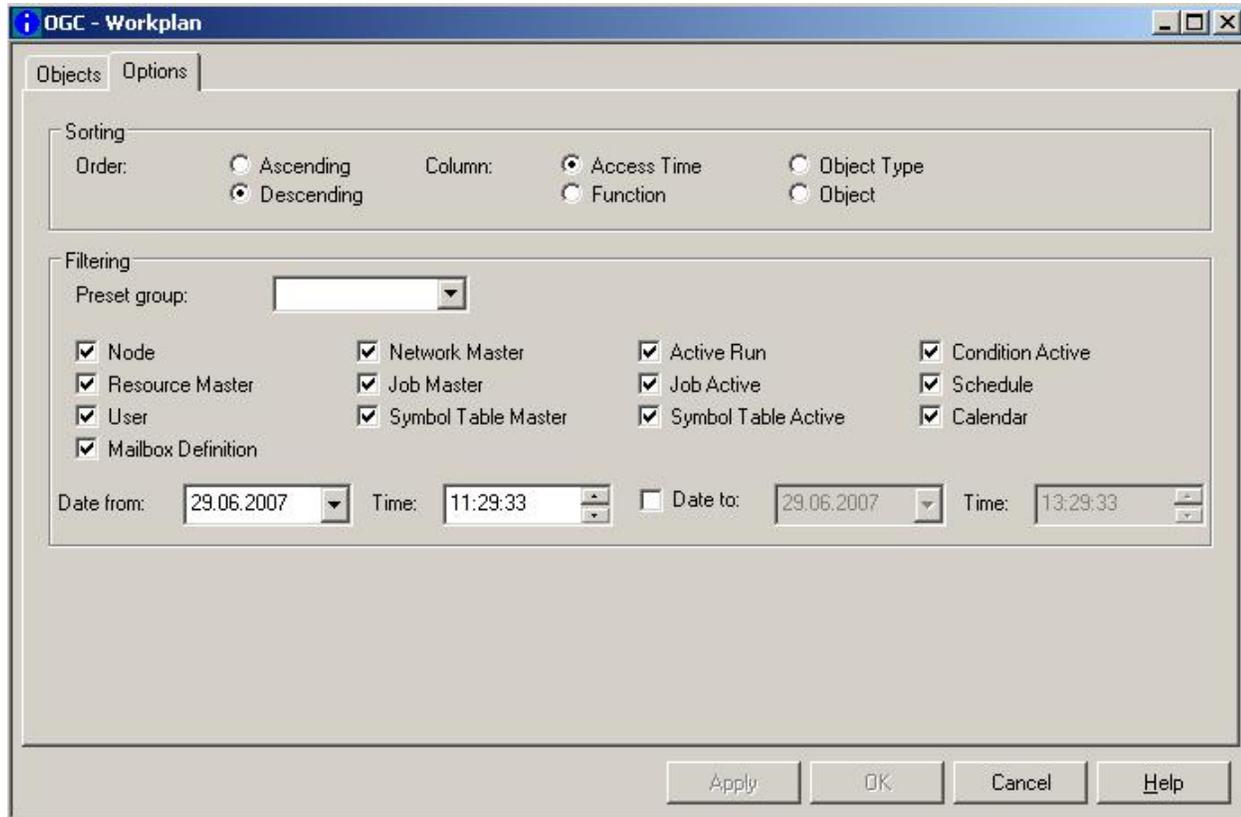

Deleting object entries from the workplan does not delete or deactivate any objects.

➤ To work with objects via the workplan

- On the **Objects** page of the **Workplan** window, select the object you want to process and right-click in the window to open the **context menu** and select the required function.

Options Tab

The **Options** tab displays all possible workplan options.

The workplan is transient by default. However, you can make the workplan persistent between sessions by setting the **Show workplan after activation** option in your user profile as described in **GUI General** in the *Administration* documentation.

The number of recent entries saved can be configured in the user profile (see the *Session Profile* in the *Administration* documentation). If the workplan lists more than the configured maximum number of saved entries, only the last recent records will be saved for the next session.

Filtering: Preset Group

This selection box allows a preselection for the following individual filters.

All

Display all entries.

Master

Display only master objects

Active

Display only active objects

Custom

The object types become determined via marking them in this dialog. It is automatically activated if you diverge from the standard preselection.

None

Deletes all subsequent individual filters.

Show all Owners

This function of the **General** metanode is allowed for users with administrator rights only. It allows you to switch to the SYSDBA mode:

- All existing owners are listed in the **Owner** metanode.
- The **Owner** metanode changes its name to **Owner (SYSDBA access)**.
- No owners are listed below **Owner via Granting**.

This function is allowed for users with administrator rights only. This function corresponds to the direct command `SET OWNERLIST ALL` described in the *Direct Commands* documentation.

See also the section [Using Owners](#).

Show linked Owners

This function of the **General** metanode is allowed for users with administrator rights only.

In opposite to the **Show all Owners** function, this function allows you to switch back from SYSDBA access mode to normal mode:

- Only linked owners are listed in the **Owner** metanode.
- Granted owners are listed in the **Owner via Granting** metanode.

This function corresponds to the direct command `SET OWNERLIST LINKED` described in the *Direct Commands* documentation.

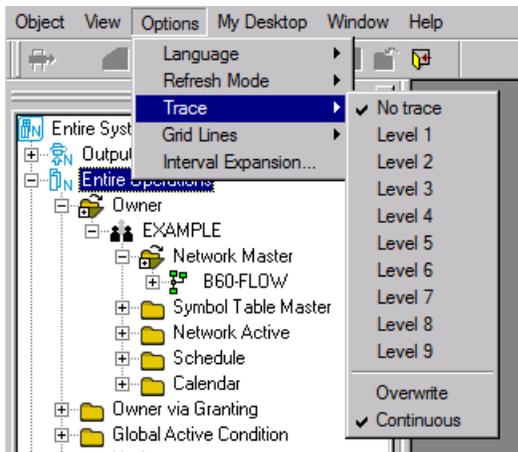

See also the section [Owner Maintenance](#).

Tracing

In case of problems, you can enable tracing and thus write trace information to a trace file. Since tracing has a negative impact on performance, we recommend that you use the trace function only if requested by Software AG support.

➤ To activate tracing and write information to a trace file

- From the **Options** menu, choose **Trace** and select a level from **Level 1** to **Level 9** and the file destination **Overwrite** or **Continuous** as shown below:

The higher the trace level (**Level 1** is low, **Level 9** is high), the more complex information is written to the trace file.

The trace file is created in the directory defined by the environment variable `%TEMP%`.

The name of the trace file depends on the trace option set:

- **Overwrite**

The content of the trace file is overwritten each time the trace is newly started. The name of the trace file is *estrace.log*.

- **Continuous**

The content of a previous trace file is not overwritten, a new trace file is created instead. The name of the new trace file is *estrace_date_time.log*, where *date* has the format `YYMMDD`, and *time* has the format `HHMMSS`. Example: *estrace_190123_120746.log*.

The trace is written to the trace file when:

- The **Trace** option setting changes from **No trace** to **Level 1** to **Level 9**.

- During startup, if the last session was closed with an active trace level of **Level 1** to **Level 9**.

➤ **To deactivate tracing**

- From the **Options** menu, choose **Trace > No Trace**.

7 User Language

- Options Menu 66
- System Default and User Profile 66
- Natural ULANG Parameter 66

In Entire Operations, the languages English and German are available. The specified language controls the display in the following locations:

- The nodes of the tree view and the context menu functions in the **object workspace**;
- The field and columns in the open windows in the content pane and in the **result list**.

Note: Entire Operations log messages are saved independent of the language. You can view them in English or German.

This section describes the locations where you can change the user language depending on your authorizations:

Options Menu

From the **Options > Language** menu of the main application window, select **English** or **German**.

The language settings are kept for future Entire Operations sessions.

System Default and User Profile

As an administrator, you can specify the language in the following locations:

- On the **Character interface settings** page of the Entire Operations Defaults window.
- In a user profile on the **Main** page of the **Maintenance/Create new User** window: see *Viewing, Adding and Modifying a User*.

See the relevant sections in the *Administration* documentation.

Natural ULANG Parameter

The Natural ULANG profile parameter controls the language used by the Entire Operations Monitor such as the SYSOUT of the Monitor tasks and the output.

You can specify ULANG dynamically at the start of a Natural session or, if authorized, statically in the Natural NATPARM parameter file.

ULANG is described in the *Parameter Reference* of the *Natural* documentation.

8 Operating System Classes and Related Operating Systems

Within Entire Operations, the term “operating system class” means one or more operating systems, which are usually handled in the same way.

| Operating System Class | Operating System |
|------------------------|--|
| B | BS2000 |
| M | z/OS |
| V | z/VSE |
| X | All supported UNIX operating systems including AIX, HP-UX, Linux and Sun Solaris |
| W | All supported Windows operating systems |

9 Date and Time Formats

- Date Display and Input Options 70
- Time Display and Input Options 71

This section describes the date and time formats Entire Operation uses for processing system function and producing output reports. These formats are independent of the format options Windows provides in an Entire Operations GUI environment.

The date displayed in a window is represented in the Entire Operations default format selected in the **Date format** field of the *Entire Operations Defaults* (see the *Administration* documentation).

If you enter a date or specify a data as a parameter, the syntax must conform to the format set in the Entire Operations defaults. Otherwise, you receive an appropriate error message indicating that the date or time does not match the required format.

Date Display and Input Options

Possible date representations and valid input values for date fields are described in the following section.

Input fields for dates have different lengths and you may have to (or can optionally) shorten the input string. Entire Operations always treats shortened input (or output fields) with the century.

A shortened input string is always extended to a complete date (even when not representable in the window), according to the default format set for your environment. This is indicated in the following examples that assume the current date is December 30, 2016.

| Date Pattern | Date Format Setting/Selection Option | Examples |
|--------------|--------------------------------------|----------|
| DD.MM.YY | G | 30.12.16 |
| | German DD.MM.YY | 301216 |
| | German format. | 30.12 |
| | | 3012 |
| DD/MM/YY | E | 30/12/16 |
| | European DD/MM/YY | 301216 |
| | European format. | |
| MM/DD/YY | A | 12/30/16 |
| | American MM/DD/YY | 123016 |
| | American format. | |
| YY-MM-DD | I | 16-12-30 |
| | International YY-MM-DD | 161230 |
| | International format (default). | 1612 |

| Date Pattern | Date Format Setting/Selection Option | Examples |
|--------------|--------------------------------------|----------|
| YYYYMMDD | 8 | 20161230 |
| | 8 digits YYYYMMDD | 2016 |
| | Eight-digit format. | |

Explanations:

- DD is a two-digit day, MM a two-digit month, YY a two-digit year and YYYY a four-digit year.

A two-digit year is internally always processed with four digits.

- Input of a year value is optional. If you omit the year, the current year is used.

If Entire Operations interprets an input string as a past date (relative to the current date), an appropriate message occurs.

- The century that relates to a 2-digit year value is determined by using a sliding window that assumes the date to be within a range of +50/-50 years, relative to the current year. For example:

If the current year is 2016, the sliding window will cover the years 1966 to 2065. A 2-digit year value *nn* from 66 to 99 is interpreted accordingly as 19*nn*, while a 2-digit year value *nn* from 00 to 65 is interpreted as 20*nn*.

- Input of the separator characters slash (/), period (.) and dash (-) is optional. If you omit the separators, the input string is extended to a complete date.

Time Display and Input Options

The time is represented in one of the following formats:

| Syntax | Example | Complete Time |
|----------|---------|---------------|
| HH:II:SS | 145231 | 14:52:31 |
| | 1452 | 14:52:00 |
| | 14:53 | 14:53:00 |
| | 14 | 14:00:00 |

Explanations:

- HH is a two-digit hour, II a two-digit minute and SS a two-digit second.

The hour range is 0 to 23. The minute and second range is 0 to 59.

- Input of minutes and seconds is optional. If you omit the minutes and/or seconds, the input string is extended to a complete time.

- Input of the separator character colon (:) is optional. If you omit the separators, the input string is extended to a complete time.

II

Entire Operations and Operating System User IDs

10 Entire Operations and Operating System User IDs

- Entire Operations User IDs 76
- Operating System User IDs 76

Entire Operations User IDs

In Entire Operations, a user ID can be used to enter the system. Entire Operations user IDs should, but need not be defined to the host TP monitor.

Several users can log on to Entire Operations with the same user ID and password at the same time. For reasons of data security and in order to trace data modifications, however, each user usually has a personal user ID and password.

Entire Operations user IDs are relevant to the following:

- **Entire Operations User Profiles**

Each Entire Operations user ID can have individual access rights to Entire Operations functionality and Entire Operations objects. For details, see *User Definitions and Profile Settings* in the *Administration* documentation.

- **Mailboxes**

A user ID can be associated with up to ten mailboxes through which the user is notified of any pending logical conditions linked to those mailboxes (see the section [Working with Mailboxes](#)).

- **Logging**

Entire Operations logs all activities and events occurring within the system, including user activities.

A user ID always has a link to at least one owner (see the section [Using Owners](#)).

Operating System User IDs

This document covers the following topics:

- [Working with Entire System Server Nodes](#)
- [Logon to an Operating System User ID](#)
- [Operating System User ID, Group, Domain](#)

- [Default User ID Determination](#)

Working with Entire System Server Nodes

If you want to work with operating system objects (e.g. editing JCL), you must perform Entire System server logons to the nodes you want to work with. After such a logon, you have access the access rights of the operating system user ID you specified. See the section [Logging on and off an Operating System Server Node](#).

For [Entire Operations networks](#) and [jobs](#), you must define operating system user IDs specifically as JCL user IDs and submit (execution) user IDs. See also [Defining Operating System Dependent JCL Specifications](#) in the section *Job Maintenance*.

Logon to an Operating System User ID

If you want to work with an operating system object and if you are not logged to the defined Entire System Server node, the node logon screen is presented automatically in many cases.

You may also perform an explicit node logon by using the `LOGON NODE` direct command.

You can use the direct command `STATUS NODES` to view your current node logon status.

Operating System User ID, Group, Domain

In network and job definitions, it is possible to specify

- a JCL user ID for the [JCL node](#);
- a submit (execution) user ID for the [execution node](#).

Additionally, it is possible to specify a group (UNIX), respective a domain (Windows).

If no group is defined for a UNIX node, the user ID's default group will be in effect.

If no domain is specified for a Windows node, the user ID is treated as a local user. If you enter the node's host name in the domain (group) field, the user ID is treated as local user too.

Default User ID Determination

- [Determination Rules](#)
- [Search Hierarchy for Submit User IDs](#)

- [Symbol Replacement](#)

Determination Rules

If no operating system user ID definition is made for **JCL node** or **execution node** locally, Entire Operations determines an operating system user ID, depending on

- The global submit security user type;
- The node-specific submit security user type.

For detailed information, see the relevant sections in the *Administration* documentation.

Search Hierarchy for Submit User IDs

If an operating system user ID other than the user ID of the Entire Operations Monitor (**Submit Security User Type** = M/User ID of the Entire Operations Monitor) is to be used, a search hierarchy for the operating system user ID is in effect. The fields **Monitor User ID** and **Submit Security User Type** are described in *Fields: Monitor Defaults - General* in the *Administration* documentation.

The search order is:

1. The job's (JCL or submit) user ID;
2. The network's (JCL or submit) user ID;
3. The node's default user ID (mainframe, UNIX and Windows).

Symbol Replacement

This applies to the network master definition, job master definition and job active definition.

Symbol replacement is possible in the fields:

- JCL User ID
- JCL Group
- Submit User ID
- Submit Group

If the activation escape character is used, the replacement is performed at activation time. This is required for JCL User ID and JCL Group. If the submission escape character is used, the replacement is performed before job submission. Symbol replacement errors in one of these fields are treated as permanent errors.

III

Activation of Networks or Jobs

11 Activation of Networks or Jobs

| | |
|---|----|
| ▪ Terminology | 82 |
| ▪ Determination and Activation of Necessary Symbol Tables | 83 |
| ▪ Manual Activation | 83 |
| ▪ Activating a Job Network Manually | 85 |
| ▪ Activating a Single Job Manually | 88 |
| ▪ Automatic (Scheduled) Activation | 91 |
| ▪ Start of Job Activation | 91 |
| ▪ Run Number | 92 |
| ▪ Cleanup of the Active Database | 93 |
| ▪ Cleanup of the Active Database in Batch Mode | 93 |

Activating a job network or job means preparing it for execution. On activation, the following is performed:

- The definitions of jobs, networks, logical conditions, symbol tables etc. are copied to the Entire Operations active database and assigned a unique **run number**;
- If necessary, symbol prompting is requested (see also [Symbol Prompting during Network or Job Activation](#)). However, symbol prompting is not performed for any subnetworks.
- The global activation exit user exit is invoked, if defined in the Entire Operations defaults;
- The JCL defined for jobs within the network is copied to the active JCL storage on the active database;
- Variables (symbols) used in dynamically generated JCL are substituted by their current values. This does not apply to variables defined to be substituted at job submission time;
- The JCL definitions of active job networks, respectively of active jobs, can differ from the JCL definitions in the master definition. To allow this, the corresponding symbol tables must contain certain reserved symbols on activation. See also [Predefined Symbols](#) in the section [Symbol Table and Symbol Maintenance](#).
- If you use pre-generated JCL, symbol replacement is performed at the time of JCL generation.
- The Entire Operations Monitor recognizes the job network as active and checks time frames, input conditions and resources defined for the jobs. If all prerequisites for any jobs are fulfilled, these jobs are submitted.

Related Topics:

- [Maintaining Active Jobs and Networks](#)
- [Schedule Maintenance](#)
- [Symbol Prompting during Network or Job Activation - Symbol Table and Symbol Maintenance](#)
- [Master Database and Active Database - Concepts and Facilities](#) documentation

Terminology

In this documentation and on the user interface, the terms *activation* and *network start/job start* are used.

- **Activation**
denotes the process of creating an active copy of a network or job definition.
- **Network start/job start**
denotes the actual execution start time of the activated/active job network or job.

Determination and Activation of Necessary Symbol Tables

During a network activation or single job activation, the list of the required (active) **symbol tables** (see the section [Symbol Table and Symbol Maintenance](#)) will be determined by Entire Operations. The result of the determination will be written to the Entire Operations log.

It may look like this:

```
List of active Symbol Tables created
Determined Symbol Table Versions for 17.01.14
... Ob Job          St  SymTab    defined    determined
... NV              00  N1649T00  (current)  -> v002
... JM J001         00  N1649T00  (unnamed)  -> (unnamed)
... JM J003         ED  N1649T00  (current)  -> v002
... JM J004         ED  N1649T00  (nv)       -> (unnamed)
... JM J005         ED  N1649T00  (svn)      -> v002
```

The column **St** contains the status of the symbol table to be activated.

ED means “evaluation duplicate”. It will be set if a previous determination (evaluation) resulted in the same symbol table with the same version. In this case, the symbol table (version) will be activated only once.

The determined symbol table versions (see [Versioning of Symbol Tables](#) in the section *Symbol Table and Symbol Maintenance*) will be used for the following symbol table activation.

In case of any determination error, the network activation of job activation will be aborted.

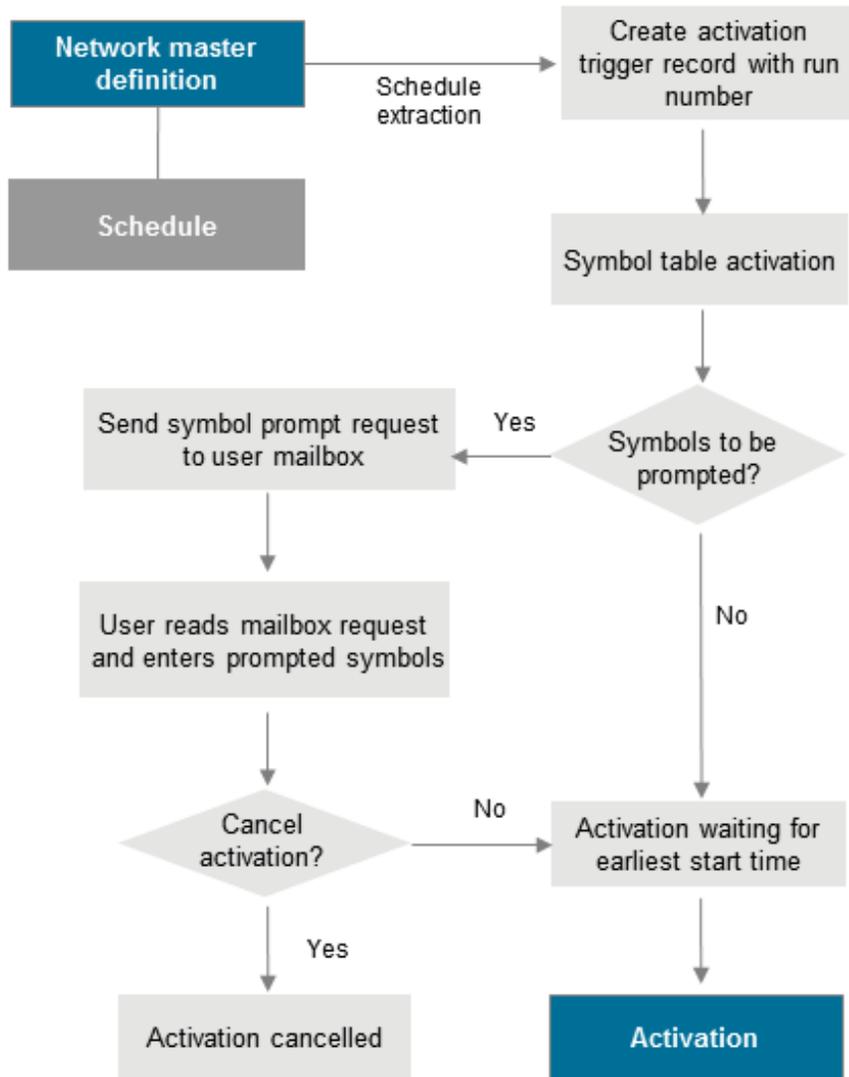

Manual Activation

It is also possible to activate a job network manually irrespective of any defined schedule. This may become necessary for a number of reasons, for example:

- No schedule has been defined for the job network;
- To override defined activation date and time;
- The job network is not scheduled for the required date.

Job network or job activation can also be triggered by any event within Entire Operations, for example by the termination of another job network or by the Entire Operations Application Programming Interface (API); see also [API Routines](#). Like manual activation, this can be performed at any time.

Symbol prompting for active symbols is also performed, when a job or network is activated manually, if at least one symbol of a symbol table used by the job or network is appropriately marked.

Activating a Job Network Manually

The Entire Operations Monitor will activate job networks automatically according to their defined schedules. However, it is also possible to activate a network manually from the **Network Master** node.

When a network is activated, all jobs within the network, except recovery jobs, are activated.

Note: Only authorized users can activate job networks manually.

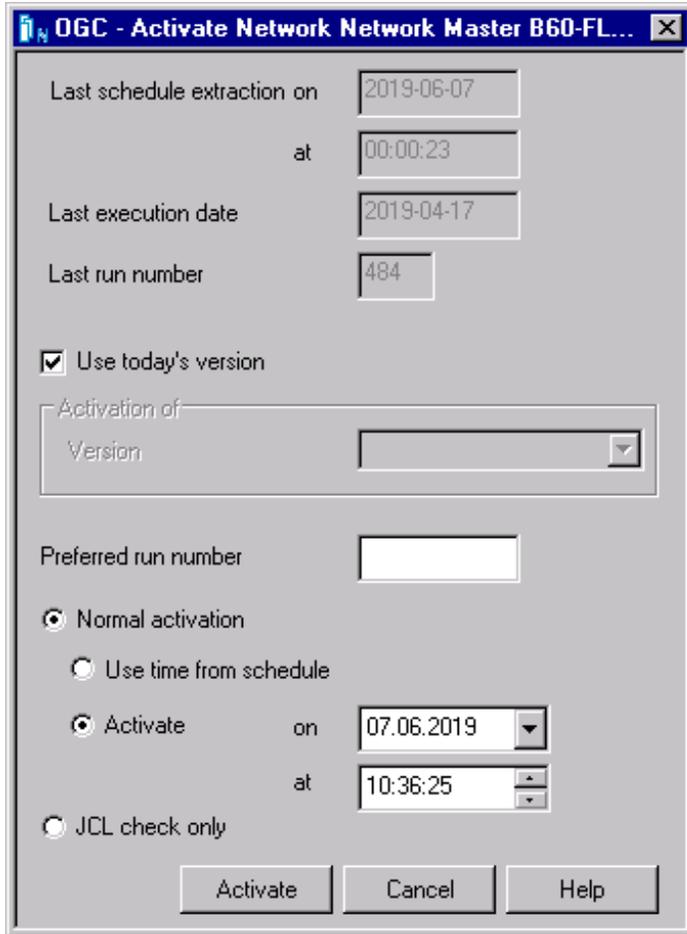

There are several situations in which you may wish to activate a job network manually:

- When no schedule has been defined for the network;
- To start the same network several times (with different run numbers);
- When the network is not scheduled for the current date;
- To reactivate a network.

> To activate a network manually

- 1 In the object workspace, select a **Network Master** instance.
- 2 Invoke the context menu and choose **Activate Network**.

An **Activate Network** window similar to the example below opens:

- 3 Change the input fields as required. All fields contained in the window are explained in [Fields: Network Activation](#).
- 4 Choose **Activate** when you are finished.

If symbol prompting has been defined for the network, a [Symbol Prompting window](#) opens with a table of symbols used during dynamic JCL generation.

If required, change the symbols and symbol values. For further explanations, see [Symbol Prompting during Network or Job Activation](#) in the section [Symbol Table and Symbol Maintenance](#).

- 5 Choose **Continue** when you are finished.

If the activation is successful, the activated network gets a new run number as returned in a message, and its execution can be tracked in the GUI Client.

If a workplan has been defined for the network, a [Workplan window](#) opens with a list of objects accessed during the current Entire Operations session.

- 6 In the **Workplan window**, change the entries as required. For further explanations, see [Show Workplan](#) in the section *Using Entire Operations GUI Client*.
- 7 Choose **OK** when you are finished.
 - [Fields: Network Activation](#)

Fields: Network Activation

The fields in the **Activate Network window** are described in the following table:

| Field/Option | Description |
|--|--|
| Use today's Version | Version of the network to be activated. |
| Activation of Version | <p>If a current version exists for the current date, it will be preset as default value.</p> <p>If more than one version exists for a network, select Use today's Version (default) or Activation of Version as needed. If a version is not defined, then Activation of Version must be used.</p> <p>If no version for a network exists, then Use today's Version and Activation of Version have no function.</p> |
| Last Schedule Extraction on/at | Date and time of the last automatic schedule extraction for this network by the Entire Operations Monitor. |
| Last Execution Date | Date of the last activation. |
| Last Run Number | Run number of the last activation. |
| Preferred Run Number | <p>If input is allowed for this field, you can enter the run number you want to be used for the activated network. Run numbers for further network activations increment from this number.</p> <p>If the requested run number is in use, Entire Operations assigns the next free number to the run.</p> <p>If this field contains a zero (0) or no value, Entire Operations (as usual) determines the number to be assigned to the run.</p> <p>Field input is allowed or not allowed (default) in the network default settings: see the option Allow setting of preferred run number during activation in the section <i>Defaults for Network Options</i> in the <i>Administration</i> documentation.</p> |
| Normal activation: Use Time from Schedule | Select this option to activate the network within the defined time frames (Earliest Start, Latest Start, Deadline) , even if the current date is not a scheduled date for this network. With this option, you can force the same time dependencies as if the network were scheduled and activated automatically. |
| Normal activation: Activate on/at | Shows the current date and time. You can modify the date and time to force activation at any time on any date. There is no limitation for future date and time settings. |

| Field/Option | Description |
|-----------------------|--|
| JCL Check only | <p>If this option is selected:</p> <p>Only a JCL check is performed for the job network or job. The required commands are automatically inserted:</p> <p>z/OS, JES2: TYPRUN=SCAN z/OS, JES3: EXEC PGM=JCLTEST BS2000: /MODIFY-SDF-OPTIONS MODE=TEST UNIX: Script execution with <code>set -vn</code> Windows: Jobs are executed as Dummy due to JCL Check</p> <p>Note:</p> <ol style="list-style-type: none"> 1. Active conditions used by the network execution for JCL check only do not interfere with active conditions of “real” active jobs or active networks. 2. These active conditions are marked with the prefix (C) in all windows and lists. <hr/> <p>If this option is not selected:</p> <p>Normal activation (job submission) is initiated.</p> <p>This is the default.</p> |

Activating a Single Job Manually

Just as you can perform an ad-hoc manual activation of a job network at any time to allow it to run outside of its scheduled times, you can also manually activate any job at any time, regardless of its position within a job network.

The activated job is assigned its own run number (in sequence with the network run number) and, if you do not change the date or time, is submitted immediately by the Entire Operations Monitor. If the job contains symbols as placeholders for variables, symbol prompting takes place as described in the section *Symbol Prompting during Network or Job Activation*. If other symbol tables are required, they are prompted too.

The differences between the manual activation of a single job and the manual activation of a job network are that when a single job is activated:

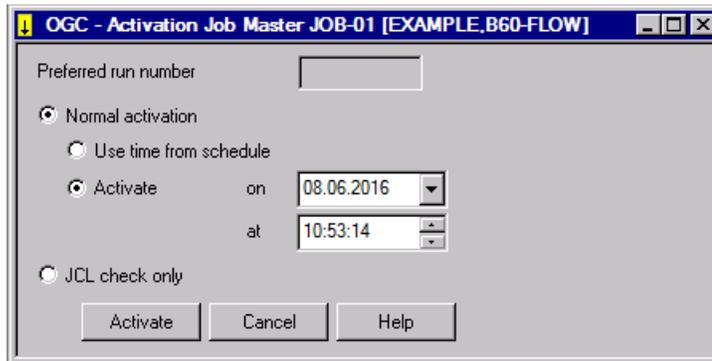

- No check for defined input conditions for the job is performed;
- No output conditions are set by the job.

All other End-of-Job actions defined for the job are executed.

➤ **To activate a job manually**

- 1 In the object workspace, select a **Job Master** instance and choose **Activate Job** from the context menu.

An **Activation Job Master** window similar to the example below opens:

The window title indicates the job (here: JOB-01) to be activated and the owner and network (here: EXAMPLE, B60-FLOW) of the job.

- 2 Make your definitions. The fields contained in the window are explained in [Fields: Job Activation](#).
- 3 When you are finished, choose **Activate**.

The job is activated and listed in the **Active Run** node.

This section covers the following topics:

- [Fields: Job Activation](#)

Fields: Job Activation

The fields of the [Activation Job Master window](#) are described in the following table:

| Field | Description |
|---|--|
| Preferred Run Number | <p>If input is allowed for this field, you can enter the run number you want to be used for the activated job. Run numbers for further job activations increment from this number.</p> <p>If the requested run number is in use, Entire Operations assigns the next free number.</p> <p>If this field contains a zero (0) or no value, Entire Operations (as usual) automatically assigns a run number.</p> <p>Field input is allowed or not allowed (default) in the network default settings: see the option Allow setting of preferred run number during activation in the section <i>Defaults for Network Options</i> in the <i>Administration</i> documentation.</p> |
| Normal activation: Use Time in Schedule | <p>Select this option to activate the job within the defined time frames (earliest start, latest start, deadline), even if the current date is not a scheduled date for this network. With this option, you can force the same time dependencies as if the network was scheduled and activated automatically.</p> <p>For more information on network time frames, see Activating a Job Network Manually in the section <i>Network Maintenance</i>.</p> |
| Normal activation: Activate at Date/Time | <p>Shows the current date and time. You can modify date and time to force activation at any time on any date. There is no limitation for future date and time settings.</p> <p>Note: No symbol prompting is performed for later activations.</p> |
| JCL Check only | <p>If this option is selected:</p> <p>Only a JCL check is performed for the job network or job. The required commands are automatically inserted:</p> <pre>z/OS, JES2: TYPRUN=SCAN z/OS, JES3: EXEC PGM=JCLTEST BS2000: /MODIFY -SDF -OPTIONS MODE=TEST UNIX: Script execution with set -vn Windows: Jobs are executed as Dummy due to JCL Check</pre> <p>Note:</p> <ol style="list-style-type: none"> Active conditions set or reset by job execution for JCL check only do not interfere with active conditions of “real” active jobs or active networks. These active conditions are marked with the prefix (C) in all windows and lists. <hr/> <p>If this option is not selected:</p> <p>Normal activation is used.</p> <p>An actual JCL check is not performed. This is the default.</p> |

Automatic (Scheduled) Activation

Job networks are activated automatically in two steps:

- At the beginning of a new day or during Monitor startup, all **schedules** are checked for job networks to be executed during that day. This process is called schedule extraction and the data extracted are called the activation trigger records.
- The activation trigger records force job network activation a short time before the earliest start of the network. This time span can be defined in the Entire Operations defaults: see the **Extraction of schedules before activation** option described in *Defaults for Time Ranges* in the *Administration* documentation.

Notes:

1. If no earliest start time is defined on the network level, the network is activated immediately after schedule extraction.
2. The modification of a calendar or schedule always triggers a schedule extraction for the dependent job networks. For this reason, a job network could be activated even for the current day after such a modification.

Automatic Activation - Symbol Prompting

After the creation of an activation trigger record, active symbol tables are created for the specific network run. If there is at least one symbol marked as to be prompted within these active tables, a **symbol prompting** request is sent to the mailboxes of all users defined as message recipients for that network.

The network activation is kept in hold, until any user sees the request and enters or confirms the symbols to be prompted. For this reason, schedule extraction can be performed several days in advance. (See *Global Schedule Extraction* in the section *Special Functions* in the *Administration* documentation.)

Start of Job Activation

1. If the calculated latest start is after the calculated deadline, the last start will be set 1 minute before the deadline.
2. If the (new) latest start is before the earliest start, the job activation will be aborted with an error message.

Run Number

Entire Operations automatically assigns a run number to each active copy of a job network on the active database. This run number uniquely identifies the active copy of a job network and is automatically passed to its jobs, input conditions, etc.

The run number is assigned:

- During the creation of an activation trigger record;
- During a manual activation;
- If a network is activated by an API routine.

Run numbers are in the range 1 to 99999 by default and are unique on network level. When the maximum run number has been reached, assignment again starts from 1.

The upper limit for run numbers can be modified in the Entire Operations defaults as described in *Defaults for Network Options* in the *Administration* documentation.

The assignment of a run number to each activation of a job network allows multiple activations of a job network on the same date, and allows you to distinguish between multiple active copies of the same job network.

Note: There is no guarantee that subsequent activations will have ascending run numbers. They are as unpredictable as operating system job numbers. Entire Operations retains the last run number, even for deleted job networks. If you define a new job network of the same name, the new run numbers start from the deleted network's last run number incremented by 1.

When manually activating a job or a network, you can specify a preferred run number to be used for the next run (see also [Activating a Job Network Manually](#) and [Activating a Single Job Manually](#)).

Related Topics:

- [Maintaining Active Runs - Active Job Networks](#)

Cleanup of the Active Database

The operative data of Entire Operations must be removed again from the active database after a certain time. Part of this process is the removal of work files as well, which Entire Operations has created in the file system for job control purposes.

- The retention periods for active objects can be defined (see *Administration*) documentation.
- The cleanup may be defined to be carried out automatically every day. If no time is defined for the cleanup, then it will be started at 00:00. A time for the daily cleanup start can be defined. For a more detailed description, see *Administration* documentation.
- The cleanup of the active database can also be started manually any time (see *Cleanup of the Active Database* in the *Administration* documentation).
- Furthermore, it is possible to run the cleanup of the active database in a Natural batch job (see *Cleanup of the Active Database in Batch Mode*) exterior to the Entire Operations Monitor. The cleanup in batch mode can be executed with the Monitor running or shut down.

Note that the cleanup of the active database depending upon the data quantity to be processed affects the system. It is recommended to schedule the cleanup for silent times.

Cleanup runs can also be performed several times a day. This makes it possible to reduce the volumes to be processed per run.

Deleting Work Files

Entire Operations creates files in the operating system under BS2000, UNIX and Windows. Among other things, they contain the job SYSOUT or the JCL to be executed.

During the deactivation of active jobs, which have run in one of these operating systems, the assigned work files are deleted as well.

All definitions are created in the Entire Operations Defaults. They are described in the *Administration* documentation.

Cleanup of the Active Database in Batch Mode

- [Parameter for CLEAN](#)
- [Example of CLEAN](#)
- [Cleanup of Mailbox Messages to SYSDBA](#)
- [Parameter for MX-DEL1P](#)

- Example of MX-DEL1P

In addition to an automatic cleanup, or alternatively, you can also do a cleanup of the active database in batch mode outside of the Entire Operations Monitor.

Use a Natural batch job with the following commands:

```
LOGON SYSEOR
CLEAN function log-target
FIN
```

Parameter for CLEAN

| Parameter | Description | |
|-------------------|------------------|---|
| <i>function</i> | Possible values: | |
| | ALL | Cleanup, deactivation, deletion of work files. |
| | CLEAN | Cleanup only. |
| | DEACT | Deactivation, deletion of work files only. |
| <i>log-target</i> | Possible values: | |
| | NOP | The cleanup is logged in the Entire Operations log . |
| | SO | The cleanup is logged in the SYSOUT of the batch job. In addition, the start and end messages of the cleanup are logged in the Entire Operations log . |
| | ALL | The cleanup is both logged in the Entire Operations log and the SYSOUT of the batch job. |

The batch cleanup can take place with the Monitor running or not. It is recommended to do the cleanup at times of low Monitor utilization.

Like the automatic cleanup the batch cleanup should be performed at least once a day. Several runs a day are possible. This may be useful to reduce the data amount of each cleanup run.

The Entire Operations retention periods also apply to batch cleanup.

Example of CLEAN

```
CLEAN ALL SO
```

Complete cleanup and log into SYSOUT.

Cleanup of Mailbox Messages to SYSDBA

The cleanup of mailbox messages to SYSDBA can be executed in batch mode. To do this, use a Natural batch job including the following commands:

```
LOGON SYSEOR
MX-DEL1P yyyymmdd hhiiss
FIN
```

Parameter for MX-DEL1P

| Parameter | Description |
|-----------------|--|
| <i>yyyymmdd</i> | Day up to which cleanup is to take place. |
| <i>hhiiss</i> | Time up to which cleanup is to take place. |

Example of MX-DEL1P

```
MX-DEL1P 20020201 100000
```

IV Prerequisite Check before Job Submission

12 Prerequisite Check before Job Submission

- Order of Prerequisite Checking 100
- Passive Wait 101
- Prerequisite Check according to the Round-Robin Procedure 103

Each active job is checked for its prerequisites before it can be submitted. The job can only be started if all defined prerequisites are available at the same time. The prerequisite checking of an active job is repeated until all defined prerequisites are available, but only before its latest start time is reached.

The following prerequisites must be met before a job can start running:

- The start and end times defined for a job or network must be reached.
- The input conditions defined for the job must be fulfilled.
- The resources defined for job usage must be available.
- Operating-system specific objects defined for a job (for example, a BS2000 user switch) must be available.
- The execution node defined for the job or network must be available.

Entire Operations uses several procedures to reduce the effort involved for the prerequisite check. These procedures are transparent to the user. Nevertheless, they are explained in the following section.

For information on actions Entire Operations performs after job termination if specified events occur, see *Events and Actions: End-of-Job Checking* in the *Concepts and Facilities* documentation and [Defining and Managing End-of-Job \(EOJ\) Checking and Actions](#).

Related Topics:

- *Events and Actions: End-of-Job Checking - Concepts and Facilities* documentation
- [Defining and Managing End-of-Job \(EOJ\) Checking and Actions](#)

Order of Prerequisite Checking

The sort order of prerequisite checking is:

1. Earliest start time;
2. Owner, network, run, job.

The sort is only applied to jobs, which reside within the prerequisite check input queue at the same time.

Passive Wait

Active jobs waiting for one or several input conditions, resources or for the availability of an operating system server (node) are placed into a particular queue, which removes them temporarily from the active check carried out by the Monitor.

Active jobs are woken up (released) from a passive wait state:

- During setup or deletion of active prerequisites at any location;
- During setup or deletion of resources at any location;
- After modification or deletion of definitions for input conditions and resources in active jobs;
- During Monitor start;
- When the date changes;
- By explicit request; see *Special Functions* in the *Administration* documentation.

After wake-up, an active check of the prerequisites, resources and operating system server is performed again. If the prerequisites required for job start are not met, then another passive wait can result out of this.

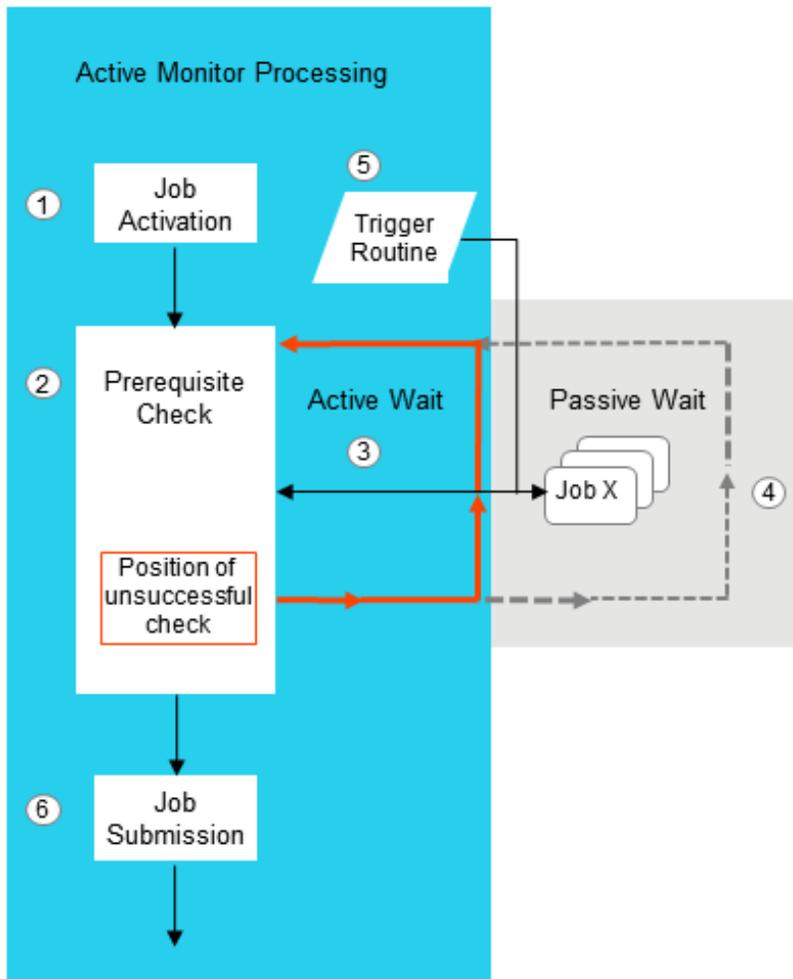

Note: The main passive wait release routine does not reactivate the waiting jobs at the same time. Instead, it performs the release in portions of 300 jobs. Between the portions, there is a wait of 30 seconds. This spreads the Monitor and database activity for the prerequisite check of a large number of jobs over a longer period of time.

- [Course during Passive Wait for Prerequisites](#)
- [Exceptions from Passive Wait](#)

Course during Passive Wait for Prerequisites

The following graphic shows the course during passive wait for prerequisites:

Legend

- ① A network has been activated and job processing is controlled by the Monitor.
- ② The prerequisites of a job are checked after job activation.
If a prerequisite is not met (for example, the execution node defined for the job is not available), the prerequisite check stops at the position where it failed.
- ③ The job is placed into an active wait state waiting for the next check to meet the required prerequisite.
The next check continues at the position where the previous check failed.
- ④ The Monitor determines how long to wait for the missing prerequisites before it places the job into a passive wait state.

- ⑤ A trigger routine reactivates the job if the criteria defined to reactivate the job are met (for example, the missing execution node is available now), and forces the job back to active checking.

The check procedure (from active to passive wait and vice versa) can repeat several times.

- ⑥ If all prerequisites are met, the job is submitted for execution.

Note: Each time the Monitor is started, all jobs in the passive wait queue are reactivated for another prerequisite check.

Exceptions from Passive Wait

A job cannot be placed into a passive wait state in the following cases:

- Waiting for an input condition which depends upon the existence of a file;
- Waiting for an input condition which depends upon the result of a user exit.

In these cases, Entire Operations cannot acknowledge on its own when such a job is to be placed again into the active wait. Therefore, in such a case, an active job is not placed into the passive wait.

Nevertheless, at least for part of the wait, a passive wait can also be carried out for these jobs, if, in parallel to the above mentioned cases, they are waiting for a *normal* prerequisite, which is set up as shortly as possible before job submission.

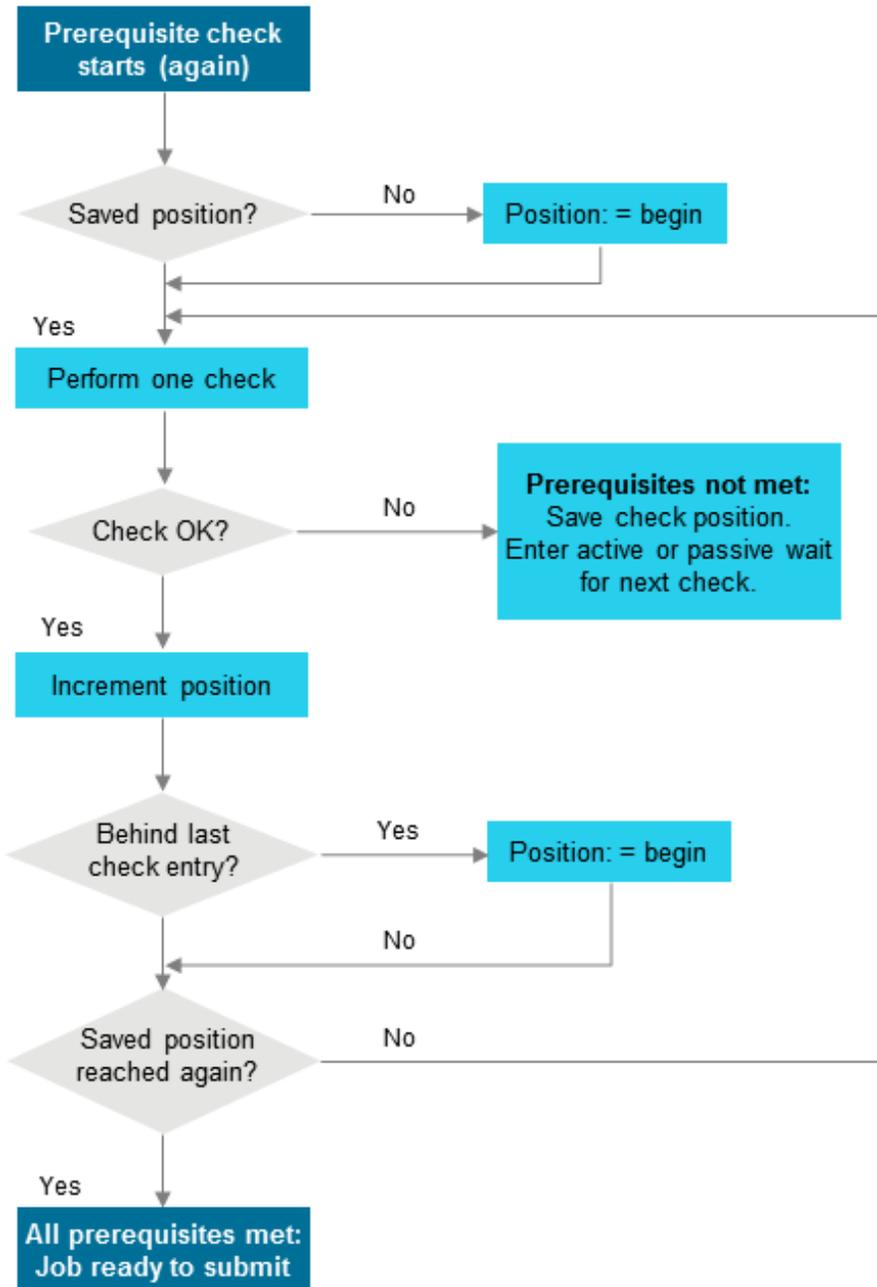

In other words: it is recommended to replace a wait for prerequisites with special dependencies by a wait for normal prerequisites.

Prerequisite Check according to the Round-Robin Procedure

If prerequisites and resources of an active job are actively checked, then the order of the job checks will be optimized dynamically.

For a follow-up check, the last unsuccessful check will be the starting point. This prevents successful checks from being redundantly repeated several times. It is guaranteed, however, that immediately before the job start release all input conditions and resources have been checked together at one point in time.

The following diagram shows the course of the Round-Robin Procedure for the check of prerequisites and resources:

V Entire Operations Utilities

Entire Operations utilities are used to perform selected Entire Operations functions.

A utility is usually a standalone Natural program that runs either online or in batch mode when invoked by a Natural batch job.

Introduction

- [Required LFILE Assignments](#)
- [Log Selection File - Format 1](#)

Required LFILE Assignments

| LFILE | Explanation |
|-------|--|
| 216 | Entire Operations System File 1. |
| 131 | System Automation Tools log file. |
| 215 | Entire Operations System File 3 (log selection file). |

Log Selection File - Format 1

An empty log selection file (LFILE=215, NOP-LOG-SELECT-1) for accounting data is part of the Entire Operations installation files.

The DDM for the log selection file is EOR-LOG-SELECTION-1.

The DDM is delivered with descriptors on almost every field. It is up to the user to release descriptors which are not necessary.

The file can be read and evaluated with Natural.

DB 255, File 215

This file applies to the default sequence of the NOP-LOG-SELECT-1 file.

| T | L | DB | Name | Format | S | D | Remarks |
|---|--------------------------|----|-----------------|--------|---|---|---------|

Extract Log Data to Log Selection File

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

LGAX1S-P P-DATE-FROM P-DATE-TO

Parameters

| Name | Format | Description |
|---------------------------|--------|---|
| P-DATE-FROM (optional) | A8 | Start date for the extraction in format YYYYMMDD. |
| P-DATE-TO (optional) | A8 | End date for the extraction in format YYYYMMDD. |

Notes:

1. Start date and end date for the extraction are optional. If wanted, both parameters must be set. If the start date is smaller than the time stamp in the private control record (see note 2 and 3), the extraction is not performed.
2. Log data extraction always starts where the last extraction ended.
3. This time stamp is kept in a private control record. (When the program is started for the first time, the start date 01.11.2001 is used.)
4. The extraction data consists of job accounting data (see [Example of Accounting Information](#) in the section [Reporting](#)).
5. New extraction data do not overwrite existing extraction data.

Delete Old Data in Log Selection File

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

LGAX1D-P P-RETENTION-DAYS

Parameters

| Name | Format | Description |
|------------------|--------|--|
| P-RETENTION-DAYS | I2 | Entries older than this parameter are deleted. |

Print Account Information from Entire Operations Log

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

LG-AP1-P P-TIME-FROM P-TIME-TO

Parameters

| Name | Format | Description |
|-------------|--------|------------------------|
| P-TIME-FROM | A14 | Format: YYYYMMDDHHIISS |
| P-TIME-TO | A14 | Format: YYYYMMDDHHIISS |

Mass Change of Network / Symbol Table Version

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

OV-MB--P
 P-OBJECT-TYPE P-OBJECT-OWNER P-OBJECT-NAME P-OLD-OBJECT-VERSION P-NEW-OBJECT-VERSION ↔
 P-ALLOW-UPD

Depending on the settings of the Natural parameter ID, parameters may need to be comma separated instead of using blanks.

Parameters

| Name | Format | Description | |
|----------------------|--------|----------------------------------|-----------------------|
| P-OBJECT-TYPE | A2 | Object type: | |
| | | NV | Network Version. |
| | | SV | Symbol Table Version. |
| P-OBJECT-OWNER | A10 | Owner of object. | |
| P-OBJECT-NAME | A10 | Object name. | |
| P-OLD-OBJECT-VERSION | A10 | Version of object to be renamed. | |

| Name | Format | Description | |
|----------------------|--------|------------------------|-----------------------|
| P-NEW-OBJECT-VERSION | A10 | New version of object. | |
| P-ALLOW-UPDATE | A1 | N | Only perform a check. |
| | | Y | Allow updates. |

**Notes:**

1. The Natural session parameter IM must be set to IM=F.
2. The Monitor should be stopped during the execution of this utility to avoid unintended results of network activations.
3. The program can be restarted in case of an abnormal termination to complete the rename action.
4. Every object (to be) changed is reported. The report is written to Natural main output.

Monitor or Task Wait Time Modification

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

MO-WTM-P P-MONITOR-WAIT-TIME P-TASK-ID

Parameters

| Name | Format | Description |
|---------------------|--------|---|
| P-MONITOR-WAIT-TIME | I4 | In seconds. |
| P-TASK-ID | I2 | Number of a Monitor task. |
| | | Only the wait time of this task will be modified. |

**Notes:**

1. If a wait time less than 5 seconds is specified, the wait time is set to 5 seconds.
2. The modifications carried out using this program only apply until the end of the current Monitor run.

Monitor Shutdown

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

MO-SHD-P

Parameters

None.

Monitor Start

- [Natural Program Call](#)
- [Parameter](#)

Natural Program Call

MO-ST--P P-MONITOR-NODE

Parameter

| Name | Format | Description |
|----------------|--------|---------------------|
| P-MONITOR-NODE | I2 | Value = 1 to 99999. |

BS2000 Jobs

These jobs are used to update the submit user ID, submit password and account number.

- [Natural Program Call](#)

- Parameters

Natural Program Call

BS2U01-P P-OWNER P-USERID-OLD P-PW-OLD P-USERID-NEW P-PW-NEW P-ACCOUNT-NEW

Parameters

| Name | Format | Description |
|---------------|--------|---|
| P-OWNER | A10 | Entire Operations owner of jobs to be modified. |
| P-USERID-OLD | A8 | BS2000 user ID to be exchanged. |
| P-PW-OLD | A8 | BS2000 submit password to be exchanged. |
| P-USERID-NEW | A8 | BS2000 new user ID. |
| P-PW-NEW | A8 | BS2000 new submit password. |
| P-ACCOUNT-NEW | A8 | BS2000 new account number. |

Notes:

1. An asterisk (*) for a parameter is converted to blank.
2. Job fields are only exchanged if the Entire Operations owner, the old BS2000 user ID, and the old submit password do match.
3. Fields are replaced, only if the new value is not blank.
4. A log is written to the screen. In batch mode, the log is printed to Natural Printer 1. This printer must therefore be assigned in the JCL.

List or Delete TO-ACTIVATE Command Records

- Natural Program Call

- [Parameters](#)

Natural Program Call

TA-DEL-P P-FUNCTION

Parameters

| Name | Format | Description | |
|------------|--------|-------------|-----------------------------|
| P-FUNCTION | A1 | D | Delete TO-ACTIVATE records. |
| | | L | List TO-ACTIVATE records. |

Notes:

1. With this batch utility you can list or delete the internal TO-ACTIVATE command records in the Entire Operations active database.
2. Use this utility only in co-operation with the Software AG support and if you have to perform a manual removal of the TO-ACTIVATE command records.
3. This utility may be used only if the Entire Operations Monitor is not running.

Check the Existence of Symbol Table Definitions

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

CHNWST-P P-FUNCTION

Parameters

| Name | Format | Description | |
|------------|--------|-------------|---|
| P-FUNCTION | A1 | A | List all networks without a symbol table. |
| | | S | List subnetworks without a symbol table. |

The report is written to Print File 1 in batch and to screen in online.

Mass Change of the Owner and Owner Deletion

- [Natural Program Call](#)
- [Parameters](#)
- [Notes](#)

Natural Program Call

```
OW-MB--P
P-OWNER-OLD P-OWNER-NEW P-ALLOW-UPDATE
```

Depending on the settings of the Natural parameter `ID`, parameters may need to be comma separated instead of using blanks.

Parameters

| Name | Format | Description | |
|----------------|--------|--|-----------------------|
| P-OWNER-OLD | A10 | Old owner | |
| P-OWNER-NEW | A10 | New owner. If you specify <code>==DELETE==</code> here, the owner will be deleted, with all references associated with the owner such as, links to users, other owners and objects maintained by the owner. | |
| P-ALLOW-UPDATE | A1 | N | Perform a check only. |
| | | Y | Allow updates. |

Notes

- The Natural session parameter `IM` must be set to `IM=F`.
- The Entire Operations Monitor must be stopped during the execution of this utility.
- The old and new owner names may not be `SYSDBA`.
- The utility runs in two passes. During the first pass, the data to be changed is checked against potential problems. An error message (line with `E:`) will result in update mode (`P-ALLOW-UPD`) switched to `N`. A typical problem is “target exists”, when owner rename would cause merging of Entire Operations objects within a network. A warning message (line with `W:`) indicates situation of interest which does not prevent from object renaming.
- The second pass is either the real update or diagnostic run depending on update mode value.
- Every object (to be) changed is reported. The report is written to Natural main output.
- The utility must run with Entire Operations System File 1 opened in Adabas exclusive (`EXU`) mode, which means: the Entire Operations Monitor and every other Natural session with Entire

Operations System File 1 must be terminated before. This prerequisite is necessary to protect the integrity of Entire Operations objects and links between them. For this reason we suggest Natural profile parameter:

```
OPRB=(EXU=fnop1,UPD=fnat,flog,ACC=fsec)
```

where:

- *fnop1* = Entire Operations System File 1
- *fnat* = Natural system file FNAT
- *flog* = Entire Operations or System Automation Tools log file
- *fsec* = Natural Security system file

Other files required to run Natural should be added to UPD= or ACC= list.

- We suggest a job with the following steps to run OW-MB--P:
 - Step 0: Adabas ADAORD/ADASAV/ADAULD to save Entire Operations System File 1 when following OW-MB--P runs in update mode;
 - Step 1: Adabas ADADBS utility with parameters:

```
ADADBS OPERCOM  
STOPF=fnop1  
ADADBS OPERCOM LOCKX=fnop1
```

- Step 2: Natural session with OW-MB--P;
- Adabas ADADBS:

```
ADADBS OPERCOM  
UNLOCKX=fnop1
```

- If the utility runs in a “normal” Natural session, it will (most likely) run out of space in the Adabas WORK area or max ISN hold limit or will be waiting for records being held by others (also with update mode N). So we strictly recommend that you run the utility in batch mode only.
- There is another Natural profile parameter, DBUPD=OFF, which may be used to run this utility safely and in parallel to other sessions however the utility report may indicate false error messages due to other activities on Entire Operations System File 1.
- When OW-MB--P reports the E: ... targets exist (xx: *nnn*) error, *xx* is the two-character target code and *nnn* is the number of target records found. *xx* can be the following:

NM (Network Master)
JM (Job Master)
EM (Event Master)
JA (Job Active)

EA (Event Active)
 JC (JCL active)
 CO (Conditions active)
 SA (Symbols Active)
 RP (Resource Prerequisites)
 RU (Resource usage)

- Existing targets are reported in the sequence above, e.g. EM means that targets NM and JM were not found.

If the reported target is:

- JM: create manually missing network definition and jobs will appear in it. Deactivate/delete it again;
- CO: these are visible in Active Conditions.
- The rest of the targets can be cleaned up with a new special “orphan” cleanup batch utility:

```
CL-ORP-P owner update-mode
```

where all parameters are mandatory:

- *owner* (A10): P-OWNER-NEW from the erroneous OW-MB--P run (SYSDBA not allowed);
- *update-mode* (L): update mode N or Y.
- Everything about execution of OW-MB--P mentioned above applies the same way to CL-ORP-P, i.e. it must be executed with Natural profile parameter OPRB to open Entire Operations System File 1 in exclusive update mode or profile parameter DBUPD=OFF may be used for diagnostic purposes. The report about (possibly) deleted “orphan” objects is written to Natural main output.
- Be sure to keep all the reports of OW-MB--P and CL-ORP-P runs with update mode Y.

Mass Change of Access Rights Granted to Networks

- [Natural Program Call](#)

- Parameters

Natural Program Call

```
LOGON SYSEOR
NV-MB--P
  P-FUNCTION,P-OWNER,P-NETWORK,P-VERSION,P-TYPE,P-NAME,P-OPTION
FIN
```

The Natural program NV-MB--P provides the option to add, modify or delete user access rights granted to networks. NV-MB--P can run online and in batch mode.

The above Natural program call assumes that the Natural profile parameter ID (input delimiter character) is set to a comma (,).

Example:

```
LOGON SYSEOR
NV-MB--P
U,EXAMPLE,*,*,0,NOPALL,DORA
```

In the example above, the access rights of owner NOPALL change to DORA for all networks and network versions of the owner EXAMPLE.

Parameters

| Name | Format | Description | |
|------------|--------|--|---|
| P-FUNCTION | A1 | D | Delete all user access rights granted to all networks specified with P-OWNER, P-NETWORK and P-VERSION. |
| | | U | Changes user access rights granted to all networks specified with P-OWNER, P-NETWORK and P-VERSION: <ul style="list-style-type: none"> Access rights are modified to P-OPTION for the user specified with P-TYPE and P-NAME. Access rights are added if the user specified with P-TYPE and P-NAME does not yet exist. |
| P-OWNER | A10 | Name of the network owner or a range of names specified with a wildcard (* or ?). You can only use one parameter to specify a name range. | |
| P-NETWORK | A10 | Name of the network or a range of names specified with a wildcard (* or ?). You can only use one parameter to specify a name range. | |

| Name | Format | Description | |
|-----------|--------|--|--|
| P-VERSION | A10 | Name of the network version or a range of names specified with a wildcard (* or ?). You can only use one parameter to specify a name range. | |
| P-TYPE | A1 | Only required for P - FUNCTION=U. User type specification: | |
| | | 0 | Owner. |
| | | U | User. |
| P-NAME | A8 | Only required for P - FUNCTION=U. Name of the owner or user whose access rights you want to change. | |
| P-OPTION | A5 | Only required for P - FUNCTION=U. Options for access restrictions (multiple values are possible): | |
| | | R | Read access. |
| | | W | Read and write access. |
| | | D | Read, write and delete. |
| | | 0 | Owner rights with permission to grant access to other users. |
| | | A | Network activation rights. |

User ID Mass Update in Network and Job Definitions

- [Natural Program Call](#)
- [Parameters](#)

Natural Program Call

US-UPD-P P-FUNCTION P-OLD-VALUE P-NEW-VALUE P-NODE P-OWNER P-NETWORK

Parameters

| Name | Format | Description | |
|------------|--------|-------------|--|
| P-FUNCTION | A3 | NSU | Change network default submit user ID. |
| | | NSG | Change network default submit group. |
| | | NJU | Change network default JCL user ID. |
| | | NJG | Change network default JCL group. |
| | | JMU | Change job modification user ID. |

| Name | Format | Description |
|-------------|--------|---|
| | | JSU Change job submit user ID. |
| | | JSG Change job submit group. |
| | | JJU Change job JCL user ID. |
| | | JJG Change job JCL group. |
| | | JSB Change SYSOUT node; <i>catid</i> ; user ID on BS2000 node. |
| P-OLD-VALUE | A20 | If not empty, change only if old user ID is equal to this. This field is case-sensitive. |
| P-NEW-VALUE | A20 | May contain user ID or group (see P-FUNCTION) or blank to reset corresponding user ID. The field is case-sensitive. |
| P-NODE-A5 | A5 | Must be a defined node in Entire Operations. If you want to pass a node number directly, you have to assign it to a field in the format A5 first. Mnemonic (short) node names in the A5 format can also be passed. SYSOUT definitions can only be used by jobs that have this node defined as a submit node. |
| P-OWNER | A10 | These two fields can be used for wildcard range definition. Wildcard is allowed in one field only. |
| P-NETWORK | A10 | |

Important: This utility may be used only if the Entire Operations Monitor is not running.

Mass Update for User Access to Nodes

The utility NOPUNA-P is used to add or update single or multiple users for node access through defined operating system IDs.

Natural Program Call

NOPUNA - P

When running NOPUNA-P in batch mode, Work File 1 must be defined with LRECL 130. The work file can contain comment lines denoted by asterisk (*), double asterisk (**) or slash asterisk (/*) in the first and second positions of the record.

For each user ID to be added or updated, one line must be defined in the following format:

nop-userid,node-number,os-userid,os-group,ld-value,aj-value,as-value

Each successful user update is logged in the Entire Operations log.

Example:

EXAMPLE,517,nprusr01,Nprgrp01,Y,Y,Y

Fields in the Input Lines

The variable fields used for the program call are described in the following table:

| Name | Format | Description |
|--------------------|---------------------|--|
| <i>nop-userid</i> | A8 (upper case) | ID of the Entire Operations user provided node access. |
| <i>node-number</i> | N5 | Number of the Entire Operations node to be accessed. |
| <i>os-userid</i> | A50 (mixed case) | ID of the operating system assigned to the node. |
| <i>os-group</i> | A20 (mixed case) | Name of a Windows or UNIX group (if defined) to which the operating system ID belongs. |
| <i>ld-value</i> | A1 | Allow (Y) or disallow (N or blank) automatic node logon. |
| <i>aj-value</i> | A1 | Allow (Y) or disallow (N or blank) automatic node logon for browsing and editing JCL only. |
| <i>as-value</i> | A1 | Allow (Y) or disallow (N or blank) automatic node logon for browsing SYSOUT only. |

Mass Change of Node Numbers

Natural Program Call

ND-MB--P LOCATION NODE-OLD NODE-NEW OWNER NETWORK NETWORK-VERSION

Parameters

| Name | Format | Description |
|-----------------|--------|--|
| LOCATION | A3 | All occurrences of node will be changed in master definitions of network, job or event. For other values, refer to the list of JCL locations . |
| NODE-OLD | N5 | Node number. |
| NODE-NEW | N5 | Node number. |
| OWNER | A10 | Owner filter (optional). |
| NETWORK | A10 | Network filter (optional). |
| NETWORK-VERSION | A10 | Network version filter (optional). |

Notes

1. Both `NODE-OLD` and `NODE-NEW` must be defined and valid and of the same operating system class, i.e., you can change `OS/390` to a `z/OS` node but not `VSE` to `z/OS`.
2. If no value is specified for `OWNER`, `NETWORK`, `NETWORK-VERSION`, an asterisk (*) is used by default.
3. You can use an asterisk (*), a greater than sign (>) or a smaller than (<) sign as a wildcard character.

If a wildcard appears in `OWNER`, `NETWORK` contains an asterisk (*).

4. Program `ND-MB--P` can be run safely (only to list objects) in a Natural session with the Natural profile parameter `DBUPD=OFF` set.

Mass Logon Processing in Batch Mode

- [Natural Program Call](#)
- [Fields in the Input Lines](#)
- [Single Node Logons without using a Work File](#)

Natural Program Call

ND-LB--P

The utility `ND-LB--P` must be run in a Natural batch environment. The logging is written both to `SYSOUT` and to the Entire Operations log (SAT log). Passwords will not be logged.

The input is read from Natural Work File 1. For each logon to be performed, one line must be defined with the format:

```
node userid group password
```

Example:

```
517 sag users sag-pwd
```

Comment lines must have an asterisk (*) as first character. The output is written to the Natural batch job SYSOUT and to the Entire Operations log.

Fields in the Input Lines

| Name | Format | Description |
|-----------------|--------|--|
| <i>node</i> | N5 | The Entire System Server node, to which the logon is to be performed. |
| <i>userid</i> | A20 | User ID for the logon. |
| <i>group</i> | A20 | Group for the logon. For Windows nodes, <i>group</i> must contain the domain. If no group or domain is used, enter a hyphen (-) instead. Example: 148 USER - USER-PWD |
| <i>password</i> | A20 | The password for the logon. The <i>password</i> parameter must be enclosed in double quotes (" <i>password</i> "), if the password contains at least one blank. Passwords with trailing blanks are not supported. |

**Notes:**

1. This utility can be used only if the Entire Operations Monitor is not running.
2. There may be one or several blanks between the parameters.
3. If no group or domain is used, enter a hyphen (-) instead.
4. For UNIX and Windows nodes, the input is case-sensitive.
5. For mainframe nodes, the text strings will be converted to upper case before the logon is performed.

Caution: Users of this utility must be aware that the input file is very security-sensitive, because it contains passwords in clear text.

Single Node Logons without using a Work File

To allow single node logons without using a work file, the parameters can be passed on the Natural command line too.

The command line parameters are:

1. node number
2. user ID
3. group (UNIX) resp. domain (Windows)
(Pass a hyphen (-) if the default group resp. no domain is to be used.)
4. password

The parameters are case-sensitive.

On return, ND-LB--P provides a return code in the AIV variable +ND-LB--P-RC (I4).

It contains 0 (zero) if the logon was successful, and any other error code in case of an error.

Bulk Execution of MACRO Commands

- [Program: MAC-GE-P](#)

Program: MAC-GE-P

The program performs the `MACRO` command in batch mode for a given selection of job network(s).

Natural Program Call

(with the Natural parameter `ID=`, being set)

```
LOGON SYSEOR
MAC-GE-P
MODE,OWNER,NETWORK,NETWORK-VERSION
FIN
```

Example:

```
LOGON SYSEOR
MAC-GE-P
A,SN,A-1,v-unnamed
FIN
```

Parameters

| Name | Format | Description | |
|-----------------|--------|-------------------------|--|
| MODE | A1 | A | Catalog all jobs with JCL location MAC. |
| | | M | Catalog jobs with JCL location MAC, which were not yet cataloged. |
| OWNER | A10 | Owner filter. | |
| NETWORK | A10 | Network filter. | |
| NETWORK-VERSION | A10 | Network version filter. | |

The parameters P-OWNER, P-NETWORK and P-NETWORK-VERSION may contain selection wildcards:

```
*, >, <, ?
```

**Notes:**

1. The Program MAC-GE-P must be started in batch.
2. The Natural profile parameters LC=ON, EDPSIZE=100 must be set.
3. On mainframe systems. The Entire Operations Monitor must be active. The task 90 must be running.

Result Checking

The SYSOUT of the batch job contains detailed information about the cataloging. The results must be checked.

Example:

```
Owner      Network   Version   Job          Library  Member    Result
SN         A-1       v-unnamed MAC1-541     EOR-T541 MAC1      Done
SN         A-1       v-unnamed MAC1N511    EOR-N541 MAC1      Error
>>> NAT0806 - Library not found.
```

Data Migration to the current Entire Operations Version

The data migration to the current Entire Operations version adapts various objects and fields, so that they can be used by the current Entire Operations version,

```
DMDRIV - P
```

It is recommended to use a Natural batch job to perform the migration. The Natural commands are:

```
LOGON SYSEOR  
DMDRIV - P  
FIN
```

Notes:

1. A data migration consists of several independent migration steps.
2. Each migration step will be performed only once. Internal control records prevent multiple executions.
3. The migration invocation may be repeated as often as necessary.
4. The migration is logged into the Natural SYSOUT.
5. The data migration may be performed only if the Entire Operations Monitor is not active.

VI

Using Entire Operations in Batch Mode

14

Using Entire Operations in Batch Mode

- Files Needed to Start Entire Operations in Batch 195
- Files Needed to Start the Batch Command Client 137
- Command Syntax for the Batch Command Client 139
- Commands for the Batch Command Client 144

This section describes the files and commands required to perform Entire Operations functions in batch mode from a Windows environment.

Note: For explanations of the syntax symbols used in this chapter, see the section *Direct Command Syntax*.

Files Needed to Start Entire Operations in Batch

The following files are required to start Entire Operations in batch mode:

1. A windows batch file (.bat)
2. A command file (.cmd)
3. A file with input data (.inp)

Examples of such files are contained in the Natural directory SYSSATGF/RES: exportapi.bat, exportapi.cmd and exportapi.inp.

- [exportapi.bat](#)
- [exportapi.cmd](#)
- [exportapi.inp](#)
- [EXPORT DIAGRAM Command Syntax](#)
- [Files Generated from EXPORT DIAGRAM Command](#)
- [Starting Entire Systems Management in Batch Mode](#)

exportapi.bat

```
"C:\SoftwareAG\Natural\bin\nderun.exe" BATCHMODE
PARM=SYSESM2 CMSYNIN="C:\exportapi.cmd" CMOBJIN="C:\exportapi.inp"
CMPRINT="C:\exportapi.out" BMSIM=MF NATLOG=OFF
```

| File | Explanation |
|--------------------------------------|---|
| C:\SoftwareAG\Natural\bin\nderun.exe | Full path to Natural executable file. |
| PARM=SYSESM2 | Natural configuration file name. |
| C:\exportapi.cmd | Full path to the file with commands (file must exist). |
| C:\exportapi.inp | Full path to the file with input data (file must exist). |
| C:\exportapi.out | Full path to the file where the output information will be exported to. File will not exist. It is created on first launch of batch file. |

We recommend that you only change the last three parameters.

exportapi.cmd

```
LOGON SYSSATGF
ESSTRPCD
FIN
```

SYSSATGF is the name of the library from which Entire Operations should be launched.

We recommend that you do not change this parameter and file.

exportapi.inp

```
/* Maximum line length: 249.
/* Blank lines are not allowed.
/* Comment lines must begin with "/*".
/*
/* Input delimiter character (= ID parameter) separates user IDs from
/* passwords or substitutes them. Default is ",".
/*
/* First coded line must contain:
/* <natural-security-userid><input-delimiter-character><natural-security-password>
/* (or <input-delimiter-character> only)
/*
/* Second coded line must contain:
/* <entirex-userid><input-delimiter-character><entirex-password>
/* (or <input-delimiter-character> only)
/*
/* Parameter definitions must conform to the direct command syntax.
/*
/* File must end with the END statement; lines that follow are ignored.
/*
NSC-USERID,NSC-PSW-38292076742878722694553347482051
,
/*
FOCUS TO SYSOGC
/*
/*---- Start of direct commands
/*
EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=B60-FLOW FORMAT=JPG PREFIX=C:\
/*
/* --- End of direct commands
/*
END
```

This is the main file you can modify as required.

General Syntax Requirements:

- A maximum of 249 characters is allowed per line.
- Blank lines are not allowed.

- Comment lines must begin with the symbol sequence /*.
- Any parameters definitions must comply with the direct command syntax.

The syntax of the exportapi.inp file is as follows:

```
[natural-security-userid],[natural-security-password]
[entirex-userid],[entirex-password]
FOCUS TO SYSOGC
direct-command ...
END
```

| Syntax Element | Description |
|-----------------------------|--|
| natural-security-userid | Optional user ID and password for Natural Security logon to be entered in the first coded. |
| natural-security-password | |
| | We recommend that you encrypt <i>natural-security-password</i> with the SYSSATGF\RES\nprpwc.exe program. |
| entirex-userid | Optional user ID and password to logon for EntireX logon to be entered in the second coded line. |
| entirex-password | |
| | We recommend that you encrypt <i>entirex-password</i> with the SYSSATGF\RES\nprpwc.exe program. |
| , | The input delimiter character (a comma in the syntax diagram above) as defined with the Natural session/profile parameter ID (described in the <i>Parameter Reference</i> of Natural for Windows). |
| (input-delimiter-character) | |
| | This character either separates a user ID from a password or substitutes a user ID and password if not available. The first and second coded source line can contain the following, for example: |
| | <pre>, ENTIREX-USERID, FOCUS TO SYSOGC ...</pre> |
| | The default input delimiter is a comma (,). |
| FOCUS TO SYSOGC | Logs on to the Natural SYSOGC system library. |
| direct-command | Insert the direct commands as required, each in a separate line. |
| END | The file must end with the END statement in a separate line. Any lines that follow are ignored. |

EXPORT DIAGRAM Command Syntax

General Syntax:

```
EXPORT DIAGRAM OWNER=owner
[NETWORK=network [RUN=run-number] [VERSION=version]]
[FORMAT=format] [PREFIX=prefix]
```

Syntax Description:

| Syntax Element | Description | Valid Values | Examples |
|-------------------|---|---|---|
| <i>owner</i> | Network owner name | Alphanumeric, wildcard (*) allowed at the end of expression. | EXAMPLE, EX*, * |
| <i>network</i> | Network name. If a wildcard is used, all networks of a network master that meet the specified name range are selected. If no wildcard is used, all networks of a network master and all active networks are selected depending on whether <i>run-number</i> is specified. | Alphanumeric, wildcard (*) allowed at the end of expression. | NET01, NET*, * |
| <i>run-number</i> | Run number. If specified, all networks from the Active Network node are selected. | Numeric, asterisk (*) allowed for all numbers, colon (:) allowed for run range. | 23, * 12:23 , not allowed: 2* |
| <i>version</i> | Version identifier of network master. | Alphanumeric, wildcard (*) allowed as an expression. Reserved keywords like (current) are not allowed. | vTest, vTe*, not allowed: (current) |
| <i>format</i> | File extension for export format. Default is WMF. | Alphanumeric | BMP, EPS, GIF, JPG, PCX, PNG, TIF, WMF, VMF |
| <i>prefix</i> | Path to directory, where exported diagrams should be placed. Default is %temp%/. See also Rules for Path Names and Directories . | A valid Windows path name | "C:\temp\Export graphic via batch\ C:\temp\ C:\temp\batch01_ |

A wildcard (*) is only allowed in a parameter that defines an owner, network, version or run. When you define several of these parameters, you can only use a wildcard in the first parameter (all other wildcards are then ignored).

Examples of valid commands:

| | |
|--|---|
| EXPORT DIAGRAM OWNER=* FORMAT=BMP | Export all network masters for all owners. |
| EXPORT DIAGRAM OWNER=EX* FORMAT=BMP | Export all network masters for owners starting with EX. |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=* FORMAT=GIF | Export all network masters for owner EXAMPLE. |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=NET* FORMAT=GIF | Export all network masters with prefix NET for owner EXAMPLE. |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=NET01 VERSION=vP* FORMAT=JPG | Export all versions with prefix vP of network masters for owner EXAMPLE and name NET01. |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=NET01 RUN=23 FORMAT=JPG | Export active network EXAMPLE/NET01/23. |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=NET01 RUN=* FORMAT=JPG | Export all active run networks of EXAMPLE/NET01. |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=NET01 RUN=12:23 FORMAT=JPG | Export all runs from 12 to 23 of network EXAMPLE/NET01. |

Examples of Invalid Commands:

| |
|---|
| EXPORT DIAGRAM OWNER=EX* NETWORK=NET01 FORMAT=JPG |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=NET* RUN=23 FORMAT=JPG |
| EXPORT DIAGRAM OWNER=EXAMPLE NETWORK=NET* RUN=* FORMAT=JPG |

Files Generated from EXPORT DIAGRAM Command

Files names are generated from the EXPORT DIAGRAM command according to the command input sequence in the following way:

prefix_owner_network_version_run.format

Rules for Path Names and Directories

- The default *prefix* for file name is : EXDIAGRAM_ownership_network_version_run.format
- If *prefix* is not specified, the default value %temp% is used.
- For a *prefix* that does not end with a backslash or slash an underscore (_) is generated instead into the path name.
- A relative path specification is not allowed.
- A specified directory must exist.

Examples of Files generated from a Command

1. EXPORT DIAGRAM OWNER=EXAMPLE network=NET01 run=23 format=JPG ←
prefix="C:\temp\Export graphic via batch\"

generates:

```
C:\temp\Export graphic via batch\EXDIAGRAM_EXAMPLE_NET01_23.JPG
```

2. EXPORT DIAGRAM OWNER=EXAMPLE network=NET* format=JPG prefix="C:\temp\Export graphic via batch\pref"

generates:

```
C:\temp\Export graphic via batch\pref_EXAMPLE_NET01.JPG
C:\temp\Export graphic via batch\pref_EXAMPLE_NET02.JPG
C:\temp\Export graphic via batch\pref_EXAMPLE_NET03.JPG
```

Starting Entire Systems Management in Batch Mode

➤ To launch Entire Systems Management in batch mode

- 1 Adapt the example files according to your requirements (Natural directory SYSSATGF/RES: exportapi.bat, exportapi.cmd and exportapi.inp).
- 2 Launch the .bat file.
- 3 View the .out file (exportapi.out file) to see the results and output messages.

If an error occurs, ensure that Entire Systems Management was launched in normal mode using the correct parameters.

Files Needed to Start the Batch Command Client

The following files are required to start the batch command client of Entire Systems Management:

1. A Windows batch file (.bat)
2. An XML batch file (.xml)

Examples of such files are located in the Natural SYSSATGF/RES directory: batchClientCommand.bat and batchClientReports.xml.

- [batchClientCommand.bat](#)

- [batchClientReports.xml](#)

batchClientCommand.bat

```
SET dirNatural=<natural-product-directory>
SET ESM_BCC_IN=<natural-fnat-directory>\SYSOGC\RES\batchClientReports.xml
SET ESM_BCC_OUT=<user-temp-directory>\batchClientReports_out.xml

"%dirNatural%\bin\nderun.exe" : PARM=SYSESM2 STACK=(LOGON SYSSATGF;ESSTBC-P;FIN)
```

| Data | Explanation |
|-------------------------------------|---|
| <i>natural-product-directory</i> | Full path to the Natural executable file. |
| PARM=SYSESM2 | Natural configuration file name. |
| <i>natural-fnat-directory</i> | Full path to the Natural FNAT system file with input data. Note: File must exist. |
| <i>user-temp-directory</i> | Full path to the file where the output information will be exported to. File will not exist. It is created on the first launch of the batch file. |
| STACK=(LOGON SYSSATGF;ESSTBC-P;FIN) | Name of the library from which to launch the batch command client of Entire Systems Management and the main program. We recommend that you do not change this name. |

| Environment Variable | Explanation |
|----------------------|--|
| ESM_BCC_IN | Mandatory variable containing the full path to input data file containing the instructions. |
| ESM_BCC_OUT | Mandatory variable containing the full path to the file where the output information will be exported to. File will not exist. It is created on first launch of batch file. |
| ESM_BCC_TRACE | Optional variable to specify the trace level which will be written to the log file. |
| ESM_BCC_LOG | Optional variable containing the full path of the file where the log/trace information will be written to. File will not exist. It is created on first launch of batch file. |

batchClientReports.xml

```
<?xml version="1.0" encoding="utf-8" ?>
<ESM_Batch_Command_Client xmlns="http://www.softwareag.com/ESM/sat34">
  <RPC User="<userid>" Password="<password>" />
  <EXX ServerName="<server-name>" ServerNode="<server-node>" />
  <ESM ApplicationID="OP" Language="2">
    <Command Object="Reports" Name="List">
      <Parameter Name="Filter_Status">Completed</Parameter>
    </Command>
  </ESM>
</ESM_Batch_Command_Client>
```

| Data | Explanation |
|--------------------|--|
| <i>userid</i> | ID of a valid user. |
| <i>password</i> | Valid password of a user. We recommend that you encrypt <i>password</i> with the SYSSATGF\RES\nprpwc.exe program. |
| <i>server-name</i> | Valid server name. See also the Natural SRVNAME profile parameter described in the Natural for Windows <i>Parameter Reference</i> documentation. |
| <i>server-node</i> | Node name. See also the Natural SRVNODE profile parameter described in the Natural for Windows <i>Parameter Reference</i> documentation. |

Command Syntax for the Batch Command Client

The batch command client of Entire Systems Management is programmed with an XML file.

XML documents use a self-describing and simple syntax. The first line is the XML declaration. It defines the XML version (1.0) and the encoding used. The second line describes the root element of the document. It is the parent element of all other elements. These child elements contain the description of the further on data or in our case processing. The last line defines the end of the root element. All tags and attributes used inside the xml file are case sensitive.

Encoding

If no encoding is given it is supposed that the XML document only contains standard ASCII characters. Special characters like the German *ü* or *ä* are not valid. If you want to use this kind of characters you have to use the encoding setting. For editing an xml file use an editor that supports encoding. Make sure that you use the same encoding during editing that is specified at the encoding attribute. Otherwise, your document may not load or your data is misinterpreted.

DTD Input File

```

Tag Reference

| Tag | Explanation |
|----------------------------|---|
| <ESM_Batch_Command_Client> | The <ESM_Batch_Command_Client> tells the processor of the batch command client of Entire Systems Management the remote environment to be used and the commands to be processed. |
| <RPC> | Defines the Natural RPC connection with user and password. |
| <EXX> | Defines the EntireX remote server and service and if necessary user and password. |
| <ESM> | Defines the Entire Systems Management application and additional settings such as language or determination date. |
| <Command> | Defines a single command which should be processed. |
| <Parameter> | Defines a parameter of a command. |

The tags are explained in the following section.

Note: The following tables contain a format column. The specified formats are based on the definition of Natural user-defined variables. Additionally, the format “enum” is used if only a fixed string out of a list of values can be used. “const” specifies a fixed string of the Natural data format A.

- [<Command> Tag](#)
- [<ESM_Batch_Command_Client> Tag](#)
- [<ESM> Tag](#)
- [<EXX> Tag](#)
- [<Parameter> Tag](#)

- **<RPC> Tag**

<Command> Tag

The **<Command>** tag defines the commands that should be processed. The element contains the child element **<Parameter>**.

The following attributes are available:

| Attribute | Format | Value | Description |
|-----------|-------------|---------------------------------------|--|
| Object | enum | Entire Systems Management object type | Name of the object type for which the command should be processed. |
| Name | enum | Name of the command | Name of a command for a specific object type. |

Example:

```
<Command Object="Reports" Name="List"/>
```

Output:

```
<Command Object="Reports" Name="List">
```

```
</Command>
```

<ESM_Batch_Command_Client> Tag

The **<ESM_Batch_Command_Client>** tag defines the xml document that provides all settings and the sequence of the commands to be processed. At the moment only report generation related commands of Entire Operations can be processed. The default namespace (**xmlns** attribute) of the document defines that the used elements belongs to the batch command client application of Entire Systems Management.

The following attributes are available:

| Attribute | Format | Value | Description |
|-----------|--------------|-------------------------------------|--|
| xmlns | const | http://www.softwareag.com/ESM/SAT34 | Specifies the XML namespace attribute. |

Example of an XML document with encoding setting and root element:

```
<?xml version="1.0" encoding="utf-8" ?>
<ESM_Batch_Command_Client xmlns="http://www.softwareag.com/ESM/SAT34">

</ESM_Batch_Command_Client>
```

<ESM> Tag

The <ESM> tag defines settings for the Entire Systems Management application.

The following attributes are available:

| Attribute | Format | Value | Description |
|---------------|--------|-----------------------|---|
| ApplicationID | enum | ID of the application | For Entire Operations GUI Client use the application ID OP. |
| Language | N2 | Application language | Same as Natural system variable *LANGUAGE: 1 for English (default) 2 for German |
| ServerLibrary | A8 | Natural library name | Optional: Specifies the server library in case not use the default name SYSSAT is used. |

Example:

```
<ESM ApplicationID="OP" Language="2"/>
```

Output:

```
<?xml version="1.0" encoding="windows-1252" ?>
<Commands ApplicationID="OP" ApplicationName="Entire Operations" ↵
ApplicationLibrary="SYSOGC" ApplicationVersion="0504010000">

</Commands>
```

<EXX> Tag

The <EXX> tag defines EntireX settings. The server is defined by a ServerName and the ServerNode settings. The settings are equal to the Natural profile parameter for Entire Systems Management (see the Natural SYSESM2 configuration file).

The following attributes are available:

| Attribute | Format | Value | Description |
|-----------|--------|--|--------------------|
| Name | A | Natural SRVNAME profile parameter | Name of RPC server |
| Node | A | Natural SRVNODE profile parameter | Name of node |
| User | A | Valid EntireX user ID | EntireX user ID |
| Password | A | Valid EntireX password We recommend that you encrypt the password with the SYSSATGF\RES\nprpwc.exe program. | EntireX password |

Example:

```
<EXX ServerName="NOP54SRV" ServerNode="bkr034:3800:TCP"/>
```

<Parameter> Tag

The <Parameter> tag defines parameter for a command.

The following attributes are available:

| Attribute | Format | Value | Description |
|-----------|--------|----------------------|--|
| Name | enum | Name of a parameter | See Command description. |
| Value | A | Value of a parameter | See Command description. |

Example:

```
<Command Object="Reports" Name="List">
  <Parameter Name="Filter_Status">Completed</Parameter>
</Command>
```

<RPC> Tag

The <RPC> tag defines setting for the Natural RPC command.

The following attributes are available:

| Attribute | Format | Explanation |
|-----------|--------|--|
| User | A | Valid Entire Systems Management user ID |
| Password | A | Valid Entire Systems Management password |

Example:

```
<RPC User="<user>" Password="<password>" />
```

Commands for the Batch Command Client

This section describes the commands provided by the batch command client of Entire Systems Management.

- Wildcard Usage
- Command - Object: Reports - Name: List
- Command - Object: Reports - Name: SaveToFile
- Command - Object: Reports - Name: Add
- Command - Object: Reports - Name: Delete
- Command - Object: CrossReferences - Name: SaveToFile
- Command - Object: - Name: DeterminationDate
- Command - Object: - Name: Language
- Command - Object: - Name: Stop
- Variable Handling
- Relative Date Feature

Wildcard Usage

The wildcard character has to be the last character in a variable value that defines a range of names.

| Wildcard Character | Meaning |
|--------------------|--|
| * | Only select objects for which the name begins with the given prefix. |
| > | Only select objects with a name greater than the given value. |
| < | Only select objects with a name less than the given value. |

Note: The use of wildcards can be disabled in the User Profile. For further information, see the *Reporting* section in the *User's Guide*.

Wildcard Usage (Owner, Network, Symbol Table, Version)

Every object is referenced according his namespace parts. Only the last part of the namespace can be extended with a wildcard.

Valid Specification

```
<Owner>EXAMPLE</Owner>
<Network>*</Network>
```

Invalid Specifications

```
<Owner>EXAMPLE</Owner>
<Network>E*</Network>
<NetworkVersion>v2*</NetworkVersion>
```

```
<Owner>EXAMPLE</Owner>
<NetworkVersion>v2*</NetworkVersion>
```

```
<Owner>E*</Owner>
<NetworkVersion>v2*</NetworkVersion>
```

Command - Object: Reports - Name: List

The `List` command evaluates data from the Reports list. This command provides major usages:

- Find reports of a specific kind by specifying filters e.g. to delete this reports or
- Wait until a report generation has been ended with the status `Aborted` or `Completed` e.g. to save `Completed reports` as file.

The `<Parameter>` tag defines the parameters for the command.

| Parameter | Format | Value | Explanation |
|----------------------|--------|--|---|
| Filter_Status | enum | Completed Aborted Running | Status of report generation. |
| Filter_ShortType | enum | A valid short type (see: Add command) | Report types. |
| Filter_CreationDate | Date | A valid Natural date with format YYYYMMDD | Date the report has been added. |
| WaitID | A | A FixedID or a VariableName | ID of a report given as variable name or as fixed value. |
| AutoRefresh_Retries | I2 | Number greater than 0 | Number of retries if the correct value is delivered. |
| AutoRefresh_Interval | I2 | Time in seconds | Time to wait between two retries. |
| returnID | A | A VariableArrayName | Name of an array containing the IDs of the found objects. |

Examples:

```
<Command Object="Reports" Name="List">
  <Parameter Name="Filter_Status">Completed</Parameter>
</Command>
```

```
<Command Object="Reports" Name="List">
  <Parameter Name="WaitID ">%new_ID%</Parameter>
  <Parameter Name="AutoRefresh_Retries">20</Parameter>
  <Parameter Name="AutoRefresh_Interval">5</Parameter>
</Command>
```

Output:

```
<Command Object="Reports" Name="List">
  <Filter Name="Status">Completed</Filter>
  <Report>
    <ID>3092265</ID>
    <Status>Completed</Status>
    <Type ShortType="LGT">Log - Terminated Jobs</Type>
    <Creation><Date Format="G">20131115</Date><Time>155134</Time></Creation>
  </Report>
  <Report>
    <ID>3092267</ID>
    <Status>Completed</Status>
    <Type ShortType="LGB">Log - Abended Jobs</Type>
    <Creation><Date Format="G">20131115</Date><Time>155136</Time></Creation>
  </Report>
  <Report>
    <ID>3092268</ID>
    <Status>Completed</Status>
    <Type ShortType="LGX">Log - Jobs not started</Type>

Command - Object: Reports - Name: SaveToFile

The `SaveToFile` command saves completed report generations with different output formats as file.

If the output type is XML an additional `XmlStyleSheet` parameter can be provided. This can be used as replacement of the online type "XML with style sheet for HTML". The style sheet has to be copied manually. Examples of style sheets can be found in the Natural SYSOGC/RES directory. The files are named `REPreport-name.xsl`.

The `<Parameter>` tag defines the parameters for the command.

| Parameter | Format | Value | Explanation |
|---------------|--------|---|--|
| ID | A | A <code>FixedID</code> or a <code>VariableName</code> | ID of a report given as variable name or as fixed value. |
| OutputType | enum | HTML XML CSV | Document type of the generated report. In general the types Extensible Markup Language (XML) and HyperText Markup Language (HTML) available. Some reports can be also saved as comma-separated values (CSV). |
| FileName | A250 | Valid local file name to the operating system | A valid path to your file system where the report will be saved. |
| XmlStyleSheet | A | Uniform Resource Identifier (URI) as absolute or relative address | If specified, and the report type is XML, a processing instruction with a reference to an external style sheet is added to generated XML Document. This processing instruction (<code><?xml-stylesheet... ?></code>) will be interpreted by browsers to automatically render the XML document e.g. as HTML. You can find style sheets for every report type in the SYSOGC/RES directory of the Natural FNAT system file. |

Example:

```
<Command Object="Reports" Name="SaveToFile">
  <Parameter Name="ID">%new_ID_AC0%</Parameter>
  <Parameter Name="OutputType">HTML</Parameter>
  <Parameter Name="FileName">C:\AC0.html</Parameter>
</Command>
```

Output:

```
<Command Object="Reports" Name="SaveToFile">
  <Report ID="3190047" ShortType="LGY" OutputType="HTML"/>
  <ExportFile>D:\ESM\Reports\LGY.html</ExportFile>
</Command>
```

Command - Object: Reports - Name: Add

The Add command invokes the user-dependent report generation. The generation is invoked within the Entire Operations GUI Client whereas the reports themselves are generated asynchronously in the background via the Entire Operations Monitor. Reports added with the batch command client of Entire Systems Management can be seen by performing the report functions of the Entire Operations GUI Client.

Report Types

| Short Type | Report * | Description |
|------------|----------------------------------|---|
| ACC | Job Accounting Data | Information on job elapsed times and CPU times of previous network executions. |
| ACO | Activation Overview | An overview of network activations. |
| CNV | Compare Networks | Compare a network with another network. |
| CST | Compare Symbol Tables | Compare a symbol table with other symbol tables. |
| LGB | Log - Abended Jobs | Information on jobs, which is extracted from the Entire Operations log. |
| LGN | Log - Networks not activated | |
| LGT | Log - Terminated Jobs | |
| LGX | Log - Jobs not started | |
| LGY | Log - Jobs with permanent errors | |
| NDD | Network Description (detailed) | Displays the same information as the short version, but includes all prose descriptions defined at the network, job or event level using the Editor facility. |
| NDS | Network Description (short) | Displays information on networks and jobs as defined on the master database, including scheduling information, prerequisites and End-of-Job checking and actions. |
| NOD | Node Overview | Displays an overview of node reports. |
| NSO | Network Schedule Overview | An overview of scheduled and/or not yet executed, system-wide network activations. |
| NSS | Network Start Summary | A status report of all network starts for a given day. |
| SCJ | Schedule of Jobs | Displays a job schedule for a specific date range. |
| XRF | Subnetwork Usage | Lists networks and related subnetworks. |

| Short Type | Report * | Description |
|------------|--|--|
| BC1 | Network Start Overview (Bar Chart) | Displays the network start and end times of a previous network execution as a bar chart. |
| BC3 | Network Schedule Overview (Bar Chart) | Displays the schedule selection of a network as a bar chart. |
| BC4 | Network and Job Start Overview (Bar Chart) | Displays the network and job starts as a bar chart. |
| AC1 | Monitor Tasks and Functions Overview | Displays data collected from performed Monitor tasks and called Monitor functions. |
| AC2 | Monitor Tasks and Exits Overview | Displays data collected from performed Monitor tasks and called Monitor exits. |

* For further information, see *Reporting* in the *User's Guide*.

Command Parameters

The <Parameter> tag defines the parameters for the command:

| Parameter | Format | Default | Value | Explanation |
|----------------|--------|--------------|---|--|
| ShortType | enum | | A valid short type | Report generation type. |
| Owner | A10 | | Uppercase name (may be terminated with wildcard characters) | |
| Network | A10 | | Uppercase name (may be terminated with wildcard characters) | |
| NetworkVersion | A10 | | Name (may be terminated with wildcard characters) | |
| Job | A10 | * | Uppercase name (may be terminated with wildcard characters) | |
| Date_From | D | current date | A valid date with format YYYYMMDD | Specify the start date and time for displaying the messages. |
| Date_Thru | D | current date | A valid date with format YYYYMMDD | Specify the start date and time for displaying the messages. |
| Time_From | T | 000000 | A valid date with format HHISS | |
| Time_Thru | T | current time | A valid date with format HHISS | |
| Run_From | N5 | 1 | Positive numeric | |
| Run_Thru | N5 | 99999 | Positive numeric | |

| Parameter | Format | Default | Value | Explanation |
|---------------------|--------|-----------|--|---|
| ScheduleType | enum | SNT | SNT Schedule, sorted by network, time ONT Only sorted by network, time OT Only sorted by time STN Schedule, sorted by time, network | |
| ActivationType | enum | All types | All types Manual Recovery API EOJ Scheduled | Specifies the activation type. Can be specified multiple times. Note: All types cannot be used with other activation types. |
| Email | A98 | | | Enter an e-mail address if you want to send a notification when the report generation has been completed. |
| Owner2 | A10 | | Uppercase name (may be terminated with wildcard characters) | |
| Network2 | A10 | | Uppercase name (may be terminated with wildcard characters) | |
| NetworkVersion2 | A10 | | Version (may be terminated with wildcard characters) | |
| Job2 | A10 | * | Uppercase name (may be terminated with wildcard characters) | |
| Node_From | N5 | 1 | A positive numeric value | |
| Node_Thru | N5 | 1 | A positive numeric value | |
| SymbolTable | A10 | | Uppercase name (may be terminated with wildcard characters) | |
| SymbolTableVersion | A10 | | Version (may be terminated with wildcard characters) | |
| SymbolTable2 | A10 | | Uppercase name (may be terminated with wildcard characters) | |
| SymbolTableVersion2 | A10 | | Version (may be terminated with wildcard characters) | |
| Show | enum | All | All | |

| Parameter | Format | Default | Value | Explanation |
|-----------|--------|---------|--------------|-------------|
| | | | Differences | |
| returnID | A | | VariableName | |

Use of Parameters Dependent on Report Type

Command - Object: Reports - Name: Delete

The `Delete` command remove reports from the report list. Command is best used in conjunction with the `List` command. The `List` can be used to generate a `VariableArray` that contains the IDs of the report list which can be deleted with the `Delete` command.

The `<Parameter>` tag defines the parameter for the command:

| Parameter | Format | Value | Explanation |
|-----------|--------|--|--|
| ID | A | A FixedID, a VariableName, or a VariableArrayName. | ID of a report given as variable name or as fixed value. This parameter can be specified multiple times or <code>VariableArray</code> can be used. |

Example 1:

```
<Command Object="Reports" Name="Delete">
  <Parameter Name="ID">3092265</Parameter>
  <Parameter Name="ID">3092267</Parameter>
  <Parameter Name="ID">3092268</Parameter>
  <Parameter Name="ID">3092271</Parameter>
</Command>
```

Output:

```
<Command Object="Reports" Name="Delete">
  <ReportDeleted ID="3092265"/>
  <ReportDeleted ID="3092267"/>
  <ReportDeleted ID="3092268"/>
  <ReportDeleted ID="3092271"/>
</Command>
```

Example 2:

```

<Command Object="Reports" Name="List">
  <Parameter Name="Filter_Status">Completed</Parameter>
  <Parameter Name="returnID">all_Completed_Reports</Parameter>
</Command>

<Command Object="Reports" Name="Delete">
  <Parameter Name="ID">%all_Completed_Reports(*)%</Parameter>
</Command>

```

Output:

```

<Command Object="Reports" Name="Delete">
  <Filter Name="Status">Completed</Filter>
  <ReportList ID="2520730">
    <Status>Completed</Status>
    <Type ShortType="NS0"> Network Schedule Overview</Type>
    <Creation><Date Format="G">20131205</Date><Time>103305</Time></Creation>
  </ReportList>
  <ReportList ID="2520731">
    <Status>Completed</Status>
    <Type ShortType="AC0"> Activation Overview</Type>
    <Creation><Date Format="G">20131205</Date><Time>103307</Time></Creation>
  </ReportList>
</Command>

<Command Object="Reports" Name="Delete">
  <ReportDeleted ID="2520730"/>
  <ReportDeleted ID="2520731"/>
</Command>

```

Command - Object: CrossReferences - Name: SaveToFile

The `SaveToFile` command for `Object="CrossReferences"` generates a list of cross-referenced objects. The types of cross-references that can be generated are listed in the following table. They are further explained in [Types of Cross-Reference Reports](#) in the section *Cross-References*.

Types of Cross-References

| Cross-Reference Type | Short Type |
|----------------------|------------|
| JCL usage | JCL |
| Node usage | NDU |
| Undefined objects | NDF |
| Resource usage | RES |
| Symbol table usage | STU |
| User exit usage | URU |

| Cross-Reference Type | Short Type |
|------------------------|------------|
| Symbol search by value | XSM |

Command Parameters

The <Parameter> tag defines the parameters for the command:

| Parameter | Format | Description | | | | | | | | | | | | | | |
|--------------------|--|---|--------------|--|------|-------------------------------------|-----|---------------------------------|-----|-----------------------------|-----|------------------------------|-----|--|----|--------------------------|
| ShortType | enum | Type of cross-reference generation Specify a valid short type . | | | | | | | | | | | | | | |
| Owner | A10 | Uppercase name of an owner or a range of names ¹ Default value: * (all owners) | | | | | | | | | | | | | | |
| Network | A10 | Uppercase name of a network or a range of names ¹ | | | | | | | | | | | | | | |
| NetworkVersion | A10 | Name of a network version or a range of names ¹ | | | | | | | | | | | | | | |
| SymbolTable | A10 | Uppercase name of a symbol table or a range of names ¹ | | | | | | | | | | | | | | |
| SymbolTableVersion | A10 | Version of a symbol table or a range of names ¹ | | | | | | | | | | | | | | |
| UserExitUsage | enum | Type of user exit Valid values: <table border="1"> <tbody> <tr> <td>IC</td> <td>Input condition user exits</td> </tr> <tr> <td>RM</td> <td>Resource master determination exits</td> </tr> <tr> <td>MJ</td> <td>Master JCL and Natural programs</td> </tr> <tr> <td>EC</td> <td>End-of-Job check user exits</td> </tr> <tr> <td>EA</td> <td>End-of-Job action user exits</td> </tr> <tr> <td>SC</td> <td>Symbol check user exits</td> </tr> <tr> <td>SP</td> <td>Symbol prompt user exits</td> </tr> </tbody> </table> | IC | Input condition user exits | RM | Resource master determination exits | MJ | Master JCL and Natural programs | EC | End-of-Job check user exits | EA | End-of-Job action user exits | SC | Symbol check user exits | SP | Symbol prompt user exits |
| IC | Input condition user exits | | | | | | | | | | | | | | | |
| RM | Resource master determination exits | | | | | | | | | | | | | | | |
| MJ | Master JCL and Natural programs | | | | | | | | | | | | | | | |
| EC | End-of-Job check user exits | | | | | | | | | | | | | | | |
| EA | End-of-Job action user exits | | | | | | | | | | | | | | | |
| SC | Symbol check user exits | | | | | | | | | | | | | | | |
| SP | Symbol prompt user exits | | | | | | | | | | | | | | | |
| UsageInActiveJobs | L | Determines the jobs in which to search Valid values: <table border="1"> <tbody> <tr> <td>false</td> <td>Searches in all jobs (default)</td> </tr> <tr> <td>true</td> <td>Searches in active jobs only</td> </tr> </tbody> </table> | false | Searches in all jobs (default) | true | Searches in active jobs only | | | | | | | | | | |
| false | Searches in all jobs (default) | | | | | | | | | | | | | | | |
| true | Searches in active jobs only | | | | | | | | | | | | | | | |
| JCLLocation | enum | Supported JCL location Valid values: <table border="1"> <tbody> <tr> <td><i>blank</i></td> <td>A blank character selects all JCL locations.</td> </tr> <tr> <td>BS2</td> <td>SAM or ISAM file</td> </tr> <tr> <td>EXE</td> <td>Executable program</td> </tr> <tr> <td>LIB</td> <td>Librarian</td> </tr> <tr> <td>LMS</td> <td>LMS library</td> </tr> <tr> <td>MAC</td> <td>Natural source object containing a macro program</td> </tr> </tbody> </table> | <i>blank</i> | A blank character selects all JCL locations. | BS2 | SAM or ISAM file | EXE | Executable program | LIB | Librarian | LMS | LMS library | MAC | Natural source object containing a macro program | | |
| <i>blank</i> | A blank character selects all JCL locations. | | | | | | | | | | | | | | | |
| BS2 | SAM or ISAM file | | | | | | | | | | | | | | | |
| EXE | Executable program | | | | | | | | | | | | | | | |
| LIB | Librarian | | | | | | | | | | | | | | | |
| LMS | LMS library | | | | | | | | | | | | | | | |
| MAC | Natural source object containing a macro program | | | | | | | | | | | | | | | |

| Parameter | Format | Description | | | | | | | | | | | | |
|--------------------------|-----------------------|---|-----|-----------------------|-----|----------------------|-----|--------------------|-----|--------------------|-----|-----------|-----|------------------|
| | | <table border="1"> <tr> <td>NAT</td> <td>Natural source object</td> </tr> <tr> <td>PDS</td> <td>Partitioned data set</td> </tr> <tr> <td>PRC</td> <td>Callable procedure</td> </tr> <tr> <td>RDR</td> <td>z/VSE reader queue</td> </tr> <tr> <td>TXT</td> <td>Text file</td> </tr> <tr> <td>VSE</td> <td>z/VSE sublibrary</td> </tr> </table> | NAT | Natural source object | PDS | Partitioned data set | PRC | Callable procedure | RDR | z/VSE reader queue | TXT | Text file | VSE | z/VSE sublibrary |
| NAT | Natural source object | | | | | | | | | | | | | |

| A | Active jobs | | | | | | | | | | | | | |
| M | Job masters | | | | | | | | | | | | | |
| Symbol | A40 | Name of a symbol or a range of names ¹ | | | | | | | | | | | | |
| MultValueMinIndex | N3 | <p>Minimum index value of a multiple-value symbol</p> <p>Valid values: 1 to 100</p> <p>Default value: 1</p> | | | | | | | | | | | | |

| Parameter | Format | Description | | | | | | | | | | | | | | | | |
|-------------------------|--|---|------|--|-----|--------------------------------------|-----|--------------------------------|----|----------|----|------|----|-----------|----|-----------|----|-----------|
| MultiValueMaxIndex | N3 or A1 | Minimum index value of a multiple-value symbol Valid values: 1 to 100 or 1 to * (all multiple values) Default value: * | | | | | | | | | | | | | | | | |
| AtPosition | enum | Position at which to search within the symbol value Valid values: <table border="1"> <tr> <td>*</td> <td>Anywhere within the symbol value (default)</td> </tr> <tr> <td>1</td> <td>At the beginning of the symbol value</td> </tr> <tr> <td>E</td> <td>At the end of the symbol value</td> </tr> </table> | * | Anywhere within the symbol value (default) | 1 | At the beginning of the symbol value | E | At the end of the symbol value | | | | | | | | | | |
| * | Anywhere within the symbol value (default) | | | | | | | | | | | | | | | | | |
| 1 | At the beginning of the symbol value | | | | | | | | | | | | | | | | | |
| E | At the end of the symbol value | | | | | | | | | | | | | | | | | |
| ScanFor | A80 | String of up to 80 characters for which to search within the symbol value | | | | | | | | | | | | | | | | |
| CaseSensitive | L | Specify <code>true</code> to perform a case-sensitive search or <code>false</code> (default) for a case-insensitive search. | | | | | | | | | | | | | | | | |
| ObjectTypeToBeValidated | enum | Type(s) of objects for which to search Valid values: <table border="1"> <tr> <td>*</td> <td>All types of objects (default)</td> </tr> <tr> <td>SM</td> <td>Symbols</td> </tr> <tr> <td>S1</td> <td>Symbol tables</td> </tr> <tr> <td>NM</td> <td>Networks</td> </tr> <tr> <td>JM</td> <td>Jobs</td> </tr> <tr> <td>RM</td> <td>Resources</td> </tr> <tr> <td>SC</td> <td>Schedules</td> </tr> <tr> <td>CA</td> <td>Calendars</td> </tr> </table> | * | All types of objects (default) | SM | Symbols | S1 | Symbol tables | NM | Networks | JM | Jobs | RM | Resources | SC | Schedules | CA | Calendars |
| * | All types of objects (default) | | | | | | | | | | | | | | | | | |
| SM | Symbols | | | | | | | | | | | | | | | | | |
| S1 | Symbol tables | | | | | | | | | | | | | | | | | |
| NM | Networks | | | | | | | | | | | | | | | | | |
| JM | Jobs | | | | | | | | | | | | | | | | | |
| RM | Resources | | | | | | | | | | | | | | | | | |
| SC | Schedules | | | | | | | | | | | | | | | | | |
| CA | Calendars | | | | | | | | | | | | | | | | | |
| Resource | A40 | Name of a resource or a range of names ¹ | | | | | | | | | | | | | | | | |
| FileName | A250 | Name of a valid directory path where the report is saved | | | | | | | | | | | | | | | | |
| OutputType | enum | Type of the report file to generate Valid values: <table border="1"> <tr> <td>HTML</td> <td>HTML-formatted file</td> </tr> <tr> <td>XML</td> <td>XML-formatted file</td> </tr> <tr> <td>CSV</td> <td>Comma-separated value file</td> </tr> </table> | HTML | HTML-formatted file | XML | XML-formatted file | CSV | Comma-separated value file | | | | | | | | | | |
| HTML | HTML-formatted file | | | | | | | | | | | | | | | | | |
| XML | XML-formatted file | | | | | | | | | | | | | | | | | |
| CSV | Comma-separated value file | | | | | | | | | | | | | | | | | |
| XmlStylesheet | A | Uniform Resource Identifier (URI) to specify an absolute or a relative address If an URI is specified for <code>OutputType XML</code> , a processing instruction with a reference to an external style sheet is added to the generated XML file. The browser then interprets this | | | | | | | | | | | | | | | | |

| Parameter | Format | Description |
|-----------|--------|---|
| | | instruction (<?xml - stylesheet...?>) and renders the requested file form, for example, HTML. You can find style sheets for all report types in the <i>SYSOGC/RES</i> directory of the Natural FNAT system file. |

¹ You can specify a range of names by using an asterisk (*) to determine a start value or to select all names available (see also *Valid Name Specifications* in *Direct Commands*).

The command only processes a single range definition and ignores any additional definitions. If more than one range is defined in a command, the parameters are processed in the following order of precedence (from highest to lowest): *Owner*, *Network*, *NetworkVersion*, *SymbolTable*, *SymbolTableVersion*. For example: If ranges are specified for *Owner*, *Network* and *SymbolTable*, only the range specified for *Owner* (highest priority) is processed.

Use of Parameters Dependent on Cross-Reference Type

| Cross-Reference Type | JCL | NDF | NDU | RES | STU | URU | XSM |
|--------------------------|-----|-----|-----|-----|-----|-----|-----|
| ShortType | X | X | X | X | X | X | X |
| Owner | X | X | X | X | X | | X |
| Network | X | X | X | X | | | |
| NetworkVersion | X | X | X | X | | | |
| SymbolTable | | | | | X | | X |
| SymbolTableVersion | | | | | X | | X |
| Symbol | | | | | | | X |
| UserExitUsage | | | | | | X | |
| UsageInActiveJobs | | | | | X | | |
| JCLLocation | X | | | | | | |
| FileNatlib | X | | | | | | |
| Member | X | | | | | | |
| JCLNode_OpSysClass | | | X | | | | |
| JCLNode_NodeNumber | | | X | | | | |
| ExecutionNode_OpSysClass | | | X | | | | |
| ExecutionNode_NodeNumber | | | X | | | | X |
| UsageIn | | | X | | | | X |
| MultValueMinIndex | | | | | | | X |
| MultValueMaxIndex | | | | | | | X |
| AtPosition | | | | | | | X |
| ScanFor | | | | | | | X |

| Cross-Reference Type | JCL | NDF | NDU | RES | STU | URU | XSM |
|-------------------------|-----|-----|-----|-----|-----|-----|-----|
| CaseSensitive | | | | | | | X |
| ObjectTypeToBeValidated | | X | | | | | |
| Resource | | | | X | | | |
| FileName | X | X | X | X | X | X | X |
| OutputType | X | X | X | X | X | X | X |
| XmlStylesheet | X | X | X | X | X | X | X |

</Command>
```

```
<Command Name="SaveToFile" Object="CrossReferences">
  <Parameter Name="ShortType">XSM</Parameter>
  <Parameter Name="Owner">INCIDENT</Parameter>
  <Parameter Name="SymbolTable">*</Parameter>
  <Parameter Name="OutputType">CSV</Parameter>
  <Parameter Name="FileName">C:\temp\xref_SearchSymbolByValue.csv</Parameter>
</Command>
```

Command - Object: - Name: DeterminationDate

The `DeterminationDate` command modifies the determination date e.g. used during the reports generation.

The `<Parameter>` tag defines the parameter for the command:

| Parameter | Format | Default | Value | Explanation |
|-----------|--------|--------------|------------------------------------|---------------------------------|
| Date | D | current date | A valid date with format YYYYMMDD. | Specify the determination date. |

Example:

```
<Command Name="DeterminationDate">
  <Parameter Name="Date">20131126</Parameter>
</Command>
```

Command - Object: - Name: Language

The `Language` command set the new application language. The language is e.g. important during report generation to get localized reports.

The `<Parameter>` tag defines the parameter for the command.

| Parameter | Format | Default | Value | Explanation |
|-----------|--------|------------------------------|-------------------------------|---|
| Language | N2 | Current Application Language | 1 for English 2 for German | Same as Natural system variable *LANGUAGE. Note: Only left-to-right single-byte languages with Latin lower case |

Example:

```
<Command Name="Language">
  <Parameter Name="Language">2</Parameter>
</Command>
```

Command - Object: - Name: Stop

The `Stop` command is used to terminate the execution of the batch client command xml file.

One or more `Stop` commands may be inserted.

Example:

```
<Command Name="Stop"/>
```

Variable Handling

The batch command client provides a simple parameter handling. Parameters with the prefix `return` provide the option to save the data as a variable. These variables can be used by other commands if a value accepts data from the type variable. If a parameter value is retrieved from a variable, the name of the variable has to be enclosed in percent (%) signs. If a variable contains a list, the variable name must end with (*).

Example to list all reports with status Completed and then delete all these reports:

```
<Command Object="Reports" Name="List">
  <Parameter Name="Filter_Status">Completed</Parameter>
  <Parameter Name="returnID">all_Completed_Reports_List</Parameter>
</Command>

<Command Object="Reports" Name="Delete">
  <Parameter Name="ID">%all_Completed_Reports_List(*)%</Parameter>
</Command>
```

In the example above, the command `List` uses the parameter `returnID` to return a list of report IDs. The command `Delete` accepts the list of report IDs for the `ID` parameter.

Example to add a report, wait for generation completion and save as file:

```
<Command Object="Reports" Name="Add">
  <Parameter Name="ShortType">LGT</Parameter>
  <Parameter Name="Owner">EXAMPLE</Parameter>
  <Parameter Name="returnID">new_ID_LGT</Parameter>
</Command>

<Command Object="Reports" Name="List">
  <Parameter Name="WaitID " ">%new_ID_LGT%</Parameter>
</Command>

<Command Object="Reports" Name="SaveToFile">
  <Parameter Name="ID">%new_ID_LGT%</Parameter>
  <Parameter Name="OutputType">HTML</Parameter>
  <Parameter Name="FileName">c:\LGT.html</Parameter>
</Command>
```

Explanation:

1. The command `Add` creates a report of the type `LGT` for the owner `EXAMPLE`. The parameter `returnID` returns the ID for the report and fills the variable `new_ID_LGT`.
2. The command `List` uses the parameter `WaitID` required to ensure that the report is completely generated before the data is written to the file. `WaitID` uses the same variable as `returnID` to select the previously generated report.
3. The command `SaveAsFile` writes the generated report to an HTML file. The parameter `ID` uses the same variable as `returnID` to select the same report previously generated.

Relative Date Feature

For parameters of type date a special feature for relative time setting is available. Based on the current date, the relative date feature gives you the possibility to specify dates in past or future.

Instead of specifying a specific date (N8, Format YYYYMMDD) an offset $+n$ or $-n$ days can be specified, where n is of type (I2).

Example:

```
<Command Object="Reports" Name="List">
  <Parameter Name="Filter_Date">-1</Parameter>
  <Parameter Name="returnID">all_Yesterday_Reports</Parameter>
</Command>

<Command Object="Reports" Name="Delete">
  <Parameter Name="ID">%all_Yesterday_Reports(*)%</Parameter>
</Command>

<Command Object="Reports" Name="Add" DeterminationDate="+7">
  <Parameter Name="ShortType">NS0</Parameter>
  <Parameter Name="Owner">EXAMPLE</Parameter>
  <Parameter Name="returnID">new_Next_Week_NS0</Parameter>
  <Parameter Name="ScheduleType">schedule network time</Parameter>
</Command>
```

Networks

Overview of Objects Available for Maintaining Job

15

Overview of Objects Available for Maintaining Job Networks

The following graphic provides an overview of objects you can maintain in Entire Objects in order to set up a job network:

 **Note:** Click on a symbol in the diagram above for more information on the respective object.

For an overview on how these objects interrelate, see *Entire Operations Object Relationship* in the *Concepts and Facilities* documentation.

VIII

Using Owners

16

Using Owners

| | |
|--|-----|
| ▪ Available Functions: Owner | 174 |
| ▪ Listing Owners | 175 |
| ▪ Owner at Logon | 176 |
| ▪ Linking Additional Owners | 177 |
| ▪ Owners Granted Access to Individual Networks | 177 |
| ▪ Adding and Removing an Owner | 180 |

Each user ID is associated with single or multiple owners in order to group network maintenance.

You can only list, access and maintain networks that belong to associated owners (unless you have administrator rights):

- The main (mandatory) owner to which your user ID is **assigned at logon**,
- The owners **linked to your user ID**, and
- The owners which **granted you individual network access**.

This section provides an overview of the functions available to view and assign owners.

Related Topics:

- The concept of user/owner assignments is described in the section *Users and Owners* in the *Concepts and Facilities* documentation.

Available Functions: Owner

➤ To list all available functions for the Owner metanode

- In the object workspace, select the **Owner** metanode and open the context menu.

The context menu provides the following functions:

| Function | Shortcut | Explanation |
|----------------------------|----------|---|
| List | F8 | Lists all owners linked to your user ID. |
| Refresh | F5 | See <i>Refreshing Object Lists</i> . |
| Filter | F3 | Selection criteria for listing network masters: see <i>Filtering Objects</i> . |
| Export | --- | Export Objects window to export all items of the metanode Owner : see <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Set Drag And Drop Function | --- | See <i>Drag & Drop</i> . |

➤ To list all available functions for an Owner instance

- In the object workspace, select an owner from the **Owner** metanode and open the context menu.

The context menu provides the following functions:

| Function | Explanation |
|----------------------------|--|
| Next Activations | See Displaying Next Network Starts - Next Activations in the section <i>Schedule Maintenance</i> . |
| List Active Jobs | See List Active Jobs . |
| Browse Log | See Browsing the Log . |
| Export | Opens the Export Objects window to export an owner: see <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Set Drag And Drop Function | See Drag & Drop . |

Listing Owners

- [Listing Owners Linked to a User](#)
- [Listing All Owners \(SYSDBA Access\)](#)

Listing Owners Linked to a User

➤ To list all owners linked to a current user

- 1 In the object workspace, select the **General** metanode and choose **Show linked Owners** from the context menu.

Or:

Use the `SET OWNERLIST LINKED` direct command as described in the *Direct Commands* documentation.

The tree view in the object workspace is reset.

- 2 Expand the **Owner** metanode node or choose **List** from the **Owner** context menu.

All owners linked to the current user are listed in the tree node or list window of the content pane, respectively.

For explanations of the **Owner via Granting** metanode, see [Owners Granted Access to Individual Networks](#).

Listing All Owners (SYSDBA Access)

This function requires administrator rights.

> To list all owners

- 1 In the object workspace, select the **General** metanode and choose **Show all Owners** from the context menu.

Or:

Use the `SET OWNERLIST ALL` direct command as described in the *Direct Commands* documentation.

The tree view in the object workspace is reset and the **Owner** metanode changes to **Owner (SYSDBA access)**.

- 2 Expand the **Owner (SYSDBA access)** node or choose **List** from the **Owner (SYSDBA access)** context menu.

All owners defined for the environment are listed in the tree node or list window of the content pane, respectively.

Owner at Logon

Your user ID is assigned an **Owner at Logon** (main owner) in your user profile as described in *Viewing, Adding and Modifying a User (Administration)* documentation).

When you log on to Entire Operations, your main owner (in the previous example, the owner EXAMPLE) is set for your current session by default. The display is filtered to show only those networks belonging to the main owner and its associated owners.

> To change the current session owner

- On the **Main** page of the **Maintenance User** window (see the *Administration* documentation), replace the name of the owner entered in the **Owner at logon** box.

You can only change the session to an owner which is associated with your user ID (unless you have administrator rights).

Linking Additional Owners

(Administrator rights required)

In addition to the **Owner at Logon** specified in your user profile, you can link other owners to your user ID as required. See *Adding and Removing User/Owner Links and Owners* in the *Administration* documentation.

Owners Granted Access to Individual Networks

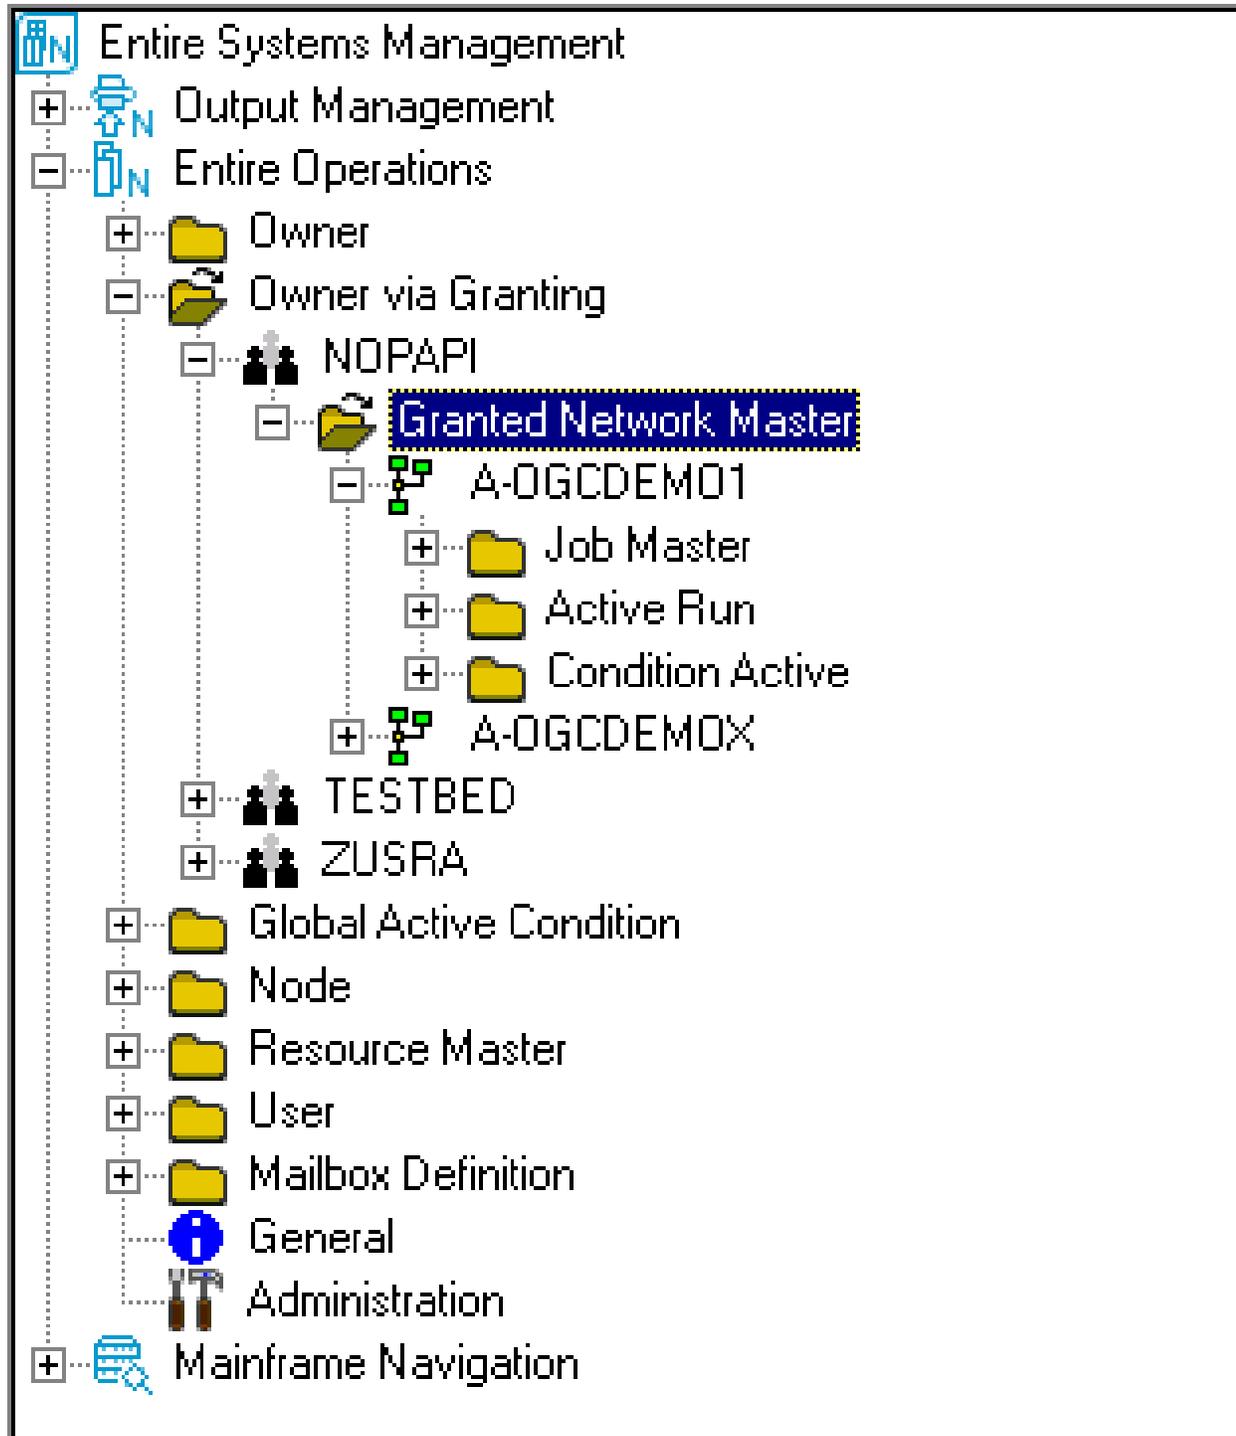

You can grant a user or an owner unrestricted or restricted access to a selected network by using the **Granting Definition** option of the network maintenance function described in [Granting Definition: Authorizing Other Users or Owners to Access a Network](#) in the section *Network Maintenance*.

Listing Granted Owners

The **Owner via Granting** metanode lists all owners who granted network access for your user ID.

The hierarchy below the **Owner via Granting** metanode shows networks granted to your user ID or to an owner linked to your user ID if the owner of these networks is not linked to your user ID. A granted owner who is also linked in your user profile is only listed in the **Owner** node.

All of these networks are separated in the tree view hierarchy by their respective owner as shown in the example below:

The context menus of the **Owner via Granting** nodes provide the following functions:

| Function | Shortcut | Explanation |
|----------------------------|----------|---|
| List | F8 | Lists all owners who granted you access. This list corresponds to the owner nodes in the tree view of the object workspace. See also <i>Example of an Owner via Granting List</i> below. |
| Refresh | F5 | See <i>Refreshing Object Lists</i> . |
| Filter | F3 | Selection criteria for listing granted network masters: see <i>Filtering Objects</i> . |
| Set Drag And Drop Function | --- | See <i>Drag & Drop</i> . |

Example of an Owner via Granting List

The functions available for a granted network master correspond to the functions available for a network master: see [Available Functions: Network Master](#).

Adding and Removing an Owner

An owner is added when entering a name for **Owner at Logon** or during a user/owner link operation.

An owner is deleted when replacing an **Owner at Logon** or removing a link to a user.

For detailed information, see *Adding and Removing User/Owner Links and Owners* in the *Administration* documentation.

IX

Network Maintenance

This section provides information on how to define and maintain job networks.

Job networks are maintained on the master database which stores all user, job network, job and scheduling definitions. It also contains all information pertaining to defined logical conditions, resources, calendars, and symbol tables. All information stored on the master database can be maintained online.

For information on all definitions made at the job and event level, see the section [Job Maintenance](#).

[Use of Job Networks](#)

[Maintaining Job Network Definitions](#)

[Maintaining Job Network Versions](#)

[Copying Job Network Definitions](#)

[Viewing and Maintaining a Job Network Diagram](#)

[Checking for a Loop in a Job Network](#)

[Applying Network Defaults to Jobs \(Mass Update\)](#)

[Defining Monitor Start Networks](#)

Related Topics:

- [Viewing Job/Network Accounting Information - Job Maintenance](#)
- [Job Networks - Concepts and Facilities](#) documentation
- [Master Database - Concepts and Facilities](#) documentation

17

Use of Job Networks

A job network is a group of jobs that stand in defined relation to each other. This relation is composed of dependencies, which are expressed as logical conditions. In the simplest case, two jobs in a job network can be linked by the condition: If Job 1 finishes OK, start Job 2 (see [Example of Job Linkage by Using Conditions](#)).

A job network is uniquely defined by its owner and network name. Each network is given a start and deadline time which determine when the network is to be activated. If your installation includes multi-CPU support, you can also specify a default node name for the jobs in the network. This node name can be overridden at the job level (see *Operating System Server Nodes* in the *Concepts and Facilities* documentation).

A user can only access a defined job network if the user's ID is associated with the same owner as the network, unless the user has special authorization to access other networks (see [Granting Definition: Authorizing Other Users or Owners to Access a Network](#)).

A job network and a single job are the units of work that can be activated by Entire Operations. When a job network is activated, it is automatically given a **run number** that uniquely identifies this network activation. This feature allows several copies of the same job network to run simultaneously.

A job network can be a **subnetwork** of another job network.

18

Maintaining Job Network Definitions

| | |
|--|-----|
| ▪ Listing all Network Definitions | 186 |
| ▪ Available Functions: Network Master | 187 |
| ▪ Displaying a Network Definition | 189 |
| ▪ Modifying a Network Definition | 189 |
| ▪ Adding a Network Definition | 191 |
| ▪ Fields: Network Definition | 191 |
| ▪ OS Specials - Operating System and Environment Defaults | 195 |
| ▪ Specifying Recipients for Network Messages | 199 |
| ▪ Granting Definition: Authorizing Other Users or Owners to Access a Network | 200 |
| ▪ Long Description - Documenting Your Networks | 203 |
| ▪ Deleting a Job Network | 206 |

Note: The **Active Run** subnode of the **Network Master** node correlates with the **Active Run** subnode of the **Network Active** node. Both subnodes control the same active runs. If you use both subnodes to change active runs during a session, consider refreshing them manually to make sure that you view the latest status.

Listing all Network Definitions

➤ To list all networks defined for an owner

- In the object workspace, select the **Network Master** node of an owner instance and choose **List** from the context menu.

Or:

Use the direct command `LIST NETWORKS` as described in the *Direct Commands* documentation.

A **Network Master List** window similar to the example below opens:

| Network | Loop | Node | Description |
|------------|------|-------|--|
| B60-FLOW | | 55522 | BS2000 Job Flow |
| E01-CONTI | | 148 | Completion-Codes, Job Duration |
| E02-IOC-01 | | 148 | I/O Conditions without events |
| E03-IOC-02 | | 148 | I/O Conditions with code events |
| E04-IOC-03 | | 148 | I/O Conditions with string events |
| E05-IOC-04 | | 148 | I/O Conditions with user routine event |
| E10-PAR-01 | | 148 | Parallel & sequential job execution |
| E20-DYN-01 | | 148 | Dynamic JCL generation |
| E40-REC-01 | | 148 | Cause a recovery situation |
| E40-REC-02 | | 148 | Recovery and Reschedule |
| E50-USRT | | 148 | User Routine Usage |
| E51-MAIL | | 148 | Mailbox Usage |
| E52-RES | | 148 | Resources |

The window lists all networks defined for the selected owner.

For further information, see:

- [Columns: Network Master List](#)
- [Available Functions: Network Master](#)

Columns: Network Master List

The [Network Master List](#) window contains the following columns:

| Column | Description |
|--------------------|--|
| Network | User-defined network name. |
| Loop | blank column No loop was found during a loop test for the corresponding network. |
| | Yes A loop was found during a loop test for the corresponding network. |
| Node | Default execution node for the jobs in the network. |
| Description | Short description of the network. |

Available Functions: Network Master

➤ To list all available functions for the Network Master metanode

- In the object workspace, select a **Network Master** metanode and open the context menu.

The context menu provides the following functions:

| Function | Shortcut | Description |
|-----------------------------------|----------|--|
| List | F8 | See Listing All Network Definitions . |
| New | CTRL+N | Creates a new network master instance: see Adding a Network Definition . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | Selection criteria for listing network masters: see Filtering Objects . |
| Paste data | CTRL+V | See Copying Job Network Definitions . |
| Export | --- | See <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all available functions for a Network Master instance

- In the object workspace, select a **Network Master** instance and open the context menu.

The context menu provides the following functions:

| Function | Shortcut | Description |
|----------------------------|----------|--|
| Open | CTRL+O | Modifies the selected network definition. |
| Display | CTRL+D | Displays the selected network definition. |
| Diagram | --- | Displays an overview of the job flow within this network. See Viewing and Maintaining a Job Network Diagram . |
| Delete | DELETE | Deletes the selected network , including all jobs and all other definitions for this network. |
| Copy data | CTRL+C | Copies all definitions of the selected network to paste them as a new network: see Copying Job Network Definitions . |
| Copy Defaults | --- | Copies network attribute definitions of the selected network as the default for all jobs contained in the network: see Applying Network Defaults to Jobs (Mass Update) . |
| Activate Network | --- | Activates the selected network manually. |
| History | --- | Displays the execution history (previous network runs). |
| Define Scheduling | --- | Opens a Define Scheduling window where you can add or change the schedule of the selected network as described in Scheduling a Network . |
| Display Schedule | --- | Displays the calendar schedule defined for the selected network. See also Viewing a Network Schedule Definition as a Calendar . |
| Next Activations | --- | See Displaying Next Network Starts - Next Activations in the section <i>Schedule Maintenance</i> . |
| Usable Symbol Tables | --- | Opens the Usable Symbol Tables window to view or modify all available symbol table definitions. See also Listing Usable Symbol Tables in the section <i>Symbol Table and Symbol Maintenance</i> . |
| Check for Loop | --- | Checks for loops in the network. |
| Version Usage | --- | Maintains the usage of network versions. |
| List Active Jobs | --- | Lists active jobs defined for this network: see Listing Active Jobs . |
| Browse Log | --- | See Displaying Logged Information - Browse Log Function . |
| Export | --- | See Exporting Objects in the <i>Import/Export Functions</i> documentation. |
| Add to Workplan | --- | Stores a reference to the currently selected object in a list of activities to be done. See also Add to Workplan . |
| Set Drag And Drop Function | --- | See Drag & Drop Function . |

Displaying a Network Definition

Displays job value, operating system special, symbol prompting and granting definition information for the currently selected Network Master.

The **Display** function invokes a dialog that displays the information for the currently selected network definition. You can only view the information, not edit it. If you want to edit the item, you have to use the **Open** function.

➤ **To display a network definition**

- 1 In the object workspace, select an owner from the **Owner** node and then a network definition from the **Network Master** node.
- 2 Invoke the context menu and choose the **Display** function.

Or:

Press CTRL+D.

A **Network Master** window opens that displays all available information for the selected network definition.

The fields and tabs of the **Network Master window** are explained in *Fields: Network Definition*.

Modifying a Network Definition

Opens job value, operating system special, symbol prompting and granting definition information for the currently selected network master in editing mode.

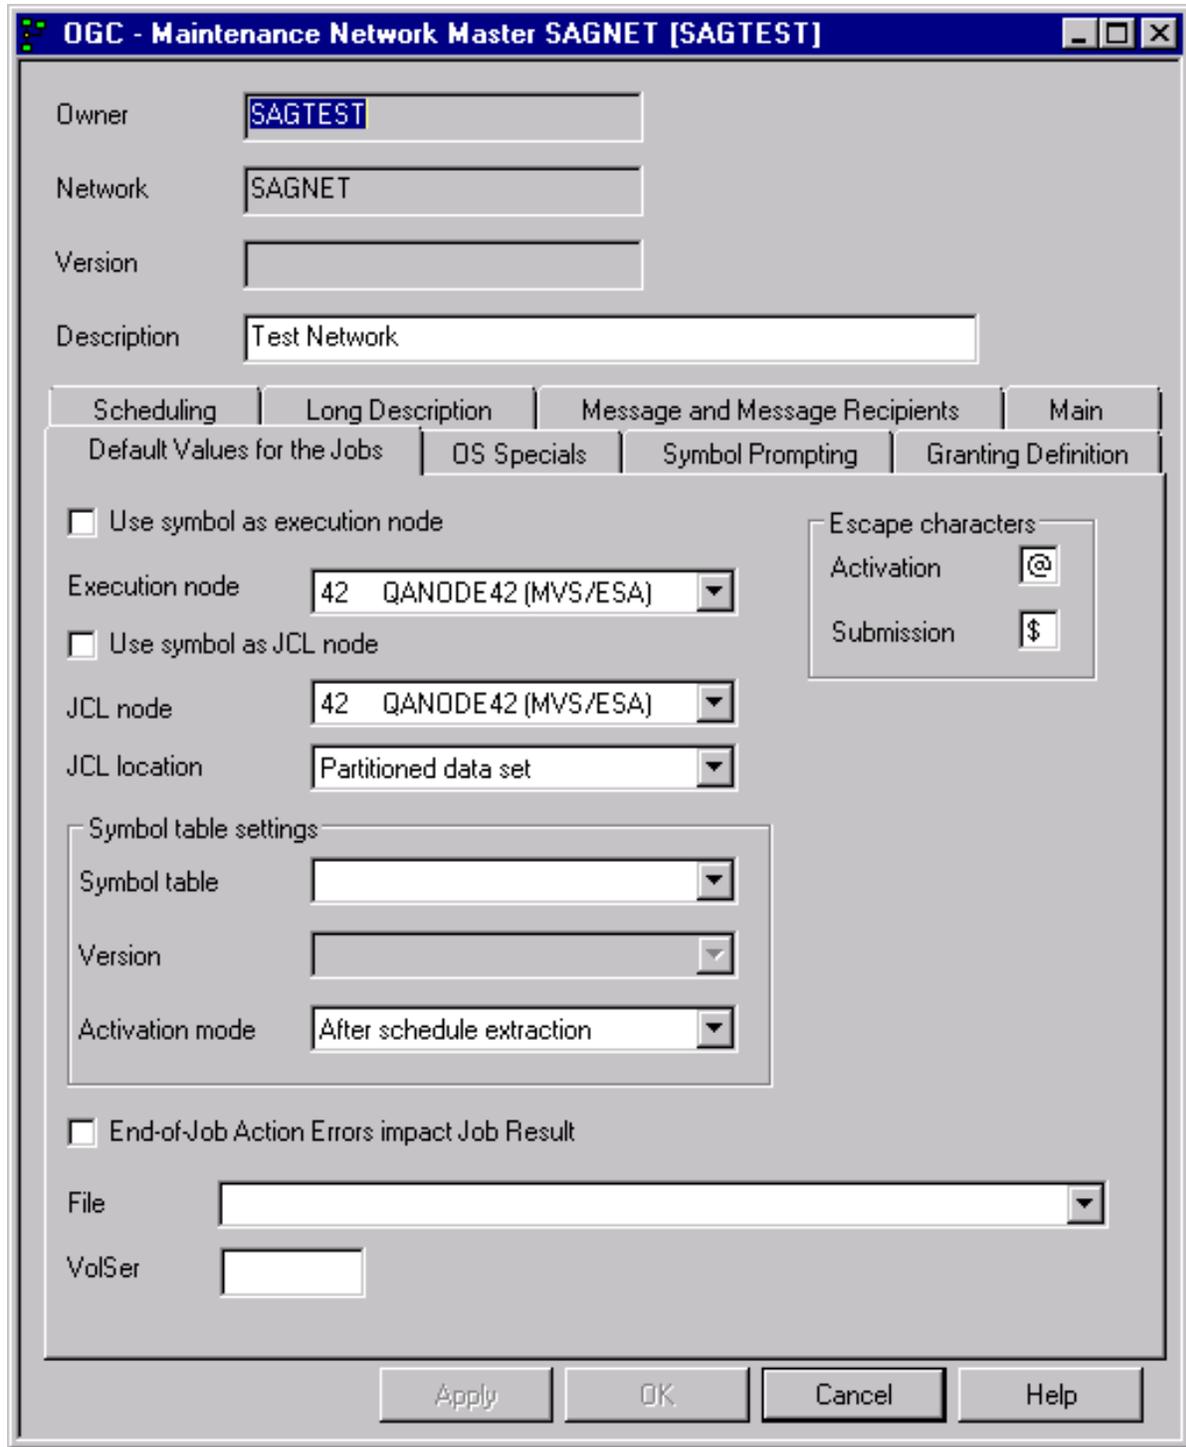

➤ **To modify a network definition**

- 1 In the object workspace, select a **Network Master** instance.
- 2 Invoke the context menu and choose the **Open** function.

Or:

Press CTRL+O.

A **Network Master** window similar to the example below opens:

3 Now, you can edit the fields you want to change.

The fields and tabs of the **Maintenance Network Master** window are explained in [Fields: Network Definition](#).

4 Select **OK**.

Your changes are saved.

Adding a Network Definition

➤ To create a new network master instance

- 1 In the object workspace, select a **Network Master** instance.
- 2 Invoke the context menu and choose the **New** function.

Or:

Press CTRL+N.

A **Create new Network Master** window opens. The fields contained in the window correspond to the fields in the **Maintenance Network Master window**. They are explained in *Fields: Network Definition*.

- 3 Enter the required values and select the required options.
- 4 Choose **OK** when you are finished.

Your entries are saved.

Fields: Network Definition

The fields and tabs of the **Create/Maintenance Network Master window** are described in the following table:

| Field/Tabbed Page | Description |
|-------------------|--|
| Owner | Owner of the network. |
| Network | Network name. Together with owner name, uniquely identifies the network in the master database. |
| Version | <p>Network version.</p> <p>You can add a new network with a blank (unnamed) version or an alphanumeric version name: see <i>Version Names</i> and <i>Reserved Version Names for Networks</i>.</p> <p>You can use the Create new Network Master window for all additional versions you want to add to an existing network.</p> <p>New network versions can also be created by copying networks as described in <i>Copying Job Network Definitions</i>.</p> |

| Field/Tabbed Page | Description |
|-------------------------------------|--|
| | For further information, see Maintaining Job Network Versions . |
| Description | <p>Short description of the network. This text appears in the list of networks in the Network List window.</p> <p>A longer description of the network can be added using the editor (see Documenting Your Networks).</p> |
| Default Values for the Jobs | The input fields on this tabbed page are used to specify default values for subsequent new job definitions in the network. Each default value specified here can be overridden at the job level. |
| Use symbol as execution node | Mark this option if you want to use a symbol for the execution node (see below). |
| Execution node | <p>Default node ID on which jobs within this network are submitted.</p> <p>This value can be modified here or overridden at the job level (see the field Execution Node in <i>Job Maintenance</i>).</p> <p>The drop-down list box shows all nodes available for selection. The operating system type appears after a valid node number.</p> <p>You can define the execution node as a symbol if the Use symbol as execution node option (see below) is selected. For details, see Symbols in Node Definitions in the section <i>Symbol Table and Symbol Maintenance</i>.</p> |
| Use symbol as JCL node | Mark this option if you want to use a symbol for a JCL node (see below). |
| JCL node | <p>Node on which JCL can be accessed.</p> <p>The default is the same as for the Execution node. The operating system type appears after a valid node number.</p> <p>The context menu of the selected node is the same as for Execution node.</p> <p>You can define the JCL node as a symbol if the Use symbol as JCL node option (see above) is marked. For details, see Symbols in Node Definitions in the section <i>Symbol Table and Symbol Maintenance</i>.</p> |
| JCL location | <p>Type of storage for the JCL: see List of JCL Locations.</p> <p>The default is used in new job definitions and can be overridden there.</p> |
| Symbol table | Default symbol table for those jobs in the network that use the dynamic JCL generation facility. Can be overridden at the job level and is therefore optional here. The drop-down list box shows all symbol tables available for selection. |
| Version (symbol table) | <p>You can maintain several versions of a symbol table. The drop-down list box shows all symbol table versions available for selection.</p> <p>Reserved names:</p> |

| Field/Tabbed Page | Description |
|--|--|
| | <p><i>blank</i> Unknown (implicit) version.</p> <p>(current) Is replaced by the current version for the activation date or determination date.</p> <p>(nv) Is replaced by the version of the network used.</p> <p>For further information, see Versioning of Symbol Tables in the section <i>Symbol Table and Symbol Maintenance</i>.</p> |
| <p>Activation mode (symbol table)</p> | <p>From the drop-down list box you can choose either of the following:</p> <ul style="list-style-type: none"> ■ During the network activation. No symbol prompting is possible. ■ After schedule extraction. Symbol prompting can be used for scheduled networks. This is the default. |
| <p>Activation (escape characters)</p> | <p>Activation Escape Character = Network default value</p> <p>This escape character is the prefix for Natural code lines and symbols to be replaced at activation time.</p> <p>Caution: Existing Dynamic JCL might become invalid after changing this escape character and applying defaults to jobs.</p> |
| <p>Submission (escape characters)</p> | <p>Submission Escape Character = Network default value</p> <p>This escape character is the prefix for Natural code lines and symbols to be replaced at submission time.</p> <p>Caution: Existing Dynamic JCL might become invalid after changing this escape character and applying defaults to jobs.</p> |
| <p>End-of-Job Action Errors impact Job Result</p> | <p>If you select this check box, for all output condition(s) defined for job events at the step level, the default checks All Checks ok or Any Check not ok are performed after all End-of-Job actions are performed. This includes End-of-Job action (EJA) exits. Any error that occurs in the End-of-Job action processing then causes the setting of the conditions for job not ok. If the job was already set to not ok, it will remain not ok, regardless of the definition here.</p> <p>Note:</p> <ol style="list-style-type: none"> 1. Setting this option may cause a longer elapsed time of a network, because the condition setting waits for the termination of the other End-of-Job actions. 2. The network level setting will be overridden by job settings. 3. This option does not change the settings of any conditions defined for any individual events. |

| Field/Tabbed Page | Description |
|---------------------------------------|---|
| | If the check box is not selected, errors during End-of-Job action processing will have no impact on the job result. Job level: If the field is empty, the network level definition will be inherited at activation time. This is the default. See also the field End-of-Job Action in the job master definition. |
| File | Name of the file or Natural library according to the value of the JCL Location field. For BS2000: The default pubset will be stripped from the file name prior to storing it. This allows easier migration to another default pubset. |
| VolSer | Volume serial number of data set (if data set is not cataloged). |
| OS Specials | This tabbed page is described in OS Specials - Operating System and Environment Defaults . |
| Symbol Prompting | This tabbed page is described in Symbol Prompting during Network or Job Activation in the section Symbol Table and Symbol Maintenance . |
| Granting Definition | This tabbed page is described in Granting Definition: Authorizing Other Users or Owners to Access a Network . |
| Scheduling | This tabbed page is described in Scheduling a Network in the section Schedule Maintenance . |
| Long Description | This tabbed page is described in Long Description - Documenting Your Networks . |
| Message and Message Recipients | This tabbed page is described in Specifying Recipients for Network Messages . |
| Main | This tabbed page is used to specify retention periods for an active network and active conditions. See Retention of Active Network Data . |

Retention of Active Network Data

You can specify how long data from an active network run is stored in the active database by using the **Retention period for network** and **Deactivation mode for active conditions** options provided on the **Main** page of the [Create/Maintenance Network Master window](#).

The settings specified here override the retention periods for active networks and active conditions, respectively, set in the Entire Operations defaults (see *Defaults for Time Ranges* in the *Administration* documentation).

Retention Period for Network

This option is used to keep active network data in the active database for the minimum number of days specified in the **days** field.

The following rules apply:

- Valid input values for **days** are 1 to 9999.

If no value is entered in this field (default), the default retention period set for active networks in the Entire Operations defaults is used.

- If the network is not completed within the given period, a warning message is sent to the mailbox(es) associated with the network.
- For unfinished active jobs, the retention periods set in the Entire Operations defaults and the retention period set for the single network calculate the actual retention period as follows:

(active jobs default - active networks default) + single network period = actual retention period

Example: (12 days - 10 days) + 5 days = 7 days

Deactivation Mode for Active Conditions

This option is used to remove active job conditions from the active database after a network run.

Possible option settings are:

| | |
|--|---|
| The global retention period for active conditions applies | Remove active conditions after the period (1 or more days) specified as retention period for active conditions in the Entire Operations defaults under Time Ranges . This is the default setting. |
| For manual and API network deactivations | Remove active job conditions set by a network run immediately after the network is deactivated either manually or by an API (application programming interface). |
| For all network deactivations | Remove active conditions set by a network run immediately after the network is deactivated either manually or automatically. |

OS Specials - Operating System and Environment Defaults

➤ To specify operating system specific defaults

- 1 In a **Network Master window**, select the **OS Specials** tab and then the required operating system from the **Operating System** drop-down list box.

Depending on the operating system selected, different input fields are provided on the page as shown in the example of BS2000 below:

| Scheduling | Long Description | Message and Message Recipients | Main |
|-----------------------------|------------------|--------------------------------|---------------------|
| Default Values for the Jobs | OS Specials | Symbol Prompting | Granting Definition |
| Operating system | BS2000 | | |
| JCL node | 31 | Execution node | 31 |
| Activation escape | @ | Submission escape | " |
| Default user ID | NOP | | |
| JCL user ID | | | |
| Job class | | Account number | |
| Submit user ID | NOP | | |
| SYSOUT user ID | NOP | SYSOUT cat ID | |
| Job priority | | Run priority | |

2 Enter the required values.

For information on all fields available, see [Input Fields: Network Defaults](#).

3 Choose **OK** when you are finished.

This section covers the following topic:

Input Fields: Network Defaults

The input fields available on the tabbed page **OS Special** depend on the operating system selected as indicated in the following table:

| Field | Description |
|--------------------------|--|
| Operating system | Operating system/environment: BS2000, z/OS, z/VSE, UNIX/Windows or SAP R/3. |
| Activation escape | Activation Escape Character = Network default value specific for operating system This escape character is the prefix for Natural code lines and symbols to be replaced at activation time. Caution: Existing Dynamic JCL might become invalid after changing this escape character and applying defaults to jobs. |
| Submission escape | Submission Escape Character = Network default value specific for operating system This escape character is the prefix for Natural code lines and symbols to be replaced at submission time. Caution: Existing Dynamic JCL might become invalid after changing this escape character and applying defaults to jobs. |
| JCL User ID | (Not applicable to z/VSE) The user ID to be used for JCL loading BS2000: If this field is not empty, the JCL is loaded with the rights of this BS2000 user ID. It can be overwritten with specific definitions. TSOS may only be defined if the user himself has logged on under TSOS. Default: The user ID from the fully qualified file name. If this field is left empty in a job definition, then the Default User ID will be inserted during the activation of the job. z/OS: JCL in z/OS will be loaded under this user ID by the Entire Operations Monitor. You can define this field only if you are logged on to the JCL node with the same user ID. Default: If this field is left blank, the user ID of the last modification will be used as JCL user ID. UNIX and Windows: With the authorization of this user ID, the Entire Operations Monitor loads the JCL of type TXT. |

| Field | Description |
|---------------------------------------|---|
| | <p>See also the default setting User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), <i>Operating System User IDs</i> and <i>Default User ID Determination</i>.</p> |
| <p>Submit User ID</p> | <p>(Not applicable to z/VSE)</p> <p>The user ID to be used at job start</p> <p>BS2000:</p> <p>The Entire Operations Monitor starts jobs in BS2000 under this user ID. In the network definition, this is a default value for the jobs.</p> <p>If this field is left empty in a job definition, then the Default User ID is inserted during the activation of the job.</p> <p>z/OS:</p> <p>The Entire Operations Monitor starts jobs in z/OS under this user ID. You can only define this user ID if you have logged on to the executing node with the same user ID.</p> <p>Default: If this field is empty, the user ID of the last modification is taken as submit user ID.</p> <p>UNIX and Windows:</p> <p>With the authorization of this user ID, the Entire Operations Monitor starts the script or the executable program.</p> <p>See also the default setting User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), <i>Operating System User IDs</i> and <i>Default User ID Determination</i>.</p> |
| <p>Applies to BS2000 only:</p> | |
| <p>Default User ID</p> | <p>This user ID is a default for all objects of this job network or job which are linked to a user ID.</p> |
| <p>Job Class</p> | <p>This job class is a default for all jobs in the network. It can be overridden by specific definitions.</p> |
| <p>Account Number</p> | <p>This account number is a default for the Submit User ID defined for the job network. It can be overridden by specific definitions.</p> |
| <p>Job Priority</p> | <p>If not empty, this job priority will be used during submission and will override a possible setting in the LOGON statement. The default value on network level will be used for new job definitions.</p> |
| <p>Run Priority</p> | <p>If not empty, this run priority will be used during submission and will override a possible setting in the LOGON statement. The default value on network level will be used for new job definitions.</p> |

| Field | Description |
|--|---|
| SYSOUT User ID | This is the user ID under which internal SYSOUT files are created by Entire Operations. If you do not enter an ID here, the Submit User ID is used. See also the default setting User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), <i>Operating System User IDs</i> and <i>Default User ID Determination</i> . |
| SYSOUT Cat ID | This is the catalog ID under which internal SYSOUT files are created by Entire Operations. This field is meaningful only if a SYSOUT user ID different from the submit user ID is used. |
| Applies to UNIX and Windows only: | |
| JCL Group | Applies to UNIX only (optional) If this field is left blank, the standard group of the UNIX user ID is used as defined under <code>/etc/passwd</code> . Otherwise, this field must contain one of the groups issued by the UNIX command groups. |
| Submit Group | Applies to UNIX only (optional) If this field is left blank, the standard group of the UNIX user ID is used as defined under <code>/etc/passwd</code> . Otherwise, this field must contain one of the groups issued by the UNIX command groups. |
| Applies to SAP only: | |
| System ID | SAP System ID (SID), as required by jexa4S. |
| System Number | SAP System Number, as required by jexa4S. |
| Client | SAP Client Symbol replacement is possible (except at logon). |

Specifying Recipients for Network Messages

You can define one or more users (recipients) to receive network-related standard messages that are sent when a specified event occurs. This is especially useful for sending information about the abnormal end of a job.

Among the events, which can cause a message to be sent, are:

- a calendar not defined for next year;
- a network not correctly terminated;
- symbol prompting requests.

The specific message text is generated automatically by the Entire Operations Monitor.

➤ **To define or remove recipients for network-related messages**

- 1 In a **Network Master window**, open the **tabbed page Message and Message Recipients**.
- 2 Change, add or remove a message recipient as described under **Recipients** in Step 3 of *To view or change a notification message* in the section *Defining Notification Messages (Job Maintenance)*.

Note: You cannot change the text of network-related standard messages.

Granting Definition: Authorizing Other Users or Owners to Access a Network

Entire Operations allows you to authorize other users and owners to access a network that belongs to you.

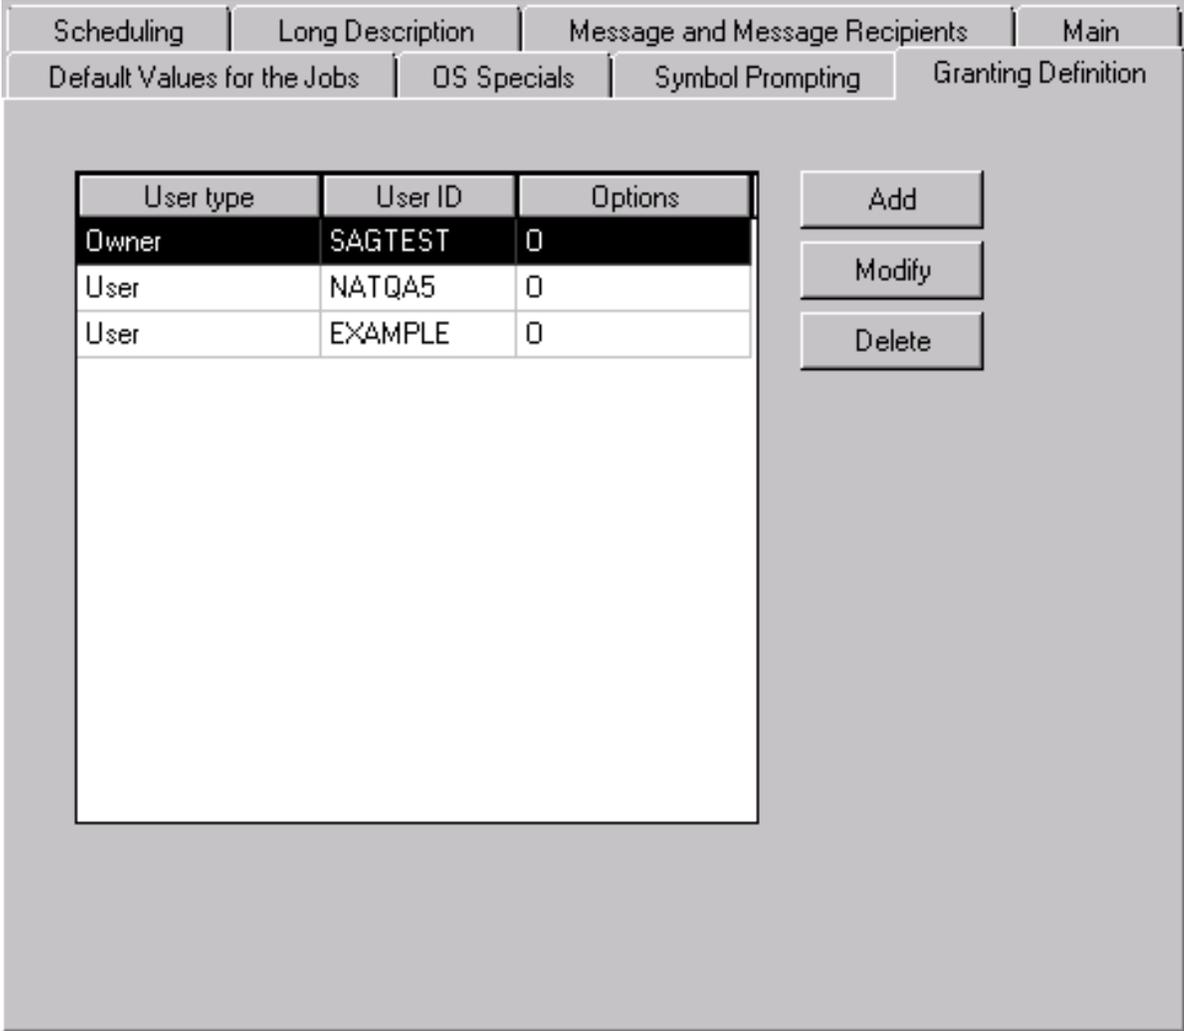

Users grouped under the owner SYSDBA have unlimited access to all networks in the system. They do not need the authorization described in this section.

Users and linked owners (lower than administrator) have limited access rights to granted networks in accordance with the rights specified in their user profiles and the restrictions specified in their individual network granting definition.

The **Owner via Granting** metanode lists all owners who granted network access for your user ID: see *Listing Granted Owners* in the section *Using Owners*.

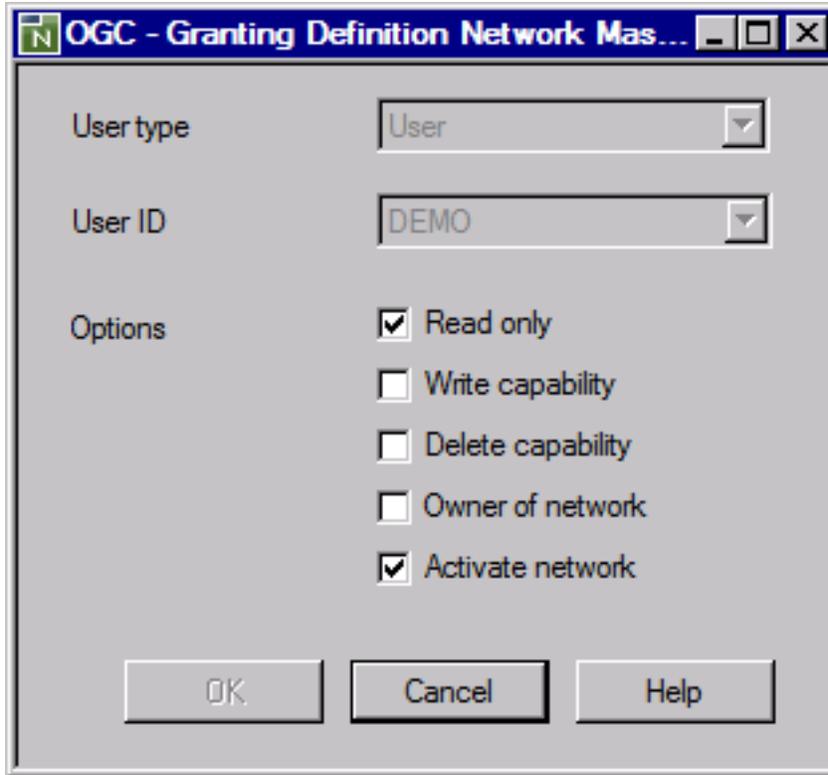

➤ **To add or modify a granting definition**

- 1 In a **Network Master** window, open the tabbed page **Granting Definition:**

- 2 Select a user type.
- 3 Select the **Add** button.

A **Granting Definition** window similar to the example below opens:

- 4 Specify the rights for the previously selected user. The fields and options available are described in *Fields: Granting Definition*.
- 5 Select **OK**.

➤ **To delete a granting definition**

- 1 On the **Granting Definition page**, select the table row that contains the user or owner whose granting definition you want to remove and choose **Delete**.

A window prompts you to confirm the deletion.

- 2 Choose **Yes** to confirm the deletion (**No** cancels the action) and close the window.
- 3 Choose **OK** to save your changes.

The users and owners you can remove depend on your user authorization. For the delete restrictions that apply, see *Adding and Removing an Owner*.

Fields: Granting Definition

The columns on the [Granting Definition page](#) and the corresponding fields and options in the [Granting Definition window](#) are described in the following table:

| Column/Field | Description | |
|------------------|--|---|
| User Type | Specifies the users to be authorized for network access. Possible options: | |
| | Owner | All users linked to the owner specified in the User ID field. |
| | User | A defined user. |
| User ID | User or owner to be granted network access. If the access rights are given to an owner, all linked users can obtain these access rights. You can select a user from the drop-down list box. | |
| Options | Authorization level for network access. You can select one or more of the following authorization levels: | |
| | Read only | Read authorization (maintenance not allowed). |
| | Write capability | Read and write authorization (maintenance allowed except delete network). |
| | Delete capability | Read, write and delete authorization for the user or owner entered in the Name field. |
| | Owner of network | Read, write and delete authorization. Authorization is also granted to all users and owners possibly authorized by the specified owner. |
| | Activate network | Activate network authorization. |

Long Description - Documenting Your Networks

You can add a [brief description](#) of a job network when defining a network in the **Network Master** window. This short description appears in the list of networks in the [Network Master List](#) window.

If you wish to add more online documentation for a network, you can invoke the Entire Operations editor.

As an alternative to a descriptive text, you can also enter an URL address that be used as a hyperlink to open another page inside or outside your Windows application.

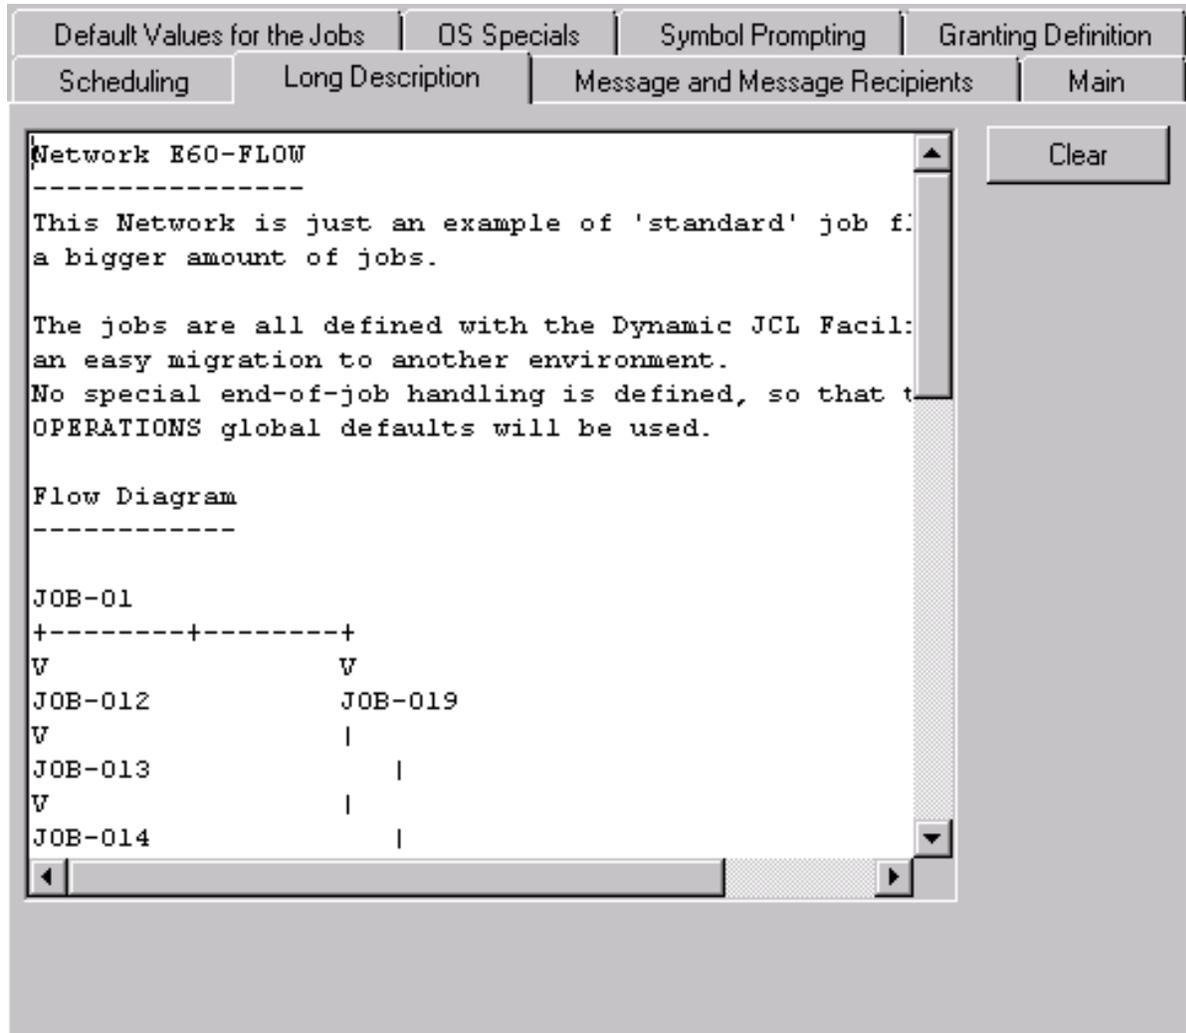

This hyperlink also works when you display the long description of a network.

> To create or modify a long description or hyperlink (URL) reference

- 1 In a **Network Master window**, open the tabbed page **Long Description**.
- 2 Enter an explanatory text or a hyperlink by choosing either of the following options.

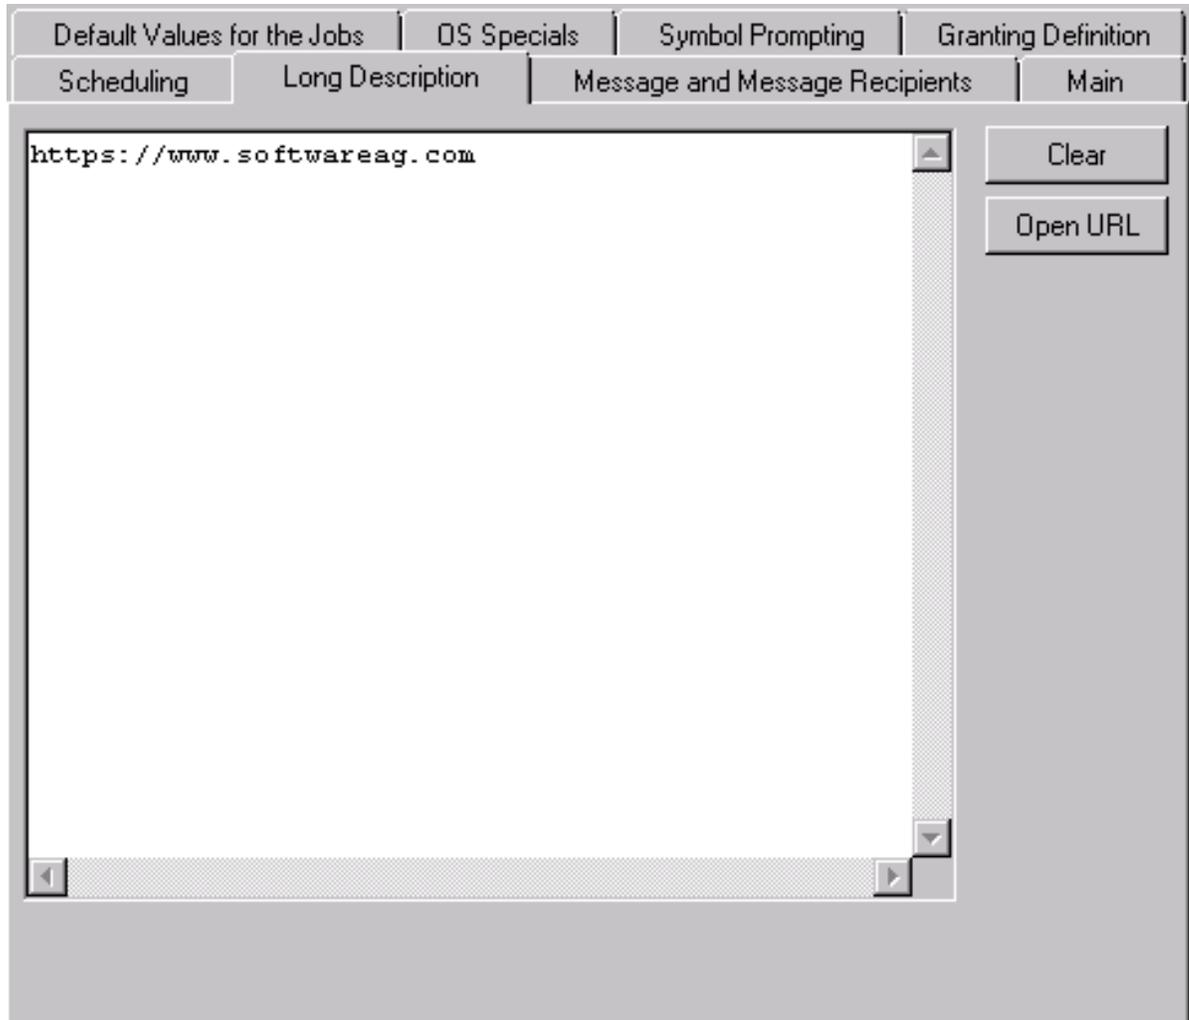

(You can choose **Clear** if you want to remove all entries on the **Long Description** page.)

Enter an explanation concerning the network master or replace existing text as shown below:

Or:

Enter a URL address that starts with `http://` or `https://` as shown below:

The URL must not contain any blank characters but it can extend over several lines. The lines are then concatenated without trailing blanks.

You can use one URL only.

Choose **Open URL** to open the default browser associated with your Windows application and view the destination page.

(This button only appears when you enter `http://` or `https://`.)

- 3 When you are finished, choose **Apply** or **OK**.

Deleting a Job Network

Only authorized users can delete a network. Only networks without active runs and version usage can be deleted.

Deleting a network also deletes all definitions made for the network on lower levels using network and job maintenance functions.

Entire Operations saves the last run number of a deleted network. The first run of a new network under the same name receives the last run number incremented by 1.

➤ To delete a network

- 1 In the object workspace, select an owner from the **Owner** node and then a network definition from the **Network Master** node.
- 2 Invoke the context menu and choose the **Delete** function.

Or:

Press DELETE.

A dialog prompts you to confirm the delete request.

- 3 Choose **Yes**.

If the delete is rejected, you receive an appropriate error message on the reason.

19

Maintaining Job Network Versions

- Versioning of Job Networks 208
- Using Network Versions for Activations 209
- Handling Network Version Usage Definitions 211

This section describes how to maintain and use different versions of job network.

Versioning of Job Networks

This section describes the rules and guidelines for maintaining network versions.

- [Version Names](#)
- [Reserved Version Names for Networks](#)
- [Version Names Exit](#)
- [Creating Network Versions by Copying Networks](#)
- [Copying Jobs](#)
- [Deleting Network Versions](#)
- [Deleting Network Versions or Single Jobs via API](#)

Version Names

The following applies when creating version names:

- The name can contain up to 10 alphanumeric characters and uppercase or lowercase letters.
- Space characters and the following special characters are not allowed:

?<>*,()_

- In general, do not use special characters and umlauts to avoid problems when porting an Entire Operations environment to another platform.
- Do not use a reserved version name (see the following section).

Reserved Version Names for Networks

blank value; in selections and in the log also: (unnamed)

Is used for an unnamed version.

This is the only network version that exists after migration from an earlier Entire Operations version that does not support network versioning.

In parameter listings (e.g., for reporting) you can use also a hyphen (-).

(current)

Will be replaced by the version that is set in the activated time schedule.

(current) can be used in version references.

Version Names Exit

With the usage of a global version name exit you can force a user-specific version name syntax. For detailed information, see *Global Exit for Version Names* in the *Administration* documentation.

Creating Network Versions by Copying Networks

You can copy network definitions to add a new version for an existing network.

See also [Copying Job Network Definitions](#).

Copying Jobs

Jobs in any version can be copied out of the originating network master.

Deleting Network Versions

You delete a network version by using the network delete function as described in [Deleting a Job Network](#)

The following applies when deleting a network version:

- You must be authorized to delete the network.
- You cannot delete a version that is defined and used in a current network activation schedule (see also [Handling Network Version Usage Definitions](#)). A version defined in an outdated schedule can be deleted.

Deleting Network Versions or Single Jobs via API

By using the API `NOPUAC5N` (Function `D`, Run Number `-1`) you can delete single network versions and jobs.

Using Network Versions for Activations

This section covers the following topics:

- [Evaluation of Network Versions for Scheduled Activations](#)
- [Manual Activation](#)
- [Activation of a Subnetwork](#)
- [Activation as End-of-Job Action](#)
- [Activation via API](#)
- [Versions without Schedule Activation](#)
- [Daily History of Network Activations](#)
- [Reporting](#)

- [Import/Export](#)
- [Exit Functionality \(Network\)](#)
- [Maximum Number of Versions per Network](#)

Evaluation of Network Versions for Scheduled Activations

The following applies:

- If only one version exists in a network, then this version will be activated. A schedule definition will be ignored.
- If multiple versions exist in a network, then it will be checked if a version has a current activated time schedule. If this is so, then this version will be activated.
- If usage intervals are defined for a network version, but the activation date is not in this interval, then the network will not be activated although scheduled. Corresponding protocol log entries and messages will be sent.

Manual Activation

If you choose a manual activation, then any network version can be selected. If defined, the standard version for schedule activation will be offered to you first.

Activation of a Subnetwork

In the subnetwork definition, you can define any version or the reserved `(current)` name.

Activation as End-of-Job Action

For the network or job activation as End-of-Job action you can define any version or the reserved `(current)` name.

Activation via API

For the network or job activation via API [NOPUAC5N](#) you can define any version or the reserved `(current)` name in the field `NETWORK-VERSION`.

Note that the API may issue version-related return codes.

Versions without Schedule Activation

In Entire Operations you can save multiple versions of job networks. Versions that are not, or are no more in the usage interval of schedule activation will not be activated automatically.

Daily History of Network Activations

The history of the network activations contains the network version for every run.

Reporting

Network versions will be considered.

Import/Export

Network versions will be considered.

Exit Functionality (Network)

Entire Operations provides user exits and APIs that perform network activation functions and support network versioning, for example, the API `NOPUAC5N`.

Maximum Number of Versions per Network

The maximum number of network versions can be limited system wide as described in *Defaults for Network Options* in the *Administration* documentation.

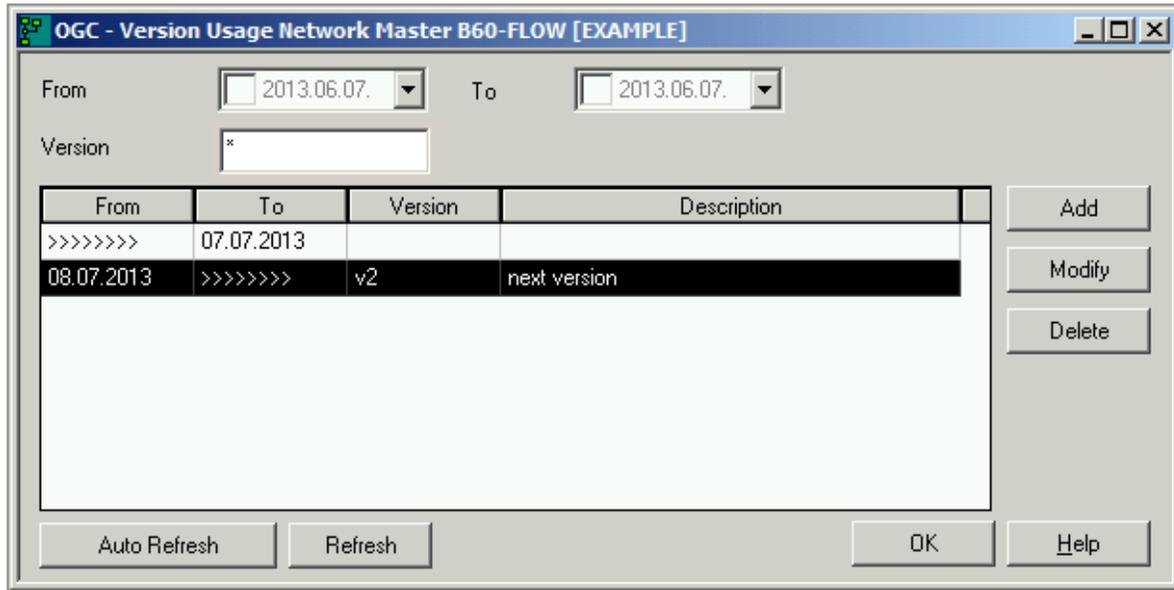

Handling Network Version Usage Definitions

You can to view and define the maintenance of date ranges, in which network versions are to be used for scheduled activations.

➤ To list, add, modify or delete a network version usage definition

- 1 In the object workspace, select a network from the **Network Master** node and choose **Version Usage** from the context menu.

A **Version Usage Network Master** window similar to the example below opens:

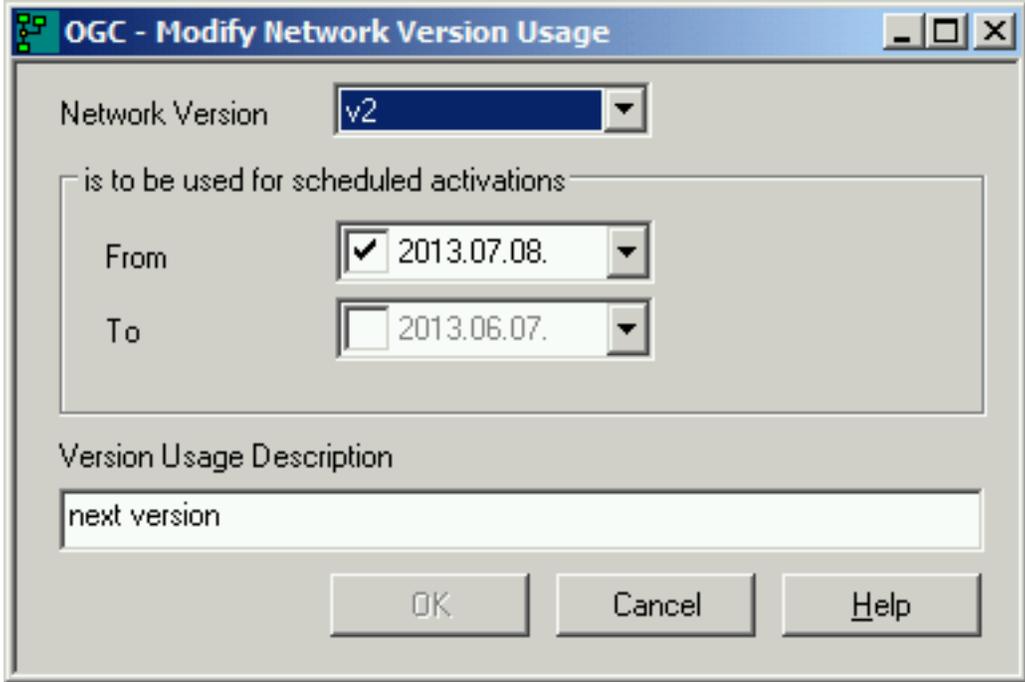

The window lists date ranges in which network versions are to be used for scheduled activations.

- 2 You can refresh the list by choosing the **Refresh** button.
- 3 You can modify or delete a defined version usage by selecting the respective row and choosing **Modify** or **Delete**, respectively.

Or:

You can add a version usage definition by choosing **Add**.

If you add or modify a defined network version usage, a window similar to the example below opens:

The screenshot shows a dialog box titled "OGC - Modify Network Version Usage". It contains the following elements:

- Network Version:** A dropdown menu with "v2" selected.
- is to be used for scheduled activations:** A checkbox that is checked.
- From:** A date field with "2013.07.08." and a dropdown arrow.
- To:** A date field with "2013.06.07." and a dropdown arrow.
- Version Usage Description:** A text box containing "next version".
- Buttons:** "OK", "Cancel", and "Help" buttons at the bottom.

Add or modify the network version usage definition for scheduled activations as required. You can select a start or an end date only. If you omit the end date, the time is unlimited (infinite).

 **Note:** The date ranges must not overlap.

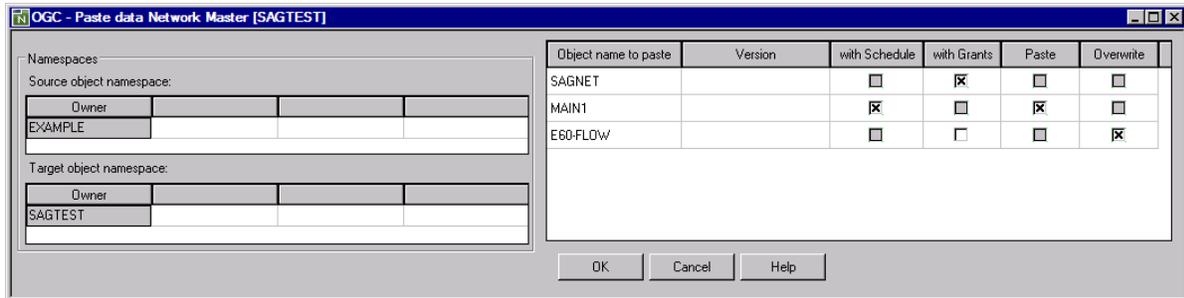

20 Copying Job Network Definitions

- Fields: Paste Data Network Master 217

> **To copy a network master**

- 1 From a **Network Master** node in the object workspace, select the network you want to copy and choose **Copy data** from the context menu, or press you CTRL+C.
- 2 Select the **Network Master** where you want to add the new network and choose **Paste data** from the context menu, or press CTRL+V.

A **Paste data Network Master** window similar to the example below opens:

The owner of the network(s) to be copied (here: EXAMPLE) and the owner of the **Network Master** node selected for copying (here: SAGTEST) are listed in the left-hand tables.

The network(s) to be copied are listed in the right-hand table. In the example above the network:

- SAGNET is not copied at all,
- MAIN1 is copied (including its schedule definition) if no network of the same name exists in the **Network Master** target node, and
- E60-FLOW is only copied if a network of the same name already exists in the target node.

- 3 Change the entries as required. The fields available in the window are described in [Fields: Paste Data Network Master](#).

When you are finished, choose **OK**.

The new network master(s) are copied to the selected **Network Master** metanode.

Fields: Paste Data Network Master

The fields of the **Paste data Network Master** window are described in the following table.

Note: You cannot copy a network to an existing network, or a version to an existing version.

| Field | Description | |
|-----------------------------|---|---|
| Namespaces | The fields in the Namespaces section contain the name of the owner from which the new network is copied. | |
| Object name to paste | The name to be used for the new network. | |
| Version | The network version to be used for the new network. To clone a network version, make sure that owner names in the Source/Target object namespaces are identical, and enter a different network version. | |
| with Schedule | Possible check box settings: | |
| | <i>unchecked</i> | The schedule linked to the source network will not be copied (default). |
| | <i>checked</i> | The schedule of the source network will also be copied. The current day will be excluded to prevent an unwanted immediate activation. The current schedule table will be copied from the day following the current day until the end of the current year. The execution history will not be copied. |
| with Grants | <i>unchecked</i> | Other users/owners granted access to the source network will not be copied to the new network (default). The new network will only have access rights for the current user/owner. See also Granting Definition: Authorizing Other Users or Owners to Access a Network . |
| | <i>checked</i> | Other users/owners granted access to the source network will be copied to the new network, in addition to the current user/owner. |
| Paste | <i>unchecked</i> | A new network is not pasted. See also Unchecked Paste and Overwrite . |
| | <i>checked</i> | Pastes the new network into the Network Master node of the owner entered in Namespaces (default). |
| Overwrite | <i>unchecked</i> | An existing network with the same name entered in Object name to paste will not be replaced (default). See also Unchecked Paste and Overwrite . |
| | <i>checked</i> | Replaces an existing network with the same name entered in Object name to paste . |

Unchecked Paste and Overwrite

If neither the **Paste** nor the **Overwrite** check box is marked, the copy function is not executed for the respective target network. This is useful, for example, if you specified multiple networks in **Object name to paste** and want to skip the copy function for a single network.

See also the [example of a Paste data Network Master](#) window.

21 Viewing and Maintaining a Job Network Diagram

- Explanations of Diagram Symbols 220
- Maintenance Functions for Diagrams 224
- Editing and Navigating in the Network Diagram 229
- Examples of Diagrams 232

Diagrams are provided for instances of a network master or an active network/job run. Diagrams can be used to view and edit a defined network or define a new network.

 **Note:** You can customize the diagram view by changing the **Diagram** settings in your user profile described in the *Administration* documentation.

➤ To view a network diagram

- 1 In the object workspace, select a **Network Master** instance or an **Active Run** instance.
- 2 Open the context menu and choose the **Diagram** function.

Depending on the node instance selected, a **Diagram Network Master** or **Diagram Active Run** window (see *Examples of Diagrams*) opens with a graphical view of the selected network.

The symbols used to represent the network components are described in *Explanations of Diagram Symbols*.

You can view and rearrange all network components as described in *Maintenance Functions for Diagrams*.

Explanations of Diagram Symbols

This section describes the symbols available in a diagram and indicates when a symbol only applies to an active job run.

The display of the symbols in the diagram graphic depends on whether the **Use new design** option is set (default) in the user profile (see the **Diagram** page described in *Administration* documentation). In general, the new design is characterized by gradient symbol colors and icons that identify specific reasons for an active job run that ended `not ok`.

The information provided with a diagram symbol can exceed the size available to display text. In addition, a complex network can contain very small symbols impossible to read without **zooming** because the size of the diagram is adjusted to the size of the network. Therefore, **tooltips** for annotations are provided for all symbols so you can always view the complete information in a readable form.

| Symbol | Description |
|------------|-------------------------------|
| JOB-01 | Job. |
| JOB/C | 42 |
| EXAM-TABLE | |
| | Common entries are |
| | ■ Job name (here: JOB-01) |
| | ■ Job type (here: JOB) |

| Symbol | Description | | | | | | | | | | | | | | | | | | | | | | |

| NET | 42 | | | | | | | | | | | | | | | | | | | | | | |
| EXA-SYMBOL | | | | | | | | | | | | | | | | | | | | | | | |

| Symbol | Description |
|--------|--|
| | Condition. Indicates the condition name (here: READ-DATA-OK) and the condition reference (here: RUN). |
| | External condition (new design) from another network. Common entries are: <ul style="list-style-type: none"> ■ Condition name (here: INPUT-1-OK) ■ Condition reference (here: RUN) ■ Network owner (here: SAGTEST) ■ Network name (here: DOC-ND-M-1) |
| | External condition (old design). |
| | Resource (here named FTP-SERVER-1). |
| | Reset condition. |
| | Set condition. |
| | Successfully ended job. |
| | Job waiting for execution. (active run only) |
| | Job executed as a temporary dummy for one of the reasons described in <i>Fields: Maintenance Job Active</i> (here: DS = dummy due to schedule definition). (active run only) |

| Symbol | Description |
|---|---|
|  | <p>Running job.</p> <p>(active run only)</p> |
|  | <p>Job in hold or suspended after changes to the job definition.</p> <p>(active run only)</p> |
|  | <p>Job ended not ok.</p> <p>(active run only)</p> |
|  | <p>Job ended not ok for one of the following reasons:</p> <ul style="list-style-type: none"> ■ Job missed the latest start time and/or deadline defined in the Scheduling Parameters of the job. ■ Latest start time and/or deadline defined in the Network schedule does not allow job execution. ■ Job exceeded latest start time for one of the above reasons. <p>(shown in the new design and for the active job only)</p> |
|  | <p>Job ended not ok because network activation was cancelled by the user.</p> <p>(shown in the new design and for the active job only)</p> |
|  | <p>Job ended not ok for any reason except  and  explained above.</p> <p>(shown in the new design and for the active job only)</p> |

The background colors used for the symbols denote the following:

| Color | Explanation |
|--------------|--|
| yellow | The job waits for its execution. If the allowed execution time is exceeded, the job is considered as ended not ok and the symbol changes to red. (active run only) |
| green | The job is currently executing. (active run only) |
| light green | The active job is affected by <ul style="list-style-type: none"> ■ an explicit hold function ■ an active regenerated JCL ■ a file/member that is changed in the active job definition. (active run only) |
| light yellow | The job ended ok. |
| red | The job ended not ok, for example, due to a JCL load error or an execution timeout. (active run only) |
| light gray | The condition is set. |
| dark gray | The condition is not set. |

Maintenance Functions for Diagrams

This section describes the functions available in a network diagram and indicates whether a function can be used only in a network master or an active run.

The following functions are available within the free space area of the diagram:

| Function | Description |
|----------------------|--|
| Arrange | Rearranges the objects of the diagram automatically. |
| Refresh | Refreshes the presentation of the diagram. You can also use F5. |
| Auto Refresh | You can: <ul style="list-style-type: none"> ■ start/stop automatic refresh ■ change the interval of automatic refresh <p>Note: Changes to the refresh settings remain valid for the diagram in the active window only. For persistent changes, modify the Automatic Refresh settings in your user profile (see the <i>Administration</i> documentation).</p> |
| Object Filter | You may switch on/off: <ul style="list-style-type: none"> ■ Condition nodes |

| Function | Description |
|---|---|
| | <ul style="list-style-type: none"> ■ Resource nodes <p>Note: Changes to the filter settings remain valid for the diagram in the active window only. For persistent changes, modify the Filter settings in your user profile (see the <i>Administration</i> documentation).</p> |
| Tooltip | <p>You can customize the information displayed in tooltip:</p> <ul style="list-style-type: none"> ■ For Job it is possible to switch the display on/off for Name, Type, Status (only in active run), Node, Symbol Table, Suffix symbol, Subnetwork, Job ID (only in active run). ■ For Condition it is possible to switch the display on/off for Name, Status (only in active run), Reference, Type, Suffix symbol, External network. ■ For Resource it is possible to switch tooltip on/off. ■ For Connector it is possible to switch the display on/off for source and target. <p>Note: Changes to the tooltip settings remain valid for the diagram in the active window only. For persistent changes, modify the Diagram settings in your user profile (see the <i>Administration</i> documentation).</p> |
| Find | <p>Opens a search dialog where you can enter a search string. You can also use CTRL+F.</p> <p>See also To search for a string.</p> |
| Find Next | <p>Finds the next occurrence of a search string entered in the search dialog. You can also use F3.</p> <p>See also To search for a string.</p> |
| Create Job | <p>Adds a new job to the network. A Create new Job Master (see Adding a Job Definition) or Create new Job Active (active run only; see Adding a New Job to the Active Network) window opens to add a new job to the network.</p> |
| Create Condition (master only) | <p>Adds a new condition. Proceed as described in To add and link a condition.</p> |
| Create Active Condition (active run only) | <p>Opens the Condition Active window to add a new active condition.</p> |
| Paste (master only) | <p>Paste a job object in the current network. See Pasting Objects.</p> |
| Browse Log | <p>Opens the Entire Operations log for the network or active run shown in the active diagram window or a symbol selected in the active diagram. The log only contains data relevant for this network or run.</p> <p>See also the Browse Log function that can be performed on a selected node in the tree view of the object workspace.</p> |

| Function | Description |
|-------------------------|---|
| Page Setup | Opens a dialog where you can specify the page setup for printing the current diagram. |
| Printer Setup | Opens a dialog where you can specify your printer settings. |
| Print Preview | Opens a print preview where you can check if the diagram is laid out for printing according to your preferences. |
| Print | Opens a dialog where you can send the diagram to a printer. |
| Zoom | You have the following possibilities to zoom the diagram: <ul style="list-style-type: none"> ■ in: makes the diagram larger ■ out: makes the diagram smaller ■ selection: zooms in/out single or multiple diagram symbols selected in the diagram. You can select single or multiple elements with CTRL+LEFT MOUSE BUTTON or by dragging the left mouse button over a group of adjacent symbols. ■ complete: shows the complete diagram on the screen ■ original: shows the diagram in its original size |
| Show World View | Opens a separate window with a minimized view of the complete diagram for easy navigation in complex diagrams. The green frame outlines the current viewport in the associated diagram. You can move the green frame to change the viewport in the diagram. |
| Show Legend View | Opens a separate window with a minimized view of the symbols used in the diagram for a quick overview of the objects (for example, resources and conditions) used in the job network. |
| Export Graphic | Opens a dialog where you can save the diagram on your hard disk. |

The following functions are available for a job symbol selected in the diagram:

| Function | Description |
|-------------------------------------|--|
| Open | Displays the currently selected job (box) and opens the Job Master or Job Active (active run only) window. Here, you can perform changes on the job. |
| Display | Displays the currently selected job (box) in the Job Master or Job Active (active run only) window. |
| New | Creates a new job (box) and opens the Create new Job Master (see Adding a Job Definition) or Create new Job Active (active run only; see Adding a New Job to the Active Network) window. |
| Mass update (master only) | Changes the Execute if temporary dummy option setting in End-of-Job actions for all jobs currently selected in the diagram. See also Changing Execute if Temporary Dummy Settings for Multiple Jobs . |
| Delete | Deletes the currently selected job (box). See Deleting Objects . |

| Function | Description |
|---|---|
| (master only) | |
| Copy data (master only) | Copies the currently selected job (box). See Copying Objects . |
| Paste data (master only) | Pastes the currently selected job (box). See Pasting Objects . |
| Usable Symbol Tables | Lists all symbol tables that can be used by the job. See also Listing Usable Symbol Tables in the section <i>Symbol Table and Symbol Maintenance</i> . |
| Deactivate (active run only) | You can cancel the planned activation of a job in a planned network run that is waiting for activation. |
| Hold (active run only) | If the job has already been submitted to the operating system, it will be held in the operating system. |
| Release (active run only) | Releases a job from hold status. |
| Cancel (active run only) | The active job is cancelled. |
| Resubmit (active run only) | After a job has terminated, you can modify and resubmit it while it is still in the active database. This function is useful after a job has failed. |
| Reactivate (active run only) | Reactivates a job. |
| Browse Master JCL (master only) | Browses the master JCL. See Displaying Master JCL . |
| Browse Active JCL (active run only) | A window opens where, you can see the actual JCL submitted to the operating system for execution. It is produced from the Master JCL when the job or network is activated. The symbols are replaced with values from the active symbol table. If it is dynamic JCL, the generation is performed at this time. The active JCL is stored in the active Entire Operations database. |
| Edit Master JCL (master only) | Edits the master JCL. See Editing Master JCL and Natural Sources . |
| Edit Active JCL (active run only) | A window opens where you can view and edit the active JCL of the job. |
| Regenerate Active JCL (active run only) | Regenerates the JCL while the job is in the active database. |

| Function | Description |
|--|---|
| Stop cyclic execution (active run only) | Stops execution of currently running cyclic job. |
| Modify Latest Start (active run only) | See Modifying the Latest Start Time for an Active Run in the section <i>Active Job Networks</i> . |
| Release edit lock (active run only) | Removes a lock from active JCL: see Release edit lock in the section <i>Active Job Networks</i> . |
| Pregenerate Active JCL (master only) | See Pregenerating Active JCL . |
| Remove pregenerated Active JCL (master only) | See Removing Pregenerated JCL . |
| Edit pregenerated JCL (master only) | See Editing Pregenerated JCL . |
| Browse SYSOUT (active run only) | A dialog opens where you can view the SYSOUT of an active job. See Viewing Job SYSOUT . |
| Extended Log / JCL (active run only) | A screen opens, where you can see the JCL which was submitted for this job. |
| Extended Log / SYSOUT (active run only) | A screen opens, where you can see the SYSOUT of the job. |
| SYSOUT Messages (active run only) | A screen opens, where you can see the SYSOUT messages of the job (z/OS only). |
| Activate Job (master only) | Opens the Activation dialog where you can activate the currently selected job (box). |
| Open Subnetwork (active run only) | Opens the subnetwork Network Master dialog for a subnetwork (Job with type Subnetwork). |
| Subnetwork diagram | Opens the Network diagram for a subnetwork (Job with type Subnetwork). |
| Zoom Subnetwork | Opens a list of jobs for a subnetwork (Job with type Subnetwork). |
| Waiting for (active run only) | See Displaying Prerequisites for Active Jobs: Waiting for in the section <i>Active Job Networks</i> . |
| List Active Jobs | See Listing Active Jobs . |
| Browse Log | Opens the log for the currently selected job (box). See Displaying Logged Information - Browse Log Function . |

| Function | Description |
|--------------------------------|---|
| Export (master only) | See <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Add to Workplan | Adds an object to the workplan. See also Add to Workplan . |

Connecting Lines

The following functions are available for the relationships (connecting lines) within the diagram:

| Function | Description |
|---|---|
| Set Input Condition (active run only) | Sets the input condition. |
| Reset Input Condition (active run only) | Resets the input condition. |
| Delete (master only) | Deletes the currently selected relationships between the objects. |
| Open Network (master only) | Opens the corresponding network maintenance dialog (see Modifying a Network Definition) for an external input condition. |
| Network Diagram (master only) | Opens the corresponding network diagram and to position diagram view to the proper condition for an external input condition. |
| Open Input Condition (master only) | Opens the Condition dialog. Here, you can perform changes on the currently selected input condition. |
| Open Output Condition (master only) | Opens the Condition dialog. Here, you can perform changes on the currently selected output condition. |

Editing and Navigating in the Network Diagram

This section provides instructions for using the diagram editor functions to maintain objects for a network and find a particular object in the diagram.

➤ To add and link a condition

- 1 From the context menu in the **Diagram Network Master** window, choose **Create Condition**.

A square symbol appears indicating the position where the new condition will be placed in the diagram.

- 2 In the free space of the diagram, left-click on the position where you want to place the new diagram symbol.

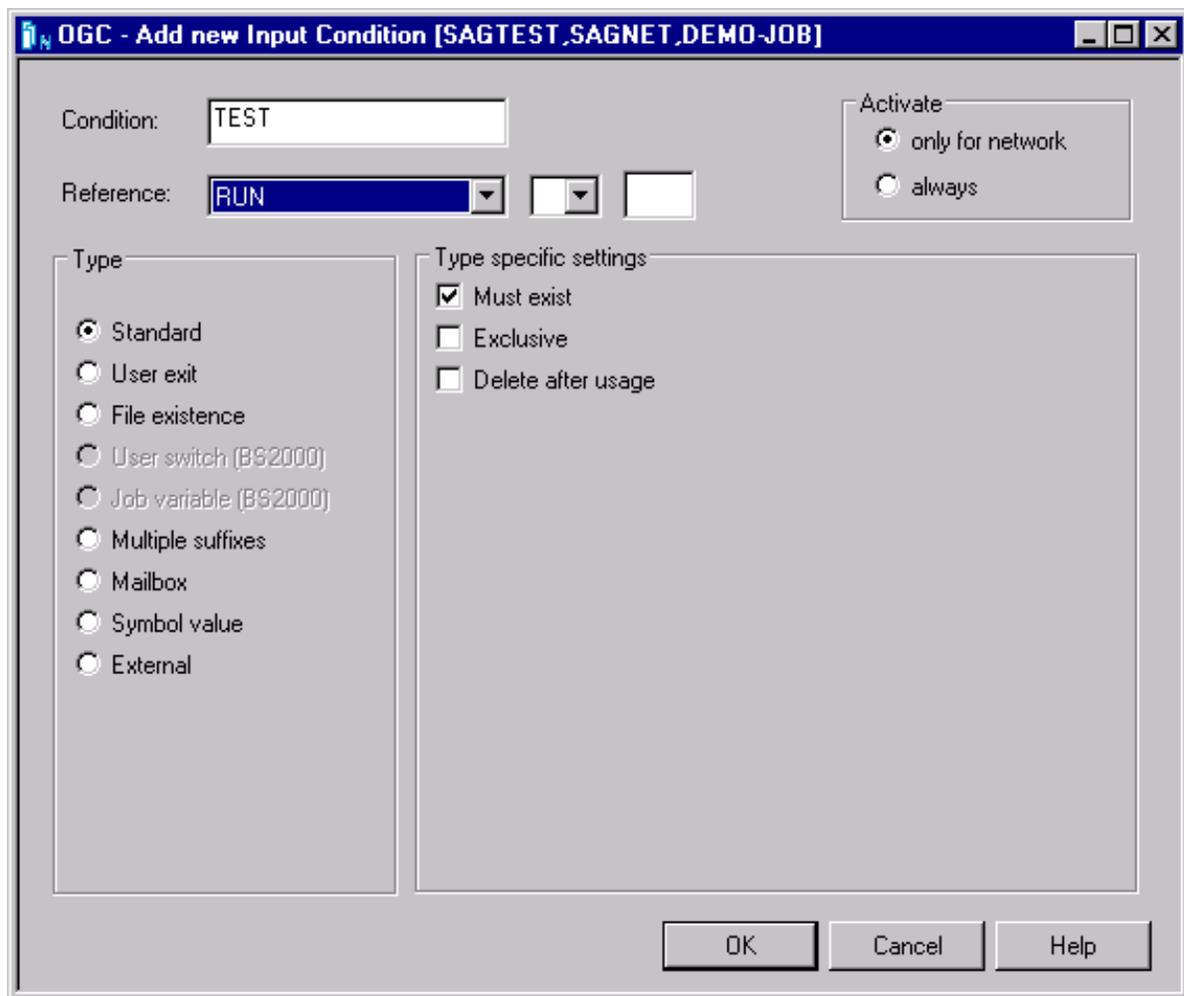

A **Create Condition** dialog appears.

- 3 Enter a valid condition name and choose **OK**.

The new condition is added to the diagram as a temporary (TMP) object, without any logical job links as shown in the tooltip information for the condition symbol.

- 4 Drag the selected condition and drop it onto the job to which you want to link the new condition as a logical input condition.

An **Add new Input Condition** window similar to the example below opens:

- 5 Enter the required definitions. The fields and options in the window are described in *Fields and Selection Options: Input Condition* in the section *Job Maintenance*.

- 6 When you are finished, choose **OK**.

The new condition is linked to the job as indicated by the connecting line between the job and the condition symbol and the tooltip information for the symbols.

➤ **To create an output condition**

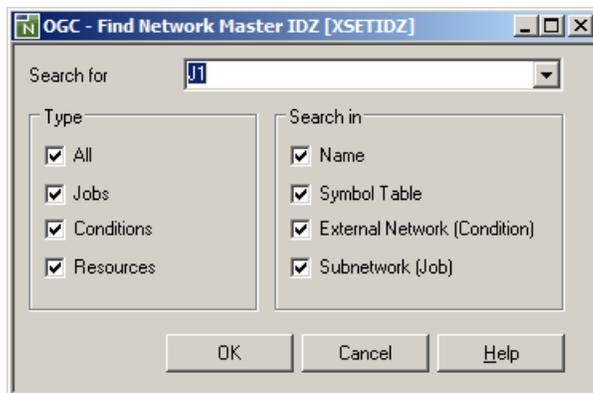

- 1 Select a job.
- 2 Drag the job and drop it onto a condition.
- 3 Select a branch (**All Checks ok** or **Any Check not ok**) to which the condition should be assigned.

➤ **To link two jobs**

- 1 Select a job.
- 2 Drag the job and drop it onto a job.
- 3 Select a branch (**All checks ok** or **Any check not ok**) to which the condition should be assigned.

➤ **To search for a string**

- 1 Call the search dialog by pressing CTRL+F or by choosing the **Find** function from the context menu:

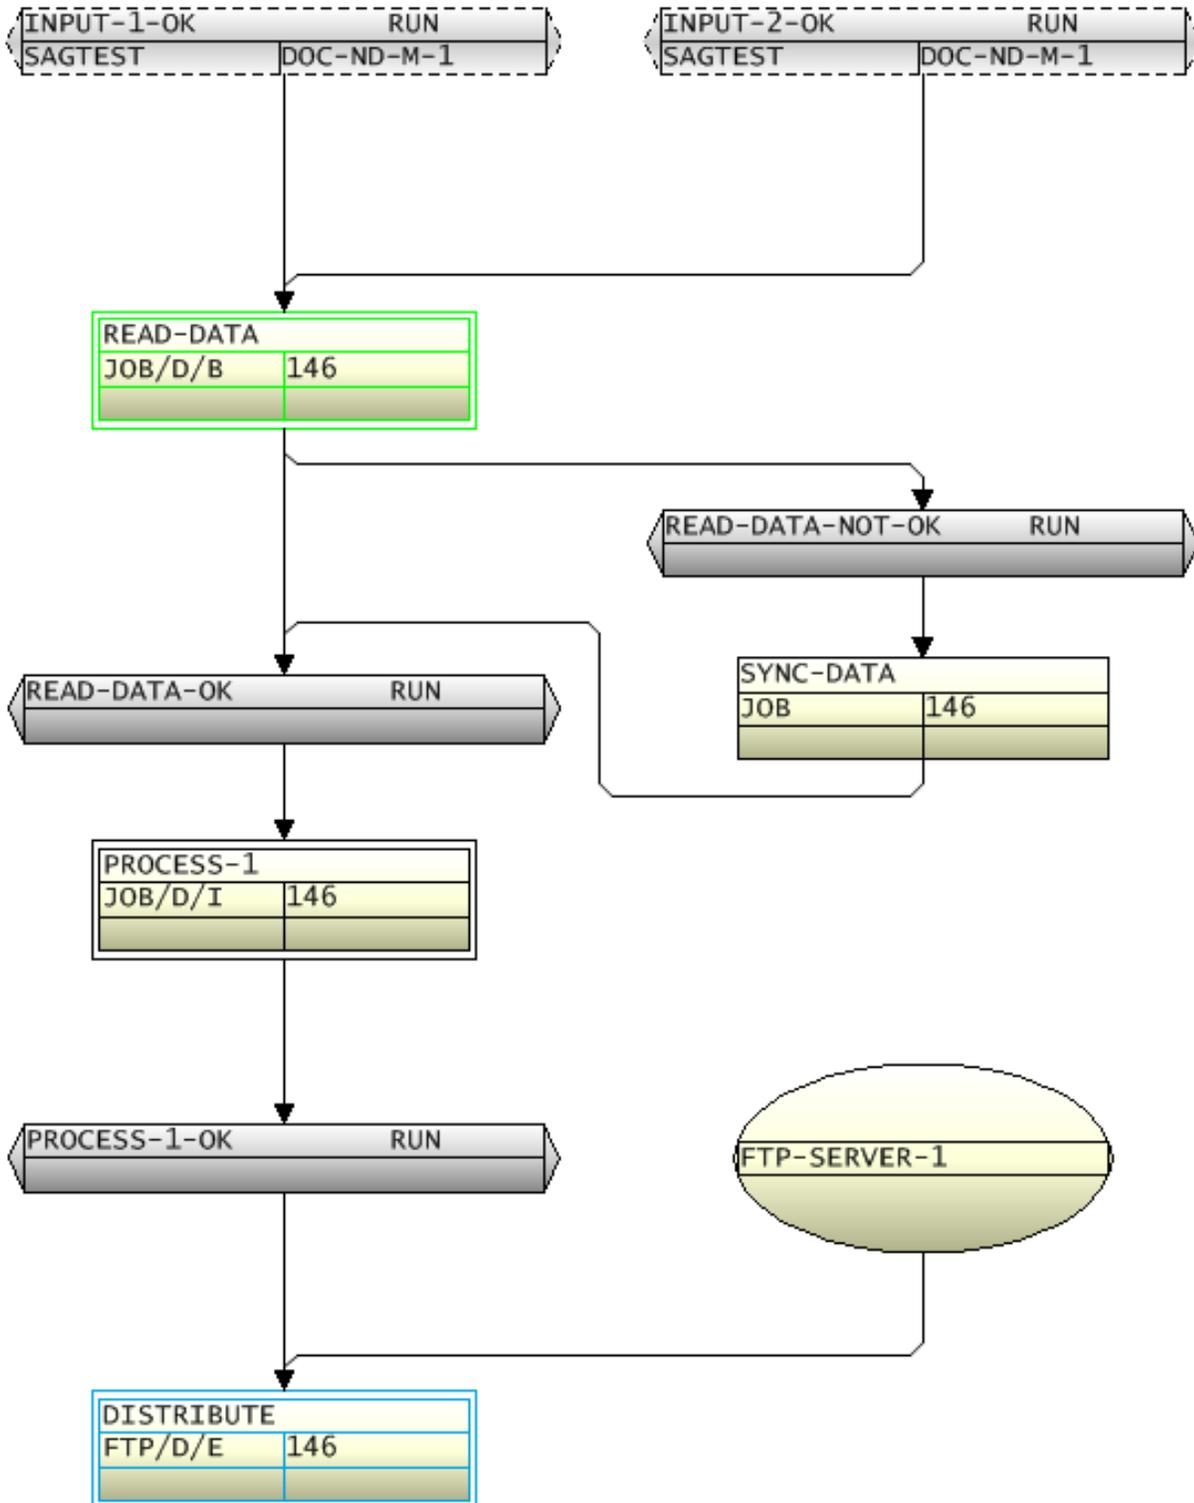

- 2 Fill in your search criteria. You can specify the search string, object type where the string is searched as well as the attribute of the object where to be searched. An asterisk ("*") is not interpreted as a wildcard.
- 3 Choose **OK**.

Examples of Diagrams

- [Example of a Diagram Active Run \(New Design\)](#)

Example of a Diagram Network Master (New Design)

Example of a Diagram Active Run (New Design)

22 Checking for a Loop in a Job Network

» To check for a loop in a network

- 1 In the object workspace, select a **Network Master** instance.
 - 2 Invoke the context menu and choose **Check for loop**.
- If a loop in the job flow is detected, the following message appears:

```
Definition Loop in xxx/yyy
```

where:

xxx is the name of the network tested for loops, and

yyy is the name of the job in the network, in which a cyclic link was first detected.

When a loop has been detected, a corresponding message is written to the Entire Operations log.

- If no loop is detected, the following message appears:

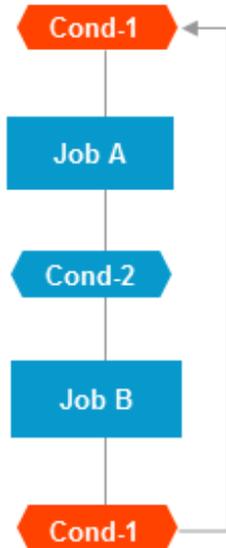

```
No Loop in Network xxx
```

- If the network contains more than 1000 jobs and no loop has been detected in these first 1000 jobs, the following message appears:

Loop check limit 1000 exceeded. Loop check stops.

Entire Operations does not perform a loop test on more than 1000 jobs.

The following figure illustrates a loop within the job flow of a network.

23

Applying Network Defaults to Jobs (Mass Update)

- Columns: Application of Network Defaults to Jobs/Copy Defaults 242
- Functions: Application of Network Defaults to Jobs/Copy Defaults 243

Caution: Use this function with extreme care. Individual job definitions can be easily overwritten by mistake. You are not asked to confirm each update and cannot undo any changes.

You can perform a mass-update of job fields within a network provided you have write permission for networks in your user profile (see *Network Maintenance Functions* in the *Administration* documentation).

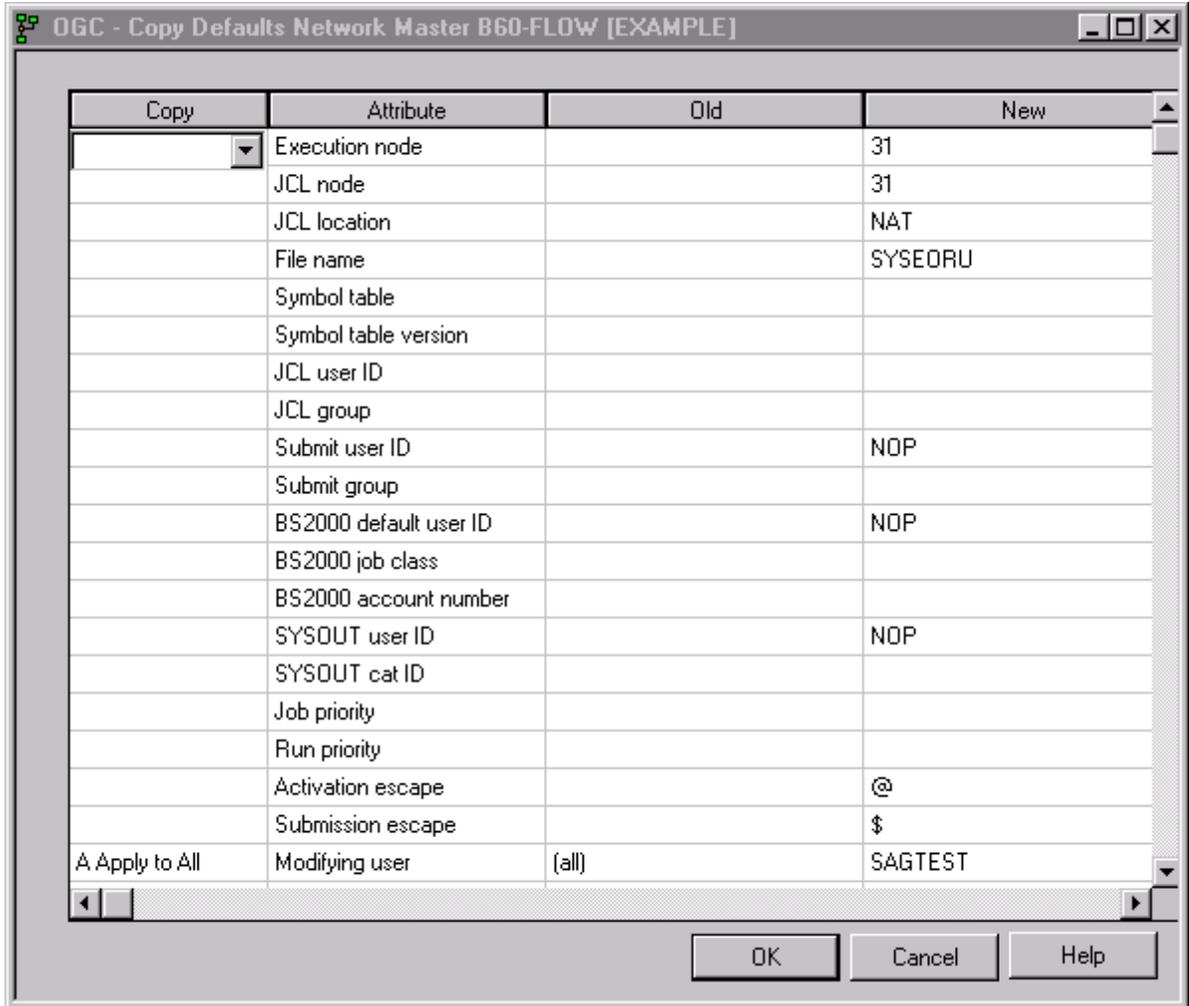

The mass update function copies values of specified network fields as default values to all jobs of a selected network.

The default values of the default network fields are also used when creating a new job.

➤ **To apply default field values to all jobs in the network**

- 1 In the object workspace, select a **Network Master** instance and choose **Copy Defaults** from the context menu.

A **Copy Defaults** window similar to the example below opens:

The **Attributes** column lists all fields that can be copied to all jobs that belong to the network. The attribute values relevant for a mass update of job fields are listed in the **Old** and **New** columns.

For more information on the columns and fields contained in the window, see [Columns: Application of Network Defaults to Jobs/Copy Defaults](#) and [Fields/Attributes: Application of Network Defaults to Jobs/Copy Defaults](#).

- From the drop-down list box in the **Copy** column, next to the attribute definition you want to copy, select the function you want to perform: see [Functions: Application of Network Defaults to Jobs/Copy Defaults](#).
- When you are finished, choose **OK**.

The function(s) are performed and specified values are copied from the network fields to the corresponding job fields, if requested by the function.

A message is returned indicating the number of jobs that have been modified.

For each job for which field values were replaced, the name of the field and the new field value are listed in the Entire Operations log with a message like `Network default Activation Escape @ applied`. See also [Displaying Logged Information](#) in the section *Log Information*.

Columns: Application of Network Defaults to Jobs/Copy Defaults

The columns of the [Copy Defaults window](#) are described in the following section:

| Column | Description |
|------------------|--|
| Copy | Select a function from the drop-down list box or leave the column empty: see Functions: Application of Network Defaults to Jobs . |
| Attribute | Network field whose value can be used as the default for all jobs that belong to the selected network. New field values indicated in the New column can be copied into the corresponding fields of all jobs that belong to the selected network. See also Fields/Attributes: Application of Network Defaults to Jobs/Copy Defaults below. |
| Old | Contains the value saved from the last change of a network field. |
| New | Contains the current value in the network field. |

Fields/Attributes: Application of Network Defaults to Jobs/Copy Defaults

The following table lists all fields in the [Copy Defaults window](#) and the corresponding network fields. The table also indicates the names of job fields if different from the names of the network fields.

All network fields are described in detail in [Fields and Commands: Network Definition](#).

| Field to Copy | Corresponding Network Field | Remark |
|-------------------|--|-------------------------|
| Execution Node | Execution Node | |
| JCL Node | JCL Node | |
| JCL Location | JCL Location | |
| Activation Escape | Escape characters: Activation | |
| Submission Escape | Escape characters: Submission Job field: Escape Characters: Submit | |
| Job Priority | Job Priority | Applies to BS2000 only. |
| Run Priority | Run Priority | Applies to BS2000 only. |
| End of job action | End-of-Job Action Errors impact Job Result Job field: End-of-Job Action | |

| Field to Copy | Corresponding Network Field | Remark |
|------------------------|--|---|
| Symbol Table | Symbol Table | |
| Symbol Table Version | Symbol Table Version Job field: Version | |
| JCL User ID | JCL User ID | |
| JCL Group | JCL Group | Applies to UNIX/Windows only. |
| Submit User ID | Submit User ID | |
| Submit Group | Submit Group | Applies to UNIX/Windows only. |
| BS2000 Default User ID | Default User ID | Applies to BS2000 only. |
| BS2000 Job Class | Job Class | Applies to BS2000 only. |
| BS2000 Account Number | Account Number | Applies to BS2000 only. |
| SYSOUT User ID | SYSOUT User ID | Applies to BS2000 only. |
| SYSOUT Cat ID | SYSOUT Cat ID | SYSOUT Catalog ID. Applies to BS2000 only. |
| Modifying User | Job field: Modified | ID of the user who last modified a job. |
| File Name | File Job field: File/NatLib | |
| SAP System ID | System ID | Applies to SAP only. |
| SAP System Number | System Number | Applies to SAP only. |
| SAP Client | Client | Applies to SAP only. |

Functions: Application of Network Defaults to Jobs/Copy Defaults

The functions available from the **Copy** drop-down list box of the [Copy Defaults window](#) are described in the following table.

The functions allow you to distinguish between jobs with network default definitions and jobs with individual definitions.

| Function | Description |
|-----------------------|--|
| A Apply to All | Replace all field values. Replace all values regardless of whether they are default settings or individual job definitions. |

| Function | Description |
|-----------------------------------|--|
| | <p>This is the default setting for Modifying User. The value (all) indicates that the Modified field in the job is always overwritten, regardless of the command used for function execution.</p> <p>The Modified contains the ID of the user who last modified a job definition.</p> |
| <p>S Apply to Specific</p> | <p>Replace specific field values only.</p> <p>Replace the value only if the value in the Old column matches the current value in the corresponding job field. All other field values remain unchanged.</p> <p>Example:</p> <p>The value in the Old column for Execution Node is 10, and the value in the New column is 20. The Execution Node field of all jobs currently containing 10 changes to 20. All other execution node numbers remain as they are.</p> |
| <p>empty column</p> | <p>Replace no field value.</p> <p>Use the empty selection option for a value you do not want to replace in a job field. A field value is not replaced when the Copy column is empty.</p> <p>This is the default for all values except Modifying User.</p> |

24

Defining Monitor Start Networks

- Monitor Start Network 246
- Day Start Network 247
- Common Start Network Considerations 248

(Administrator rights for owner SYSDBA required)

You can define a job network to be executed after each Monitor start and before the activation of any other job.

If a job network with the name `MON-START` is defined under the owner SYSDBA, this network is executed exclusively at each Monitor startup. This is called the Monitor start network.

No other job network is started until the start network is terminated correctly.

The last job of the start network must not set any condition (but can reset conditions). During execution of the start network, the absolute condition `MON-START-RUNNING` (owner SYSDBA) is set.

If any job of the start network ends `not OK`, this condition remains true and blocks any other Monitor action. The condition can be reset manually to free continuation of other processing. While the absolute condition is active, the message `Start Network still running` appears in the log and on the system console during each Monitor pass.

Monitor Start Network

You can define a job network to be executed after each Monitor start and before the activation of any other job.

If a job network with the name `MON-START` is defined under the owner SYSDBA, this network is executed exclusively at each Monitor startup. This is called the Monitor start network.

No other job network is started until the start network is terminated correctly.

The last job of the start network must not set any condition (but can reset conditions). During execution of the start network, the absolute condition `MON-START-RUNNING` (owner SYSDBA) is set.

If any job of the start network ends `not OK`, this condition remains true and blocks any other Monitor action. The condition can be reset manually to free continuation of other processing. While the absolute condition is active, the message `Start Network still running` appears in the log and on the system console during each Monitor pass.

Execution

The start network is intended to run exclusively before any other network. Therefore, the absolute condition `MON-START-RUNNING` (owner `SYSDBA`) is set at activation time.

The setting of this condition is automatically taken over by the first job of the start network. This job sets no conditions during End-of-Job checking and actions.

Note: The absolute condition `MON-START-RUNNING` is to be reset, only if the whole start network ends normally. Any other activity of the Monitor is blocked during execution of the start network. If any error occurs in the start network, the whole processing of other networks is blocked until there is a manual intervention. To force the normal processing to start, reset the condition `MON-START-RUNNING` manually.

Day Start Network

You can define a job network to be executed at the start of each day (when the date changes) and before the activation of any other job. If the Monitor is not active at this time, it is executed at Monitor start time.

If a network with the name `DAY-START` is defined under the owner `SYSDBA`.

Day Start Execution

The start network is intended to run exclusively before any other network. Therefore, the absolute condition `DAY-START-RUNNING` (owner `SYSDBA`) is set at activation time.

The setting of this condition is automatically taken over by the first job of the start network. This job sets no conditions during End-of-Job checking and actions.

Note: The absolute condition `DAY-START-RUNNING` is to be reset only if the whole start network ends normally. Any other activity of the Monitor is blocked during execution of the start network. If any error occurs in the start network, the whole processing of other networks is blocked until there is a manual intervention. To force the normal processing to start, reset the condition `DAY-START-RUNNING` manually.

Common Start Network Considerations

- Exclusive Execution
- Use

The considerations in this section apply to the Monitor start network and the day start network.

Exclusive Execution

While a start network is running, a warning message is repeatedly written to the log.

During the execution of the start network, the following Monitor activities are blocked:

- Schedule extraction
- Activation (except start network)
- Cleanup

Note: The Monitor start network and the day start network can execute in parallel.

Use

Some possibilities for the use of the start network are:

- Preparation of symbol tables for other networks;
- Activation of other networks;
- Condition setting;
- Any Entire System Server functions.

X Job Maintenance Defining and Managing End-of-Job (EOJ)

Checking and Actions

This section describes the purpose of jobs and the functions available to create, maintain and delete Entire Operations objects of the type job.

Jobs are maintained on the master database which stores all user, job network, job and scheduling definitions. It also contains all information pertaining to defined logical conditions, resources, calendars, and symbol tables. All information stored on the master database can be maintained online.

25

Use of Jobs

All jobs are members of job networks and can be linked by logical conditions. Some differences arise in End-of-Job checking, depending on the job type and the operating system (see the section *Defining and Managing End-of-Job (EOJ) Checking and Actions*). However, you can always define Job OK or Job not OK as a condition for subsequent system action.

For z/OS and z/VSE: An operating system job can consist of several steps. In these cases, Entire Operations can check the result of each job step as part of End-of-Job analyses and triggers system action accordingly.

A job is uniquely identified within a job network by its job name. The job name can, but need not be the same as the JOB or LOGON statement name (job name by which the operating system identifies the job). Before job submission, jobs can therefore only be identified by the name defined to Entire Operations. A job can only be accessed through Entire Operations by its Entire Operations name.

When defining a job, you must also specify:

- JCL location (depending on job type);
- JCL and **execution nodes** (if different from those specified for the job network);
- JCL and submit user IDs;
- Scheduling parameters (optional; otherwise, the network default is used);
- End-of-Job checking and End-of-Job action specifications (see the section *Defining and Managing End-of-Job (EOJ) Checking and Actions* for details).

Note for z/OS:

We recommend that the JCL of one Entire Operations job contains only one job statement. Entire Operations retains only the first job number assigned to a submitted job.

26

Defining and Managing Jobs

- Listing Jobs 254
- Available Functions: Job Master 256
- Displaying and Modifying a Job Definition 258
- Creating a Job Definition 265
- Writing and Viewing Online Documentation for a Job 267
- Deleting a Job Definition 269
- Displaying Job Dependencies 269

Listing Jobs

This section describes how to list all job masters defined for a network.

Related Topics:

- [Listing Active Jobs](#) in the section *Active Job Networks*
- [Listing Jobs of a Subnetwork](#)

> To list all jobs defined for a network

- 1 In the object workspace, select the **Job Master** node of the required network.
- 2 From the context menu, choose **List**, or press F8.

All jobs defined for the selected network are listed in the **Job Master List** window as shown in the following example:

| Job | Type | Loc | Spec.Type | Description | File or Library | Member |
|------------|------|-----|-----------|--|--------------------|---------|
| J2-SUB | NET | | | Subnetwork Job for Subnetwork SAGNETSUB2 | SAGTEST/SAGNETSUB2 | (D) |
| JOB-01 | SRV | | | Where it all starts | | |
| JOB-012 | JOB | BS2 | | Depending on Job-01 | \$NOP.SYSEORU | |
| JOB-013 | JOB | MAC | | Depending on JOB-012 | SYSEORU | B60-M01 |
| JOB-015 | DUM | | | Depending on JOB-014 | | |
| JOB-019 | JOB | MAC | | Depending on JOB-01 | SYSEORU | B60-M01 |
| JOB-02 | JOB | MAC | | Dep. JOB-15, JOB-19 | SYSEORU | B60-M02 |
| JOB-03 | NAT | NAT | | Depending on JOB-02 | SYSEORU | B60-P01 |
| JOB-04 | JOB | MAC | | Depending on JOB-03 | SYSEORU | B60-M01 |
| JOB-05 | DUM | | | Depending on JOB-04 | | |
| JOB-06 | JOB | MAC | | Where it all ends | SYSEORU | B60-M02 |
| SUBNETJOB1 | NET | | | Subnetwork job for subnetwork SAGNETSUB1 | SAGTEST/SAGNETSUB1 | (D) |

The window columns are described in [Columns: Job Master List](#).

This section covers the following topics:

Available Functions: Job Master

> To list all functions available for a Job Master metanode

- In the object workspace, select a **Job Master** metanode and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| List | F8 | See Listing Jobs . |
| New | CTRL+N | See Adding a Job Definition . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | See Filtering Objects . |
| Paste data | CTRL+V | See Pasting Objects . |
| Export | --- | See Exporting Objects in the Import/Export Functions documentation. |
| Set Drag And Drop Function | --- | See Drag & Drop . |

> To list all functions available for a Job Master instance

- In the object workspace, select a **Job Master** instance and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|-----------------|----------|--|
| Open | CTRL+O | See Displaying and Modifying a Job Definition . |
| Display | CTRL+D | See Displaying and Modifying a Job Definition . |
| Mass update | --- | Change the setting of the Execute if Temporary Dummy option in End-of-Job actions of multiple jobs. See Changing Execute if Temporary Dummy Settings for Multiple Jobs . |
| Network Diagram | --- | This function is used for navigation purposes. It opens the diagram of the network that contains the job. You can work with the diagram as described in Viewing and Maintaining a Job Network Diagram in the section <i>Network Maintenance</i> . |
| Open Subnetwork | --- | Open the Maintenance Network Master window for the network that is linked to a job of the type Subnetwork (NET). |

| Function | Shortcut | Description |
|--|----------|--|
| Zoom Subnetwork | --- | Open a list of jobs associated with the network to which a job of the type Subnetwork (NET) is linked. See also <i>Listing Jobs of a Subnetwork</i> . |
| Subnetwork Diagram | --- | This function is used for navigation purposes. It opens the network diagram for the network linked to a job of the type Subnetwork (NET). You can work with the diagram as described in <i>Viewing and Maintaining a Job Network Diagram</i> in the section <i>Network Maintenance</i> . |
| Delete | DELETE | See <i>Deleting a Job Definition</i> . |
| Copy data | CTRL+C | See <i>Copying Objects</i> . |
| Usable Symbol Tables | --- | Open the Usable Symbol Tables window to view or modify symbol table definitions available for the job. See also <i>Listing Usable Symbol Tables</i> in the section <i>Symbol Table and Symbol Maintenance</i> for details. |
| Browse Master JCL | --- | See <i>Displaying Master JCL</i> . |
| Edit Master JCL | --- | See <i>Editing Master JCL and Natural Sources</i> . |
| Activate Job | --- | See <i>Activating a Single Job Manually</i> . |
| Pre-generate Active JCL | --- | See <i>Pregeneration of Active JCL</i> . |
| Remove pre-generated Active JCL | --- | See <i>Removing Pregenerated JCL</i> . |
| Edit pre-generated JCL | --- | See <i>Editing Pregenerated JCL</i> . |
| List Active Jobs | --- | Open a list of active jobs for the selected job. See <i>Listing Active Jobs</i> in the section <i>Active Job Networks</i> . |
| Browse Log | --- | See <i>Displaying Logged Information - Browse Log Function</i> . |
| Export | --- | See <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Add to Workplan | --- | See <i>Add to Workplan</i> . |
| Set Drag And Drop Function | --- | See <i>Drag & Drop</i> . |

Displaying and Modifying a Job Definition

> To view a job definition

- 1 In the object workspace, select a **Job Master** instance.
- 2 Open the context menu and choose **Display**, or press CTRL+D.

A **Display Job Master** window opens.

The protected fields and tabbed pages in the window correspond to the fields and pages of the **Maintenance Job Master window**. They are explained in *Fields: Job Definition (Master)*.

> To modify a job definition

- 1 In the object workspace, select a **Job Master** instance.
- 2 Open the context menu and choose **Open**, or press CTRL+O.

A **Maintenance Job Master** window similar to the example below opens:

OGC - Maintenance Job Master JOB-01 [EXAMPLE.B60-FLOW]

Job name: Use symbol as execution node

- 3 Edit the fields you want to change. The fields are explained in [Fields: Job Definition \(Master\)](#).
- 4 When you are finished, choose **OK**.

Your changes are saved.

This section covers the following topics:

- [Fields: Job Definition \(Master\)](#)

Fields: Job Definition (Master)

The fields in the **Job Master window** are described in the following table.

Note: The fields and tabbed pages available depend on the **Job Type**, the **Special Type** and the operating system of the **Execution Node** specified for the job.

| Field/Tabbed Page | Description |
|---------------------|--|
| Job name | <p>Job name.</p> <p>Entire Operations recognizes a job by this name. It can, but need not be the same name as the JCL source used by the job (the operating system recognizes a job by its JCL name).</p> <p>Note: Job names should start with a character. Job names starting with a digit are tolerated, but are not recommended.</p> |
| Description | <p>Short description of the job.</p> <p>The maximum input is 50 characters.</p> <p>This text appears in the list of jobs in the Job Master List window.</p> <p>You can add a long description for the job: see Writing and Viewing Online Documentation for a Job.</p> |
| Job type | <p>Job type as defined to Entire Operations. For further information, see the section Job Types.</p> |
| Special type | <p>You can select one of the following types from the list box:</p> <ul style="list-style-type: none"> ▪ Normal Job Normal job without special condition. ▪ Cyclic execution (This is a replacement and extension of the former CYC (cyclic) job type.) Execution at certain intervals. If this type is specified, a cyclic interval must be defined in the job schedule parameters. This is checked during job activation and before job start. Each job type can be provided with this attribute. Note: You can use the reserved condition <code>P-STOPCYC-<i>jobname</i></code> to interrupt a cyclic job execution loop. See also reserved condition names in <i>Restrictions for Condition Names</i>. ▪ Execute as dummy Execution as a dummy job. This allows you to prevent the job from being executed without having to delete the definition. You can also set this type in an active job before a repetition. If this value is deleted in an active job, then the active JCL is generated, provided that it is already present. However, this does not have a resubmission of the job as a consequence. |

| Field/Tabbed Page | Description | | | | | | |
|--------------------------------------|--|---------|--|----|-------------------------------|-----|--|
| | <p>■ Stop Job Job type Started Task: Stops a started task.</p> <p>Job type Windows Service: Stops a Windows service.</p> <p>■ Recovery Job For a recovery job. You must also use this special type for jobs that are later activated with the job import API NOPUJIXN (see the section <i>API Routines</i>).</p> <p>Note: Recovery jobs are not activated during a normal job network activation. They are activated only if they are defined for another job and if a certain event makes a recovery necessary.</p> | | | | | | |
| Execution node | <p>Node on which to submit the job.</p> <p>The default is the value specified in the job network definition (see the field Execution Node in the section <i>Network Maintenance</i>).</p> <p>You can enter a different node for the job here.</p> <p>You can define the execution node as a symbol if the Use symbol as execution node option (see below) is selected. For details, see <i>Symbols in Node Definitions</i> in the section <i>Symbol Table and Symbol Maintenance</i>.</p> | | | | | | |
| Use symbol as execution node | <p>Select this check box if you want to use a symbol for the execution node (see above).</p> | | | | | | |
| Main page: | | | | | | | |
| Symbol table | <p>Name of the symbol table to be referenced for substitution of variables in dynamic JCL. Select a name from the list. Alternatively, you can enter a new name to define a new symbol table. See <i>Modifying a Symbol Table Master</i> in the section <i>Symbol Table and Symbol Maintenance</i> for more information.</p> <p>Note: If no symbol table is defined on the job level, the symbol table on the network level (if defined) is activated during network activation or job activation (if defined).</p> | | | | | | |
| Version (Symbol table) | <p>Version of the symbol table to be used.</p> <p>Reserved names (are replaced).</p> <table border="1" data-bbox="402 1545 1482 1713"> <tr> <td>current</td> <td>Current version for the activation date or determination date.</td> </tr> <tr> <td>nv</td> <td>Version of the using network.</td> </tr> <tr> <td>svn</td> <td>Symbol table version of the using network.</td> </tr> </table> | current | Current version for the activation date or determination date. | nv | Version of the using network. | svn | Symbol table version of the using network. |
| current | Current version for the activation date or determination date. | | | | | | |
| nv | Version of the using network. | | | | | | |
| svn | Symbol table version of the using network. | | | | | | |
| Suffix symbol | <p>(Optional field)</p> <p>If several instances of the job are to be activated in parallel, this field must contain a symbol name which is in the defined symbol table. The symbol itself must contain the suffixes to be</p> | | | | | | |

| Field/Tabbed Page | Description |
|--------------------------|---|
| | <p>appended to active job names and output conditions. The sum of the lengths (prefix+suffix) must not exceed the maximum field lengths for job names or conditions.</p> <p>For example, if the job master name is PARA, and the symbol contains 001, 003, 012, then the active jobs PARA001, PARA003 and PARA012 are created. If the suffix symbol value is not defined in a network and the network has a calling network (if it is a subnetwork), then the search for the suffix symbol is performed upward up to the highest level.</p> <p>If Suffix symbol does not contain any values, the job is activated as a temporary dummy job. For information about the definition of multiple symbol values, see Defining Multiple Symbol Values in the section <i>Symbol Table and Symbol Maintenance</i>. For information about the assignment of multiple symbol values to Suffix symbol, see Symbol Replacement with Multiple Symbol Values.</p> |
| Restartable | <p>Only applies to BS2000.</p> <p>Job can be restarted automatically. Possible selection options:</p> <ul style="list-style-type: none"> ■ Restart The job is to be restarted without any recovery after a system crash. ■ No restart No automatic restart after a system crash. ■ BS2000/RESTART The job is to be restarted when repeated. SYSOUT files are not renamed. <p>Automatic SYSOUT rerouting can be delayed with the following line right after the /LOGON instruction:</p> <pre data-bbox="337 1209 1378 1241">/REMARK EOR-SYSOUT-DIRECT=LATER</pre> <p>Later, the following line must appear:</p> <pre data-bbox="337 1346 1378 1377">/REMARK EOR-SYSOUT-DIRECT=NOW</pre> <p>This allows user-defined actions before using a SYSOUT file.</p> <p>Additional Restart Criteria:</p> <p>Job submission time must be before the last IPL time and the job must not be terminated. The field Monitor JV must contain \$R. The system session number at the job check time must be different from the session number at submission time.</p> |
| Modified | User ID, date and time of the last modification of the job definition. |
| End-of-Job Action | <p>Job output conditions.</p> <p>Possible selection options:</p> |

| Field/Tabbed Page | Description |
|------------------------|--|
| | <ul style="list-style-type: none"> ■ No impact on the job result Errors during End-of-Job action processing have no impact on the job result. ■ Errors impact the job result Errors during End-of-Job action processing have an impact on the job result. <p>For all output condition(s) defined for events at the job step level, the default checks All Checks ok and Any Check not ok are performed after all End-of-Job actions are performed. This includes End-of-Job action (EJA) exits. Any error that occurs in the End-of-Job action processing then causes the setting of the conditions defined for <code>job not ok</code>. If the job was already set to <code>not ok</code>, it remains <code>not ok</code>, regardless of the definition here.</p> <p>Note:</p> <ol style="list-style-type: none"> 1. Setting this option can cause a longer elapsed time of a network, because the condition setting waits for the termination of the other End-of-Job actions. 2. The network level settings are overridden by job settings. 3. This option does not change the settings of any conditions defined for any individual events. <ul style="list-style-type: none"> ■ Impact as defined for the network If the field is empty, the job uses the End-of-Job definition from its network. <p>See also the field End-of-Job Action in the network master definition.</p> |
| Milestone types | <p>Milestone job types.</p> <p>You can set single or multiple milestone attributes (types) for a job that performs an important task within a job network, such as tracking significant events or controlling the successful completion of other jobs.</p> <p>Possible selection options for user-defined milestones:</p> <ul style="list-style-type: none"> ■ Network Begin Milestone job performs as the first network job. ■ Network End Milestone job performs as the last network job. ■ Other Milestone job performs in no particular job order. <p>Possible values for system milestones dynamically set by Entire Operations during job submission (applies to active jobs only):</p> <ul style="list-style-type: none"> ■ First Job Milestone job performs as the first network job. |

| Field/Tabbed Page | Description |
|------------------------------|--|
| | <p>■ Last Job Milestone job performs as the last network job.</p> <p>You can use the application programming interface NOPUMI1N (see the section <i>API Routines</i>) to define your own milestones.</p> <p>For further information on milestone jobs, see the section <i>Event Store Milestones</i> in the <i>System Automation Tools</i> documentation.</p> |
| Escape Characters: | This is the activation escape character . It is a prefix for Natural code lines and symbols to be replaced at activation time. If you change this character, dynamic JCL can become invalid. |
| Activation | See also Symbol Escape Characters (<i>Symbol Maintenance</i>) and Notes about Escape Characters . |
| Escape Characters: | This is the submission escape character . It is a prefix for symbols to be replaced at submission time. If you change this character, dynamic JCL can become invalid. |
| Submit | Default is the dollar sign (\$). See also Symbol Escape Characters (<i>Symbol Maintenance</i>) and Notes about Escape Characters . |
| Other pages: | |
| Resources | This tabbed page is used to define a prerequisite resource for a job master. The fields and options on this page are explained in Handling Prerequisite Resources for a Job . |
| Input Conditions | This tabbed page is used to define input conditions for a job master. The fields and options on this page are explained in Defining and Managing Job Conditions . |
| EOJ Checking | This tabbed page is used to add, modify and delete an End-of-Job check for a job master and define a user message for the check. Furthermore, you can define an output condition for the End-of-Job check. The fields and options on this page are explained in Defining and Managing End-of-Job (EOJ) Checking and Actions . |
| JCL Definition | This tabbed page is not available for all types of jobs. The fields and options on this page are explained in Defining JCL for a Job . |
| FTP Definition | This tabbed page is not available for all types of jobs. The fields and options on this page are explained in Defining Parameters for an FTP Job . |
| Scheduling Parameters | This tabbed page allows you to define a schedule for the job. The fields and options on this page are explained in Scheduling a Job in the section <i>Schedule Maintenance</i> . |
| User Defined Log Data | The fields and options on this tabbed page are explained in Defining Job-Specific Log Information . |

| Field/Tabbed Page | Description |
|-------------------|--|
| Long Description | This tabbed page provides the option to write a long descriptive text for a job, in addition to the short job description you can enter in the Description field. See also Writing and Viewing Online Documentation for a Job . |
| Subnet | This tabbed page is only available for jobs of the type Subnetwork (NET). The fields and options on this page are described in Fields: Job Type Specific Execution Features in the section <i>Defining a Subnetwork</i> . |
| OS Specials | This tabbed page is not available for all types of jobs. The fields and options available on this page are described in Fields: Operating System Specific Execution Features . |

Note about Escape Characters

The job escape character is always used for symbol replacements and macro JCL.

When a job is created or when an escape character is reset, the default value is taken in the following order from:

1. [Network defaults \(operating system specific\)](#) if defined for the current operating system;
2. [Network definition](#) if non-blank;
3. Global operating system specific defaults for z/OS and z/VSE, BS2000, UNIX and Windows (*Administration* documentation).

See also [Symbol Escape Characters](#) in the section *Symbol Maintenance*.

Creating a Job Definition

When defining a new job, you can either enter all required attributes individually, or copy all attributes from an existing job master including all input conditions and End-of-Job activities defined for the job.

This section covers the following topics:

- [Adding a Job Definition](#)

- [Copying Job Definitions](#)

Adding a Job Definition

➤ To add a job definition

- 1 In the object workspace, select a **Job Master** node and choose **New** from the context menu, or press CTRL+N.

Or:

Open the [Job Master List](#) window and choose the **New** context function from within the list table, or press CTRL+N.

A **Create new Job Master** opens. The fields contained in the window correspond to the fields in the [Maintenance Job Master window](#). They are described in [Fields: Job Definition \(Master\)](#).

- 2 Enter the required values.
- 3 Choose **OK** to save your entries.

The new job master is created and ready to use within the job network.

Copying Job Definitions

You can copy a job within the current network or between networks.

Prerequisites for copying are:

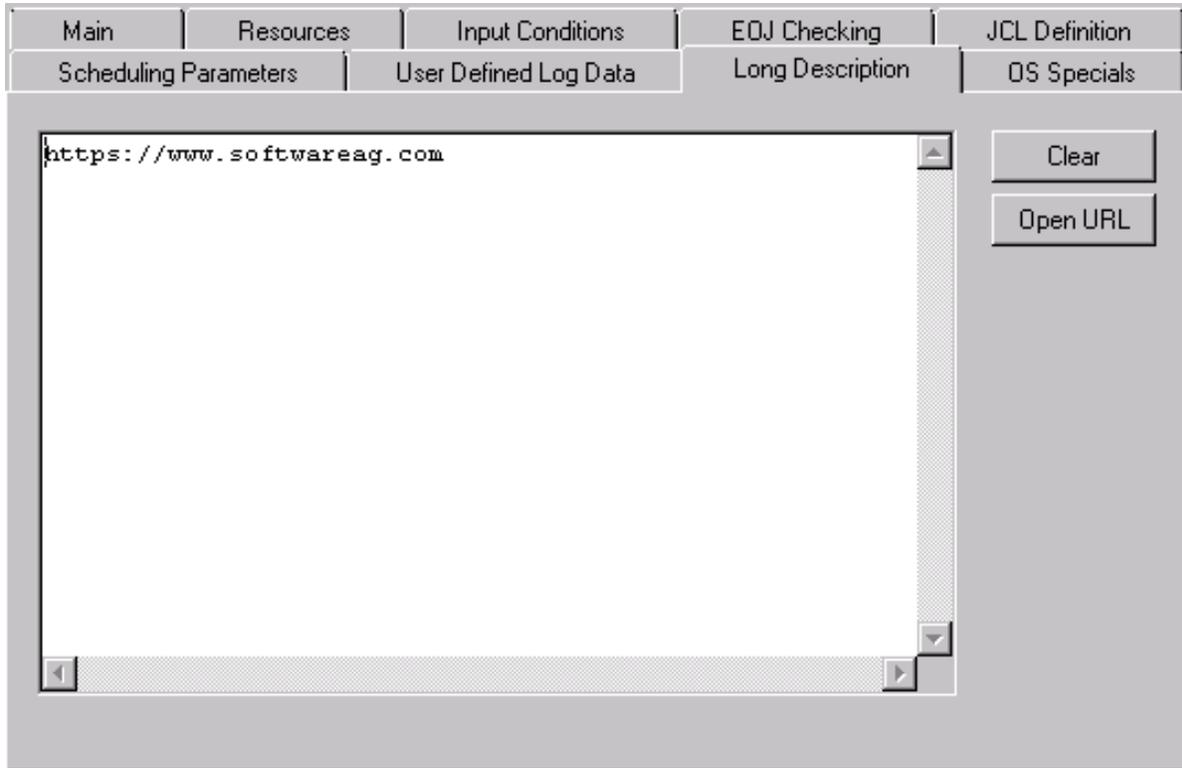

- You must be allowed to perform the copy function; see the settings of the **write** permissions in the *Network Maintenance Functions* of your user profile (*Administration* documentation).
- You must be granted access to the networks of a specified target owner.
- The target network must exist; you cannot create a new network with the copy function.

➤ To copy a job definition

- In the object workspace, select the job you want to copy from **Job Master** node and proceed as described in [Copying Objects](#).

Or:

Enter a URL address that starts with `http://` or `https://` as shown below:

The URL must not contain any blank characters but it can extend over several lines. The lines are then concatenated without trailing blanks.

You can use one URL only.

Choose **Open URL** to open the default browser associated with your Windows application and view the destination page.

(This button only appears when you enter `http://` or `https://`.)

- 3 When you are finished, choose **Apply** or **OK**.

Once online documentation is written, it can be read by any user who is authorized to access the network to which the job belongs.

You can also display or print online documentation by using the **Reporting** function described in the section [Reporting](#). If long job descriptions exist, they are included in the **Network Description (detailed)** report as indicated in the [Example of Network Description \(detailed\)](#).

Deleting a Job Definition

Note: Deleting a job definition also deletes all definitions made at the job level, including its input conditions and [End-of-Job checking and actions](#). The original JCL is not deleted.

> To delete a job definition

- 1 In the object workspace, select the job you want to delete from the **Job Master** node.
- 2 From the context menu, choose **Delete**.

Or:

Press DELETE.

A dialog opens where you have to confirm the deletion.

Displaying Job Dependencies

The **Network Diagram** function allows you to see which jobs must run before a specific job can start, and which jobs run after it.

You can trace job dependencies through whole networks and display cross-network job links.

Displaying Job Dependencies for a Specific Job

> To view job dependencies in a network

- 1 In the object workspace, select a job from the **Job Master** or **Job Active** node.
- 2 Open the context menu and choose the **Network Diagram** function.

Depending on the node selected, a [Diagram Network Master](#) or [Diagram Active Run](#) window (see the examples in the section *Network Maintenance*) opens with a graphical view of the selected network.

The symbols used to represent the network components and the functions available from the context menu in the diagram, are described in [Explanations of Diagram Symbols](#) and [Maintenance Functions for Diagrams](#) in the section *Network Maintenance*.

In a complex network, you can use the **Find** function to locate the required job.

Defining Job-Specific Log Information

Entire Operations allows you to define which information is to be logged in addition to the Entire Operations default system log.

This information is defined at the job level and can be job SYSOUT, JCL or selected operating system messages from the SYSOUT.

This section covers the following topics:

- [Specifying Extended Log Information](#)
- [Fields: User Defined Log Data](#)

Specifying Extended Log Information

➤ **To specify extended log information**

- 1 In the [Maintenance Job Master window](#), open the tabbed page **User Defined Log Data**:

Job name: Use symbol as execution node

Execution node: ▾

Description:

Job type: ▾ Special type: ▾

Main Resources Input Conditions EOJ Checking JCL Definition

Scheduling Parameters User Defined Log Data Long Description OS Specials

Log SYSOUT Files:

Log JCL

Log system messages:

| Code | Code | Code | Code |
|------|------|------|------|
| | | | |
| | | | |
| | | | |
| | | | |

Log the selected message, if it contains one of the following strings:

- 2 Make your definitions. The input fields and options are explained in [User Defined Log Data](#).
- 3 Choose **OK** to save your definitions.

The logged information can be viewed after job termination using the [Browse Log](#) function described in the section [Log Information](#).

Fields: User Defined Log Data

The input fields of the [User Defined Log Data page](#) are described in the following table:

| Field/Column | Description | |
|---|---|-----------------------------|
| Log SYSOUT | Specifies logging of job SYSOUT files after job termination. Possible check box settings: | |
| | <i>checked</i> | Logs SYSOUT. |
| | <i>unchecked</i> | No SYSOUT files are logged. |
| | SYSOUT logging can also be defined as SYSOUT action . If the SYSOUT file or spool data set exceeds a given line limit, the log display is truncated: see SYSOUT line limit in <i>Defaults for Network Options</i> in the <i>Administration</i> documentation. | |
| Files | (z/OS only) Input valid only if Log SYSOUT is specified. Enter number(s) of SYSOUT file(s) to be logged. | |
| Log JCL | Specifies logging of JCL after job termination. This is useful for dynamically generated JCL or if JCL is frequently modified for different job runs. Possible check box settings: | |
| | <i>checked</i> | Logs JCL. |
| | <i>unchecked</i> | No JCL is logged. |
| | See also JCL Log . | |
| Log System Messages | Specifies operating system messages to be logged. Enter a message code in a field under the Code column. | |
| Log the selected message if it contains one of the following strings | Specifies additional selection strings for the message entered and selected in the Code column. The message is logged if no additional string is specified, or if at least one specified string is found in the message. | |

JCL Log

The JCL log is generated from the following sources:

| | |
|---------------|--|
| BS2000 | From the ENTER file. (The ENTER file is deleted after copying into the Entire Operations Log.) |
| z/OS | If Entire Operations runs on a mainframe: from the SYSOUT. If Entire Operations does not run on a mainframe: from the active JCL. |
| z/VSE | From the active JCL. |

| | |
|----------------|--|
| UNIX | From the effectively submitted shell script. |
| Windows | From the effectively submitted BAT file. |

27 Defining Job Types and Job Execution Features

- Available Job Types 276
- Defining Job Type Specific Execution Features 278
- Defining Operating System Specific Execution Features 281

You define a job according to the **job type** you require and the operating system on which your Entire Operations environment runs.

The functions and specification options available to define a job depend on the following entries in the **Maintenance Job Master window**:

- The job type entered in the **Job Type** field,
- The job type entered in the **Special Type** field, and
- The operating system of the node entered in the **Execution Node** field.

Depending on the job type, the special type and the operating system selected in the **Maintenance Job Master window**, additional pages are provided to define individual execution features for the job.

This section describes the types of jobs you can define in Entire Operations and the type specific features provided to execute a job.

Available Job Types

Note: Only the job types **JOB**, **SRV** and **STC** result in operating system jobs when submitted.

You can define the following job types to Entire Operations:

| Job Type | Description |
|------------------------------------|--|
| <p>DAT</p> <p>Text File</p> | <p>A UNIX, Windows or DAT text file.</p> <p>Jobs of type DAT (data file generation) can be used to create text files in the same way as active JCL is generated.</p> <p>Instead of a submission, the created text is just being written to a text (data) file.</p> <p>Symbol replacement, symbol functions, text block inclusions can be used like in other JCL.</p> <p>If the DAT output file is to be created on a mainframe node, no trigraph encoding is performed during JCL loading.</p> <p>If the DAT output file is to be created on a UNIX or Windows node, trigraph encoding is performed during JCL loading, and trigraph decoding is performed during DAT file writing.</p> <p>For more information, see Trigraph Encoding for JCL Submission on UNIX and Windows.</p> |

| Job Type | Description |
|---|---|
| DUM Dummy Job | <p>A dummy job has no JCL and is not submitted to the operating system.</p> <p>You can use dummy jobs to set input conditions with a time range, to provide a time window for other jobs or as placeholders for future or seldom used jobs, etc.</p> <p>You can define an estimated running time for a dummy job (see the field Estimated Elapsed Time). The dummy job is then executed for exactly this amount of time without burdening the system.</p> <p>Execution node:</p> <p>Even if a dummy job itself does not need it, it may be necessary to define an execution node with a Submit User ID. This is the case if any prerequisite check, End-of-Job check or End-of-Job action uses an Entire System Server node. The Monitor determines whether a node access is required, and performs Entire Systems Management logons only if they are necessary for any action.</p> <p>See also <i>Using a Dummy Job</i>.</p> |
| FTP File Transfer Job | <p>This job type can be used for file transfers in batch mode using the File Transfer Protocol (FTP). The JCL for the file transfer job is generated by Entire Operations, depending on the FTP parameters in the JCL definition.</p> |
| JOB Standard Job | <p>This includes all standard operating system jobs with their own JCL. Jobs of the type JOB (Standard Job) are submitted as batch jobs. The JCL of JOB-type jobs can contain symbols as placeholders for variables defined in the symbol table specified for the job. These symbols are replaced by their current value at job activation or at job submission time. See also <i>Symbol Replacement in JCL</i>.</p> <p>If the job is executed on a UNIX or Windows node, command line parameters can be passed by the symbol CMDLINE-job. See <i>Reserved Symbols for Command Line Parameters</i> in the section <i>Symbol Table and Symbol Maintenance</i>.</p> |
| NAT Natural Program | <p>This is a Natural subprogram.</p> <p>It has no JCL and is executed directly by the Entire Operations Monitor.</p> <p>A subprogram, for example, is used to code user exit routines (see the relevant section) used by a job.</p> <p>See also <i>Editing Master JCL and Natural Sources</i>.</p> |
| NET Subnetwork | <p>This job type enables you to execute a complete network within a main network. See <i>Defining a Subnetwork</i>.</p> <p>The concept of subnetworks is described in detail in the section <i>Defining a Subnetwork</i>.</p> |
| SAP Job within SAP System | <p>The job is executed within the SAP runtime system.</p> <p>See the SAP-specific network defaults described in <i>Input Fields: Network Defaults (Operating System and Environment Defaults)</i> and <i>Job Execution Specials for Job Type SAP</i>.</p> |

| Job Type | Description |
|---|---|
| SRV Windows Service | <p>With this job type, you can define a service under Windows. A service must first be defined in Windows before it can be started.</p> <p>For further information, see:</p> <ul style="list-style-type: none"> ■ Job Execution Specials for Job Type SRV ■ Passing Command Line Parameters <p>Stopping a Windows service: Create a copy of the main Windows Service job, and define the special type Stop Job described in <i>Fields: Job Master Definition</i>.</p> |
| STC Started Task | <p>A started task is a special type of batch job on z/OS or z/VSE. Started tasks have static JCL which can reside in any PROCLIB (z/OS) or POWER RDR (z/VSE).</p> <p>For z/OS: only PDS is a valid JCL location for this job type.</p> <p>Entire Operations can activate and process started tasks like any other job type. See also Passing Command Line Parameters.</p> <p>Stopping a started task: Create a copy of the main Started Task job, and define the special type Stop Job described in <i>Fields: Job Master Definition</i>.</p> |
| WPS Windows PowerShell Script | <p>Applies to Windows only.</p> <p>This job type is for Windows PowerShell Scripts (with extension .ps1).</p> <p>The Windows PowerShell (powershell.exe) is used as the command interpreter instead of the old Windows command interpreter. The script must conform to the PowerShell syntax.</p> <p>Command line parameters can be passed by the symbol CMDLINE - job. See Reserved Symbols for Command Line Parameters in the section <i>Symbol Table and Symbol Maintenance</i>.</p> |

Defining Job Type Specific Execution Features

➤ To define job type specific execution features

- In the [Maintenance Job Master window](#), open the extra page that appears when selecting one of the following job types in the **Job type** field:

For the job type **File Transfer Job** (FTP), the tabbed page **FTP Definition** is provided.

For the job type **Subnetwork** (NET), the tabbed page **Subnet** is provided.

For the job type **Text File** (DAT), the job type dependent fields are contained on the tabbed page [OS Specials](#).

All type specific fields are described in [Fields: Job Type Specific Execution Features](#).

This section covers the following topics:

- [Fields: Job Type Specific Execution Features](#)

Fields: Job Type Specific Execution Features

The job types for which type specific fields are provided on additional pages of the **Job Master** window including the **OS Specials page** are described in the following table.

| Job Type | Field | Description | | | | | | |
|--|--|--|--|---|---|--|----------------------------|--|
| NET Subnetwork (tabbed page Subnet) | JCL Node | Node where the JCL of the job (if defined) is located. | | | | | | |
| | Subnetwork owner | Owner of the subnetwork. Enter a name or select a name from the drop-down list box. | | | | | | |
| | Subnetwork name | Name of the subnetwork. Enter a name or select a name from the drop-down list box. | | | | | | |
| | Subnetwork version | Version of the subnetwork if defined. | | | | | | |
| | | | | | | | | |
| | Activation mode | <p>Activation time: see Time of Activation of a Subnetwork in the <i>System Overview</i>.</p> <p>Possible selection options:</p> <table border="1"> <tr> <td>At activation time</td> <td>At the moment of the activation of the calling job.</td> </tr> <tr> <td>At submission time</td> <td>At the moment of the start of the calling job.</td> </tr> <tr> <td>Use global defaults</td> <td>Use global default values as set in the Entire Operations defaults for Network Options (see the <i>Administration</i> documentation).</td> </tr> </table> | At activation time | At the moment of the activation of the calling job. | At submission time | At the moment of the start of the calling job. | Use global defaults | Use global default values as set in the Entire Operations defaults for Network Options (see the <i>Administration</i> documentation). |
| | At activation time | At the moment of the activation of the calling job. | | | | | | |
| | At submission time | At the moment of the start of the calling job. | | | | | | |
| | Use global defaults | Use global default values as set in the Entire Operations defaults for Network Options (see the <i>Administration</i> documentation). | | | | | | |
| | Append multiple suffixes | <p>Select this check box to append the suffix of the calling multiple job to the name of the subnetwork.</p> <p>The resulting name must not have more than 10 characters. Otherwise, the name of the active job network is the same as the name of the job master network. Uniqueness is ensured by different run numbers.</p> | | | | | | |
| Use subnetwork time frames | <p>Possible check box settings:</p> <table border="1"> <tr> <td><i>unchecked</i></td> <td>Use the time frame from the calling job of the type NET (default).</td> </tr> <tr> <td><i>checked</i></td> <td>Use the time frame defined for the subnetwork itself.</td> </tr> </table> | <i>unchecked</i> | Use the time frame from the calling job of the type NET (default). | <i>checked</i> | Use the time frame defined for the subnetwork itself. | | | |
| <i>unchecked</i> | Use the time frame from the calling job of the type NET (default). | | | | | | | |
| <i>checked</i> | Use the time frame defined for the subnetwork itself. | | | | | | | |
| | | | | | | | | |

| Job Type | Field | Description | |
|---|--|---|--------------------------------------|
| DAT Text File (tabbed page OS Specials) | Submit User ID | The user ID to be used to write a DAT text output file. | |
| | Target Location | (No JCL required) | Generate active JCL only. |
| | | SAM or ISAM file | BS2000 text file. |
| | | LMS library | BS2000 LMS file. |
| | | Natural source | Natural source object. |
| | | Macro Natural source | Natural source object for macro JCL. |
| | | Partitioned data set | z/OS partitioned data set. |
| | | Text file | UNIX or Windows text file. |
| | | z/VSE sublibrary | z/VSE sublibrary member with type. |
| | Target overwrite | This option is available only for some target locations. | |
| Possible check box settings: | | | |
| <i>unchecked</i> | | Append the output to target file. | |
| | <i>checked</i> | Overwrite target file with the output. | |
| Target File | Text file to which the DAT output is to be written. Symbol replacement is possible. Additionally to symbols with activation escape characters, also symbols with submission escape characters are resolved. Both resolutions are performed at submission time. | | |
| Member | The target locations LMS, NAT and PDS also require the definition of a target file member. Symbol replacement is possible. Additionally to symbols with activation escape characters, also symbols with submission escape characters are resolved. Both resolutions are performed at submission time. | | |
| input field/selection box for member type | Additional selection box or input field for z/VSE or BS2000, respectively. BS2000, LMS: The LMS member type. For possible selection options, see the description of the Type field in <i>Fields: Operating System Specials for JCL</i> . z/VSE: Member type of the z/VSE library. | | |
| SAP Job within SAP System (tabbed page SAP Definitions) | System ID | SAP System ID (SID), as required by jexa4S. | |
| | System Number | SAP System Number, as required by jexa4S. | |
| | Client | SAP Client Symbol replacement is possible (except at logon). | |
| | SAP Job | Name of the job in the SAP system. | |
| | Job Count | Job count assigned by the SAP system. This is a read-only field and applies to active (submitted) jobs only. | |

| Job Type | Field | Description |
|--|-------------------------|---|
| | Target Server | SAP Target Server, as required by jexa4S. |
| | SAP User ID | User ID (for the Job) in the SAP system. |
| | Password | Password in the SAP system. The ciphering is to be performed with the jexa4S utility encryptpw. |
| | External User ID | External user for SAP jobs. Default: Submit User ID of the Entire Operations job. |
| SRV Windows Service (tabbed page OS Specials) | Service Name | The internal name of a Windows service. Note: You can obtain the internal name of a Windows service by using the following Windows command line command: <code>sc getkeyname <external-name></code> . |

Defining Operating System Specific Execution Features

➤ To define operating system specific execution features

- In the **Job Master** window, open the tabbed page **OS Specials** shown in the following example of a BS2000 job:

The input fields provided depend on the operating system (here: BS2000) of the execution node.

(The **OS Specials** page is only available if execution features can be specified for the operating system of the selected execution node.)

All operating system specific fields are described in [Fields: Operating System Specific Execution Features](#).

In general, these fields correspond to the operating system specific fields provided for network maintenance.

This section covers the following topics:

▪ [Fields: Operating System Specific Execution Features](#)

Fields: Operating System Specific Execution Features

The operating system specific input fields provided for job execution are described in the following table.

| Operating System | Field | Description |
|------------------|-------------------------|---|
| BS2000 | Default User ID | <p>Valid logon user ID defined for BS2000.</p> <p>Unqualified file and job variable names in this job definition are prefixed with this BS2000 user ID. File and job variable names are not prefixed with the user ID if the name contains the activation escape character in input conditions and End-of-Job actions.</p> <p>See also BS2000: User ID Propagated to Variables and Files.</p> <p>Note: The user ID TSOS can be defined only if the user defining the ID is working under TSOS.</p> |
| | Submit User ID | <p>Jobs in BS2000 are submitted under this user ID by the Entire Operations Monitor.</p> <p>This ID has no meaning for other operating systems.</p> <p>Note: The user ID TSOS can be defined only if the user defining the ID is working under TSOS.</p> <p>In the Monitor standard values/submit user type in the access control system, certain checks of the Submit User ID can be defined. See also the field Submit Security User Type in the section <i>Monitor Defaults</i> in the <i>Administration</i> documentation.</p> <p>If this field is left blank, then the default user ID is inserted at job activation.</p> <p>See also the default setting User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), and the sections Operating System User IDs and Default User ID Determination.</p> |
| | Account Number | <p>Account number to be used for the BS2000 Submit User ID.</p> <p>If you leave this field blank, the account number is taken automatically from the BS2000 JOIN entry (only if the Entire Operations Monitor is under TSOS or under the same user ID as the job).</p> <p>Symbol replacement is performed in this field if the activation escape character is used.</p> |
| | BS2000 Job Class | <p>Valid job class for job submission defined for BS2000.</p> <p>Symbol replacement is performed in this field if the activation escape character is used.</p> |

| Operating System | Field | Description |
|------------------|------------------------|--|
| | Job Priority | <p>If not empty, this job priority is used during submission and overrides a possible setting in the LOGON statement.</p> <p>The default value on the network level is used for new job definitions.</p> |
| | Run Priority | <p>If not empty, this run priority is used during submission and overrides a possible setting in the LOGON statement.</p> <p>The default value on the network level is used for new job definitions.</p> |
| | Share SYSOUT | <p>Make BS2000 SYSOUT file shareable.</p> <p>If you select this check box, the internal temporary SYSOUT file can be accessed from other BS2000 user IDs.</p> |
| | Submit Password | <p>Password for job submission. (Required only for BS2000 password encryption where submit node Entire System Server version is less than Version 3.4.1).</p> |
| | SYSOUT User ID | <p>User ID under which internal SYSOUT files are created by Entire Operations. If you leave this field blank, the Submit User ID is used.</p> <p>See also the default setting User ID Definition described in <i>Defaults for Other Settings</i> in the <i>Administration</i> documentation.</p> |
| | SYSOUT Cat ID | <p>Enter the SYSOUT catalog ID.</p> <p>This is the catalog ID under which internal SYSOUT files are created by Entire Operations. This field is meaningful only if you specify a SYSOUT User ID different from the Submit User ID.</p> |
| | Collect SYSLST | <p>If you select this check box, and if the job contains a SYSLST assignment (like /SYSFILE SYSLST=... or /ASSIGN-SYSLIST TO-FILE=...), the SYSLST output is appended to the SYSOUT collection by Entire Operations. The SYSLST output is then also available in the SYSOUT online display.</p> |
| | Monitor JV | <p>Name of the BS2000 Monitor Job Variable to be used at job submission.</p> <p>If you leave this field blank, Entire Operations generates an internal unique name.</p> |
| | Password | <p>Password for the defined BS2000 Monitor Job Variable.</p> <p>Only alphanumeric passwords are supported.</p> |
| z/OS | Submit User ID | <p>In z/OS, the Entire Operations Monitor starts jobs under this user ID. You can only define this user ID if you are logged on to the executing node with the same user ID.</p> <p>Default: If this field is empty, the user ID from the last Submit User ID change is taken.</p> <p>In the Monitor standard values/job start user type in the access control system, certain checks of the job start user ID can be defined. See also the field Submit Security User Type in the section <i>Monitor Defaults</i> in the <i>Administration</i> documentation.</p> |

| Operating System | Field | Description | |
|------------------|----------------------------------|---|--|
| | | See also the default setting User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), and the sections Operating System User IDs and Default User ID Determination . | |
| UNIX and Windows | Submit User ID | <p>The Entire Operations Monitor sets the user ID of the shell script to this value. The user ID is converted to lower case automatically.</p> <p>In the Monitor standard values/job start user type in the access control system, certain checks of the job start user ID can be defined. See also the field Submit Security User Type in the section <i>Monitor Defaults</i> in the <i>Administration</i> documentation.</p> <p>See also the default setting User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), and the sections Operating System User IDs and Default User ID Determination.</p> | |
| | Use Symbol as SYSOUT Node | Select this check box if you want to use a symbol for the SYSOUT node (see below). | |
| | Submit Group | <p>UNIX: If this field is empty, the user's default UNIX group (from <code>/etc/passwd</code>) is used. Otherwise, this field must contain one of the UNIX groups, which is visible in the output of the UNIX groups command.</p> <p>Windows: You can specify the user's domain in this field.</p> | |
| | SYSOUT Node | <p>Only if SYSOUT is to be copied to BS2000:</p> <p>Node to which internal SYSOUT files are to be copied by Entire Operations. The SYSOUT node must be different from the execution node, and it must be a BS2000 node.</p> <p>You can define the SYSOUT node as a symbol if the Use Symbol as SYSOUT Node option is selected. For details, see Symbols in Node Definitions in the section <i>Symbol Table and Symbol Maintenance</i>.</p> | |
| | SYSOUT Cat ID | <p>Only if SYSOUT is to be copied to BS2000:</p> <p>Catalog ID under which internal SYSOUT files are copied by Entire Operations.</p> | |
| | SYSOUT User ID | <p>Only if the SYSOUT is to be copied to BS2000:</p> <p>User ID under which internal SYSOUT files are copied by Entire Operations.</p> <p>See also the default setting User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), and the sections Operating System User IDs and Default User ID Determination.</p> | |
| | Command Line obligatory | | Possible check box settings: |
| | | <i>checked</i> | The existence of the symbol <code>CMDLINE - job</code> is obligatory. If it is missing or empty, the job is not submitted. See Reserved Symbols for Command Line Parameters in the |

| Operating System | Field | Description |
|------------------|------------------|---|
| | | section <i>Symbol Table and Symbol Maintenance</i> . |
| | <i>unchecked</i> | A command line is not obligatory for the job (default). |

BS2000: User ID Propagated to Variables and Files

The BS2000 user ID specified in the **Default User ID** field of a job master or job active definition is propagated to all job variables and file names linked to an EOJ checking and/or input condition defined for the respective job.

Examples:

| Old Default User ID | New Default User ID | New User ID in Job Variable/File Name |
|-----------------------------|-----------------------------|---|
| No user ID (blank field) | ID - A | ID - A (provided the old user ID is also blank) |
| ID - A | ID - B | ID - B (provided the old user ID is also ID - A) |
| ID - B | No user ID (blank field) | No value changes, the old user ID is retained. |

Restriction:

The ID is not propagated if the job variable or file name contains the job **activation escape character**.

Note: For jobs with the execution node BS2000, the **Default User ID** field on the tabbed page **OS Specials** is protected after a change. If you want to change the ID again, press **Apply** or **OK**.

28

Executing a Job as Dummy or Including Epilog Scripts

- Job Execution as a Dummy Job 288
- Job Execution Including an Epilog Script (UNIX and Windows) 288

Job Execution as a Dummy Job

The execution of a dummy job means that the job is running without job control and without its own action within Entire Operations. Dummy jobs can have an expected run time, which they will be waiting in the system. Dummy jobs will always terminate with the state `o.k.`.

For detailed information on dummy jobs, see [Using a Dummy Job](#).

Job Execution Including an Epilog Script (UNIX and Windows)

You can run an epilog script within the JCL frame of a UNIX or Windows job. The epilog script is called by the frame script and runs after the main script. Usually, the frame script calls the main script directly.

For detailed information on using and defining epilog scripts, see [Reserved Symbol for Epilog Scripts \(UNIX and Windows\)](#) in the section *Symbol Table and Symbol Maintenance*.

29

Using a Dummy Job

- Permanent Dummy Jobs 290
- Temporary Dummy Jobs 290
- Excluding a Job from Actual Execution 291
- Supervision of Running Jobs 292

The execution of a dummy job means that the job is running without job control and without its own action within Entire Operations. A dummy job is directly executed by the prerequisite checking routine. A dummy job always terminates with the state `o.k..`

A dummy job is useful for several reasons:

- Testing the job flow when creating or changing a network.
- Finding erroneous jobs in a chain of concatenated jobs.
- Excluding or including a job from a chain of concatenated jobs without having to change job queues and adapting job definitions.
- Excluding jobs that execute tasks that are not frequently required to avoid overhead, balance workload and improve performance.

Permanent Dummy Jobs

Permanent dummy jobs are declared with the job type **Dummy Job** (`DUM`) in the job master definition.

Permanent dummy jobs execute with the estimated elapsed time, which is defined for the job. This does not block any queues within the Entire Operations Monitor.

Temporary Dummy Jobs

In principle, you can execute any type of job as a temporary dummy job. An active job that fulfills any of the conditions described under *Dummy due to Condition* is always executed as a dummy for a particular run.

Temporary dummy jobs with the job type **Standard Job** (`JOB`) have a master JCL definition (see *Defining and Managing JCL for a Job*).

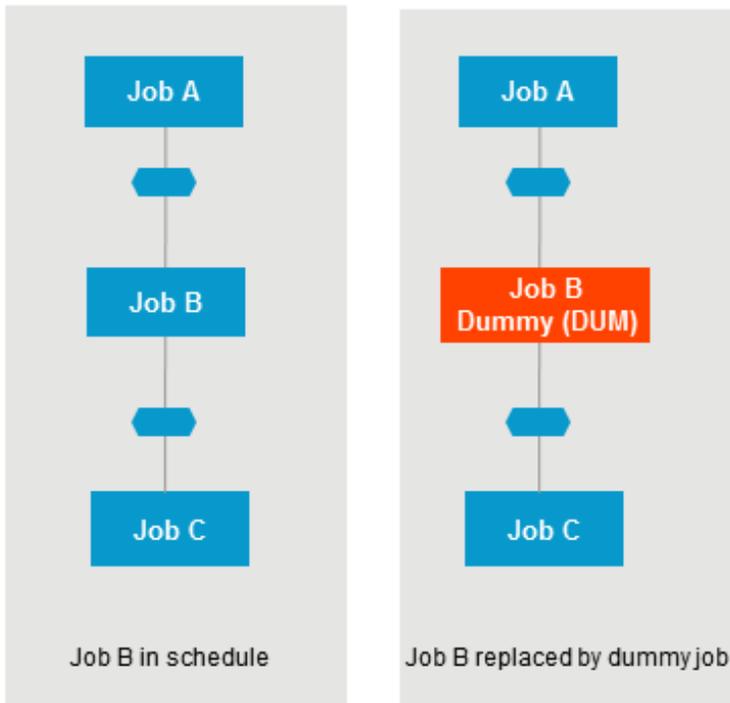

Temporary dummy jobs always have the execution time zero, regardless of which estimated elapsed time is defined for the job.

During its activation or during a prerequisite check, a job can be put into the state `temporary dummy job` for the following reasons:

| Dummy due to Condition | Description |
|------------------------|---|
| Definition | If the special type Execute as dummy (D) is set in the job master definition, the JCL definition can be maintained, but the execution as a dummy job can be forced. |
| Schedule | Depending upon the schedule of the network or upon a calendar, a job can be submitted as a temporary dummy job on particular days. For further information, see <i>Maintaining Schedule Dependencies for a Job</i> . |
| Prerequisite | It can be defined that the existence or non-existence of an active prerequisite results in execution as a temporary dummy job. For further details, see <i>Possible References for Input Conditions</i> . |
| Recovery Action | If a job is not to be submitted again in the case of a defined recovery action. For details, see <i>Defining Recovery Actions</i> . |
| JCL check | Execution of the job control in the mode <i>JCL check</i> . Thus, jobs (see Fields: Job Activation) or Job Networks (see Fields: Network Activation) are activated for the JCL check. |
| Empty JCL | If the loading process of the job control reveals that the JCL is empty, the job is submitted as a temporary dummy job. This state can result from the JCL generation by means of macro instructions, for instance. |
| Multiple Suffixes | If the activation is to take place by means of multiple suffixes: if the multiple-value symbol used does not contain any occurrences, then a dummy job is activated as a placeholder in the network during activation. |

Excluding a Job from Actual Execution

You can exclude a job from actual execution on certain schedule or calendar days without disturbing the job network structure. If a job is not to be activated, it can be converted into a dummy job just for this run. For example:

You can use the **Schedule Dependency** feature to define job activation or input condition usage to be checked only on certain days. In this case, you can execute a job as a dummy job without changing any job definitions.

For information on using the **Schedule Dependency** feature, see [Maintaining Schedule Dependencies for a Job](#) in the section *Schedule Maintenance*.

Supervision of Running Jobs

Running jobs are checked as to whether they have exceeded their predefined deadline time.

If this is the case, a message:

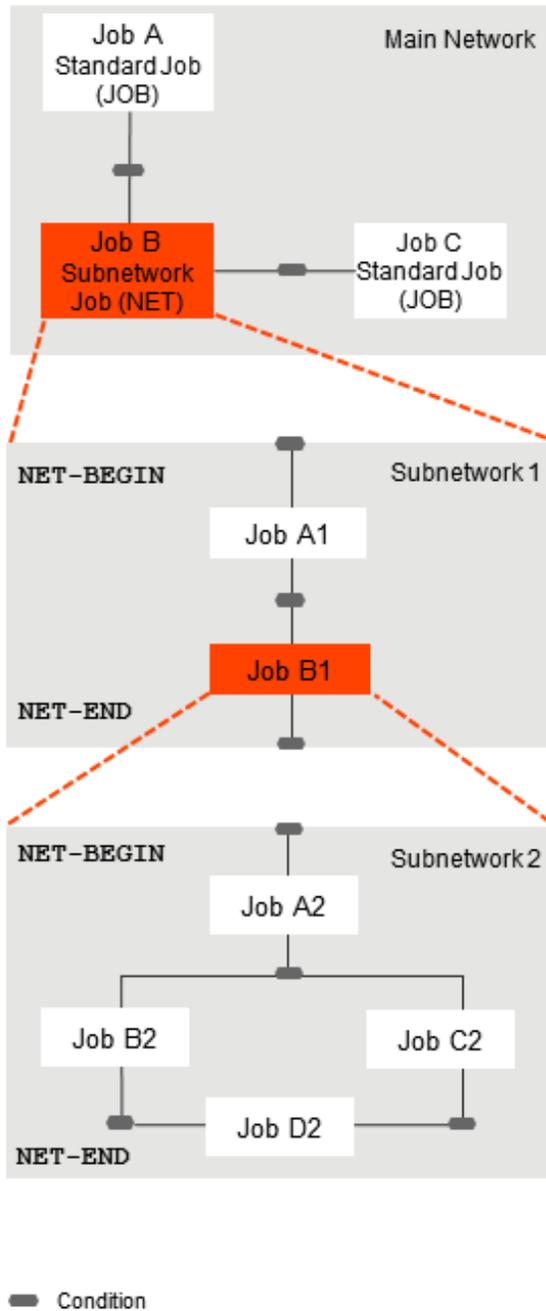

- is sent to all mailboxes linked to the network;
- is written to the log;
- appears in the [List Active Jobs](#), **Active Job List** or **List Active Jobs Job Active** window.

30

Defining a Subnetwork

- Link to the Main Network 295
- Subnetwork Activation and Execution 296
- Restrictions for Subnetworks 297
- Adding or Modifying a Subnetwork Definition 298
- Listing Jobs of a Subnetwork 300

The job type **Subnetwork** (NET) allows you to define a whole network as a job. The subnetwork must already be defined. It must have an input condition `NET-BEGIN` and an output condition `NET-END` as illustrated in the following example:

The same subnetwork can be defined in different jobs of the main network.

The subnetwork can be activated together with the calling network (or job of the type NET) or at the moment the job of the type NET is started.

On activation, each active subnetwork is assigned a unique **run number**.

Link to the Main Network

The following reserved conditions are used to link a subnetwork to a main network and control the connection between the calling NET job and the subnetwork called.

| Reserved Condition | Description |
|--------------------|---|
| NET-BEGIN | You must specify NET-BEGIN to start the subnetwork and run the first job of the subnetwork. |
| NET-END | You must specify NET-END to run the last job of the subnetwork and indicate the end of the subnetwork. |
| NET-END-NOTOK | <p>This condition is optional.</p> <p>If specified and fulfilled during subnetwork termination, the job is treated as ended not ok.</p> <p>If NET-END-NOTOK is specified in the subnetwork but NET-END is missing, the status of the NET job changes to Sub-NW executing - error indicated. In this case, the global message Job ended not ok is sent if the corresponding option is enabled in the Global Messages for Events settings (see the <i>Administration</i> documentation).</p> <p>If NET-END-NOTOK is reset in the subnetwork, the status of the NET job changes back to Subnetwork executing. In this case, the global message mentioned above is sent again.</p> |
| NET-END-OK | <p>This condition is optional.</p> <p>If specified at least once in your subnetwork and fulfilled during subnetwork termination, the NET job (that is, the whole subnetwork) is treated as ended ok.</p> <p>This has an impact on the release of resources, which are allocated on the network level. You can force the resource release by setting this condition. See also the deallocation mode set in the prerequisite resource definition.</p> |

Notes on Subnetwork Usage

1. If the condition NET-END-NOTOK is found together with NET-END, the calling job is set to the status not ok.
2. Jobs of the type NET can use all kinds of prerequisite checks and can have all **kinds of End-of-Job actions**.
3. The scheduling parameters of a job of the type NET are passed on to the subnetwork. See the section *Scheduling a Job*.
4. The calling job of a subnetwork (job of type NET) should have an own symbol table definition.

Subnetwork Activation and Execution

A subnetwork is activated together with the main network. The subnetwork is assigned its own **run numbers**.

If the calling job of the type **Subnetwork** (NET) becomes a temporary dummy job due to any reason, no subnetwork activation is performed (if the subnetwork was not activated already).

Reserved symbols pass information to the jobs of the subnetwork about which job invoked the subnetwork. These symbols are described in *Predefined Symbols for Subnetworks and Recovery Jobs* in the section *Symbol Table and Symbol Maintenance*.

If the subnetwork has a standard symbol table, these values are entered as symbols in the active copy of this table.

This enables you to trace, even through several steps, from where the subnetwork was invoked.

If the job of the type NET can be activated (satisfies all input conditions), the condition NET-BEGIN of the subnetwork is set and the subnetwork starts to work: the NET job is then executing. It remains in this status until the subnetwork has set the condition NET-END. Only at this point are the **End-of-Job checking and actions** performed which are defined in the invoking network.

If an execution error occurs in the subnetwork, the execution of the invoking network is also blocked. If the subnetwork sets the condition NET-END before its actual termination (or at its very start), the invoking network continues to run, and a parallel asynchronous execution of the networks is possible. However, the user him/herself then becomes responsible for later synchronizing the subnetwork with the invoking network.

This section covers the following topics:

Time of Activation of a Subnetwork

Subnetworks can be activated at two different times:

- **After the activation time of the calling network**

The subnetwork is always activated (i.e., with the job type NET) after the calling network has been activated. The time discrepancy depends on the Monitor activation cycle. The subnetwork will be available from this point in time with **run number** and active JCL. This is the default.

- **At the start time (submission) of the calling job of the type NET**

The subnetwork is only activated if the calling job of the type NET is really started. This can prevent a subnetwork from even being activated if the calling job is not executed at all later on. Moreover, the effort for job activations and loading the JCL is thus compensated for, and the waiting-time for prerequisites within the subnetwork is shorter.

The subnetwork activation mode can be defined as follows:

- As a global default value (see **Subnetwork activation mode** in *Defaults for Network Options* in the *Administration* documentation).
- In the definition of the calling job of the type NET (see **Activation mode**).

Symbol Table Activation for Subnetworks

The order of symbol table activation for subnetworks is:

1. Set caller info into the active table (P-C-... symbols).
2. Activate symbol table(s).
3. Perform symbol modification exit.

The order of symbol table activation for subnetworks is the same as for main networks.

Restrictions for Subnetworks

This section covers the following topics:

- [Recursion Checking](#)

- [Maximum Nesting Level](#)

Recursion Checking

Subnetworks can in turn be invoked within subnetworks; however, a subnetwork cannot invoke itself, because this can cause an infinite recursion.

The definition of a network as its own subnetwork is prohibited. If this is attempted, the error message `Recursive Subnetwork Definition prohibited` is issued.

Maximum Nesting Level

The maximal supported nesting level for subnetworks is 5.

Adding or Modifying a Subnetwork Definition

➤ To display or modify a subnetwork definition

- 1 From a **Job Master** node in the object workspace, select a job of the type **Subnetwork** (NET), and choose **Display** or **Open** from the context menu.

Or:

From the table in a **Job Master List** window, select a job of the **Type** NET, and choose **Display** or **Open** from the context menu.

A **Maintenance Job Master window** opens.

- 2 Open the **tabbed page Subnet**.

The fields on the page are described in *[Fields: Job Type Specific Execution Features](#)*.

➤ To add a subnetwork definition

- 1 From the **Job Master window**, select **Subnetwork** from the **Job type** drop-down list box.

The tab **Subnet** appears.

- 2 Open the tabbed page **Subnet** similar to the example below:

OGC - Maintenance Job Master SUBNETJOB1 [SAGTEST.B60-FLOW]

Job name: SUBNETJOB1 Use symbol as execution node

Execution node: 42 QANODE42 (MVS/ESA)

Description: Subnetwork job for subnetwork SAGNETSUB1

Job type: Subnetwork Special type: Normal Job

Main Resources Input Conditions EOJ Checking Scheduling Parameters

User Defined Log Data Long Description Subnet OS Specials

Subnetwork owner: SAGTEST

Subnetwork name: SAGNETSUB1

Subnetwork version:

Activation mode: Use global defaults

Append multiple suffixes

Use subnetwork time frames

Apply OK Cancel Help

- 3 Make your definitions. The input fields available on the page are described in [Fields: Job Type Specific Execution Features](#).
- 4 Choose **OK** when you are finished.

Listing Jobs of a Subnetwork

If a master or active job has the type **NET**, and if the subnetwork is defined properly, you can invoke the master or active job list of the defined subnetwork directly.

If the subnetwork was not defined yet, the subnetwork definition screen is invoked instead.

➤ **To list the jobs of a subnetwork**

- From a **Job Master** or **Job Active** node, select a job of the type **Subnetwork (NET)**, and choose **Zoom Subnetwork** from the context menu.

Or:

From the table in a **Job Master List** or an **Active Job List** window, select a job of the **Type NET**, and choose **Zoom Subnetwork** from the context menu.

The jobs of the subnetwork defined for the selected **NET** job are listed in a (separate) **Job Master List** or **Active Job List** window, as shown in the following example:

| Job | Type | Loc | Spec.Type | Description | File or Library | Member |
|------------|------|-----|-----------|--|--------------------|--------|
| JOB-1 | JOB | NAT | | Where it all starts | SYSEXP | JCLJOB |
| SUBNETJOB2 | NET | | | Subnetwork Job for Subnetwork SAGNETSUB2 | SAGTEST/SAGNETSUB2 | (D) |

31

Defining Parameters for an FTP Job

- Adding an FTP Parameter Definition 302
- JCL Generation for FTP Jobs 304

Jobs of the type [FTP](#) use JCL generated by Entire Operations, depending on the defined FTP (File Transfer Protocol) parameters.

Adding an FTP Parameter Definition

➤ To add or modify the FTP definition for a job

- 1 In the [Maintenance Job Master window](#), select [File Transfer Job](#) from the [Job type drop-down list box](#) and open the tabbed page [FTP Definition](#) similar to the example below:

The screenshot shows a window titled "OGC - Maintenance Job Master MVS-LIN-01 [SN,FTP-001]". The window contains several input fields and a tabbed interface. The "FTP Definition" tab is selected, showing fields for Remote host, User ID, Group, Password, Remote directory, File, File 2 (Target), Local directory, FTP type, Function, and File type. The "Main" tab is also visible, showing fields for Job name, Execution node, Description, Job type, and Special type.

| Field | Value |
|------------------|----------------------|
| Job name | MVS-LIN-01 |
| Execution node | N0148 F-MC (MVS/ESA) |
| Description | MVS -> Linux |
| Job type | File Transfer Job |
| Special type | Normal Job |
| Remote host | pcsn.eur.ad.sag |
| User ID | sag |
| Group | |
| Password | ■■■■■ |
| Remote directory | remdir |
| File | test |
| File 2 (Target) | |
| Local directory | localdir |
| FTP type | |
| Function | reget |
| File type | ASCII |

- 2 Make your definitions.

The input fields are explained in [Fields: FTP Parameter Definition](#).

- 3 When you are finished, choose **OK** to save your entries.

This section covers the following topics:

- Fields: FTP Parameter Definition

Fields: FTP Parameter Definition

The fields on the [FTP Definition page](#) are described in the following table.

| Field | Description |
|-------------------------|--|
| Remote Host | Name of the remote host to be used for the file transfer. Example: host1.company.net Symbols can be used. |
| User ID | User ID for the FTP login on the remote host. Symbols can be used. Note for UNIX: If you use .netrc (on the execution node's host) to specify user IDs and passwords for remote hosts, you may leave this field empty. |
| Account | Account for the FTP login on the remote host. Required for some platforms only. Symbols can be used. |
| Group | Group or domain, respectively, for the FTP login on the remote host. Required for some platforms only. Symbols can be used. |
| Password | Password for the FTP login on the remote host. Note for UNIX: If you use .netrc (on the execution node's host) to specify user IDs and passwords for remote hosts, you may leave this field empty. |
| Remote Directory | Directory on the remote host, which contains (or is the target) of the file(s) to be transferred. Symbols can be used. |
| File | File(s) to be transferred. Symbols can be used. |
| File 2 (Target) | File name for the target (optional). Use this field only if the file is to be renamed on the target machine. Symbols can be used. |

| Field | Description | |
|------------------------|--|-------------------------|
| Local Directory | Directory on the local host (execution node), which contains (or is the target) of the file(s) to be transferred. Symbols can be used. | |
| FTP Type | FTP type set to Standard FTP . | |
| Function | File transfer function to be used. Examples: get, put, mget, mput | |
| File Type | File type. Possible selection options: | |
| | ASCII | ASCII for text files. |
| | binary | Binary for other files. |

JCL Generation for FTP Jobs

Submit User ID

If no **Submit User ID** is defined for a z/OS FTP job, Entire Operations tries to use the network's default **Submit User ID**. If this fails, Entire Operations attempts to use the **execution node's** default **Submit User ID**.

z/OS Job Card

The z/OS job card generation can be done manually by defining the symbol `FTP-JOBC1-jobname`.

A job card continuation can be defined optionally in `FTP-JOBC2-jobname`.

If neither symbol is present, the z/OS job card is generated as

```
//submit-userid JOB ...
```

Site Commands

If the predefined symbols `FTP-SITE1-jobname` and `FTP-SITE2-jobname` are defined, one or two FTP site commands are generated, appended by the contents of these symbols.

FTP Function

If the FTP function is `put`, and if the target file is to be renamed, a sequence of `put` (with the origin name) and `rename` is generated now.

FTP Parameters

The FTP parameter generation can be done manually by defining the symbol `FTP-PARM1-jobname`.

The default is:

| | |
|--------------------|---------------|
| For z/OS: | "-e -i -v -n" |
| For UNIX, Windows: | "-d -i -v -n" |

See also [Predefined Symbols](#) in the section *Symbol Table and Symbol Maintenance*.

32

Defining and Managing JCL for a Job

| | |
|--|-----|
| ▪ Using Job Control in Entire Operations | 308 |
| ▪ Dynamic JCL Generation (JCL Location MAC) | 309 |
| ▪ Job Control for Jobs under BS2000 | 314 |
| ▪ Job Control for Jobs under UNIX | 314 |
| ▪ Job Control for Jobs under Windows | 314 |
| ▪ Defining Master JCL for a Job | 318 |
| ▪ Displaying Master JCL | 321 |
| ▪ JCL Locations | 322 |
| ▪ Defining Operating System Dependent JCL Specifications | 326 |
| ▪ Handling JCL during Job Submission | 327 |
| ▪ Symbol Replacement in JCL | 330 |
| ▪ Pregenerating Active JCL | 330 |

A job needs job control language (JCL) instructions to perform a task. The required JCL is contained in the JCL member of a library/file of the operating system, or in a Natural object contained in a Natural library/system file.

This section provides information on defining JCL for a job master and editing the JCL source referenced by a job.

Note: FTP jobs do not have a standard JCL definition. They have an [FTP parameter definition](#) instead.

Related Topics:

- [Editing Master JCL and Natural Sources](#)
- [Regenerating Active JCL](#) in the section *Active Job Networks*

Using Job Control in Entire Operations

Entire Operations handles JCL as follows:

- **Job Master Control**
Entire Operations used JCL in its original format on the original storage medium. The usual JCL storage locations of the various operating systems are supported. The source texts for [dynamic JCL generation](#) are also considered job master control.
- **Active Job Control**
Entire Operations used the actual JCL submitted to the operating system for execution. It is produced from the master JCL when the job or network is activated. The symbols are replaced with values from the active symbol table. If it is [dynamic JCL](#), the generation is performed at this time. The active JCL is stored in the active Entire Operations database.
- **Pregenerated Active Job Control**
For reasons of performance, it might be necessary to generate active JCL in advance. See also [Pregenerating Active JCL](#).

JCL must be pregenerated again when:

- The definition of the master JCL storage has been modified;
 - The master JCL has been edited;
 - The corresponding symbol table has been modified.
- **Submitted Job Control - Header Information**
Entire Operations inserts a header with Entire Operations environment information as a comment into the submitted JCL.

For UNIX, the header is inserted into the frame script.

For Windows, the header is inserted into the frame BAT file.

■ Submitted Job Control - Environment Variables for UNIX and Windows

The generated and submitted JCL frame script (UNIX) or frame BAT file (Windows) can contain predefined symbols provided as environment variables. For details, see [Reserved Symbols for UNIX and Windows Environment Variables](#) in the section *User Exits*.

Dynamic JCL Generation (JCL Location MAC)

When defining a job within a network, you can specify that its JCL is to be generated dynamically either at job activation time or at job submission time.

Dynamic JCL generation is achieved by using the Entire Operations edit macro function. The text strings contained in the JCL can contain **escape characters** (see [Symbol Escape Characters](#)) followed by variables that are replaced by their current values during dynamic generation.

These current values are taken from a **symbol table** which must contain the current values to be substituted. The symbol table to be used can be determined by choosing the **Usable Symbol Tables** function from the context menu of a network or job node (see [Listing Usable Symbol Tables](#)).

If any symbol specified in the dynamic JCL is not found in the symbol table defined for the job, the symbol is searched for in the symbol table next in the search hierarchy for symbol tables (see [Symbol Table Types and Symbol Search Order](#)).

Additionally, Entire Operations passes **predefined symbols** from the parameter section to the dynamically generated program, such as job owner, network name, current job name and original scheduling date. The same applies to Natural system variables such as *DATE, *TIME and *USER. As these parameters can be replaced in any part of the JCL, different JCL configurations can be generated depending on time, date, user ID etc.

Entire Operations provides dynamic JCL generation for all supported operating systems (z/OS, z/VSE, BS2000, UNIX and Windows) as shown in the following examples.

This section covers the following topics:

- [Example 1: Dynamic JCL in a z/OS Environment](#)
- [Example 2: Dynamic JCL in a BS2000 Environment](#)
- [Example 3: Dynamic JCL in a UNIX Environment](#)

Related Topics:

- [Handling Macro Sources for Dynamic JCL Generation](#)

Example 1: Dynamic JCL in a z/OS Environment

The following is the symbol table specified for the macro program:

| Symbol Name | Current Value |
|-------------|----------------|
| STEPLIB | SN.SYSF.SOURCE |
| CLASS | G |

The variable from the parameter section is assumed to have the following value:

| | |
|---------|------|
| P-OWNER | NET1 |
|---------|------|

The system variables are assumed to have the following values:

| | |
|------------|----------|
| *TPSYS | COMPLETE |
| *DEVICE | BATCH |
| *INIT-USER | SN |

The following is a macro Natural program including a parameter section and JCL with the escape character (#) followed by variable names from the symbol table:

```
# DEFINE DATA PARAMETER USING NOPXPL-A
# LOCAL /* MUST BE CODED
# END-DEFINE
//SNMAC4 JOB ,#P-OWNER,MSGCLASS=X,CLASS=#CLASS //STEP01 EXEC
PGM=NOPCONTI,PARM='C0004' //STEPLIB DD DISP=SHR,DSN=#STEPLIB
/* DEVICE: *DEVICE, INIT-USER: *INIT-USER /* TPSYS: *TPSYS
# IF CLASS = 'G'
/* THE MSGCLASS IS REALLY 'G'
# ELSE
/* ANOTHER MSG-CLASS FOUND
# END-IF
/*
```

The resulting dynamically generated JCL will be:

```
//SNMAC4 JOB ,NET1,MSGCLASS=X,CLASS=G
//STEP01 EXEC PGM=NOPCONTI,PARM='C0004' //STEPLIB DD
DISP=SHR,DSN=SN.SYSF.SOURCE /* DEVICE: BATCH, INIT-USER: SN
/* TPSYS: COMPLETE
/* THE MSGCLASS IS REALLY 'G'
/*
```

Example 2: Dynamic JCL in a BS2000 Environment

The fields taken from the DB-INFO view are assumed to have the following values after the FIND statement:

| Field | Value |
|---------|---------|
| NUCLEUS | 055 |
| LP1 | 1000 |
| NU1 | 100 |
| ACCOUNT | EXAMPLE |
| NH1 | 4000 |
| MSG | FHL |
| VERSION | 524 |

The variables taken from the parameter section have the following current values:

| Variable | Value |
|------------------|--------|
| P-OWNER | OS |
| P-JOB | NUC055 |
| P-EXECUTION-NODE | 055 |

No symbol table was defined for this example job.

The following is the example JCL written using the edit macro function, including variables to be substituted from the DB-INFO view and the parameter section. Variables are preceded by the escape character (#):

```
# DEFINE DATA PARAMETER USING NOPXPL-A
# 1 L-JOB
# 1 REDEFINE L-JOB
# 2 L-JOB-A (A3)
# 2 L-JOB-NUC (N3)
# LOCAL /* LOCAL VARIABLES START HERE
# 1 DB-INFO VIEW OF DB-INFO
# 2 NUCLEUS
# 2 LP1
# 2 NU1
# 2 ACCOUNT
# 2 NH1
# 2 MSG
# 2 VERSION /* E.G. 524
# 1 LWP (N7)
# 1 NUC (N3)
# 1 SPOOL (A10) INIT <'NOSPOOL'>
# END-DEFINE
```

```
# *
# MOVE P-JOB TO L-JOB-A
# MOVE P-EXECUTION-NODE TO NUC
# F1. FIND DB-INFO WITH NUCLEUS = NUC
/.NUC NUC LOGON #P-OWNER,#ACCOUNT
/OPTION MSG=#MSG
/REMARK
/REMARK  NUCLEUS #NUC
/REMARK
/SYSFILE  SYSLST = NUC NUC..LST.NUC
/SYSFILE  SYSDTA = SYSCMD
/FILE  ADA VERSION..MOD, LINK=DDLIB
/FILE  *DUMMY, LINK=DDLOG
/FILE  *DUMMY, LINK=DDSIBA
/FILE  ADA NUC..ASSO, LINK=DDASSOR1, SHARUPD=YES
/FILE  ADA NUC..DATA, LINK=DDDATAR1, SHARUPD=YES
/FILE  ADA NUC..WORK, LINK=DDWORKR1, SHARUPD=YES
/EXEC  (ADARUN, ADA VERSION..MOD)
# COMPUTE LWP = F1.LP1 * (F1.NU1 + 100)
ADARUN PROG=ADANUC, LP=F1.LP1, LU=65535, LWP=#LWP ADARUN
DB=#NUC, NU=#NU1, NC=20, TT=600, TNAE=1800 ADARUN NH= NH1
/SYSFILE  SYSLST = (PRIMARY)
/SYSFILE  SYSDTA = (PRIMARY)
/SYSFILE  SYSOUT = (PRIMARY)
/LOGOFF  SPOOL
# END-FIND
```

The resulting dynamically generated JCL will be:

```
/.NUC055 LOGON OS, EXAMPLE
/OPTION MSG=FHL
/REMARK
/REMARK  NUCLEUS 055
/REMARK
/SYSFILE  SYSLST = NUC055.LST.NUC
/SYSFILE  SYSDTA = SYSCMD
/FILE  ADA524.MOD, LINK=DDLIB
/FILE  *DUMMY, LINK=DDLOG
/FILE  *DUMMY, LINK=DDSIBA
/FILE  ADA055.ASSO, LINK=DDASSOR1, SHARUPD=YES
/FILE  ADA055.DATA, LINK=DDDATAR1, SHARUPD=YES
/FILE  ADA055.WORK, LINK=DDWORKR1, SHARUPD=YES
/EXEC  (ADARUN, ADA524.MOD)
ADARUN PROG=ADANUC, LP=1000, LU=65535, LWP=200000 ADARUN
DB=055, NU=100, NC=20, TT=600, TNAE=1800 ADARUN NH=4000
/SYSFILE  SYSLST = (PRIMARY)
/SYSFILE  SYSDTA = (PRIMARY)
/SYSFILE  SYSOUT = (PRIMARY)
/LOGOFF  NOSPOOL
```

Note: Any JCL generated at activation time using the macro language can be modified by the user until the job is actually submitted. Of course this modification is valid only for the current network run.

Example 3: Dynamic JCL in a UNIX Environment

The following example illustrates dynamic symbol replacement within a Bourne shell script (escape character \$):

```
#
# Bourne shell script for checking the number of users
# entered in /etc/passwd.
# If more than $USER-LIMIT entries appear,
# the script will be ended with exit 1.
#
#!/bin/sh
set -x
USER_COUNT='wc -l < /etc/passwd'
echo Number of users on node 'hostname' : $USER_COUNT
if test $USER_COUNT -gt $USER-LIMIT
then
    echo USER_COUNT_WARN
    exit 1
else
    echo USER_COUNT_OK
fi
```

The symbol table to be used should appear as follows:

| Symbol Name | Current Value |
|-------------|---------------|
| USER-LIMIT | 100 |

The result is the following executable shell script:

```
#
# Bourne shell script for checking the number of users
# entered in /etc/passwd.
# If more than 100 entries appear,
# the script will be ended with exit 1.
#
#!/bin/sh
set -x
USER_COUNT='wc -l < /etc/passwd'
echo Number of users on node 'hostname' : $USER_COUNT
if test $USER_COUNT -gt 100
then
    echo USER_COUNT_WARN
    exit 1
else
```

```
echo USER_COUNT_OK  
fi
```

Note: Any JCL generated at activation time using the macro language can be modified by the user until the job is actually submitted. Of course this modification is valid only for the current network run.

Job Control for Jobs under BS2000

This section covers the following topics:

- [Naming Conventions for Work Files](#)
- [User Exit for Work File Names](#)

Naming Conventions for Work Files

The name generation for work files under BS2000 is described in the section *Naming Conventions for Work Files* of the *Installation and Setup* documentation.

User Exit for Work File Names

Names of BS2000 work files can also be generated via an exit (see [Generating SYSOUT File Names for BS2000](#) in the section [API Routines](#)).

Job Control for Jobs under UNIX

The environment variable \$EOR_WORK of Entire System Server/UNIX contains the name of the Entire Operations work directory. Within this directory, the work files are hierarchically stored.

Job Control for Jobs under Windows

This section covers the following topics:

- [Job Control Characteristics under Windows](#)
- [Components Required](#)
- [Executing Operating System Functions](#)
- [File Names](#)
- [SYSOUT Redirection](#)
- [Entire Operations Work Directory](#)
- [Environment Variables](#)

- Job Control (JCL)
- Job Start and Job Control
- End-of-Job Check
- End-of-Job Actions

Job Control Characteristics under Windows

The job control system Entire Operations also runs in a Windows environment, with the following characteristics:

- Operating system neutral modeling of job networks.
- Entire Operations functionality and flexibility is also transparently available on Windows.
- Support of DOS batch files and executables (EXE).
- It is not necessary to directly enter Windows DOS commands.
- Can also run in mixed mainframe/Windows/UNIX environments.
- Job control on several Windows machines at the same time.

Components Required

■ **Entire Operations Monitor**

The Monitor can run under the operating systems BS2000, z/OS, z/VSE or UNIX, concurrently controlling jobs executed under BS2000, z/OS, z/VSE and UNIX.

■ **Entire System Server - For Mainframes, UNIX and Windows**

Required to access mainframe, UNIX or Windows operating systems.

On every machine to be controlled, an Entire System Server/Windows server has to be installed. This is installed as a Windows service and is administrated with the Windows services administration.

■ **Entire Net-work/EntireX Broker**

Used as the transport layer.

Executing Operating System Functions

For executing operating system functions, there is a server of type Entire System Server/Windows on each Windows node. This server runs as a background Windows process.

The Entire Operations Monitor and the Entire Operations online application use the following components for server communication:

- The System Automation Tools (SAT) communication layer
- The EntireX Broker for transmitting client/server requests
- Entire Net-work as the transport layer
- Up to 740 Windows nodes can be served concurrently

File Names

As there is no backslash (\) available on mainframes, Windows file names can be written with a slash (/) as an alternative as well if the character sequence +F+ directly precedes the file name. This applies to file names within JCL as well.

Example:

| | |
|----------------------------|-----------------------|
| Original Windows | c:\jcl\script1.bat |
| Alternative representation | +F+c:/jcl/script1.bat |

SYSOUT Redirection

From the Entire Operations Monitor, all jobs are started which redirect their output to a file. The SYSOUT files are stored in the Entire Operations work directory. If the job is repeated, the old SYSOUT file is renamed.

Entire Operations Work Directory

The Entire System Server/Windows environment variable %EOR_WORK% contains the name of the Entire Operations work directory. Within this directory, the work files are stored hierarchically.

The name generation for work files under BS2000 is described in *Naming Conventions for Work Files Created by Entire Operations, Windows* in the section *Installing Entire Operations on Mainframes* in the *Installation and Setup* documentation.

The name of the work directory for an active network is available in the predefined symbol [P-NADIR](#). You may store application-specific work files there, provided there are no naming conflicts with files created by Entire Operations.

Work files created by Entire Operations or by the application are deleted by the Entire Operations Monitor on network or job deactivation.

Environment Variables

You can use Windows environment variables freely within file names. This corresponds to the behavior of BAT files. You can combine environment variables and variables from symbol tables.

Job Control (JCL)

The Windows JCL can be stored in any place. Among other places, it can be stored in Natural text objects or in mainframe files. Symbol replacement and JCL generation (jobs with JCL location MAC) are available.

Job Start and Job Control

The Entire Operations Monitor starts jobs based on conditions and on time. **Accounting data** is retrieved and stored. You can manually cancel the job from the online environment.

End-of-Job Check

Entire Operations adds some echo commands to the Windows job control. This allows control of certain messages in the SYSOUT:

- Starting and ending message with timestamp
- Elapsed job time

These messages are used to check whether a job did run completely. Additionally, **accounting information** is retrieved. For checking the job, strings can be searched for in SYSOUT and End-of-Job check routines can be used.

End-of-Job Actions

You can send messages (for example by e-mail) to other users from the Windows node. In the Windows node definition, a program for sending mail can be defined. It is required that this program can be started from the DOS command prompt. One example for such a program is the shareware wsendmail. All other forms of news broadcasting, such as the Entire Operations Mailbox, can still be used.

You can define printing of files and of SYSOUT lists as an End-of-Job action. For each Windows node, a Windows print command with a variable for the file name can be defined. User exits can help start further actions.

Defining Master JCL for a Job

> To define master JCL for a Job

- 1 In the **Maintenance Job Master window**, open the tabbed page **JCL Definition**:

The screenshot shows a window titled "OGC - Maintenance Job Master TEST-JOB [SAGTEST,SAGNET]". The window has several tabs: "Scheduling Parameters", "User Defined Log Data", "Long Description", "OS Specials", "Main", "Resources", "Input Conditions", "EOJ Checking", and "JCL Definition". The "JCL Definition" tab is active. The form contains the following fields and controls:

- Job name: TEST-JOB
- Execution node: 42 QANODE42 (MVS/ESA)
- Description: Job for JCL Test
- Job type: Standard Job
- Special type: Normal Job
- Use symbol as JCL node:
- JCL node: 42 QANODE42 (MVS/ESA)
- JCL load mode: At activation
- JCL location: Macro Natural source
- File/Natlib: SYSEORU
- Member: E51-M01
- Password: (empty)
- OS Specials: JCL user ID: (empty)

Buttons at the bottom include Apply, OK, Cancel, and Help.

- 2 Make your definitions. The input fields and special functions available are explained in *Fields: Master JCL Definition* and *Functions: Master JCL Definition*.
- 3 Choose **OK** to save your definitions.

If you want to edit the defined JCL, proceed as described in [Editing Master JCL and Natural Sources](#).

This section covers the following topics:

- [Fields: Master JCL Definition](#)
- [Functions: Master JCL Definition](#)

Fields: Master JCL Definition

The fields on the [JCL Definition](#) page are described in the following table:

| Field | Description | | | |
|-------------------------------|--|----------------------|--|----------------------|
| Use symbol as JCL node | Select this check box if you want to use a symbol for a JCL node (see below). | | | |
| JCL Location | Type of JCL storage location. For selection options, see JCL Locations . In a network definition, this field serves as a default for the entire network. See also Fields: Network Definition in the section <i>Network Maintenance</i> . | | | |
| JCL Node | JCL for the job is read from this node. The job is started on the execution node . The default is the value specified in the job network definition (see Fields: Network Definition), which can be overwritten here. You can define the JCL node as a symbol if the Use symbol as JCL node option is marked. For details, see Symbols in Node Definitions in the section <i>Symbol Table and Symbol Maintenance</i> . | | | |
| JCL Load Mode | Possible selection options: | | | |
| | <table border="1"> <tbody> <tr> <td>At activation</td> <td>Load JCL at activation time (default).</td> </tr> <tr> <td>At submission</td> <td>Load JCL at submission time. Use this only if prerequisites for JCL are not available at activation time. Note: 1. JCL load errors are detected very late. 2. Network execution may slow down, because of the time necessary for JCL load before submission. 3. JCL pregeneration also works with submission time JCL load. 4. If resources are defined, they are allocated before JCL load at submission time. If the JCL load fails, the allocated resources are freed immediately.</td> </tr> </tbody> </table> | At activation | Load JCL at activation time (default). | At submission |
| At activation | Load JCL at activation time (default). | | | |
| At submission | Load JCL at submission time. Use this only if prerequisites for JCL are not available at activation time. Note: 1. JCL load errors are detected very late. 2. Network execution may slow down, because of the time necessary for JCL load before submission. 3. JCL pregeneration also works with submission time JCL load. 4. If resources are defined, they are allocated before JCL load at submission time. If the JCL load fails, the allocated resources are freed immediately. | | | |

| Field | Description |
|--------------------|---|
| | <p>5. JCL loading at submission time is mainly intended to allow the generation of macro JCL as late as possible.</p> <p>6. For other types of JCL, we still recommend submission time symbol replacement, which causes less system overhead.</p> |
| File/Natlib | <p>Storage type of the JCL corresponding to the job type.</p> <p>For Natural programs and dynamic JCL (storage location NAT): the Natural library where the program or the variable JCL resides. The Natural library must reside in the FUSER system file and must not have the same name as the SYSEOR system library.</p> <p>For z/VSE: library and sub-library associated by a period (.).</p> <p>For all others: the file name.</p> <p>You can select the required library or file from the drop-down list box.</p> <p>For BS2000: The default pubset is stripped from the file name prior to storing it. This allows easier migration to another default pubset.</p> <p>For UNIX: Be aware of upper and lower case. You may use environment variables and symbols within names.</p> <p>Symbols may be used. If a JCL file contains the activation escape character (see <i>Escape Characters</i>), symbol replacement is performed:</p> <ul style="list-style-type: none"> ■ When editing JCL (temporary, using the master symbol table); ■ When loading JCL (permanently, using the active symbol table). <p>For detailed information, see the section <i>Symbol Table and Symbol Maintenance</i>.</p> |
| Member | <p>Name of the Natural object or library/file member of the operating system that contains the JCL.</p> <p>This applies to all JCL locations which support members: see <i>List of JCL Locations</i>. This field cannot be used and is protected for other JCL locations.</p> <p>When you add a new job definition, the name of the job is entered in this field by default.</p> <p>You can select the required member from the drop-down list box.</p> <p>New Members: You can also enter the name of a non-existing member if, for example, no JCL has yet been defined for the job. Entire Operations accepts the member name assuming a member with this name will be created.</p> <p>Before activating a network and before starting a job, Entire Operations checks whether a member has been defined. If there is no member, an error message is issued.</p> |

| Field | Description |
|--------------------|--|
| | <p>Symbols may be used. If a JCL file contains the activation escape character (see <i>Escape Characters</i>), symbol replacement is performed:</p> <ul style="list-style-type: none"> ■ When editing JCL (temporary, using the master symbol table); ■ When loading JCL (permanently, using the active symbol table). <p>For detailed information, see the section <i>Symbol Table and Symbol Maintenance</i>.</p> <p>Note for BS2000:</p> <p>JCL location PRC (Callable procedure): If no member is specified, the JCL file must be a BS2000 sequential file.</p> |
| VolSer | <p>Volume serial of the file.</p> <p>Only required if the file has not been cataloged (z/OS only).</p> |
| Password | The file password if the file has been protected by a password. |
| OS Specials | Operating system-dependent input fields: see <i>Fields: Operating System Specials for JCL</i> . |

Functions: Master JCL Definition

The following special function is available on the [JCL Definition page](#):

| Function | Description |
|-------------|--|
| Edit | <p>Opens the editor for the source entered in the Member field or the file entered in the File/Natlib field depending on the specified JCL location.</p> <p>This command is only available if you are authorized to edit the specified source and if the Apply and OK buttons are disabled in the window.</p> <p>This command corresponds to the Edit Master JCL or Edit Active JCL function available from the context menu of a selected job instance.</p> <p>See also <i>Editing Master JCL and Natural Sources</i>.</p> |

Displaying Master JCL

➤ To display the master JCL source defined for a job

- In the object workspace, select a **Job Master** instance and choose **Browse Master JCL** from the context menu.

A **Browse** window similar to the **Edit window** opens displaying the source of the JCL.

JCL Locations

This section covers the following topics:

- [List of JCL Locations](#)
- [Restrictions for Job Types](#)
- [Location on another Node](#)
- [Replacing Symbols](#)
- [JCL Location PRC: BS2000 Procedure](#)
- [JCL Frames for BS2000 DO Procedures](#)

List of JCL Locations

Entire Operations offers a broad range of possible locations for its original (master) JCL.

The following table describes the physical locations you can select for JCL from the **JCL location** drop-down list box on the [JCL Definition page](#).

The locations NAT (**Natural source**) and MAC (**Macro Natural source**) are available on all operation systems supported by Entire Operations. Other locations are available for individual operating systems only as indicated in the following table:

| JCL Location/Selection Option | Applies to Operating System | Description |
|--|-----------------------------|---|
| <i>blank field</i> (No JCL required) | n/a | None (no JCL required). |
| BS2 SAM or ISAM | BS2000 | SAM or ISAM file. See also BS2000 in <i>Fields: Operating System Specials for JCL</i> . |
| EXE Executable program | UNIX, Windows | Executable, for direct file execution. Not intended for shell scripts or BAT files. You can pass parameters to the executable file with the CMDLINE-job reserved symbol. See Reserved Symbols for Command Line Parameters in the section <i>Symbol Table and Symbol Maintenance</i> . |
| LIB Librarian | z/OS | Librarian. |

| JCL Location/Selection Option | Applies to Operating System | Description |
|------------------------------------|-----------------------------|---|
| LMS LMS library | BS2000 | LMS library. See also BS2000 in <i>Fields: Operating System Specials for JCL</i> . |
| MAC Macro Natural source | all | For macro JCL. A Natural source object is used. |
| NAT Natural source | all | Natural source object. See also Restriction for Job Types . |
| PDS Partitioned data set | z/OS | Member of a partitioned data set. See also Restriction for Job Types . |
| PRC Callable procedure | BS2000 | BS2000 procedure. See JCL Location PRC: BS2000 Procedure for more information. |
| RDR z/VSE reader queue | z/VSE | z/VSE reader queue for job type STC (Started Task) . |
| VSE z/VSE sublibrary | z/VSE | z/VSE member in z/VSE sublibrary. |
| TXT Text file | UNIX, Windows | Text file. See also UNIX and Windows in <i>Fields: Operating System Specials for JCL</i> . |

Restrictions for Job Types

- Jobs of the type [STC \(Started Task\)](#) must have the location [PDS \(Partitioned data set\)](#) on z/OS.
- Jobs of the type [NAT \(Natural Program\)](#) must have the location [NAT \(Natural source\)](#).
- Jobs of the type [DUM \(Dummy Job\)](#) must not have any JCL location.
- Jobs of the type [FTP \(File Transfer Job\)](#) do not require a JCL location. Entire Operations generates the FTP JCL itself, depending on the FTP parameters defined on the [FTP Definition page](#).

During definition, it is checked whether the defined JCL exists at all. If the JCL cannot be found, a warning appears in the Job JCL Definition (Master) window.

Location on another Node

The JCL can be saved on another machine, not identical with the executing machine and even on another operating system, not identical with the executing operating system.

Replacing Symbols

In all JCL locations, you can easily replace symbols as described in [Symbol Replacement](#) in the section *Symbol Table and Symbol Maintenance*.

JCL Location PRC: BS2000 Procedure

If this location has been defined, Entire Operations generates a BS2000 ENTER job in the active JCL calling this procedure.

The following rules are applied:

- If no JCL member is specified, the JCL file must be a BS2000 sequential file. If a JCL member is specified, the JCL file must be a BS2000 LMS library.
- The BS2000 job name adopts the Entire Operations job name and if it is longer than 8 characters, it cuts the name to 8 characters.
- SDF statements (CALL-PROC) are used.
- The symbol table for which the job has been defined must contain all parameters of the BS2000 procedure. The symbol values are used for calling the BS2000 procedure.
- Positional and keyword parameters are supported.
- Numbers and names of the parameters are automatically retrieved from the procedure (PROC / BEGIN-PROC statement).
- The generated CALL-PROCEDURE statement has the parameter LOGGING=*YES.
- BS2000 job submissions are performed with the generated line /MODIFY-SDF-OPTIONS CONTINUATION=*NEW-MODE.

JCL Frames for BS2000 DO Procedures

For BS2000 procedures, a user-defined JCL frame can be used. It must be saved under the name PRCFRAME in the library SYSEORU. If PRCFRAME is not found in SYSEORU (or in SYSEOR, for compatibility), Entire Operations generates a standard frame.

Special Commands

| Command | Description |
|---|---|
| #ESC - FRAME <i>escape-character</i> | Defines the escape character the JCL frame uses to replace symbols. This command must be at the top and is compulsory. |
| #CALL - PROC | <p>The procedure call (/CALL - PROC) is generated here.</p> <p>Adding User-Defined Parameters to the /CALL-PROC Statement</p> <p>It is possible to add user-defined parameters to the CALL - PROC statement in the PRCFRAME text object. The following applies:</p> <ul style="list-style-type: none"> ■ The #CALL - PROC line must look like #CALL - PROC -. The minus sign (-) indicates a continuation. In the generated JCL, it will be placed in column 72. ■ The user-defined continuation(s) follow the #CALL - PROC line. They must begin with the following characters: / , . <p>Example:</p> <pre>#CALL - PROC - / , LOGGING=YES</pre> |

Example of PRCFRAME Contents

```
#ESC - FRAME $
/.SN$P-RUN LOGON SN,1
/REMARK === PRC FRAME EXAMPLE
/REMARK $AAAA YYYYYYYYYYYYYY
#CALL - PROC
/STA L
$BBBB
/LOGOFF
```

Notes:

1. All symbols used in the JCL frame must be contained in the active symbol table of the job. The active symbol table must continue to contain all symbols for calling the procedure.
2. If a symbol does not exist, job activation is discontinued.

Defining Operating System Dependent JCL Specifications

Some operating systems or JCL locations may require some additional definitions.

➤ **To define JCL parameters specific to an operating system**

- **On the JCL Definition page**, enter valid values in the input fields provided for the relevant operating system in the **OS Specials** section.

The fields contained in the window are explained in *Fields: Operating System Specials for JCL*.

This section covers the following topics:

- [Fields: Operating System Specials for JCL](#)

Fields: Operating System Specials for JCL

The operating system specific input fields provided in the **OS Specials** section of the **JCL Definition page** are described in the following table.

| Operating System | Field | Description |
|------------------|-----------------|---|
| BS2000 | Default User ID | Valid logon user ID defined for BS2000. This ID has no meaning for other operating systems. Unqualified file and job variable names in this job definition are prefixed with this BS2000 user ID. Note: The user ID TSOS can be defined only if the user defining the ID is working under TSOS. See also the default setting User ID Definition described in <i>Defaults for Other Settings</i> in the <i>Administration</i> documentation. |
| | JCL User ID | If this field is not empty, the JCL is loaded under the rights of this BS2000 user ID and may be overridden by specific definitions. TSOS may only be defined, if the defining user is working under TSOS. Default: If this field is left blank, the user ID from the fully qualified JCL file name is used as JCL User ID . See also the default setting of User ID Definition (<i>Defaults for Other Settings, Administration</i> documentation), and the sections Operating System User IDs and Default User ID Determination . |

Handling JCL during Job Submission

This section covers the following topics:

- [JCL Modifications during Submission](#)
- [Notes about the JCL Header Generation](#)
- [Trigraph Encoding for JCL Submission on UNIX and Windows](#)

JCL Modifications during Submission

Jobs defined and scheduled in Entire Operations are submitted automatically under the control of the Entire Operations Monitor. During the submission process, the submitted JCL can be handled in any of the following ways:

- Completion or modification of the job JCL according to the Entire Operations defaults;
- Checking of all submitted JCL by a global user exit (to be defined in the Entire Operations defaults);
- Insertion of header information as comments into the submitted JCL. This is always performed. The header information can be viewed in the job SYSOUT as shown in the following example:

```

Job SNNOPLEX (1355) Type SM File 2----- Columns 001 072
====>                                     SCROLL====> CSR
***** ***** top of data *****
00001      1 //NOPE01J1 JOB ,SN,CLASS=G,MSGCLASS=X,MSGLEVEL=(1,1),
00002      // TYPRUN=SCAN
00003      *** $ACFJ219 ACF2 ACTIVE DAEF
00004      *** =====
00005      ***              S O F T W A R E   A G
00006      ***              E N T I R E   O P E R A T I O N S
00007      ***
00008      *** Owner:      SN              Run:              328
00009      *** Network:   SN-2           Symbol Table:    EXAM-ST1
00010      *** Job:      CHECK-TIME     Escape Act:      Sub: $
00011      ***              Submit User ID: SN
00012      ***
00013      *** 29.10.08 15:15 activated          by SN
00014      *** 29.10.08 15:15 created/modified by SN
00015      *** 29.10.08 15:15 submitted
00016      *** =====
00017      *** Symbols replaced at Activation Time:
00018      ***

```

Note: In BS2000, the LOGON statement is checked. If nothing else was specified at job definition, the LOGON parameters, account-number, job-class, monitoring job variable

(with password, if specified) are taken from here. Job priority, run priority and CPU time limit can also be given via LOGON statement.

- Insertion of information about all replaced symbols and their current values if any symbols were replaced. For example:

```

Job SNNPEX (1355) Type SM File 2----- Columns 001 072
====>                                SCROLL====> CSR
00015      *** 29.10.08 15:15 submitted
00016      *** =====
00017      *** Symbols replaced at Activation Time:
00018      ***
00019      *** Symbol   : UID
00020      ***   Owner  : SN   Symbol Table: EXAM-ST1
00021      ***   Modif. : SN   at 22-06-07 12:31
00022      ***   Value  : SN
00023      *** Symbol   : CLASS
00024      ***   Owner  : SN   Symbol Table: EXAM-ST1
00025      ***   Modif. : SN   at 22-06-07 12:32
00026      ***   Value  : G
00027      *** Symbol   : MSGCLASS
00028      ***   Owner  : SN   Symbol Table: EXAM-ST1
00029      ***   Modif. : SN   at 22-06-07 12:32
00030      ***   Value  : X
00031      *** Symbol   : P-EXECUTION-NODE
00032      ***   Value  : 146
00033      *** Symbol   : JOBLIB
    
```

- Replacement of symbols in the JCL with their current values at submission time.
- **For z/OS only:**
If a submission time symbol replacement error occurs, a JCL error is forced to prevent the job from executing. Lines similar to the following force a JCL error:

```
// ##### Entire Operations Symbol Replacement Error #####
```

The job remains in an error status such as the following:

```
JobId 51058 - Symbol Replacement Error
```

End-of-Job processing is not completed, because this is treated as a submission error.

See also [Working with Entire System Server Nodes](#) in the section *Operating System User ID*.

Notes about the JCL Header Generation

1. The **Submit User ID** is always shown.
2. The created/modified user ID is modified only if the job definition or JCL was modified. Activation or re-activation does not count as a modification.

Trigraph Encoding for JCL Submission on UNIX and Windows

Trigraph encoding is used to avoid translation failures during ASCII/EBCDIC text conversion. An ASCII character for which no equivalent EBCDIC character exists is then substituted by a trigraph and the text can be encoded successfully.

Entire Operations uses trigraphs when generating JCL for UNIX and Windows. For Entire System Server execution nodes on UNIX and Windows, trigraph encoding is switched on by default using the question mark (?) as the default escape character.

Switching Trigraph Encoding On and Off

You can switch on and off trigraph encoding in the JCL with the following meta commands:

| | |
|---------------|-----------------------------|
| #EOR-TRIG=YES | Enables trigraph encoding. |
| #EOR-TRIG=NO | Disables trigraph encoding. |

Each meta command must be in a single line as shown in the following example for UNIX and Windows.

Defined JCL:

```
...
echo '??( test ??)'
#EOR-TRIG = OFF
echo '??( test ??)'
#EOR-TRIG = ON
...
```

Submitted JCL:

```
...
echo '[ test ]'
echo '??( test ??)'
...
```

Supported UNIX and Windows Trigraphs

Entire System Server execution nodes on UNIX and Windows support the trigraphs listed in the following table. A trigraph always begins with two escape characters; the table below assumes the question mark (?) to be the default escape character.

| ASCII | Trigraph | Remarks |
|-------|----------|-----------|
| [| ??(| |
| \ | ??/ | |
|] | ??) | |
| ^ | ??' | |
| { | ??< | |
| | ??_ | |
| } | ??> | |
| ~ | ??- | |
| @ | ??% | |
| ` | ??; | |
| ! | ??: | |
| \f | ??+ | Form feed |
| \t | ??& | Tab |

Symbol Replacement in JCL

Symbols for replacement can be defined for all storage locations of master JCL.

Escape characters for symbols can be assigned system-wide, and they can also be defined individually for each job. Defaults for escape characters can be defined for each operating system.

Escape characters for symbol replacement must not conflict with other characters used in the JCL.

For detailed information, see the following sections in *Symbol Table and Symbol Maintenance*:

- [Defining Symbols and Symbol Values](#)
- [Symbol Replacement](#) and [Defining Escape Characters](#)

Pregenerating Active JCL

For performance reasons, it might be necessary to pregenerate active JCL to be used for job submission. This function is conceived mainly for macro jobs, whose **dynamic JCL generation** can become time-consuming, because macro language must always be executed. JCL can also be pregenerated for all other job types.

Note: In the case of a **resubmission of the active job**, the pregenerated JCL is not reloaded if the active JCL of the job has been edited in the meantime.

➤ **To pregenerate active JCL**

- In the object workspace, select a **Job Master** instance and choose **Pre-generate Active JCL** from the context menu.

If no generation errors occur, a message indicates that active JCL is pregenerated for the job.

- [Editing Pregenerated JCL](#)
- [Removing Pregenerated JCL](#)

Related Topic:

- [Regenerating Active JCL](#) in the section *Active Job Networks*

Editing Pregenerated JCL

This function allows editing the pregenerated JCL.

➤ **To edit pregenerated JCL**

- 1 In the object workspace, select a **Job Master** instance for which pregenerated active JCL exists.
- 2 Choose **Edit pre-generated JCL** from the context menu.

An **Edit window** opens where you can change the pregenerated JCL as required.

See also [Editing Master JCL and Natural Sources](#).

Removing Pregenerated JCL

➤ **To remove pregenerated active JCL**

- 1 In the object workspace, select a **Job Master** instance for which pregenerated active JCL exists.
- 2 Invoke the context menu and choose the **Remove pre-generated Active JCL** function.

The message `Pregenerated JCL deleted` indicates that the pregenerated JCL has been removed.

Editing Master JCL and Natural Sources

- General Editing Considerations 334
- UNIX and Windows: Handling of Tab Characters (H'09') within JCL Lines 336
- Starting an Edit Session 337
- Handling Macro Sources for Dynamic JCL Generation 341
- Usage of Text Objects in JCL 347
- Locking of Natural Sources 350

This section provides information on editing JCL and Natural source objects.

By editing the master JCL, you change the master definition that affects each future executed active job.

Before writing the file back, the editor creates a backup copy of the edited file.

Related Topics:

- [Editing Active JCL](#) in the section *Active Job Networks*

General Editing Considerations

This section covers the following topics:

- [Automatic Logon to the Operating System Server](#)
- [Logon to a Node](#)
- [Windows: File Names](#)
- [UNIX and Windows: Text Files](#)
- [UNIX: Usage of Profile Scripts](#)
- [z/OS: JES2 /* ROUTE Statement](#)

Automatic Logon to the Operating System Server

Before JCL is edited, Entire Operations checks whether the user may access the JCL file. If it is an operating system file, then an automatic logon with the defined JCL user ID ([BS2000](#) and [UNIX and Windows](#)) is performed, if required. If this automatic logon fails (e.g., if a password is required), an appropriate message is displayed. In this case, the user must first logon to the corresponding operating system server.

Logon to a Node

While editing the master JCL, an implicit logon is triggered to establish the connection to the required node. The logon is not prompted if you have already logged on to this node within this session.

For further information, see the [logon function](#) described in the section *Using Entire Operations GUI Client*.

Windows: File Names

File names in Windows can be written in an alternative notation if the backslash character (\) is not available, like in mainframe environments. See [File Names in Job Control for Jobs under Windows in the section System Overview](#).

UNIX and Windows: Text Files

If a file to be edited or loaded as JCL is not a text file, the error message `EOR0325 - No Text File` is returned. For JCL loading, this is treated as a permanent error.

UNIX: Usage of Profile Scripts

Entire Operations determines usage of profiles in non-login UNIX scripts (as they are submitted by Entire Operations) during submission of the shell script as described in the following section:

- The Entire Operations Monitor checks whether the symbol `ETC-PROFILE` exists in the symbol table of the active job, or in another symbol table in the standard [symbol search hierarchy](#), up to SYSDBA/A.
 - If the symbol `ETC-PROFILE` is found and if it contains the **value** `Y`, the frame script (`job.current.sh`) sources the profile script(s) executed in the currently running shell (other scripts are not sourced). These scripts are retrieved from `/etc/profile` and `/etc/profile.local`.
 - The user script (`job.current.frame.sh`) locates the environment variables of the profile script being set.
- The Entire Operations Monitor checks whether the symbol `ENV` exists in the symbol table of the active job, or in another symbol table in the standard [symbol search hierarchy](#), up to SYSDBA/A.
 - If the symbol `ENV` is found and contains a **value**, its content is assumed to be a profile script like `$HOME/.profile`.
 - If a profile script exists, its name is assigned to the environment variables `ENV` and `BASH_ENV` by the frame script (`job.current.sh`).
 - The frame script (`job.current.frame.sh`) sources the profile script.
 - The user script (`job.current.sh`) locates the environment variables of the profile script being set.

For more information on `ETC-PROFILE` and `ENV`, see the section [Reserved Symbols for Profile Scripts \(UNIX\)](#).

Notes:

1. Several profile scripts can be sourced sequentially if the symbol `ETC-PROFILE` contains the value `Y` and if the symbol `ENV` contains the name of a profile script.

2. The user is responsible to make the used profile scripts proof against multiple execution, e.g., by using the PROFILEREAD variable like in Linux.

z/OS: JES2 /* ROUTE Statement

If a z/OS JES2 JCL contains a statement

```
/* ROUTE XEQ target
```

the job executes on the *target* target machine.

As long as the SYSOUT is passed back to the submission machine, the running job is not accessible. Entire Operations detects a rerouting, and behaves differently for such jobs.

For rerouted z/OS jobs, some features do not work, for example:

- Direct execution tracking.
- Browsing of SYSOUT while the job is executing.
- Cancelling.

However, if SYSOUT is available again, all End-of-Job checking and End-of-Job actions can be performed.

UNIX and Windows: Handling of Tab Characters (H'09') within JCL Lines

- If a master or active JCL is edited, each tab character is converted to a single blank before the editing. This prevents strange effects during editing. The JCL is written back without tab characters in any case.
- Extended logging, JCL logging: for the extended logging of JCL tab characters are also converted to blanks.
- If Entire Operations is running on a mainframe, the middleware translation tables convert tab characters to blanks anyway. This means that each UNIX and Windows JCL is submitted without tab characters.
- If Entire Operations is running on UNIX or Windows, tab characters remain in master and active JCL, as long as the master or active JCL is not edited from within Entire Operations.

Starting an Edit Session

This section describes how to edit JCL and Natural sources including user exits.

➤ To edit JCL of a standard operating system job or a Natural source

- 1 In the object workspace, select a **Job Master** instance and choose **Edit Master JCL** or **Edit Active JCL** from the context menu.

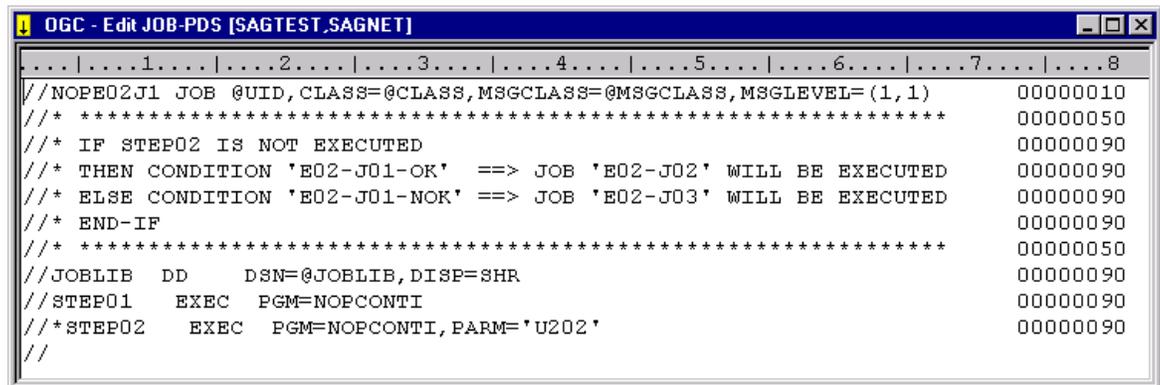

Or:

On the [JCL Definition page](#) in the **Maintenance Job Master** or **Maintenance Job Active** window, choose **Edit** (see also [Functions: Master JCL Definition](#)).

An **Edit** window similar to the following examples opens.

(If the source of the specified JCL member does not yet exist, the **Edit** window is empty.)

- Example of JCL for the [location Partitioned data set \(PDS\)](#):

```

... |...1...|...2...|...3...|...4...|...5...|...6...|...7...|...8
//NOPE02J1 JOB @UID,CLASS=@CLASS,MSGCLASS=@MSGCLASS,MSGLEVEL=(1,1)      00000010
//* *****                                                                    00000050
//* IF STEP02 IS NOT EXECUTED                                             00000090
//* THEN CONDITION 'E02-J01-OK' ==> JOB 'E02-J02' WILL BE EXECUTED      00000090
//* ELSE CONDITION 'E02-J01-NOK' ==> JOB 'E02-J03' WILL BE EXECUTED      00000090
//* END-IF                                                                  00000090
//* *****                                                                    00000050
//JOBLIB DD DSN=@JOBLIB,DISP=SHR                                           00000090
//STEP01 EXEC PGM=NOFCONTI                                                  00000090
//*STEP02 EXEC PGM=NOFCONTI,PARM='U202'                                     00000090
//

```

The example above shows the JCL member NOPE02J1 of the job JOB-PDS.

- Example of JCL for the [location Macro Natural source \(MAC\)](#):

```

@ DEFINE DATA PARAMETER USING NOPXPL-A
@ LOCAL      /* LOCAL VARIABLES START HERE
@ 1 #JOBNAME  (A10)
@ 1 #DATE     (D)
@ 1 #WEEKDAY  (A10)
@ END-DEFINE
@ * -----
@ MOVE P-JOB TO #JOBNAME
@ EXAMINE #JOBNAME FOR '-' DELETE
@ MOVE P-ACTIVATION-TIME TO #DATE
@ MOVE EDITED #DATE (EM=N(10)) TO #WEEKDAY
//EORE51J1 JOB  ,@P-OWNER,MSGCLASS=@MSGCLASS,CLASS=@CLASS
/*
//STEP01 EXEC PGM=NOPCONTI,PARM='C=0000,T=00:00:10'
//STEPLIB DD  DISP=SHR,DSN=@STEPLIB
@ IF #WEEKDAY = 'Wednesday'
/* -- THIS STEP IS EXECUTED ON WEDNESDAYS ONLY --
//WEDNESDY EXEC PGM=NOPCONTI,PARM='C=0004,T=00:10:00'
//STEPLIB DD  DISP=SHR,DSN=@STEPLIB
@ END-IF
/*

```

The example above shows the macro Natural source E51-M01 contained in the Natural library SYSEORU.

For details on using macro sources and special edit functions, see [Handling Macro Sources for Dynamic JCL Generation](#).

- 2 Edit the source as required.

You can use the editor functions provided in the context menu of the **Edit** window (or the toolbar of the **main application window**) to find and change text, navigate in the source or perform special functions for macro sources. See [Available Functions: Edit Window](#) and [Handling Macro Sources for Dynamic JCL Generation](#).

- 3 When you are finished, choose **Save** from the toolbar or **Object** menu to save any changes.

➤ To edit the source of a user exit

- 1 In the object workspace, select a **Job Master** instance and open the **Input Conditions** page.

Select an input condition of the type **Exit**.

Choose **Edit**.

Or:

In the object workspace, select a **Job Master** instance and open the [EOJ Checking page](#).

Select an action user exit (indicated by an **X** in the **Action** column) or a checking user exit and choose **Edit Action Exit** or **Edit User Exit**, respectively.

An **Edit** window similar to the following opens:

```

OGC - Edit BS2EJA01 [SYSEORU]
DEFINE DATA PARAMETER USING NOPXPL-A
LOCAL      /* ... ALL LOCALS SHOULD START WITH 'L-'
1 L-DUMMY          (A1)
1 #USERID          (A8)
1 #DBENV           (A10) CONST <' (THIS) '>
1 #RUN-I4          (I4)
1 #USE-NAT-MSG-CACHE (L)  CONST <FALSE>
1 #LOG-STATUS      (N4)
1 #LOG-MESSAGE     (A70)
END-DEFINE
* -----
WRITE *PROGRAM *TIME
  / '=' P-JOB-ID-10
#USERID := *USER
#RUN-I4 := P-RUN
MOVE 8001 TO #LOG-STATUS
COMPRESS P-CALL-PLACE 'Job Id' P-JOB-ID-10
  INTO #LOG-MESSAGE
CALLNAT 'NOPULW8N'
  #USERID (AD=O) #LOG-STATUS (AD=O) #LOG-MESSAGE (AD=O)
  #DBENV (AD=O)
  P-OWNER (AD=O) P-NETWORK (AD=O) #RUN-I4 (AD=O) P-JOB (AD=O)
  P-JOB-ID-10 (AD=O)
  'NOP' #USE-NAT-MSG-CACHE (AD=O)|
RESET P-RC
MOVE #LOG-MESSAGE TO P-RT
END

```

(If the source of the selected user exit has not yet been created and cataloged, the **Edit** window only contains an incomplete **DEFINE** sample statement.)

- 2 Edit the source as required.

In order to use a user exit, it must be saved and cataloged as a Natural object in a Natural library.

For information on coding action user exits, see also *User Exits for End-of-Job Checking and Actions* in the section *User Exits*.

You can use the editor functions provided in the context menu of the **Edit** window (or the toolbar of the **main application window**) to find and change text, navigate in the source or perform special functions for macro sources. See *Available Functions: Edit Window*.

This section covers the following topics:

- [Available Functions: Edit Window](#)

Available Functions: Edit Window

The following functions are provided from the context menu in an **Edit window** or the toolbar in the **main application window**:

| Function | Shortcut | Description |
|---------------------|--------------|---|
| Undo | CTRL+Z | Undo the last action. |
| Redo | CTRL+Y | Redo the last action. |
| Cut | CTRL+X | Cut the selected text string to the clipboard. |
| Copy | CTRL+C | Copy the selected text string to the clipboard. |
| Paste | CTRL+V | Paste the text string previously cut or copied to the clipboard. |
| Delete | DELETE | Delete the selected text string. |
| Select All | CTRL+A | Select the whole text contained in the Edit window. |
| Upper | CTRL+SHIFT+U | Convert the selected text string to uppercase letters. |
| Lower | CTRL+SHIFT+L | Convert the selected text string to lowercase letters. |
| Find | CTRL+F | Open the Find dialog to enter a search string and specify search options (case-sensitive and/or whole word only) and the search direction backward (scrolls up in the source) or forward (scrolls down in the source). By default, the currently selected text string is entered in the Find dialog. |
| Find Next | F3 | Find the next occurrence of the search string specified in the Find dialog. |
| Replace | CTRL+H | Open the Replace dialog to enter a Find search string and a Replace text string and specify search options and the search directory as described for the Find dialog. By default, the currently selected text string is entered in the Find dialog. |
| Replace Next | CTRL+F3 | Replace the next occurrence of the search string specified in the Replace dialog. |
| Go To | CTRL+G | Open the Go To dialog to place the cursor on the source line entered in the dialog. |

| Function | Shortcut | Description |
|---------------------|----------|--|
| Toggle ruler | CTRL+R | Show or hide a vertical ruler at the top of the editor window as shown in a previous example. If you want to switch on the ruler display by default, set the corresponding option in your user profile: see <i>GUI General</i> in the <i>Administration</i> documentation. |
| Print | CTRL+P | Output the text on a printer. |
| Check | --- | Applies to Natural sources only. Check the syntax of the source. |
| Catalog | --- | Applies to Natural sources only. Catalog the source. |
| Stow | --- | Applies to Natural sources only. Check the syntax and catalog the source. |
| Macro | --- | Applies to macro sources only. See <i>Special Editor Functions for Macro Sources</i> . |
| Test | --- | Applies to macro sources only. See <i>Special Editor Functions for Macro Sources</i> . |

Handling Macro Sources for Dynamic JCL Generation

Jobs with the **JCL location Macro Natural source** (MAC) use the edit macro function of Entire Operations, which allows the use of variables anywhere in the JCL. Dynamic generation of JCL refers to the automatic substitution of these variables with their current values either when the job network is activated or when the job is submitted. The same job can thus have different JCL for different activation.

The **Macro** editor function must be used to generate the final JCL. The **Test** editor function can be used to test the generated JCL.

This section covers the following topics:

- [Special Editor Functions for Macro Sources](#)
- [Escape Character for Natural Source Lines](#)
- [Parameter List](#)

- [Variables in Dynamically Generated JCL](#)

Special Editor Functions for Macro Sources

The following special editor functions are available for a macro source:

| Function | Description |
|--------------|--|
| Macro | <p>Compile the macro JCL into an executable Natural object. This object is executed by Entire Operations during JCL load. It generates the executable active JCL. (This command is similar to the STOW command used for standard Natural programs.)</p> <p>Note: The Macro function can be executed in batch mode, e.g., for whole networks.</p> <p>See also Bulk Execution of MACRO Commands.</p> |
| Test | <p>Generate JCL for testing purposes. The generated JCL is displayed in a new window.</p> <p>Note:</p> <ol style="list-style-type: none"> 1. The macro source is not saved during execution of the Macro function. 2. The generated object is not compiled with the Natural STOW command during execution of the Test function. Since no changes are made to the original macro source and the existing generated object, the TEST command can also be performed by users who have read access only for the macro source. |

Run Number used for the Test Function

The reserved run number used during the **Test** function is -3. During **Test**, a temporary active symbol table with this run number is used. This avoids any influence on the defined master symbol table. In the log display, this reserved run number is not displayed.

Escape Character for Natural Source Lines

Natural source lines must be preceded by the [activation escape character](#) of the job (see *Symbol Escape Characters* in the section *Symbol Table and Symbol Maintenance*).

The activation escape character at the beginning of a line distinguishes the line as a Natural statement from the JCL. The use of Natural statements provides full Natural functionality in dynamic JCL, including access to Adabas and Entire System Server. This means you do not need to learn any special control statements. All Natural statements used in dynamic JCL must be coded in structured mode.

Variables are user-defined and can be used in any part of the JCL. Variables are distinguished in the JCL by preceding them with an escape character: the activation escape character denotes variables to be substituted at activation time; the [submission escape character](#) denotes variables to be substituted at job submission time (see *Symbol Escape Characters* in the section *Symbol Table and Symbol Maintenance*).

Note: These escape characters can be changed by the system administrator. However, this should only be done if absolutely necessary, for example for countries with a different alphabet. It is not advisable to use escape characters which have a defined meaning in a particular operating system or which are already defined as escape characters, e.g., \$ in BS2000 or UNIX.

Parameter List

Each JCL for a job with the JCL location **Macro Natural source** (MAC) must start with the declaration of the common user exit parameter list `NOPXPL-A`:

```
$ DEFINE DATA PARAMETER USING NOPXPL-A
```

where the first character (here: \$) is the **activation escape character** of the job.

The `P-CALL-PLACE` parameter in `NOPXPL-A` contains the value `MAC`.

See also [Common User Exit Parameter Data Area NOPXPL-A](#) and [User Exit Types, P-CALL-PLACE](#) in the section *User Exits*.

Variables in Dynamically Generated JCL

You can use four types of variables:

- A variable from the symbol table specified for the job;
- A variable from the parameter section (`P- . . .`);
- A local variable defined in this Natural program, which can be computed in your program (`L- . . .`);
- A Natural system variable (`TIME`, `DATE`, etc.) which is distinguished by an asterisk (*), for example, `*TIME` and `*DATE`.

Note: All variables with prefixes other than `P-`, `L-` or `*` are assumed to be found in the symbol table. Symbol replacement itself (without embedding Natural statements) is also available for standard JCL (`JOB (Standard Job)` type jobs). See [Symbol Replacement](#) in the section *Symbol Table and Symbol Maintenance*.

This section covers the following topics:

- [Sample JCL](#)
- [#GET-SYMBOL](#)
- [#SET-SYMBOL](#)
- [#SET-SYMBOL-M](#)
- [General Notes](#)

- Examples of Using #GET-SYMBOL, #SET-SYMBOL and #SET-SYMBOL-M

Sample JCL

The following sample JCL illustrates the use of variables in the dynamically generated JCL of a job with JCL location **Macro Natural source (MAC)**:

```

$ DEFINE DATA PARAMETER USING NOPXPL-A
$ LOCAL      /* ... ALL LOCALS SHOULD START WITH 'L-'
$ 1 L-01     (A30)
$ 1 CLASS   (A01)      /* FROM SYMBOL TABLE, FOR #GET-SYMBOL
$ END-DEFINE
$ * -----
#GET-SYMBOL CLASS
$ COMPRESS P-NETWORK P-JOB INTO L-01
//SNOPEX JOB , $P-OWNER,MSGCLASS=$MSGCLASS,CLASS=$CLASS
//STEP01 EXEC PGM=NOPCONTI,PARM='C=0004'
//STEPLIB DD DISP=SHR,DSN=$STEPLIB
/* DEVICE: $*DEVICE, INIT-USER: $*INIT-USER, TIME: $*TIME
/* L-01 : $L-01
$ IF CLASS = 'K'      /* SYMBOL USED IN STATEMENT -> #GET-SYMBOL
/* THE CLASS IS $CLASS
$ ELSE
/* ANOTHER MSGCLASS FOUND
$ END-IF
/*

```

The variables used in the JCL are assumed to have the following current values:

Symbol Table Variables

| | |
|----------|-------------------|
| STEPLIB | NOP.SYSF.DEV.LOAD |
| CLASS | K |
| MSGCLASS | X |

Natural System Variables

| | |
|------------|--------|
| *DEVICE | BATCH |
| *INIT-USER | EORMON |

Variables from the Parameter Section

| | |
|-----------|---------|
| P-NETWORK | EX131A |
| P-JOB | EX-1-24 |
| P-OWNER | SN |

When the job is activated, Entire Operations substitutes the variables with their current values. The following JCL is generated as a result:

```
//SNNPEX JOB ,SN,MSGCLASS=X,CLASS=K
//STEP01 EXEC PGM=NOPCONTI,PARM='C0004'
//STEPLIB DD DISP=SHR,DSN=NOP.SYSF.DEV.LOAD
//* DEVICE: BATCH, INIT-USER: EORMON
//* L-01 : EX131-A EX-1-24
//* THE CLASS IS K
/*
```

#GET-SYMBOL

#GET-SYMBOL can be used within macro JCL to put an active symbol value into a local variable.

The symbol is taken from where it is found first in the symbol search path.

The syntax is as follows:

```
#GET-SYMBOL variable [value]
```

value is optional. If it is not specified, the variable is filled with the contents of a symbol with the same name.

value must be of the format A (alphanumeric). To convert *value* to a numeric field, use the Natural VAL system function.

```
#GET-SYMBOL variable(index)
```

With this syntax, an instance of a multiple value symbol can be obtained. The variable must be defined as a local array with a sufficient array size.

Example:

```
#GET-SYMBOL L-SYMBOL(L-IND)
```

See also [Examples of Using #GET-SYMBOL, #SET-SYMBOL and #SET-SYMBOL-M](#).

#SET-SYMBOL

#SET-SYMBOL can be used within macro JCL to set an active symbol and its value from a local variable or string.

The symbol is set in the active symbol table which belongs to the active job.

For #SET-SYMBOL, a job must have a locally defined symbol table.

The syntax is as follows:

```
#SET-SYMBOL symbol [value]
```

value is optional and can contain one of the following values:

| Value | Meaning | Example |
|-----------------|--|-----------------------|
| none | Set the value of the symbol <i>symbol</i> to the content of a local variable with the name <i>symbol</i> . | #SET-SYMBOL S1 |
| 'text' | Set the value of the symbol <i>symbol</i> to 'text'. | #SET-SYMBOL S2 'v002' |
| <i>variable</i> | Set the value of the symbol <i>symbol</i> to the content of the local variable with name <i>variable</i> . | #SET-SYMBOL S3 S30 |

See also [Examples of Using #GET-SYMBOL, #SET-SYMBOL and #SET-SYMBOL-M](#).

#SET-SYMBOL-M

#SET-SYMBOL can be used within macro JCL to set a master symbol and its value from a local variable or string.

The symbol is set in the master symbol table which belongs to the active job.

For #SET-SYMBOL-M, a job must have a locally defined symbol table.

The syntax is as follows:

```
#SET-SYMBOL-M symbol [value]
```

value is optional and can contain the same values as described for #SET-SYMBOL.

See also [Examples of Using #GET-SYMBOL, #SET-SYMBOL and #SET-SYMBOL-M](#).

General Notes

Text strings must not contain blanks.

Blanks are used as separators for the parameters of `#GET-SYMBOL` and `#SET-SYMBOL`.

Examples of Using `#GET-SYMBOL`, `#SET-SYMBOL` and `#SET-SYMBOL-M`

The activation escape character used in the examples is the paragraph sign (§).

| Statement | Description |
|--|---|
| <code>#GET-SYMBOL J</code> | Move the contents of symbol J to the local variable J. |
| <code>#GET-SYMBOL #J §BB</code> | Move the contents of symbol BB to the local variable #J. |
| <code>#GET-SYMBOL #J '§BB'</code> | Move the contents of symbol BB to the local variable #J. |
| <code>#GET-SYMBOL L-MULT '§?MV<M1,§I>'</code> | Move the result of a symbol function call into the local variable L-MULT. |
| <code>#SET-SYMBOL J</code> | Set the active symbol J to the contents of the local variable J. |
| <code>#SET-SYMBOL I #A</code> | Set the active symbol I to the contents of the local variable #A. |
| <code>#SET-SYMBOL AA 'text'</code> | Set the active symbol AA to the value <i>text</i> . |
| <code>#SET-SYMBOL BB §I</code> | Set the active symbol BB to the contents of symbol I. |
| <code>#SET-SYMBOL BB '§I'</code> | Set the active symbol BB to the contents of symbol I. |
| <code>#SET-SYMBOL CC '§D.§E'</code> | Concatenate symbol values of D and E, and put the result into the active symbol CC. |
| <code>#SET-SYMBOL-M DD 'value'</code> | Set the master symbol DD to the value <i>value</i> . |
| <code>#SET-SYMBOL-M TAGYYMMDD '&!D<T,YYMMDD>'</code> | Sets the result of the symbol function <code>&!D<T,YYMMDD></code> (e.g. 150211) into the master symbol TAGYYMMDD. |

Usage of Text Objects in JCL

You can include text objects in JCL. The text objects can have their own local parameters. Text objects can invoke other text objects, i.e., nesting is possible.

This feature is not limited to jobs with JCL location `MAC` (macro Natural source), but can also be used from within standard JCL.

This section covers the following topics:

- [Inserting Text Objects into JCL](#)
- [Parameters for Included Text Objects](#)
- [Nested \(Recursive\) #EOR-INCL Statements](#)
- [Replacement of Parameters within the Text Object](#)

- [Examples of #EOR Statements](#)

Inserting Text Objects into JCL

You can insert Natural text objects anywhere in your JCL.

The meta commands described here are stripped from the active JCL and the submitted JCL.

The syntax is as follows:

```
#EOR-INCL LOC=NAT LIB=library MEM=text-object
```

Parameters of the #EOR-INCL Statement

| Parameter | Description |
|-----------|---|
| LOC | Location NAT Natural text object. This is the only location which is currently allowed for text objects. |
| LIB | Library of the text object. |
| MEM | Name of the text object. |

If the text object cannot be read, the JCL generation is aborted with an error message.

Symbol replacement is possible within the #EOR-INCL statement.

Parameters for Included Text Objects

You may invoke included text objects with specific parameters.

For each parameter you want to pass to the text which is included by a #EOR-INCL statement, you must code a #EOR-PARM line in front of the #EOR-INCL statement.

These parameters are in effect only for the text included (and all nested inclusions) in the following #EOR-INCL statement.

The syntax is as follows:

```
#EOR-PARM parameter = value [parameter = value]...
```

Multiple parameters can be passed on the #EOR-PARM line. This is limited by the line size.

Parameter values implicitly have the format A (alphanumeric).

Parameter values may contain blanks. In this case, they must be included in apostrophes (' ') or double quotes (" ").

Nested (Recursive) #EOR-INCL Statements

You may use nested #EOR-INCL statements inside text objects which have already been included. These nested inclusions may have their own parameter lists.

Note: Be aware that the total number of inclusions for JCL is limited by the Natural editor buffer size for the Natural task executing.

Replacement of Parameters within the Text Object

Parameters for text objects can be used within the included text object like any other symbol. They have precedence over the symbols of the current symbol table of the job (and the other symbol tables in the search hierarchy).

Therefore, parameters for included text objects can temporarily override symbols with the same name. The scope of a parameter is only the included text object, and the text objects which are invoked from within this text object by nested calls.

The lifetime of parameters defined via #EOR-PARM is JCL load time only. Normal symbol replacement can be used within included text objects like everywhere else in the JCL.

Examples of #EOR Statements

Example 1:

```
...
#EOR-INCL LOC=NAT LIB=JCLLIB MEM=$OBJECT
...
```

Include the Natural text object the name of which is in the symbol OBJECT from the library JCLLIB.

Example 2:

```
...
#EOR-PARM DBID = 9
#EOR-PARM TEXT-1 = "a string with blanks"
#EOR-INCL LOC=NAT LIB=USERLIB MEMBER=BLOCK1
/* JCL statement
#EOR-PARM DBID = 10
#EOR-PARM TEXT-1 = "another string"
#EOR-INCL LOC=NAT LIB=USERLIB MEMBER=BLOCK1
...
```

Include the Natural text object `BLOCK1` from the library `USERLIB`. The parameters `DBID` and `TEXT-1` are passed to the text object with different values for the two invocations.

Locking of Natural Sources

If you start Natural with the profile parameter `SLOCK` set to `PRE`, a lock avoids that two or more users can concurrently edit a Natural source object from an Entire Operations, an Entire Operations GUI Client or within a native Natural environment.

If `SLOCK` is set to `POST` or `OFF`, no locking is performed but the Entire Operations editor detects that several users edit a source at the same time.

You can use the Natural system command `UNLOCK` to check or unlock locked Natural source objects.

For detailed information on `SLOCK` and `UNLOCK`, refer to the relevant sections in the Natural *Parameter Reference* documentation.

Additional Prerequisites for Source Locking

- In a UNIX or Windows environment, the Natural Development Server must be installed in the current Natural FNAT system file.
- If you want to avoid concurrent source editing among users in a local Entire Operations GUI Client environment, in addition to Natural, you also have to start the Natural RPC server with `SLOCK` set to `PRE`.

| ▪ Input Condition: BS2000 Job Variable | 378 |
| ▪ Listing Jobs Linked to an Input Condition | 380 |
| ▪ Deleting an Input Condition Definition | 382 |

Logical conditions are dependencies between jobs. Jobs within a job network are linked by user-defined logical conditions. A logical condition can be added, deleted or modified. A logical condition can have either of two statuses that determine how Entire Operations is to continue processing: true (condition exists) or false (condition does not exist).

During execution of networks and submission of jobs, Entire Operations automatically checks the status of logical conditions and triggers system actions accordingly. Alternatively, logical conditions can be set by an [API routine](#) (see the relevant section).

All conditions are identified by name and a reference date to allow the Entire Operations Monitor to distinguish between the same event occurring on different dates. Condition names must be unique within a job network. Dates can be specified as relative dates or explicit dates. All relative dates are converted to real dates when the job is put in the active queue.

Apart from a name and reference date, the user can also assign a mailbox to a condition. Entire Operations will automatically notify each user of all pending conditions assigned to any mailboxes associated with his user ID.

Jobs are linked by defining the output condition (End-of-Job checking) of one job as the input condition (prerequisite) of the subsequent job.

Related Topics:

- [Defining Schedule Dependencies for an Input Condition](#) in the section *Schedule Maintenance*
- [Maintaining Active Job Conditions](#) in the section *Active Job Networks*
- [Logical Conditions](#) in the *Concepts and Facilities* documentation

Use of Input and Output Conditions

There are two ways of using logical conditions:

- As input conditions;
- As output conditions.

This section covers the following topics:

- [Input Conditions](#)
- [Output Conditions](#)

- [Example of Job Linkage by Using Conditions](#)

Input Conditions

Input conditions are prerequisites for job submission. Entire Operations does not submit a job until all input conditions and other prerequisites are set (fulfilled). Before job submission, all input conditions defined for the job are checked automatically by the Entire Operations Monitor. If you want the checking to be done by a Natural user exit, this routine must also be defined as an input condition.

An input condition can be set by the occurrence of an event detected by Entire Operations or manually by the user when [maintaining active job conditions](#). It can also be set by a reply to a mailbox request.

You can set an input condition to true or false. The job then must wait until the condition is fulfilled before it starts running. This is useful, for example, to avoid that two or more jobs with the same input condition run at the same time. You can also specify whether an input condition is reset after job submission.

If no input condition is defined for a job, Entire Operations assumes a virtual true input condition. This means that this job can be submitted immediately at the (earliest) starting time defined for it, unless the job has other prerequisites such as resources.

It is possible to define a maximum of 40 input conditions per job. If you need more input conditions, you must use intermediate dummy jobs to collect the conditions. See also [Job Execution as a Dummy Job](#).

Input conditions can refer not only to the current run of a job network, but also to given time frames in the past or to previous runs.

You can also use an input condition to turn a job into a dummy job when it occurs. For further information on this topic, see [Using a Dummy Job](#).

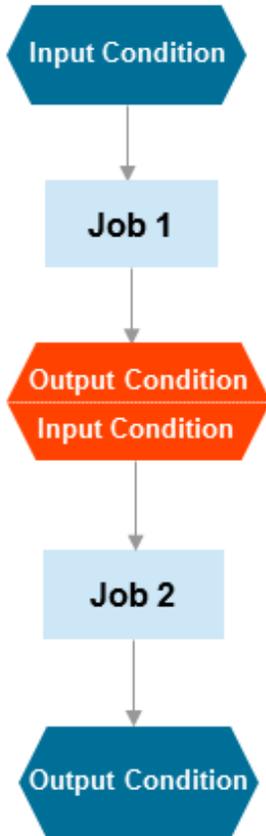

Output Conditions

Output conditions can be set or reset during End-of-Job checking of Entire Operations. For each job or job step (operating system job), you can specify any number of possible events. Each event can be associated with up to 20 output conditions. When any of these events occur, Entire Operations automatically sets the associated output conditions and starts those jobs which have these conditions as input conditions (see also [Defining and Managing End-of-Job \(EOJ\) Checking and Actions](#)).

As in the case of input conditions, output conditions are defined by name and reference. Additionally, you can specify whether the output condition is to be set (to true) or reset (set to false) when the associated event occurs.

Example of Job Linkage by Using Conditions

The figure below illustrates a simple example of two jobs linked by logical conditions:

To link the two jobs: an Output Condition of Job 1 is defined as an Input Condition for Job 2.

Listing Input Conditions

> To list input conditions

- In the **Maintenance Job Master window**, open the tabbed page **Input Conditions** similar to the example below:

All input conditions defined for the job are listed on the page.

The columns and functions available on the page are explained in [Columns: Input Conditions Maintenance](#) and [Functions: Input Conditions](#).

This section covers the following topics:

- [Columns: Input Conditions](#)

▪ [Functions: Input Conditions](#)

Columns: Input Conditions

The following table explains the column headings for the data listed on the [Input Conditions page](#) of the **Maintenance Job Master** window:

| Column | Description | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
|-------------------|---|------|---|-------|---|-----------|---------------------------------|-----------|---------------------------------|----------|--|----------|--|------|---|--------|------------------|--------|----------------------|-----------|---------------------------------------|-----------|---|----------|--|--------|---|-----------|---|-----------|---|-----------|---|------------|--|
| Condition | User-defined condition name. See also Restrictions for Condition Names and Global Conditions . | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Reference | Reference date used to refer to a certain occurrence of the input condition. For possible entries, see Possible References for Input Conditions in the section Input Condition References . | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Type | The values shown in this column refer to the condition defined in the Input Condition window: <table border="1"> <tbody> <tr> <td>true</td> <td>Condition must exist for the job to be submitted.</td> </tr> <tr> <td>false</td> <td>Condition must not exist for the job to be submitted.</td> </tr> <tr> <td>exclusive</td> <td>Exclusive use of the condition.</td> </tr> <tr> <td>destruct.</td> <td>Condition is deleted after use.</td> </tr> <tr> <td>extern +</td> <td>Condition from another network must exist.</td> </tr> <tr> <td>extern -</td> <td>Condition from another network must not exist.</td> </tr> <tr> <td>Exit</td> <td>Condition depends on the result of a user exit.</td> </tr> <tr> <td>File +</td> <td>File must exist.</td> </tr> <tr> <td>File -</td> <td>File must not exist.</td> </tr> <tr> <td>User Sw +</td> <td>User switch must exist (BS2000 only).</td> </tr> <tr> <td>User Sw -</td> <td>User switch must not exist (BS2000 only).</td> </tr> <tr> <td>Job Var.</td> <td>Condition depends on a job variable (BS2000 only).</td> </tr> <tr> <td>Symbol</td> <td>Condition depends on the value of a symbol in a symbol table.</td> </tr> <tr> <td>mult.Sfx.</td> <td>Condition depends on multiple suffixes.</td> </tr> <tr> <td>Mailbox +</td> <td>Condition must exist. It is prompted in the mailbox and must be set or reset to continue job execution.</td> </tr> <tr> <td>Mailbox -</td> <td>It is prompted in the mailbox and must be set or reset to continue job execution.</td> </tr> <tr> <td>Recov.tmp.</td> <td>Condition is used for recovery (only temporary created by the Entire Operations Monitor for active jobs only).</td> </tr> </tbody> </table> | true | Condition must exist for the job to be submitted. | false | Condition must not exist for the job to be submitted. | exclusive | Exclusive use of the condition. | destruct. | Condition is deleted after use. | extern + | Condition from another network must exist. | extern - | Condition from another network must not exist. | Exit | Condition depends on the result of a user exit. | File + | File must exist. | File - | File must not exist. | User Sw + | User switch must exist (BS2000 only). | User Sw - | User switch must not exist (BS2000 only). | Job Var. | Condition depends on a job variable (BS2000 only). | Symbol | Condition depends on the value of a symbol in a symbol table. | mult.Sfx. | Condition depends on multiple suffixes. | Mailbox + | Condition must exist. It is prompted in the mailbox and must be set or reset to continue job execution. | Mailbox - | It is prompted in the mailbox and must be set or reset to continue job execution. | Recov.tmp. | Condition is used for recovery (only temporary created by the Entire Operations Monitor for active jobs only). |
| true | Condition must exist for the job to be submitted. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| false | Condition must not exist for the job to be submitted. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| exclusive | Exclusive use of the condition. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| destruct. | Condition is deleted after use. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| extern + | Condition from another network must exist. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| extern - | Condition from another network must not exist. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Exit | Condition depends on the result of a user exit. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| File + | File must exist. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| File - | File must not exist. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| User Sw + | User switch must exist (BS2000 only). | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| User Sw - | User switch must not exist (BS2000 only). | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Job Var. | Condition depends on a job variable (BS2000 only). | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Symbol | Condition depends on the value of a symbol in a symbol table. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| mult.Sfx. | Condition depends on multiple suffixes. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Mailbox + | Condition must exist. It is prompted in the mailbox and must be set or reset to continue job execution. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Mailbox - | It is prompted in the mailbox and must be set or reset to continue job execution. | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Recov.tmp. | Condition is used for recovery (only temporary created by the Entire Operations Monitor for active jobs only). | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |
| Sched.Dep. | If the condition is defined to be schedule-dependent, a short summary of the dependency appears in this column. For more information, see Defining Schedule Dependencies for an Input Condition in the section Schedule Maintenance . | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Column | Description | |
|---------|--|---------------------------|
| Ex. | x mark in the table | Condition must exist. |
| | no mark in the table | Condition must not exist. |
| Library | Natural library where a defined user exit resides. | |

Functions: Input Conditions

The following functions are available on the [Input Conditions page](#):

| Function | Description |
|---------------|--|
| Add | Add an input condition definition. |
| Modify | Modify the input condition definition. |
| Delete | Delete the input condition definition. |
| Schedule Dep. | Add or modify schedule dependency. See Defining Schedule Dependencies for an Input Condition in the section <i>Schedule Maintenance</i> . |
| Where Used | Display jobs for which the condition is used as an input or output condition. See Viewing the Usage of a Prerequisite Resource . |
| Edit | Edit user exit to set input condition. |
| Open Net. | Open the network definition for an external input condition. See Accessing another Network Defined for an Input Condition . |
| Diagram | View the network diagram for the input condition. For further information, see Viewing and Maintaining a Job Network Diagram . |

Adding and Modifying a Master Input Condition

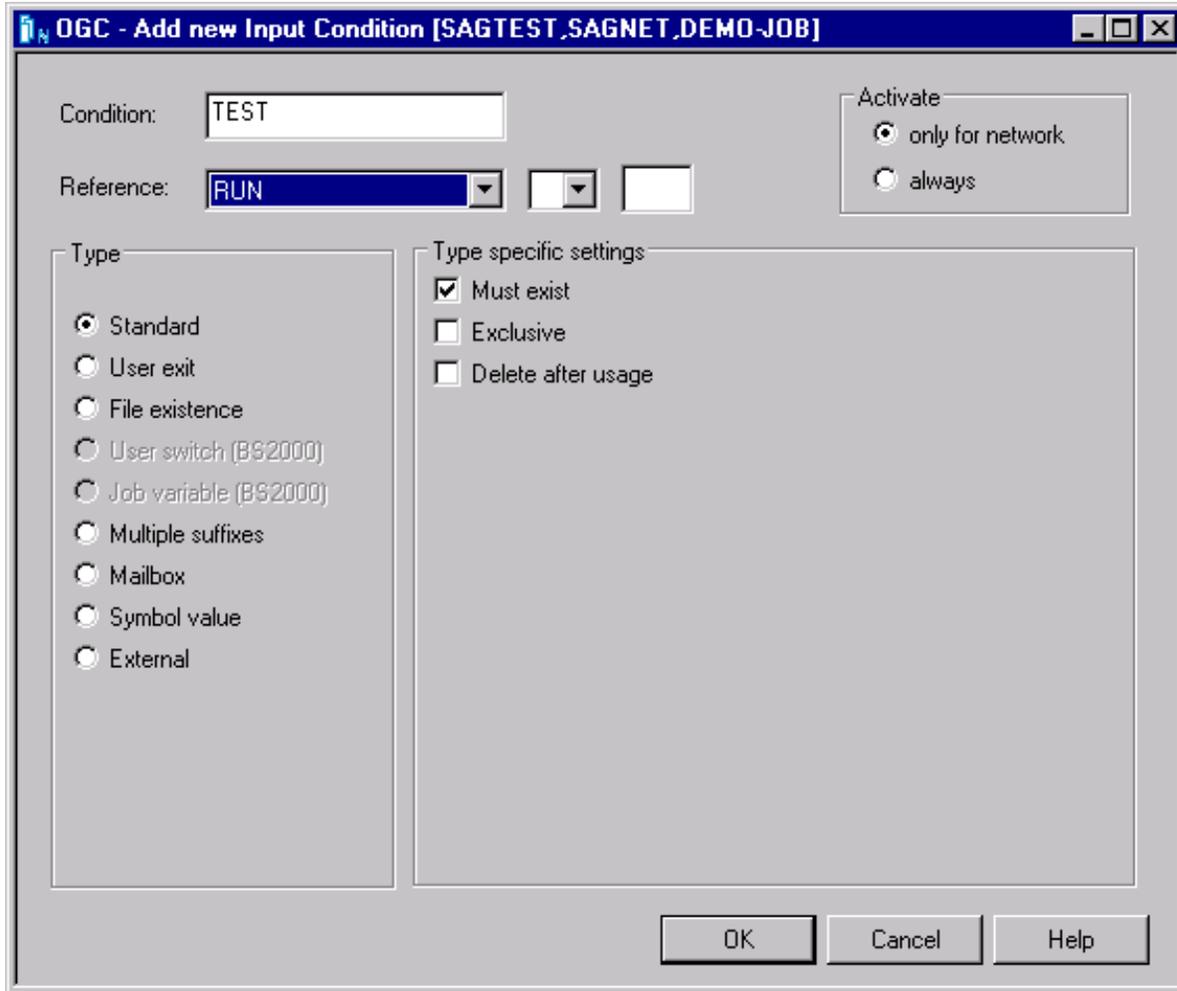

➤ To add or modify an input condition

- 1 On the [tabbed page Input Conditions](#), choose **Add** to create a new input condition.

Or:

On the [tabbed page Input Conditions](#) select an input condition from the table and choose **Modify** to change an input condition.

An **Input Condition** window similar to the example below opens:

- 2 Make your definitions. The fields and options in the window are described in *Fields and Selection Options: Input Condition*.
- 3 Choose **OK**.

The new input condition is now allocated to the job master.

Note: After an input condition has been defined or modified, a loop check is performed for the network. The same conditions apply as described in *Checking for a Loop in a Job Network* in the section *Network Maintenance*, with one exception: if a loop is detected in the job flow, no corresponding message appears.

▪ [Fields and Selection Options: Input Condition](#)

Fields and Selection Options: Input Condition

The input fields and selection options in the [Input Condition window](#) are described in the following table.

The fields and options provided in the **Type specific settings** section of the window depend on the **Reference** and **Type** selected for the condition.

| Field | Description | |
|--|---|---|
| Condition | Name assigned to the condition. The condition name and its reference date uniquely identify an active condition. See also Restrictions for Condition Names . | |
| Run | Current run number (for active jobs only). | |
| Reference | Reference date to specify which occurrence of this definition the job uses. For possible selection options, see Possible References for Input Conditions in the section Input Condition References . | |
| Activate | <i>checked</i> | Input condition definition is always activated (for job activations as well). |
| | <i>unchecked</i> | Default. Input condition definition is activated for network activations only. |
| Type specific settings section: | | |
| Must Exist | <i>checked</i> | Specifies that the condition must exist (be true) as a prerequisite to job submission. |
| | <i>unchecked</i> | Specifies that the condition must not exist (be false) as a prerequisite for job submission. Alternatively, this field also controls the setting of the condition according to the existence or non-existence of a file specified in the File Existence field (file or member in a file). |
| Exclusive | <i>checked</i> | Specifies that when this condition is in use, no other job can access this condition until it is free (job finished). |
| | <i>unchecked</i> | Any job can use the condition at any time. This feature is useful to prevent simultaneous execution of jobs with the same input conditions. Default. |
| Delete after usage | <i>checked</i> | Specifies that the condition is automatically reset after the job is submitted. |

| Field | Description |
|------------------------------|---|
| | <p><i>unchecked</i></p> <p>Do not reset condition: later job runs can use this condition according to the Reference date.</p> <p>Default.</p> |
| Activate | <p><i>checked</i></p> <p>Input condition definition is always activated (for job activations as well).</p> |
| | <p><i>unchecked</i></p> <p>Input condition definition is activated for network activations only.</p> <p>Default.</p> |
| Type section: | |
| Standard | Select this radio button (default) to set the standard condition usage options (must exit, exclusive and/or delete after usage). |
| User Exit | <p>Select this radio button if the condition is to be set by a user exit.</p> <p>For further information and the fields/options available in the Type specific settings section, see Input Condition with User Exit.</p> |
| File Existence | <p>Select this radio button to define an input condition dependent on the existence or non-existence of a file.</p> <p>For further information and the fields/options available in the Type specific settings section, see Input Condition: File Existence.</p> |
| User Switch (BS2000) | <p>User switch (BS2000 only).</p> <p>Select this radio button to define an input condition dependent on the existence or non-existence of a user switch.</p> <p>For further information and the fields/options available in the Type specific settings section, see Input Condition: BS2000 User Switch.</p> |
| Job Variable (BS2000) | <p>Job variable (BS2000 only).</p> <p>Select this radio button to define an input condition dependent on a comparison with the contents of a BS2000 job variable.</p> <p>For further information and the fields/options available in the Type specific settings section, see Input Condition: BS2000 Job Variable.</p> |
| Multiple Suffixes | <p>Select this radio button to define a symbol to be used for the active condition name.</p> <p>For further information and the fields/options available in the Type specific settings section, see Input Condition: Multiple Suffixes.</p> |
| Mailbox | <p>Select this radio button to define a user prompt to a mailbox.</p> <p>For further information and the fields/options available in the Type specific settings section, see Input Condition: Mailbox.</p> |

| Field | Description |
|---------------------|---|
| Symbol Value | Select this radio button to define an input condition dependent on a comparison with the value of a symbol in a symbol table. For further information and the fields/options available in the Type specific settings section, see Input Condition: Symbol Value . |
| External | Select this radio button to define an input condition dependent on another network. See also Accessing another Network Defined for an Input Condition . |

Restrictions for Condition Names

The name of a condition can contain numbers and letters as required. The maximum name length is 20 bytes.

The following restrictions apply:

- Umlauts are not allowed.
- The use of special characters is restricted to the following:

-+/\$/#\$_&

- Names of **global conditions** begin with a plus sign (+).
- The **activation escape character**, the **submission escape character** and a period (.) symbol delimiter are still accepted if symbol replacement is allowed for the relevant name fields.
- The following condition names are reserved for special purposes and may not be used for common conditions:

| Reserved Condition Name | Explanation |
|----------------------------|---|
| NET-BEGIN | Used for subnetwork control. |
| NET-END | These reserved conditions are described in detail in the section Link the Main Network . |
| NET-END-NOTOK | |
| NET-END-OK | |
| P-STOPCYC - <i>jobname</i> | If this condition is set in the active symbol table of a job with the special type C , the cyclic execution is stopped. For detailed information, see the field Special Type in the section <i>Fields: Job Master Definition</i> . |
| <i>jobname</i> -MAX-RETRY | The special condition <i>jobname</i> -MAX-RETRY is set by the Entire Operations Monitor when the message EOR5316 (Recovery Retry Maximum:1: exceeded) is issued during a job recovery . |

Accessing another Network Defined for an Input Condition

➤ To access another network defined for an input condition

- From the table on the [tabbed page Input Conditions](#), select an input condition of the **Type** `extern` and choose **Open Net..**

The **Maintenance Network Master** window of the network defined for the input condition opens.

If required, you can change the network definitions. The fields and tabs of the **Network Master window** are explained in *Fields: Network Definition* in the section *Modifying a Network Definition*.

Input Condition References

To check an input condition, you must know which reference is meant. References can result in time or run number intervals.

The simplest reference is `RUN`, which refers to conditions set in the current network run. However, if you define an external input condition (which is not produced by the current network), you should always remember that different networks usually have different run numbers, which implies that `RUN` makes no sense in this case.

Run numbers are not assigned sequentially in chronological order. For references to previous network runs use `LNR`.

With the exception of `RUN`, all references described in this section also apply to [global conditions](#).

- [Possible References for Input Conditions](#)
- [Relative Values](#)

Possible References for Input Conditions

The following table describes all references you can select from the drop-down list box next to the **Reference** field of the [Input Condition window](#).

| Reference | Unit of Relative Value | Description |
|---------------|------------------------|---|
| AAC | | Job uses condition only if there is at least one entry in the active database for the owner, the network and the job. |
| ABS | | Job uses condition only if it is absolute. Absolute conditions are independent of run numbers and can exist only once under the same name. |
| ANY | | Job uses any occurrence of the condition, except ABS (absolute), which has a reserved run number. |
| ANT | | Job uses condition only if there is no entry in the active database for this owner, network and job. |
| DAT | Days | Job uses the condition as set by the network run on the current date. |
| Explicit date | | A date entered in the format YYYYMMDD. Job uses condition only if set on the explicit date. The job then uses the condition as set by the network run on this date (does not apply when job can run more than once daily). |
| DST | | Job uses the condition as set during the network run on the date specified as the job start time. |
| DUM | | If this condition is satisfied, the job is started as a temporary dummy job. If this condition is not satisfied, the job is started normally. If several conditions with the reference DUM are defined for a job, only one condition must be satisfied for the job to be executed as a dummy. The condition can have a special dependency (for example, on a file). The active condition is also accepted if it has the reference ABS (absolute). If a job is started as a temporary dummy job on account of a condition, then this is written to the log. |
| HRC | Hours | Job uses the condition only if it was set a defined number of hours previous to the check time of the condition. This reference can only be entered with a relative hour value . HRC - 24 is the default value if this field is left blank and if the condition is set in a different network. (RUN is the default in the same network.) |
| LNR | Hours | <ul style="list-style-type: none"> ■ If the condition was set by another network: Job uses the condition if it was set by the most recent run in the previous <i>nnn</i> hours. ■ If the condition was set by an earlier run of the same network: Job uses the condition if it was set by an earlier run in the previous <i>nnn</i> hours. ■ The condition is not set if an error occurred during the most recent or earlier run. |

| Reference | Unit of Relative Value | Description |
|-----------|------------------------|---|
| | | This reference is recommended for constructing chains of networks and must be followed by a relative value (see Relative Values). |
| LNT | Hours | This reference is used like LNR. Additionally, the condition is set to true if the creating job network did not have an active run in the previous <i>nnn</i> hours. Network runs that were already deactivated are indicated in the accounting data . |
| MON | Months | Job uses the condition as set by the network run of the current month. |
| NSD | | Job uses the condition as set during the network run on the date specified as the network start time. |
| PDA | Days | Job uses the condition only if set on the same production date. The production date end time can be defined in the Entire Operations default settings: see <i>Defaults for Time Ranges</i> in the <i>Administration</i> documentation. Note: This reference does not evaluate schedules or calendars. |
| PDS | | Job uses the condition only if set on the same production date. The production date end time can be defined in the Entire Operations default settings: see <i>Defaults for Time Ranges</i> in the <i>Administration</i> documentation. Note: This reference does not evaluate schedules or calendars. |
| RCA | | A job with multiple active subnetworks uses the same input conditions defined for a predecessor job that runs in the primary subnetwork. If Multiple suffixes are used as an input condition (see Input Condition: Multiple Suffixes) for the predecessor, the multiple suffixes are appended to the job. If RCA is specified, the output condition of the corresponding predecessor job must be referenced with RCM: see RCM in the section <i>Field Descriptions: Output Conditions</i> . |
| RUN | Run numbers | Job uses the condition as set by the current network run. This is the default value if this field is left blank and if the condition is set in the same network. (HRC-24 is the default in a different network.) |
| WEK | Weeks | Job uses the condition as set by the network run of the current week. |
| WCC | Days | Real date, relative to the current day. |
| WCW | Days | Calendar day, relative to the current day, in a linked calendar (workday). |
| WCS | Days | Schedule day, relative to the current day, in a linked schedule. |

Relative Values

Some references can be followed by a minus (-) or plus (+) sign and a numeric offset. This is called a relative value. For example:

| | |
|---------|---------------------------------|
| DAT - 1 | Refers to yesterday. |
| HRC - 2 | Refers to the previous 2 hours. |
| WEK - 1 | Refers to the previous week. |

In this case, additional fields appear next to the **Reference** field where you can select the required sign (+ or -) and enter a number.

Global Conditions

Logical conditions are either set for a single job network or independently of any networks. Independent conditions are referred to as global conditions.

A global condition is not restricted to a particular owner, network or job but reflects the current value of a condition set for the given environment. It is defined once and can be used in several networks and job environments.

The following applies to a global condition:

- A global condition has the prefix + (plus sign).
- A global condition is assigned to the owner SYSDBA and to the network SYSDBA.
- A global condition gets the reference `abs .` (absolute). The reference `RUN` is accepted but is converted to `abs .` at runtime.

This document covers the following topics:

- [Restrictions for Global Conditions](#)

Related Topic:

- [Maintaining Active Job Conditions](#) in the section *Active Job Networks*.

Restrictions for Global Conditions

For global conditions, only the following [references](#) are allowed:

| | |
|---|--|
| With the definition of an active condition | ABS, ANY, RUN |
| If used as input condition | HRC, DAT, PDA, WEK, MON, ABS, ANT, DUM, RUN, ANY |
| If used as output condition | ABS, RUN |

Input Condition with User Exit

Input conditions can depend on the result of a user exit (**P-CALL-PLACE** set to **IC0**; see [Parameters Used for Different Call Places](#)). If a user exit is defined for an input condition, Entire Operations automatically executes the exit when checking the status of input conditions during the prerequisite check. The user exit can perform any database or Entire System Server call to obtain the necessary information. This allows Entire Operations to react to complex or user-specific dependencies.

User exits are Natural subprograms and can be edited with the Entire Operations editor. See also the section [User Exits](#).

When defining a user exit as an input condition, consider the following:

- The Entire Operations Monitor sets the parameter field **P-RC** (return code) to 0 (zero) before the user exit is called.
- You can also specify an input condition user exit for an input condition with the reference **DUM** (execute the active job as a temporary dummy job). See [Return Code Settings for an Input Condition User Exit](#) for the meaning of the return codes used for the input condition reference **DUM**.
 - [Defining and Editing a User Exit for an Input Condition](#)
 - [Fields: Input Condition User Exit](#)
 - [Return Code Settings for an Input Condition User Exit](#)
 - [Example of a User Exit](#)

Defining and Editing a User Exit for an Input Condition

➤ To define a user exit for an input condition

- 1 In the [Input Condition window](#), select **User exit** from the **Type** section.

In the **Type specific settings** section, enter the name of the user exit and the name of the Natural library in which the user exit resides.

The input fields available are described in [Fields: Input Condition User Exit](#).

- 2 When finished, choose **OK** to save your entries and close the window.

➤ **To edit the user exit of an input condition**

- 1 From the table on the [tabbed page Input Conditions](#), select an input condition of the type **Exit** and choose **Edit**.

An editor window opens containing the source of a Natural subprogram similar to the [Example of a User Exit](#).

(If no user exit is specified for the selected input condition, an appropriate message occurs instead.)

- 2 Modify the user exit as required.

For detailed information on handling user exits, see the section [User Exits](#).

Fields: Input Condition User Exit

The input fields provided for a user exit in the **Type specific settings** section of the [Input Condition](#) window are described in the following table:

| Field | Description |
|------------------------|--|
| Natural Library | Name of the Natural library where the user exit resides. This library must be different from the Entire Operations system library. |
| Exit | Name of the user exit which sets the condition. The user exit coding must start with <code>DEFINE DATA PARAMETER USING NOPXPL-A</code> . For further information, see Common User Exit Parameter Area NOPXPL-A . |

Return Code Settings for an Input Condition User Exit

When defining a user exit as an input condition for a job, you must set the return code as follows:

| Input Condition Reference | Return Code | Meaning |
|---------------------------|-------------|--|
| DUM | 0 | Job executes as dummy due to condition. |
| | 99 | Job waits for the input condition, for example, until an ICO user exit sets another return code. |
| | other | Job executes normally. |
| other | 0 | Job executes normally. |
| | other | Job waits for the input condition, for example, until an ICO exit sets another return code. |

Example of a User Exit

Below is an example of a user exit which sets an input condition:

```

*
Entire Operations

* USER EXIT TO SET AN INPUT CONDITION
*
* THIS ROUTINE CHECKS THE EXISTENCE OF A FILE, DEPENDING ON
* GIVEN PARAMETERS
*
DEFINE DATA PARAMETER USING NOPXPL-A
LOCAL                /* LOCAL VARIABLES START HERE
1 CATALOG VIEW OF CATALOG      /* An Entire System Server VIEW
  2 NODE
  2 DSNAME
  2 ERROR-CODE
  2 ERROR-TEXT
*
1 #DSNAME                (A54)
END-DEFINE
* -----
RESET P-RC                /* ASSUME GOOD RETURN -> SET CONDITION
COMPRESS P-OWNER '.SYSF.SRCE' INTO #DSNAME LEAVING NO SPACE
CAT. FIND CATALOG WITH NODE = P-EXECUTION-NODE
  AND DSNAME = #DSNAME
  IF CAT.ERROR-CODE NE 0
    MOVE CAT.ERROR-CODE TO P-RC      /* BAD RETURN
    MOVE CAT.ERROR-TEXT TO P-RT
  ESCAPE ROUTINE
  END-IF
END-FIND                /* (CAT.)
END

```

The user exit must set a return code in P-RC.

If P-RC is not equal to 0, the condition is reset (false) and the user is notified with a message. In the example above, the returned condition code (ERROR-CODE) sets (fulfills) the input condition for which the user exit is defined if the routine finds a file with the string *owner.SYSF.SRCE*.

Input Condition: Multiple Suffixes

If you define a symbol for multiple suffixes, its contents are separated and the single fields are concatenated to the active condition name. These multiple conditions are used to wait until all parallel executing predecessors are finished.

The active conditions are created during activation of the job network. For example, if the condition name is COND and if the specified symbol contains 001003012, the active conditions CONDO01, CONDO03 and CONDO12 are created.

➤ To define an input condition dependent on multiple suffixes

- 1 In the **Input Condition window**, select **Multiple suffixes** from the **Type** section.
- 2 In the **Type specific settings** section, enter a symbol name and select a symbol table/version, if required. See also *Fields: Input Condition Multiple Suffixes*.
- 3 When finished, choose **OK** to save your entries and close the window.

This section covers the following topics:

- [Fields: Input Condition Multiple Suffixes](#)

Fields: Input Condition Multiple Suffixes

The input fields provided for multiple suffixes in the **Type specific settings** section of the **Input Condition window** are described in the following table:

| Field | Description | | | | |
|------------------------------------|--|----------------|--|------------------|---|
| Always use Job Symbol Table | Specifies whether the symbol table defined for the job is used. Possible check box settings: | | | | |
| | <table border="1"> <tr> <td><i>checked</i></td> <td>The multiple suffix is taken from the symbol table defined for the job (default). (A symbol table defined for the network to which the job belongs is ignored.)</td> </tr> <tr> <td><i>unchecked</i></td> <td>The multiple suffix is taken from the symbol table specified for this input condition only.</td> </tr> </table> | <i>checked</i> | The multiple suffix is taken from the symbol table defined for the job (default). (A symbol table defined for the network to which the job belongs is ignored.) | <i>unchecked</i> | The multiple suffix is taken from the symbol table specified for this input condition only. |
| <i>checked</i> | The multiple suffix is taken from the symbol table defined for the job (default). (A symbol table defined for the network to which the job belongs is ignored.) | | | | |
| <i>unchecked</i> | The multiple suffix is taken from the symbol table specified for this input condition only. | | | | |
| | Note: In the case of a job or network copy, it is recommended to select this check box. By this you make sure that always the defined symbol table of the job is used, even if it was changed in the job definition. | | | | |

| Field | Description | |
|-------------------------|---|---|
| Symbol Table | Name of the symbol table with the symbol that contains the suffix(es) to be used for the condition when the job network is activated. You must specify the same symbol table in the predecessor job definition. | |
| Version | Version of the symbol table (if defined). | |
| Symbol | Name of the symbol that contains the suffix(es) to be used for the condition when the job network is activated. You must specify the same symbol in the predecessor job definition. | |
| Always Job Table | Possible check box settings: | |
| | <i>checked</i> | The multiple suffix is always taken from the job symbol table. A local definition is ignored (default). |
| | <i>unchecked</i> | Use the symbol table defined here. |
| | Note: In the case of a job or network copy, it is recommended to select this check box. By this you make sure that always the defined symbol table of the job is used, even if it was changed in the job definition. | |

Input Condition: File Existence

An input condition value can be dependent on the existence or non-existence of a file or of one of its members. The Monitor checks for the file or member on the job's **execution node** until the condition is satisfied.

➤ To define an input condition that requires a file

- 1 In the **Input Condition window**, select **File existence** from the **Type** section.
- 2 In the **Type specific settings**, enter a file and a member name. The input fields and options are described in *Fields: Input Condition File Existence*.
- 3 When finished, choose **OK** to save your entries and close the window.

This section covers the following topics:

- [Fields: Input Condition File Existence](#)

▪ [Rules for File Names and File Checking](#)

Fields: Input Condition File Existence

The input fields provided for a file existence check in the **Type specific settings** section of the **Input Condition window** are described in the following table:

| Field | Description | |
|-------------------|---|--|
| File | <p>Name of the file that must or must not exist. If the file is not cataloged, specify the volume serial number in the format <i>file/volume</i>.</p> <p>Note: When entering a file name, remember to observe the rules for upper and lower case which are specific to some operating systems.</p> <p>See also Rules for File Names and File Checking.</p> | |
| Member | <p>(Optional field)</p> <p>If the input condition is dependent on the existence or non-existence of a member in the file specified in the File field, enter the member name. Using a Wildcard in the Member Name: A wildcard (*) can be used at the string end. The condition is set (or not set) if at least one member is found.</p> <p>Note: Only specify a member where necessary and possible. If this field is left blank, the existence of the whole file is checked.</p> <p>See also Rules for File Names and File Checking.</p> | |
| Must exist | Possible check box settings: | |
| | <i>checked</i> | The file (or member) must exist as a prerequisite to job submission. |
| | <i>unchecked</i> | The file (or member) must not exist as a prerequisite. |

Rules for File Names and File Checking

The following rules apply when specifying a file as an input condition check:

BS2000 Files

The condition is satisfied only if the file is closed. For opened BS2000 files, the condition is not satisfied.

Migrated (archived) Files

Migrated (archived) files are recognized like files that are actively used. If a member is included in the file existence check, the active job is set to a permanent error, with the error text Prerequisite File Check - Library containing *member* is archived.

Entire System Server Node used for File Check

The node used for the file check is always the **execution node** of the job. The file is checked with the access rights of the **Submit User ID** (on UNIX and Windows: submit and submit group).

If you must check a file on a different node, use a predecessor dummy job with a different **execution node** and/or **Submit User ID** for this purpose.

Variable File Name: Using Escape Characters

The fields **File** and/or **Member** can contain symbols preceded by an **activation escape character**.

If the activation escape character is used, symbol replacement is performed during the first existence check.

Symbol replacement can be used, for example, for:

- file generation groups;
- changing input files;

After successful symbol replacement, these fields will contain the replaced value in the active job. This reduces the effort with symbol replacements.

The symbols are taken from the active symbol table assigned to the job. The symbol replacement in the file name is performed only once and the result is written back to the active input condition definition for further check. A missing symbol causes a permanent error.

It is also possible to use the **submission escape character**. In the case of an unsatisfied condition, the symbol replacement in the file name is performed before each file check. The result is not written back. This allows more flexible use of symbols, but may cause more system overhead.

File in Use

The case `file in use` is handled as a temporary error. The file check is repeated as long as the file is in use. The waiting job is not sent to passive wait.

z/OS: HSM Migrated Libraries

The following applies only if the operating system of an Entire System Server node is z/OS, and if the Entire System Server version is greater than or equal to Version 3.2.1. The Entire Operations Monitor performs the initialization of a file recall.

The file member check is repeated in intervals of two minutes, until the file is reloaded. A reload is not initiated if the file check is on file level only.

Input Condition: Mailbox

Mailboxes are defined to the system and assigned to user IDs by using the appropriate context function of the **Mailbox Definition** metanode. For more information on defining mailboxes, see *Mailbox Definition* in the *Administration* documentation.

For more information on how mailboxes can be used, see [Working with Mailboxes](#).

- [Using Mailboxes with Input Conditions](#)
- [Defining an Input Condition of the Type Mailbox](#)

Using Mailboxes with Input Conditions

Each logical condition can be assigned to a mailbox.

- If the condition is the only one pending (unfulfilled) and is therefore delaying the start of the subsequent job, a message is automatically sent to the mailbox.
- If an input condition is dependent on manual action(s), a message is sent to a mailbox that asks a user to confirm completion of the action(s).

Each user linked to this mailbox receives this message.

A user can be associated with up to ten mailboxes.

Defining an Input Condition of the Type Mailbox

» To send a message to a mailbox for an input condition that is not satisfied during network execution

- 1 In the [Input Condition window](#), select **Mailbox** from the **Type** section.
- 2 In the **Mailbox** field of the **Type specific settings** section, enter the name of the mailbox to which you want to send a message.

Or:

Select a name from the drop-down list box next to the **Mailbox** field.

- 3 When finished, choose **OK** to save your entry and close the window.

Input Condition: Symbol Value

An input condition can be dependent on a comparison with the contents of a symbol (symbol value) or the substring of a symbol value in a symbol table. The Monitor checks the value of the symbol on the job's **execution node** until the condition is satisfied.

You can specify the **instance** of a symbol table to be used for the symbol check: the active symbol table or the master symbol table.

This section covers the following topics:

- [Defining an Input Condition of the Type Symbol Value](#)
- [Fields: Input Condition Symbol Value](#)
- [Nested Symbol Evaluation](#)

Defining an Input Condition of the Type Symbol Value

➤ **To define an input condition that depends on a symbol value**

- 1 In the **Input Condition window**, select **Symbol value** from the **Type** section.

In the **Type specific settings** section you can enter the symbol to be compared and further parameters to specify the symbol.

The input fields available are described in [Fields: Input Condition Symbol Value](#).

- 2 When finished, choose **OK** to save your definitions and close the window.

Fields: Input Condition Symbol Value

The input fields of the **Type specific settings** for the type **Symbol value** in the **Input Condition window** are described in the following table:

| Field | Description |
|---------------------|---|
| Symbol | Valid symbol name. Predefined symbols can also be used. The value of this symbol, or a part of it, is to be compared with the given value. |
| Symbol table | Valid symbol table name. If you leave this field blank, the symbol search procedure starts with the active symbol table of the job. Otherwise, the active symbol table with this name is searched instead of the symbol table of the job. If the symbol is not found there or in the caller's symbol tables, the owner's symbol master table with this name is searched too. |

| Field | Description | | | |
|--|--|--|---|--|
| | See also Symbol Table Types and Symbol Search Order in the section <i>Symbol Table and Symbol Maintenance</i> . | | | |
| Version | Symbol table version. | | | |
| | Possible version names: | | | |
| | (current) | Current version at determination date. | | |
| | (nv) | Same version as network version. | | |
| | (svn) | Symbol table version of network. | | |
| | (svj) | Symbol table version of job. | | |
| | (unnamed) Unnamed version (without name). | | | |
| Symbol instance | Instance of the symbol table where to perform the symbol value check. | | | |
| | Valid selection options: | | | |
| | <table border="0"> <tr> <td>Check symbol in the active symbol table</td> <td>Perform symbol check in the active symbol table (default). This setting has no effect on the symbol tables SYSDBA/A and <i>owner/A</i>. They only exist as master symbol tables, and are therefore always checked as master symbol tables. (See also Symbol Table Types and Symbol Search Order in the section <i>Symbol Table and Symbol Maintenance</i>.)</td> </tr> <tr> <td>Check symbol in the master symbol table</td> <td>Perform symbol check in the master symbol table.</td> </tr> </table> | Check symbol in the active symbol table | Perform symbol check in the active symbol table (default). This setting has no effect on the symbol tables SYSDBA/A and <i>owner/A</i> . They only exist as master symbol tables, and are therefore always checked as master symbol tables. (See also Symbol Table Types and Symbol Search Order in the section <i>Symbol Table and Symbol Maintenance</i> .) | Check symbol in the master symbol table |
| Check symbol in the active symbol table | Perform symbol check in the active symbol table (default). This setting has no effect on the symbol tables SYSDBA/A and <i>owner/A</i> . They only exist as master symbol tables, and are therefore always checked as master symbol tables. (See also Symbol Table Types and Symbol Search Order in the section <i>Symbol Table and Symbol Maintenance</i> .) | | | |
| Check symbol in the master symbol table | Perform symbol check in the master symbol table. | | | |
| Position | Position of the substring of the symbol value to be checked. (Checked only if Format is set to A.) Possible values: 1 to 120 characters. | | | |
| Length | Length of the substring of the symbol value to be checked. (Checked only if Format is set to A.) Possible values: 1 to 120 characters. | | | |
| Format | Format in which the substring of the symbol value is to be checked against the comparison string. | | | |
| | Possible selection options: | | | |
| | A | Alphanumeric. | | |
| | D | Date in the format YYYYMMDD. See also Date and Time Formats . | | |
| | N | Numeric (zoned). | | |

| Field | Description | | | | | | | | | | | | |
|--------------------------|--|---------|-----------------------------------|----------|---|---------|---------------------------------------|----------|---|---------|-------------------------------------|----------|---|
| Symbol is | <p>Comparison operator.</p> <p>Specify a logical operator for the comparison of the defined symbol against the comparison string (see below).</p> <p>Possible selection options:</p> | | | | | | | | | | | | |
| | <table border="0"> <tr> <td>= or EQ</td> <td>Code is equal to specified value.</td> </tr> <tr> <td>>= or GE</td> <td>Code is greater than or equal to specified value.</td> </tr> <tr> <td>> or GT</td> <td>Code is greater than specified value.</td> </tr> <tr> <td><= or LE</td> <td>Code is lower than or equal to specified value.</td> </tr> <tr> <td>< or LT</td> <td>Code is lower than specified value.</td> </tr> <tr> <td><> or NE</td> <td>Code is different from specified value.</td> </tr> </table> | = or EQ | Code is equal to specified value. | >= or GE | Code is greater than or equal to specified value. | > or GT | Code is greater than specified value. | <= or LE | Code is lower than or equal to specified value. | < or LT | Code is lower than specified value. | <> or NE | Code is different from specified value. |
| = or EQ | Code is equal to specified value. | | | | | | | | | | | | |
| >= or GE | Code is greater than or equal to specified value. | | | | | | | | | | | | |
| > or GT | Code is greater than specified value. | | | | | | | | | | | | |
| <= or LE | Code is lower than or equal to specified value. | | | | | | | | | | | | |
| < or LT | Code is lower than specified value. | | | | | | | | | | | | |
| <> or NE | Code is different from specified value. | | | | | | | | | | | | |
| compared to | <p>Comparison string.</p> | | | | | | | | | | | | |
| <i>comparison string</i> | <p>In the input lines below compared to, enter the string or field to be compared with the substring of the symbol value.</p> <p>The strings are compared in the defined Format.</p> <p>Symbol replacement is possible in this field.</p> <ul style="list-style-type: none"> ■ If an activation escape character is used, the replacement is performed once during activation. A symbol replacement error is treated as a permanent error in this case. ■ If a submission escape character is used, the replacement is performed directly before each prerequisite check. This causes more system overhead. A symbol replacement error is treated as temporary error in this case. | | | | | | | | | | | | |

Nested Symbol Evaluation

The symbol value may contain other (nested) symbols, prefixed by both activation escape character and submission escape character.

Symbols prefixed by the activation escape character are evaluated only once, at job activation.

Symbols prefixed by the submission escape character are evaluated at each prerequisite check of the active job.

Input Condition: BS2000 User Switch

An input condition value can be dependent on the existence or non-existence of a BS2000 user switch. The Monitor checks for the user switch on the job's **execution node** until the condition is satisfied.

This section covers the following topics:

- [Defining an Input Condition of the Type User Switch](#)
- [Fields: Input Condition User Switch](#)

Defining an Input Condition of the Type User Switch

➤ To define an input condition that depends on a user switch

- 1 In the **Input Condition window**, select **User switch (BS2000)** from the **Type** section.

In the **Type specific settings** section, enter a user switch and BS2000 user ID.

The input fields available are described in [Fields: Input Condition User Switch](#).

- 2 When finished, choose **OK** to save your entries and close the window.

Fields: Input Condition User Switch

The input fields of the **Type specific settings** for the type **User switch (BS2000)** in the **Input Condition window** are described in the following table:

| Field | Description | |
|-----------------------|--|---|
| User Switch | Number of a user switch. | |
| BS2000 User ID | BS2000 user ID to which the specified user switch belongs. | |
| Must exist | Possible check box settings: | |
| | <i>checked</i> | The user switch must exist as a prerequisite to job submission. |
| | <i>unchecked</i> | The user switch must not exist as a prerequisite. |

Input Condition: BS2000 Job Variable

An input condition can be dependent on a comparison with the contents of a BS2000 job variable. The Monitor checks for the job variable on the job's **execution node** until the condition is satisfied.

This section covers the following topics:

- [Defining an Input Condition of the Type Job Variable](#)
- [Fields: Input Condition Job Variable \(BS2000\)](#)
- [Using Symbols](#)

Defining an Input Condition of the Type Job Variable

➤ **To define an input condition that depends on a job variable**

- 1 In the **Input Condition window**, select **Job variable (BS2000)** from the **Type** section.

In the **Type specific settings** section, enter a job variable and further parameters to specify the input condition.

The input fields are described in [Fields: Input Condition Job Variable \(BS2000\)](#).

- 2 When finished, choose **OK** to save your entries and close the window.

Fields: Input Condition Job Variable (BS2000)

The input fields provided for a job variable in the **Type specific settings** section of the **Input Condition window** are described in the following table:

| Field | Description |
|---------------------|--|
| Job variable | <p>Enter the name of a valid BS2000 job variable.</p> <ul style="list-style-type: none"> ■ If the specified job variable does not exist, a content comparison is done by Entire Operations, when the Monitor detects that the job variable has been created. ■ If a job variable does not exist, a job cannot be declared “dummy due to condition”. Instead, the Entire Operations Monitor waits until the job variable exists and then performs the check. ■ If the job variable is specified without an explicit user ID, the job default BS2000 user ID is used as prefix. ■ Symbol replacement: see Using Symbols. |
| Position | <p>Enter the position of the substring of the job variable value to be checked. Possible values: 1 to 253.</p> |

| Field | Description | | | | | | | | | | | | |
|--|---|---------|-----------------------------------|----------|---|---------|---------------------------------------|----------|---|---------|-------------------------------------|----------|---|
| Length | Enter the length of the substring of the job variable value to be checked. Possible values: 1 to 253. | | | | | | | | | | | | |
| Format | Specify the format in which the substring of the job variable value is to be checked against the comparison string. Possible selection options: <table border="1" data-bbox="402 457 1479 548"> <tr> <td>A</td> <td>Alphanumeric.</td> </tr> <tr> <td>N</td> <td>Numeric (zoned).</td> </tr> </table> | A | Alphanumeric. | N | Numeric (zoned). | | | | | | | | |
| A | Alphanumeric. | | | | | | | | | | | | |
| N | Numeric (zoned). | | | | | | | | | | | | |
| Variable is | This is the comparison operator. Specify a logical operator for the comparison of the defined job variable substring against the comparison string (see below). Possible selection options: <table border="1" data-bbox="402 751 1479 1024"> <tr> <td>= or EQ</td> <td>Code is equal to specified value.</td> </tr> <tr> <td>>= or GE</td> <td>Code is greater than or equal to specified value.</td> </tr> <tr> <td>> or GT</td> <td>Code is greater than specified value.</td> </tr> <tr> <td><= or LE</td> <td>Code is lower than or equal to specified value.</td> </tr> <tr> <td>< or LT</td> <td>Code is lower than specified value.</td> </tr> <tr> <td><> or NE</td> <td>Code is different from specified value.</td> </tr> </table> | = or EQ | Code is equal to specified value. | >= or GE | Code is greater than or equal to specified value. | > or GT | Code is greater than specified value. | <= or LE | Code is lower than or equal to specified value. | < or LT | Code is lower than specified value. | <> or NE | Code is different from specified value. |
| = or EQ | Code is equal to specified value. | | | | | | | | | | | | |
| >= or GE | Code is greater than or equal to specified value. | | | | | | | | | | | | |
| > or GT | Code is greater than specified value. | | | | | | | | | | | | |
| <= or LE | Code is lower than or equal to specified value. | | | | | | | | | | | | |
| < or LT | Code is lower than specified value. | | | | | | | | | | | | |
| <> or NE | Code is different from specified value. | | | | | | | | | | | | |
| compared to <i>comparison string</i> | In the input lines below compared to , enter the string or field to be compared with the substring of the job variable value. The strings are compared in the defined Format . The content of this field is compared with the substring of the job variable value, or it is inserted into the substring of the job variable value. The content is treated as blank if ' ' (2 single quotes, no space) or ' ' (single quote, space, single quote) is defined. The comparison is made in the defined format. Symbol replacement: see Using Symbols . | | | | | | | | | | | | |
| Password | (Optional field) If the job variable is read password-protected, specify the password here. | | | | | | | | | | | | |

Using Symbols

Resolving symbols in the job variable name produces the same behavior as resolving symbols in the job variable value:

- If the activation escape character is used:
 - The symbol is replaced once during the job activation.
 - The active job variable name is the resolved string.
- If the submission escape character is used:
 - The symbol is resolved during each performed prerequisite check.
 - This allows symbol setting shortly before the usage.

Note: The submission escape character option causes more system overhead.

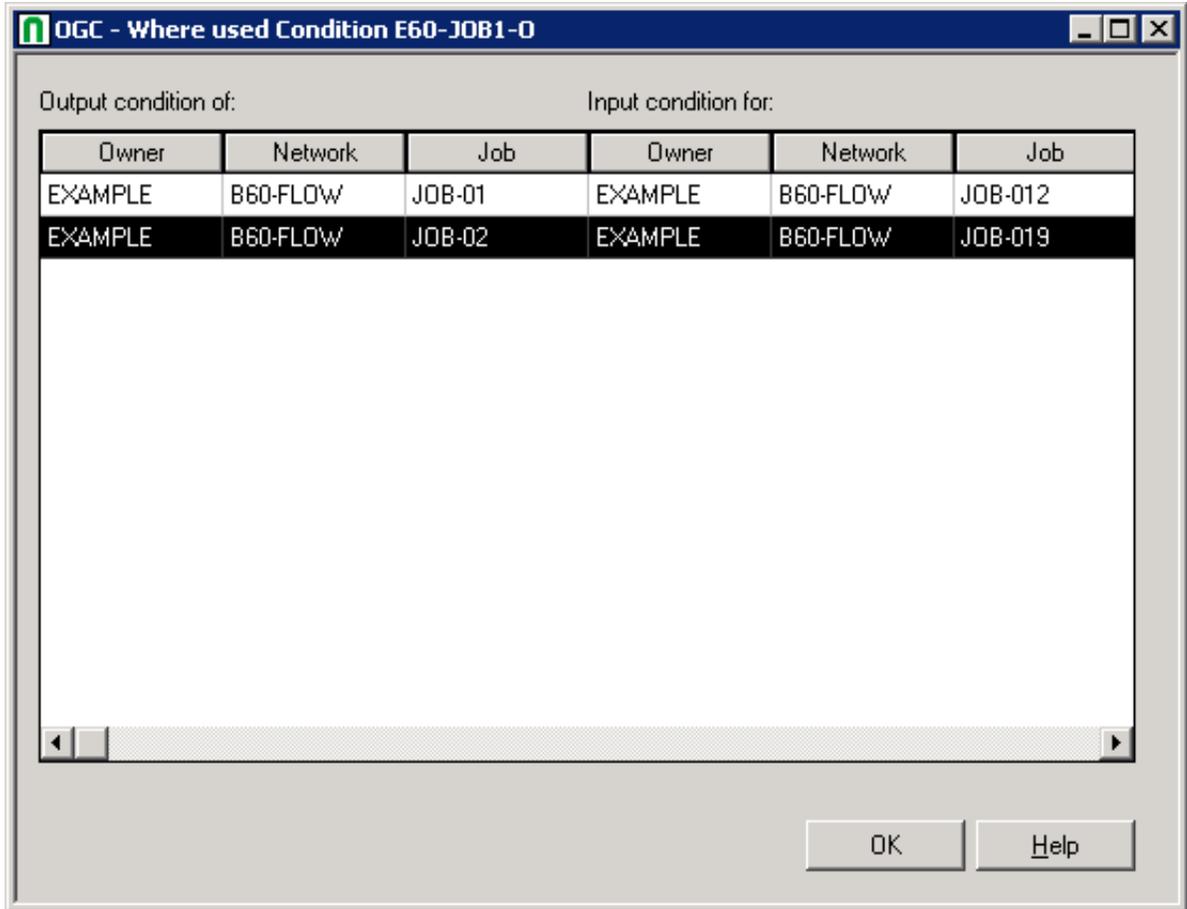

Listing Jobs Linked to an Input Condition

You can list jobs that also use a selected input condition as an input condition, or that use this input condition as an output condition (see also [Defining Output Condition Actions](#)).

➤ To list jobs linked to a condition

- From the table on the [tabbed page Input Conditions](#), select an input condition and choose **Where Used**.

A **Where used Condition** window similar to the example below opens:

The window displays the name of the selected condition and two lists of jobs:

- one lists the jobs which use the condition as input condition;
- the other lists the jobs which use the condition as output condition.

The jobs are listed according to owner, network and job name.

 **Note:** For an active input condition, a similar window opens: see the [Active Usage Condition](#) window described in the section *Active Job Networks*.

Deleting an Input Condition Definition

➤ **To delete an input condition**

- 1 On the **tabbed page Input Conditions**, select an input condition in the table and choose **Delete**.
- 2 Select an input condition in the table.
- 3 Choose the **Delete** button.

The input condition is now deleted for this job master.

35 Handling Prerequisite Resources for a Job

- Use of Resources and Resource Allocation 384
- Listing Prerequisite Resources Defined for a Job 388
- Viewing the Usage of a Prerequisite Resource 389
- Displaying, Modifying and Adding a Prerequisite Resource Definition 390
- Columns and Fields: Prerequisite Resource Definitions 391
- Deleting a Prerequisite Resource Definition 392

The functions described in this section are used to list and define single or multiple resources for a job that are a prerequisite for submitting the job.

Related Topics:

- [Resources](#) (maintenance of resource masters) - *Administration* documentation
- [Viewing and Modifying Resources Used by Active Jobs](#) - *Active Job Networks*

Use of Resources and Resource Allocation

You can specify certain amounts of a defined resource master as a prerequisite for job submission. Entire Operations does not submit the job until the specified amount is available.

Before you can define a resource as a prerequisite for a job, it must be defined as resource master to Entire Operations. You define resources to Entire Operations by using the maintenance functions of the **Resource Master** metanode described in the *Administration* documentation.

Resources can be

- Quantitative or absolute;
- Reusable or not reusable.

Some examples of resources are listed below:

| Resource | Type |
|--------------------------|----------------------------|
| Print forms | Quantitative, not reusable |
| Main storage | Quantitative, reusable |
| Line to a remote machine | Absolute |
| Availability of a device | Absolute |

This section covers the following topics

- [Scope of Resource Allocation](#)
- [Ordering of Resource Allocation](#)
- [Resource Amount Determination by User Exits](#)
- [Periods of Resource Allocation and Deallocation](#)
- [Resource Allocation Modes](#)

- [Resource Deallocation Modes](#)

Scope of Resource Allocation

Prerequisite resources are allocated for all **job types** (including) and for all kinds of temporary dummy jobs. You can set an **allocation mode** to disallow resource allocation for temporary dummy jobs.

Ordering of Resource Allocation

The following rules apply for the ordering of resource allocations:

1. If a resource is requested by the same owner, network, job, but different runs (at the same time), the active job with the lowest **run number** or earliest activation time will get the resource first.
2. If several different jobs of one active network or of several active networks wait for the same resource: The available quantity of the resource will be allocated to as many as possible jobs in parallel, but under the restriction of item 1.

If a resource waiter with a higher priority is found during a prerequisite resource check, the message `Res. resource available, other jobs have priority` will be written to the log. It is followed by `Res. resource - waiting with higher priority:` and one or several lines with context information.

Resource Amount Determination by User Exits

The available amount of a resource can be determined by the usage of an exit. A resource master determination exit (described in the *Administration* documentation) will be invoked by the Entire Operations Monitor before prerequisite resource checks.

Resource master amounts can be modified by API calls. Note that this is possible only if the amount is not determined by a resource master determination exit. For more information, see [Handling of Resource Allocations \(NOPURE2N\)](#) in the section *List of Available Entire Operations API Routines*.

Periods of Resource Allocation and Deallocation

A resource is usually allocated for the duration of job execution.

If you want to allocate a resource for a longer time, you can change the resource deallocation mode set for a job as described in [Resource Deallocation Modes](#).

The reasons and rules for resource allocation or deallocation are described in the following section:

- **Retention period of condition reached**

A resource is deallocated if the retention period for an active condition is reached.

- **Deallocation mode set**

If you want to allocate a resource for a longer time, you can change the resource deallocation mode set for a job as described in [Resource Deallocation Modes](#).

■ **Deactivated network or job**

If an active network or job is deactivated, all resources allocated by it are deallocated too.

This is performed regardless of the defined [deallocation mode](#).

This means that even resources with deallocation mode `K` (keep until explicit release) are released in such cases.

■ **Database cleanup performed**

Resources are deallocated when an automatic cleanup of the active database is performed (see also *Defaults for Time Ranges* described in the *Administration* documentation).

■ **Allocation kept for jobs that ended not ok**

It is possible to prevent a resource from deallocation if a job ended `not ok`. This can be used, for example, to keep a resource during a recovery for an unsuccessful run.

See the option **Deallocate if job not ok** in the [Resource Prerequisite window](#) described in [Columns and Fields: Prerequisite Resource Definitions](#) in the section *Job Maintenance*.

■ **Forced deallocation**

You can force freeing of a resource allocation.

All current resource allocations can be inquired in usage lists. From these active resource usage lists it is possible to force the deallocation of a given resource allocation.

For further information, see *Listing Jobs Currently Using a Resource* in the section *Resources* in the *Administration* documentation.

Use this feature with care. Be aware that one or several active jobs may be started immediately, which were way for this resource.

■ **Allocation or deallocation determined by API**

Resources can be allocated for a job by an [API call](#). These additionally allocated resources are handled in the same way as defined prerequisite resources.

Resources can be deallocated by [API calls](#). Preliminary releases of resources are allowed for deallocation modes.

For more information, see [Handling of Resource Allocations \(NOPURE2N\)](#) in the section *List of Available Entire Operations API Routines*.

All resource allocations and deallocations are logged (see also the section [Log Information](#)).

Resource Allocation Modes

This section describes the resource allocation modes that can be set for the prerequisite resource defined for a job (see also *Displaying, Modifying and Adding a Prerequisite Resource Definition*). Allocation modes are also indicated on resource lists.

| Mode/Selection Option | Explanation |
|--|--|
| A Always | Allocate the resource (default). |
| T Only if the active job does not become a temporary dummy job | Do not allocate the resource if the job executes as a temporary dummy job . |

Resource Deallocation Modes

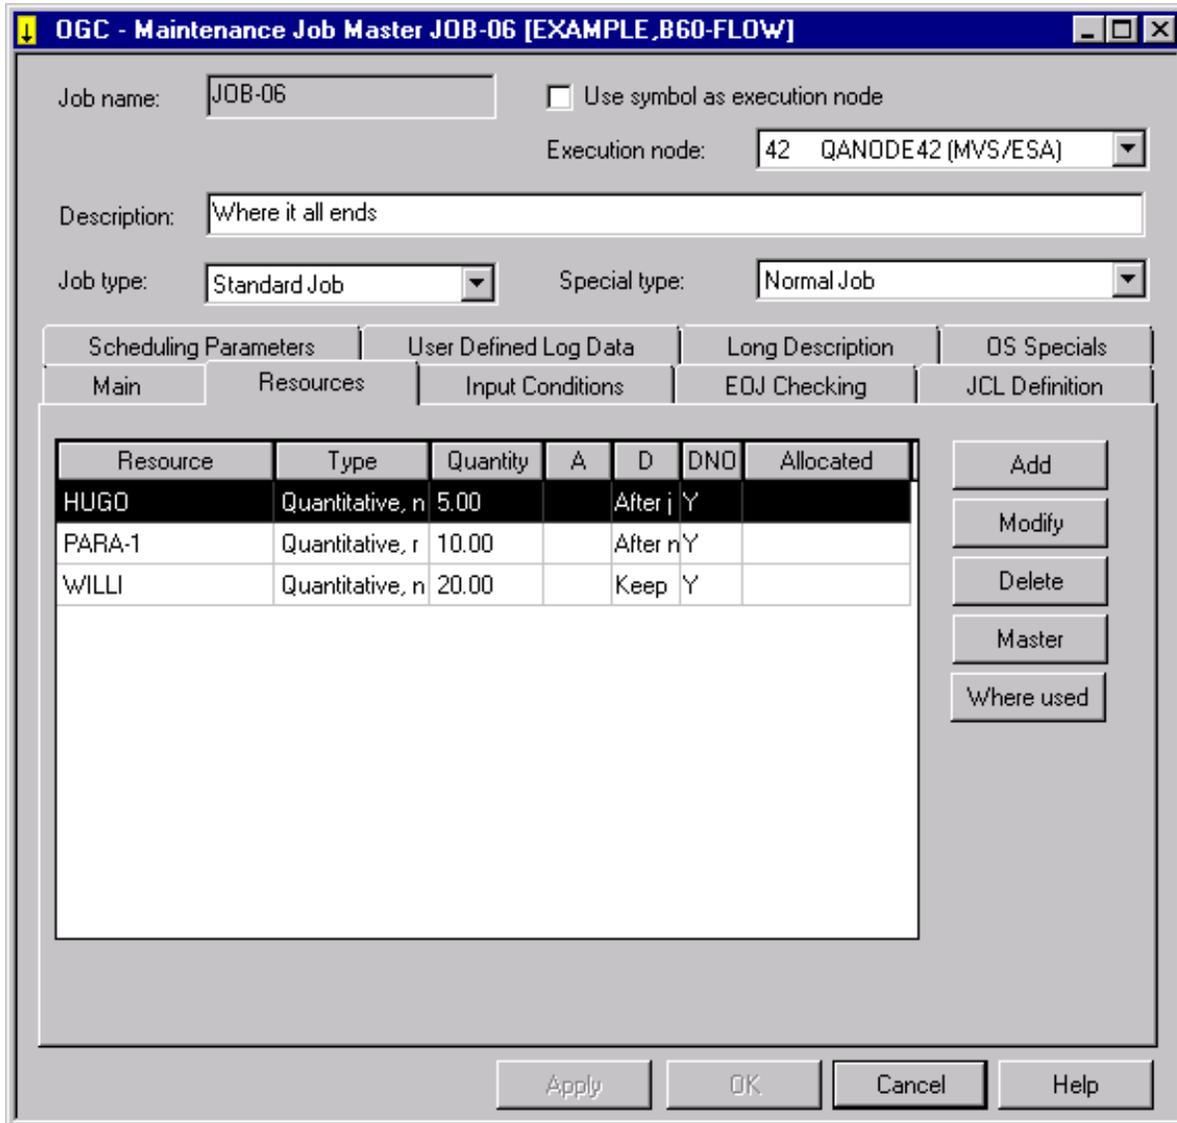

This section describes the resource deallocation modes that can be set for the prerequisite resource defined for a job (see also *Displaying, Modifying and Adding a Prerequisite Resource Definition*). Deallocation modes are also indicated on resource lists.

| Mode/Selection Option | Explanation |
|--|--|
| J After job termination | Release resource at job termination (default). The resource is released when the allocating job terminates. |
| N After network termination | Release resource at network termination. The resource is released when the Entire Operations Monitor detects that all jobs of a job network are terminated. The resource is released also if a currently executing network is being deactivated. Note: To override the automatic detection of network ended ok, you must set the reserved condition NET-END-OK at least once in your network. |
| E Keep until network termination | Release resource at network termination, but release earlier after an erroneous job. The resource is kept until network termination. If any job ends not ok, it is released immediately after this job's termination. |
| K Keep until explicit release | Keep resource until manual release. The resource is not released automatically at job or network termination. If the retention period for active conditions is reached, the resource is released automatically. |

Listing Prerequisite Resources Defined for a Job

> To list all prerequisite resources defined for a job

- In the **Maintenance Job Master window**, open the tabbed page **Resources**:

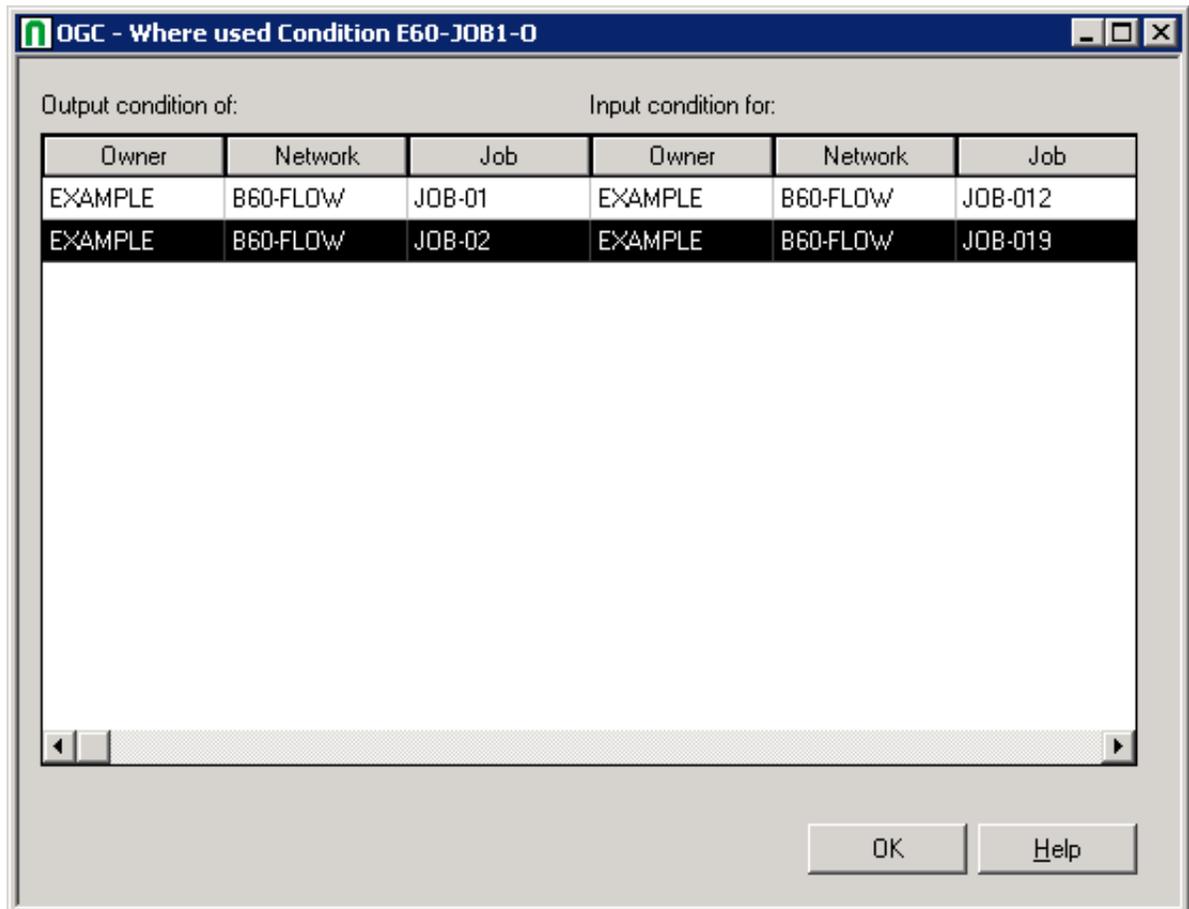

The table in the window lists all resources defined as prerequisites for the job. The table columns are described in [Columns and Fields: Prerequisite Resource Definitions](#).

Viewing the Usage of a Prerequisite Resource

➤ To find out where a predefined resource is used

- 1 From the table on the **Resources** page, select the required resource.
- 2 Choose **Where Used**.

A **Where used Condition** window similar to the example below opens:

If invoked for a job master definition: Shows the usage of this resource as a prerequisite in all job master definitions.

If invoked for an active job definition: Shows the current usage of this resource by active jobs.

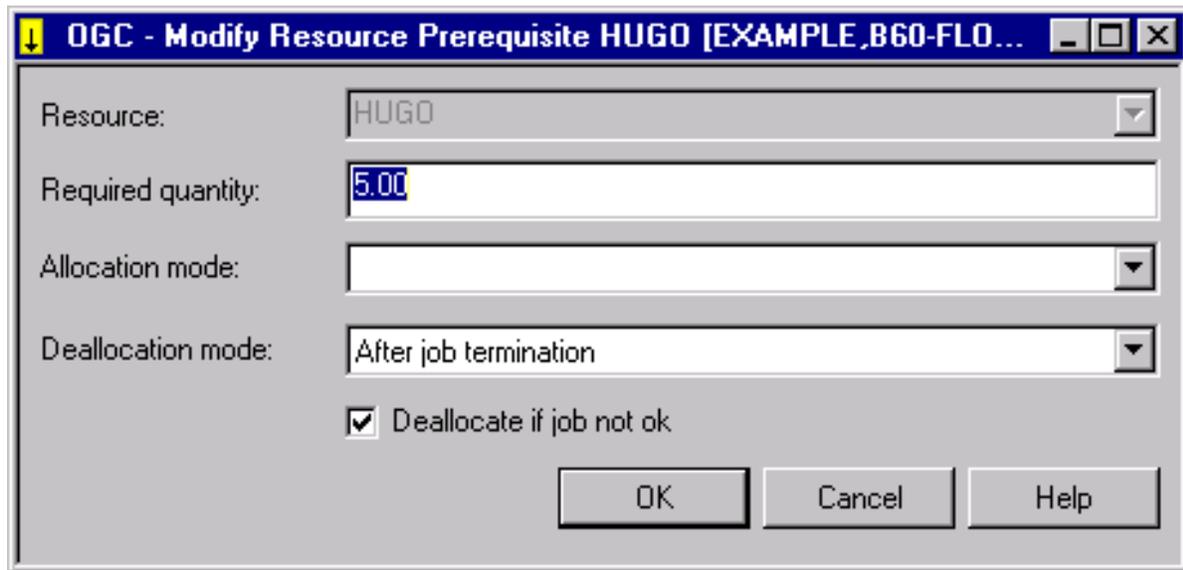

The fields and columns contained in the window correspond to the fields and columns of the **Defined in Jobs** page. They are described in *Field and Columns: Resource Defined in Jobs* in the section *Resources* in the *Administration* documentation.

Displaying, Modifying and Adding a Prerequisite Resource Definition

> To display or modify the prerequisite resource definition of a job

- 1 From the table on the [tabbed page Resources](#), select the resource definition you want to view or change and choose **Modify**.

A **Resource Prerequisite** window similar to the example below opens:

- 2 Make your definitions. The input fields and selection options available in the window are described in [Columns and Fields: Prerequisite Resource Definitions](#).
- 3 Choose **OK** when you are finished.

> To add a prerequisite resource definition for a job

- 1 On the [tabbed page Resources](#), choose **Add**.

A **Resource Prerequisite window** similar to the previous example opens.

- 2 Make your definitions. The input fields and selection options available in the window are described in [Columns and Fields: Prerequisite Resource Definitions](#).
- 3 Choose **OK** when you are finished.

Columns and Fields: Prerequisite Resource Definitions

The following table explains the columns on the [Resources page](#) and the corresponding input fields/options of the [Resource Prerequisite window](#):

| Column | Input Field | Description | |
|------------------|---------------------------------|--|---|
| Resource | Resource name | Name of the resource as defined in Entire Operations and listed in the Resource Master List window (see <i>Resources</i> in the <i>Administration</i> documentation). | |
| T | n/a | Resource type as defined for the resource master: see the description of the Type field in the section <i>Resources</i> (<i>Administration</i> documentation). | |
| Quantity | Required Quantity | Resource quantity required for job execution. Input field: Enter the resource quantity required for job execution. Entire Operations does not submit the job until this amount of resource is available. | |
| A | Allocation Mode | Allocation mode of this prerequisite resource: see Resource Allocation Modes . | |
| D | Deallocation Mode | Deallocation mode of this prerequisite resource: see Resource Deallocation Modes . | |
| DNO | Deallocate if Job not ok | Applies to deallocation mode After job termination only. | |
| | | Deallocate if job is not ok: | |
| | | Y | The resource is always deallocated after job termination, even if the job ended not ok. |
| | | N | The resource is not deallocated if the job ended not ok. (However, the job will still be deallocated at network termination.) |
| | | Input option: select this check box if you want to deallocate the job. | |
| Allocated | Allocated | Applies to active prerequisite resources only. Date and time when the resource was allocated for the current job. If the resource has not yet been allocated or if it has already been deallocated, this field is empty. See also Date and Time Formats . | |

Deleting a Prerequisite Resource Definition

➤ To delete a resource definition

- From the table on the [tabbed page Resources](#), select the resource definition you want to remove and choose **Delete**.

The selected resource is deleted for this job master.

Defining End-of-Job checking and actions means instructing Entire Operations what actions to trigger after a job has terminated. The triggered action is referred to as an End-of-Job action.

End-of-Job checking and actions consists of two steps:

1. Analysis of job results (determination of End-of-Job status);
2. Triggering of appropriate system actions.

The End-of-Job action depends on the status of the whole job or any other event which can be checked by Entire Operations on termination. The status of the job on termination is determined by the occurrence of certain events during job execution which Entire Operations can check.

Before Entire Operations can check for an event, it must be defined to the system, together with instructions as to the action to be triggered. If no events are specified, Entire Operations performs End-of-Job checking automatically using **system defaults**.

This chapter describes the End-of-Job (EOJ) checking functions used to check the job status on job completion and take appropriate action, if required.

Related Topics:

- [Passing Files to Entire Output Management](#).
- For conceptual information, see *Events and Actions: End-of-Job Checking* in the *Concepts and Facilities* documentation.

Events

In the terminology of Entire Operations, an event is the occurrence of a defined situation which is recognized during the End-of-Job analysis. Entire Operations automatically triggers system action, depending on the occurrence of events during job processing.

If you do not specify any event, Entire Operations provides a default event expressed as `job OK` or `job not OK`, depending on whether a received condition code is greater or less than a default condition code, or, for BS2000, whether certain system messages are received.

Some examples of possible defined events are:

- Exit code of a UNIX job equals 2;
- STEP2 of JOB1 ends with a condition code greater than 8;
- No job step ends with a condition code greater than 0;
- A defined message appears in the job SYSOUT;
- A database or file contains or does not contain certain expected data;
- The result of a user exit (expressed by its return code).

- A job variable contains certain expected data (BS2000).

Event Check Method

Events are checked on a check OK/not OK basis. End-of-Job actions can be triggered by:

- the result of a single event check (for example, a job step checking in z/OS);
- the result of all End-of-Job checks (including the default checks), which always causes either the event job OK (**All Checks ok**) or job not OK (**Any Check not ok**) to occur.

Both of these event definitions are always predefined for every job.

In the latter case, you can define two sets of actions:

- one set is performed if all checks finished OK (**All Checks ok**, i.e., job OK);
- the other is performed if at least one check finished not OK (**Any Check not ok**, i.e., job not OK).

All Checks ok and **Any Check not ok** are mutually exclusive parameters to be checked.

All events can be combined as required. You can specify up to 30 different event checks for a job.

This section covers the following topics:

- [End-of-Job Checks for Operating Systems and Job Types](#)
- [Job SYSOUT Check](#)
- [Retrying End-of-Job Checking](#)

End-of-Job Checks for Operating Systems and Job Types

The following table provides an overview of the availability of End-of-Job checks for the supported operating systems and [job types](#):

| End-of-Job Check | z/OS | z/VSE | BS2000 | UNIX | Windows | SAP |
|-------------------|------|-------|--------|------|---------|-----|
| Termination Codes | * | * | | | | |
| Job Variables | | | * | | | |
| User Exit | * | * | * | * | * | |
| String Search | * | * | * | * | * | * |
| User Switch | | | * | | | |
| Exit Code | | | | * | * | |

An asterisk (*) indicates that the End-of-Job check is available for the operating system or job type. These checks are described later in this section.

Job SYSOUT Check

- On z/OS: The job result check will be retried by the Monitor up to 10 times, when the message Job disappeared from Spool Queue appears.

The wait interval between SYSOUT read attempts is constantly at least 30 seconds (not to be confused with the Monitor wait time, because it may be very short).

- On BS2000: Entire Operations can only check job SYSOUT if it is assigned to a file. JCL of jobs that are to run under Entire Operations control must therefore not contain SYSOUT assignments to **dummy, primary* or to a temporary file, otherwise no End-of-Job checking is possible.

See also [Defining SYSOUT Actions](#).

Retrying End-of-Job Checking

For the operating system z/OS the following applies:

- In case of incomplete SYSOUT, the SYSOUT reading will be retried 10 times, with intervals not shorter than 30 seconds. Interval can be longer if the monitor task wait time is longer.

Possible End-of-Job Actions

End-of-Job actions refer to all actions performed after termination of a job. These actions can be performed automatically by Entire Operations or manually by the user.

All End-of-Job actions can be defined for an event (job step) or at the job level.

For each of the user-specified or default events, you can define how Entire Operations is to act.

Possible End-of-Job actions are:

- Set/reset output conditions to continue the job flow.

See [Defining Output Condition Actions](#).

- Set/modify symbol values.

See [Defining Actions for Symbol Value Modification](#).

- Release resources held by a job.

See [Defining Release Actions for Kept Resources](#).

- Set/reset/modify job variables (BS2000 only).

See [Defining Actions for Modifying Job Variable Values](#).

- Execute End-of-Job action user exits.

See *Defining Action User Exits*.

- Deactivate job.

See *Defining Other Actions: Deactivate Job Automatically*.

- Activate other job networks or single jobs.

See *Defining Network and Job Activation Actions*.

- Start job recovery.

See *Defining Recovery Actions*.

- Handle job SYSOUT data.

See *Defining SYSOUT Actions*.

- Pass output files to Entire Output Management.

See *Passing Files to Entire Output Management*.

- Send message to user or console with information about any abnormal event or pending condition.

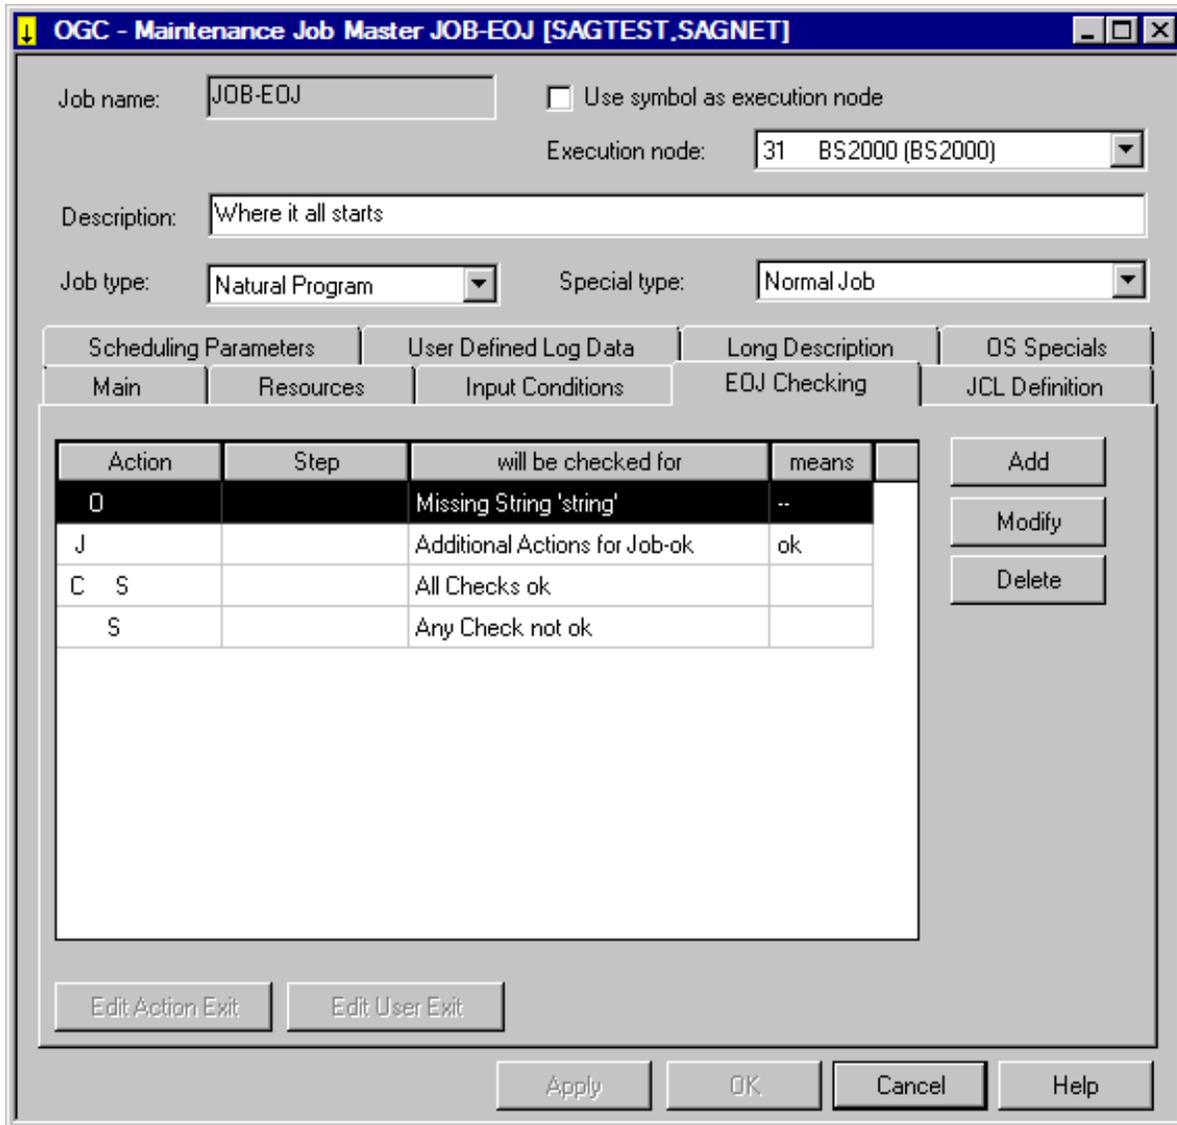

See *Defining Notification Messages*.

Only one action of the same type can be defined for an event (except in the case of output conditions). If you need several actions of the same type for the event `job OK` or `job not OK`, you can define these by adding an **Add. Job-ok, Job-not-ok** event.

Displaying End-of-Job Events and Actions

➤ To view End-of-Job events and actions defined for a job

- In the **Job Master** window, open the tabbed page **EOJ Checking** as shown in the following example:

The page lists all End-of-Job actions and events defined for the selected job.

The **columns** and **functions** available on the page are described in the relevant sections.

This section covers the following topics:

- [Columns and Rows: End-of-Job \(EOJ\) Checking and Actions](#)
- [Action Indicators: EOJ Checking Page](#)

- [Functions: EOJ Checking Page](#)

Columns and Rows: End-of-Job (EOJ) Checking and Actions

The [tabbed page EOJ Checking](#) provides the following columns:

| Column/Row | Description | | | | | | | | | | | | | | | | | | | | | |
|----------------------------|---|--|----------------------|------|----------------------------------|------------------------|---|---|----------------------|-----|---|-----------------|-------------------|---|------------------------------------|--|---|--------------------------------|---------------------------------|---|--|-----------------------------|
| Action | <p>Summary of defined actions for the event.</p> <p>Each character listed in this column represents an action defined for the event.</p> <p>All characters possibly shown here are listed in Action Indicators: EOJ Checking Page.</p> | | | | | | | | | | | | | | | | | | | | | |
| Step | <p>Applies to z/OS only.</p> <p>Step name in JCL (ANYSTEP means all steps).</p> | | | | | | | | | | | | | | | | | | | | | |
| will be checked for | Event to be checked (condition code, system code, user abend code, system message, etc.). | | | | | | | | | | | | | | | | | | | | | |
| means | <p>Event status after the check:</p> <table border="1"> <tr> <td>ok</td> <td>All checks ended OK.</td> </tr> <tr> <td>n.ok</td> <td>At least one check ended not OK.</td> </tr> <tr> <td>--</td> <td>Event has no influence on the job result. (Corresponds to No influence.)</td> </tr> </table> <p>See also Handling End-of-Job Actions.</p> | ok | All checks ended OK. | n.ok | At least one check ended not OK. | -- | Event has no influence on the job result. (Corresponds to No influence .) | | | | | | | | | | | | | | | |
| ok | All checks ended OK. | | | | | | | | | | | | | | | | | | | | | |
| n.ok | At least one check ended not OK. | | | | | | | | | | | | | | | | | | | | | |
| -- | Event has no influence on the job result. (Corresponds to No influence .) | | | | | | | | | | | | | | | | | | | | | |
| OA | <p>This column only appears on the EOJ Checking page in the Maintenance Job Active window of an active job.</p> <p>This column only contains entries if an event occurred during job execution.</p> <p>The entries under O indicate the status of the event check, the entries under A indicate whether the action defined for the event was performed:</p> <table border="1"> <thead> <tr> <th>Entry</th> <th>O</th> <th>A</th> </tr> </thead> <tbody> <tr> <td><i>blank</i></td> <td>Event was not checked.</td> <td>No action performed.</td> </tr> <tr> <td>-</td> <td>Event did not occur.</td> <td>n/a</td> </tr> <tr> <td>+</td> <td>Event occurred.</td> <td>Action performed.</td> </tr> <tr> <td>E</td> <td>Error occurred during event check.</td> <td>One or more actions performed erroneously.</td> </tr> <tr> <td>M</td> <td>Event definition was modified.</td> <td>Action definition was modified.</td> </tr> <tr> <td>E</td> <td>Error occurred during the event check.</td> <td>One or more actions failed.</td> </tr> </tbody> </table> | Entry | O | A | <i>blank</i> | Event was not checked. | No action performed. | - | Event did not occur. | n/a | + | Event occurred. | Action performed. | E | Error occurred during event check. | One or more actions performed erroneously. | M | Event definition was modified. | Action definition was modified. | E | Error occurred during the event check. | One or more actions failed. |
| Entry | O | A | | | | | | | | | | | | | | | | | | | | |
| <i>blank</i> | Event was not checked. | No action performed. | | | | | | | | | | | | | | | | | | | | |
| - | Event did not occur. | n/a | | | | | | | | | | | | | | | | | | | | |
| + | Event occurred. | Action performed. | | | | | | | | | | | | | | | | | | | | |
| E | Error occurred during event check. | One or more actions performed erroneously. | | | | | | | | | | | | | | | | | | | | |
| M | Event definition was modified. | Action definition was modified. | | | | | | | | | | | | | | | | | | | | |
| E | Error occurred during the event check. | One or more actions failed. | | | | | | | | | | | | | | | | | | | | |

Action Indicators: EOJ Checking Page

The character(s) shown in the **Action** column of the **EOJ Checking page** indicate the action(s) that have been defined for the event. For example: PSU indicates that a description (P), a SYSOUT action (S) and a notification message (U) have been defined for the event.

| Action Indicator | Action Indicated |
|------------------|---|
| A | Job or job network activated. |
| C | Output condition defined. |
| J | Job variable defined. |
| L | Kept resource released. |
| O | Other actions defined. |
| P | Description of event exists. See also <i>Creating and Viewing Online Documentation for Events</i> . |
| R | Recovery action defined. |
| S | SYSOUT action defined. |
| T | SYSOUT or other files passed to Entire Output Management. |
| U | User message defined. |
| X | Action user exit defined. |
| Y | Symbol or symbol settings modified. |

Functions: EOJ Checking Page

The following functions are available for a table item selected on the **EOJ Checking page**:

| Function | Description |
|-------------------------|--|
| Add | Define a new End-of-Job event and action(s). See <i>Adding and Modifying an Event Definition</i> . |
| Modify | Edit the selected End-of-Job event and action(s). See <i>Adding and Modifying an Event Definition</i> . |
| Delete | Delete the selected End-of-Job event and action(s). |
| Edit Action Exit | Edit the action user exit to be executed if the selected event occurs. This command is only available if you are authorized to modify the selected user exit. See also <i>User Exits for End-of-Job Checking and Actions</i> in the section <i>User Exits</i> . |
| Edit User Exit | Edit the user exit specified for the selected checking user exit. This command is only available if you are authorized to modify the selected user exit. See also <i>User Exits for End-of-Job Checking and Actions</i> in the section <i>User Exits</i> . |

Adding and Modifying an Event Definition

➤ To add or modify an End-of-Job (EOJ) check and action definition

- 1 In the **Job Master** window, open the tabbed page **EOJ Checking**.
- 2 Choose **Add** or **Modify** depending on whether a definition already exists.

An **EOJ checking** window similar to the example below opens:

The input fields and tabs provided in the **EOJ checking** window depend on the operating system (here: BS2000) of the execution node and the **Event type** (here: **String**) specified for the job. All fields and tabs that can be available in the window are explained in [Fields: EOJ Checking Window](#).

- 3 Make your definitions and choose **OK** to save your entries.

This section covers the following topics:

- [Fields: EOJ Checking Window](#)

Fields: EOJ Checking Window

This section describes the fields and tabs contained in the [EOJ checking window](#).

The fields in the **Event type**, **Means** and **Event type specific settings** group boxes are used to define the job event.

The fields on the tabbed pages in the lower window section are used to define the action to be taken if the event occurs. The following table indicates when a field in a group box has a corresponding field on a tabbed page.

Note: The fields and tabbed pages available to define an event or action depend on the operating system of the execution node and the **Event type** selected for the job. This is also indicated in the table below.

| Field Page | Description |
|--------------|---|
| Event type | <p>A - Add. Job-ok, Job-not-ok:</p> <p>Additional definition for All Checks ok or Any Check not ok to execute multiple End-of-Job actions of the same type.</p> <p>This event is required to define several actions of the same type for the event <code>job ok</code> or <code>job not ok</code>.</p> <p>Note: You can use these additional event definitions to set conditions, but it is not recommended, because they are not evaluated for the display of job dependencies.</p> <p>See also Handling End-of-Job Actions and Example of an Additional Job OK/not OK Event (Event Type A).</p> |
| | <p><small>(z/OS and z/VSE only)</small></p> <p>C - Termination Code:</p> <p>Termination code received during job execution (job step). For possible values, see the field Event field.</p> <p>See also Example of a Termination Code Event (Event Type C).</p> |
| | <p><small>(BS2000, UNIX and Windows only)</small></p> <p>J - Job Special Event:</p> <p>Special event during job execution. When such an event occurs this always means <code>Job not ok</code>.</p> <p>This event occurs if an operating system abend or hardware failure occurs during job execution. This is always used when a job did not run on LOGOFF (job ended normally) or ABEND (job interrupted with error). The defined actions are taken after the start of the Monitor.</p> |

| Field Page | Description | | |
|--------------|---|-----------|-----------|
| | <p>See also Example of a Job Special Event (Event Type J).</p> <p>R - User Exit:</p> <p>Job SYSOUT is to be checked by a user exit.</p> <p>See also Example of a User Exit Event (Event Type R).</p> <p>S - String:</p> <p>Occurrence of a specific string in the job SYSOUT or a specified file.</p> <p>See also the field String and Example of a String Event (Event Type S).</p> <p><small>(BS2000 only)</small></p> <p>U - User Switch:</p> <p>Event depends on a user switch.</p> <p>See also Example of a User Switch Event (Event Type U).</p> <p><small>(BS2000 only)</small></p> <p>V - Job Variable:</p> <p>Event depends on the contents of a job variable.</p> <p>The input fields available to define a job variable are explained in Fields: Job Variable Definitions (BS2000 only).</p> <p>See also Example of a Job Variable Event (Event Type V).</p> <p><small>(UNIX and Windows only)</small></p> <p>X - Exit Code:</p> <p>Exit code check. The result of the event comes from the exit code of a script under UNIX or Windows or from the exit code of a program executable under Windows.</p> <p>Specify a logical operator and an exit code to compare the received exit code with the specified values.</p> <p>Note: A standard check for the exit code can be defined in the Entire Operations defaults.</p> <p>If a SYSOUT file read error occurs while the Monitor is trying to read the exit code from the job SYSOUT, this error is treated as a temporary error. The Monitor attempts to read the exit code up to 10 times. The time between the attempts is equal to the Monitor wait time. If there is still no success after 10 attempts, the job is set to the status permanent error.</p> <p>See also Example of an Exit Code Event (Event Type X).</p> | | |
| Means | <p>Specifies the event check status if the defined event occurs.</p> <p>Possible check-box settings:</p> <table border="1" data-bbox="446 1822 1481 1864"> <tr> <td data-bbox="446 1822 938 1864">OK</td> <td data-bbox="938 1822 1481 1864">Check OK.</td> </tr> </table> | OK | Check OK. |
| OK | Check OK. | | |

| Field Page | Description | |
|---|--|---|
| | Not OK | Check not OK. |
| | No influence | No effect on the job result. |
| | See also Handling End-of-Job Actions . | |
| Event type specific settings: | | |
| Stepname <small>(z/OS and z/VSE only)</small> | <small>(z/OS and z/VSE only)</small> | |
| | JCL step to be checked for the return code specified in the Operator and fields. | |
| | Special step names: | |
| | ANYSTEP (or /ANYSTEP) | Event occurs if the definition is true for any step of the jobs. |
| | MAXCC (or /MAXCC) | Event occurs if it is true for the maximum termination code (condition code) of the job. |
| | Note: In z/VSE, you can define step names for Entire Operations with the LABEL statement <code>.label</code> , where label stands for STEPNAME. The STEPNAME defined in this way is valid for the following EXEC statement. | |
| | See also Example of a Termination Code Event (Event Type C) . | |
| Operator <small>(z/OS and z/VSE only)</small> | <small>(z/OS and z/VSE only)</small> | |
| | Specifies the logical operator used to compare the received return code with the value entered in the Event field. | |
| | See also Example of a Termination Code Event (Event Type C) . | |
| Event <small>(z/OS and z/VSE only)</small> | <small>(z/OS and z/VSE only)</small> | |
| | Select a termination condition and enter a value, if required: | |
| | Condition | 4-character condition/return code |
| | User Abend | 4-character user abend code (z/OS only). |
| | System Abend | 4-character system abend code (z/OS only). |
| | Job deleted by operator | Job deleted by operator. |
| | Job failed JCL error | Job failed, JCL error. Note: If this event occurs and a Job failed JCL error event definition with 0K exists, this can be treated as 0K. |
| | Job execution interrupted | Job execution interrupted, for example, system crash (z/OS only). |
| | 'Not cataloged' error | Not cataloged (compiled) error (z/OS only). |
| | Job not run JCL error | Note: If this event occurs and a Job not run JCL error event definition with 0K exists, this can be treated as 0K. |

| Field Page | Description | | | | | | |
|---|--|------------------------------|--|------------------|--|----------------|---|
| | <p>See also z/OS and z/VSE Defaults for Event Checking and Example of a Termination Code Event (Event Type C).</p> | | | | | | |
| User exit | <p>Name of the End-of-Job checking user exit which is to run on job termination.</p> <p>Note: Entire Operations performs an Entire System Server logon to the job's execution node with the job's submit user ID prior to the execution of the exit.</p> <p>To display a selection list of user exits, first enter the name of a Natural library in the Natural library field. You can then select a user exit from the drop-down list box of the User exit field.</p> <p>Depending on your permissions, you can Edit or Delete a checking user exit on the tabbed page EOJ Checking.</p> <p>See also:</p> <ul style="list-style-type: none"> ■ Example of a User Exit Event (Event Type R). ■ User Exits for End-of-Job Checking and Actions in the section <i>User Exits</i> and | | | | | | |
| Natural library | <p>Name of the Natural library which contains the required user exit.</p> <p>This library should be different from the Entire Operations system library.</p> <p>See also Example of a User Exit Event (Event Type R).</p> | | | | | | |
| Execute user exit asynchronously | <table border="1"> <tr> <td data-bbox="446 1062 938 1136">Possible check-box settings:</td> <td data-bbox="938 1062 1479 1136"></td> </tr> <tr> <td data-bbox="446 1136 938 1220"><i>unchecked</i></td> <td data-bbox="938 1136 1479 1220">User exit is executed synchronously (default).</td> </tr> <tr> <td data-bbox="446 1220 938 1220"><i>checked</i></td> <td data-bbox="938 1220 1479 1220">User exit is executed asynchronously (in a Natural task).</td> </tr> </table> | Possible check-box settings: | | <i>unchecked</i> | User exit is executed synchronously (default). | <i>checked</i> | User exit is executed asynchronously (in a Natural task). |
| Possible check-box settings: | | | | | | | |
| <i>unchecked</i> | User exit is executed synchronously (default). | | | | | | |
| <i>checked</i> | User exit is executed asynchronously (in a Natural task). | | | | | | |
| String | <p>Specify the string to be searched for in SYSOUT or any defined file. If the string is found, the event occurs. The following applies:</p> <ul style="list-style-type: none"> ■ All checks of the SYSOUT file and actions which refer to the SYSOUT file are not executed if no SYSOUT file is available. This case only applies if the job is submitted as a temporary dummy job. ■ A string search in a non-existent file is handled like <code>string not found</code> in an existing file. ■ The search string may contain symbols. ■ Symbols with activation escape characters are replaced at job activation time. ■ Symbols with submission escape characters are replaced at End-of-Job checking time. ■ Missing symbols cause a permanent activation error or permanent End-of-Job checking error. <p>Note for BS2000 and UNIX:</p> <p>If the search string contains at least one blank at the beginning, in the middle or at the end, it must be enclosed in quotes. For example:</p> | | | | | | |

| Field Page | Description |
|--|---|
| | ' leading blanks' |
| | See also Example of a String Event (Event Type S) . |
| missing | String missing. Possible check-box settings: |
| (string) | <i>unchecked</i> The event occurs if the string is found (default). |
| | <i>checked</i> The event occurs if the string is not found. |
| Select | (z/OS and z/VSE only) |
| (string) | z/OS: |
| (z/OS and z/VSE only) | You can limit the search for strings by specifying file numbers in this field according to the file type (SM, SO, JL and CC). |
| | Enter the file type followed by a number, a range of numbers or an asterisk (*) as a wildcard. For example: |
| | SM 1 Search system messages 1. |
| | SM 1 : 5 Search system messages 1 to 5. |
| | SO * Search in all SYSOUT files. |
| | CC 1 Search condition codes 1. |
| | z/VSE: |
| | You can use these file types: LST, PUN and RDR. |
| | See also Example of a String Event (Event Type S) . |
| in File | (BS2000, UNIX and Windows only) |
| (string) | Name of the file to be scanned for the specified search string . You may have to supply a user ID and a password with the file name. |
| (BS2000, UNIX and Windows only) | Symbol replacement is possible for the file name or any part of it: |
| | <ul style="list-style-type: none"> ■ with activation escape - once at activation time. ■ with submission escape - during EOJ checking. |
| | If the file name contains the activation escape character, a symbol replacement is performed (from the active symbol table). The updated file name is stored in the active database. |
| | If you leave this field blank, Entire Operations searches for the string in the SYSOUT collection file created by the Entire Operations Monitor. Symbol replacement is possible. The submission escape character is to be used. |
| Perform string search also if temporary dummy | (BS2000, UNIX and Windows only) |
| (string) | Specifies whether to perform the string search for temporary dummies. |
| | check box settings: |

| Field Page | Description | |
|--|---|--|
| (BS2000, UNIX and Windows only) | <i>checked</i> | The string search is always performed (default). |
| | <i>unchecked</i> | The string search is only performed if the job is not executed as a temporary dummy. |
| Password (string, job variable) (BS2000 only) | (BS2000 only) Alphanumeric password for a defined job variable or a password-protected file (optional). | |
| User Switch ... of BS2000 User ID ... (BS2000 only) | (BS2000 only) Enter a valid BS2000 user switch in the range from 0 to 31 and the BS2000 user ID of the user switch. See also Example of a User Switch Event (Event Type U) . | |
| Tabbed Pages: | | |
| Activation | The tabbed page Activation is explained in Defining Network and Job Activation Actions . | |
| Output Conditions | The tabbed page Output Conditions is explained in Output Conditions for an Event . | |
| Job Variable (BS2000 only) | (BS2000 only) The tabbed page Job Variable is explained in Fields: Job Variable Definitions (BS2000 only) . | |
| Release Kept Resource | The tabbed page Release Kept Resource is described in Release Kept Resource Action . | |
| Other | The tabbed page Other is explained in Defining Other Actions: Deactivate Job Automatically . | |
| Description | The tabbed page Description is used to add, view or modify text that describes an event. See Creating and Viewing Online Documentation for Events | |
| SYSOUT Action | The tabbed page SYSOUT Action is explained in SYSOUT Action . | |
| Output Management | The tabbed page Output Management is used to pass single or multiple files to Entire Output Management for further processing after job completion. For detailed information, see Passing Files to Entire Output Management . | |
| Action Exit | The fields on the tabbed page Action Exit are used to define an action user exit. See Defining Action User Exits . | |
| Symbol | The tabbed page Symbol is explained in Defining Actions for Symbol Value Modification . | |
| Message and Message Recipients | The tabbed page Message and Message Recipients is explained in Defining Notification Messages . | |

| Operator | Explanation |
|----------|---|
| = | Equal to the specified value. |
| EQ | |
| >= | Greater than or equal to the specified value. |
| GE | |
| > | Greater than the specified value. |
| GT | |
| <= | Less than or equal to the specified value. |
| LE | |
| < | Less than the specified value. |
| LT | |
| <> | Not equal to the specified value. |
| NE | |

Deleting an Event Definition

➤ To delete an event definition

- 1 On the tabbed page **EOJ Checking**, select the required event and choose **Delete**.

A window prompts you to confirm the deletion.

- 2 Choose **Yes** to confirm the deletion.

(**No** cancels the action.)

The page closes and the event definition is removed.

Operating System Dependent Defaults for Event Checking

This section covers the following topics:

- [Common Defaults for Event Checking](#)
- [z/OS and z/VSE Defaults for Event Checking](#)
- [BS2000 Defaults for Event Checking](#)

- [UNIX and Windows Defaults for Event Checking](#)

Common Defaults for Event Checking

- Symbol replacement error during job submission:

If a symbol replacement error occurs at submission time, the event **Job not run JCL error** is set to `occurred`.

If the event **Job not run JCL error** is not defined, it is added to the active job.

- If a string defined in the Global Message Code Table (see the *Administration* documentation) is found anywhere in the SYSOUT, its severity equivalent is compared with the highest condition code value accepted as OK. The job is `not OK` if the severity equivalent is higher than this default.

z/OS and z/VSE Defaults for Event Checking

If no events are defined for a job, Entire Operations provides a default check of the return code type (for termination codes):

- If a system code that is not equal to 0 (zero) has occurred at any job step, the job is evaluated as `not OK` if this event is not explicitly defined. This also applies if an event has occurred which has been defined using `ANYSTEP`. The occurrence of such an event has the priority over definitions, which apply for any steps.
- For z/VSE only:

No system codes are available in the z/VSE operating system.

- For z/VSE only:

The following messages lead to a `not OK` status of the z/VSE job:

- PROGRAM ABEND
- ENDED ABNORMALLY
- OPERATOR CANCEL
- You can set the default for how to treat the message `IEF201I job terminated` if it occurs. The appropriate option in the **Operating System Specials** (see the *Administration* documentation) determines whether to treat this message as `not OK`. If treated as `not OK`, a log is written and the job is set to the status `Job interrupted`. If treated as `OK`, the occurrence of `IEF201I` in SYSOUT has no consequences and the job continues.
- If the message `IEF287I data set not cataloged` is received, it is written to the log and the job is treated as `not OK`.
- If a condition code or user code, which is not explicitly defined, is received at any job step, it is compared with the highest value accepted as `OK`. The job is `not OK` if the code is higher than this

default. The job is also not OK if no explicit check has returned an OK. For more information, see the **Operating System Specials** option.

- Events like JCL error, Job not run and Job interrupted cause the status not OK by default. Dedicated event definitions can override this.
- In all other cases, the job is accepted as OK.
- Precedence of event checks:
 - If a MAXCC or ANYSTEP check has been defined and this event occurs, no check is done on the highest value accepted as still OK.
 - MAXCC precedes ANYSTEP.
- For z/VSE only:

Date formats in z/VSE SYSOUT:

In z/VSE SYSOUT, the following date formats are recognized and handled:

| | |
|------------------------|----------------------|
| American Format | MM/DD/YY, MM/DD/YYYY |
| European Format | DD/MM/YY, DD/MM/YYYY |

If a date contains a 2-digit year specification in the SYSOUT, Entire Operations adds the century for further processing. In this case, a sliding window of + / - 50 years is applied (see also [Date Display and Input Options](#)).

BS2000 Defaults for Event Checking

Entire Operations either uses a defined Monitor job variable for a job or creates its own job variable if job variables are available.

- If the Monitor job variable displays an abnormal end, the job is not OK.
- By default, if defined message keys appear, the job is regarded as faulty and is set to not OK. These message codes (see *BS2000 Default Message Codes* in den *Administration* documentation) are default settings which are in effect after the installation of Entire Operations. However, they can be freely adapted. It is possible to completely delete this table.

Note: Each time this table is modified, possibly faulty jobs may no longer be set to not OK.

- If messages like program dump appear in the SYSOUT, the job is not OK.
- In all other cases, the job is accepted as OK.

UNIX and Windows Defaults for Event Checking

Entire Operations inserts start and end messages (EOR0301, EOR0302) in the SYSOUT.

- If the end message EOR0302 is missing, the job is treated like an interrupted job. Because it is possible that the SYSOUT of an asynchronous child process is written behind the end message, the message EOR0302 is searched in the whole SYSOUT file. If the End-of-Job checking detects that there is unexpected SYSOUT behind the end message, you cannot obtain the process times for accounting. A note is written to the log:

```
Process times for accounting not found ... SYSOUT of background processes may exist.
```

- If no special event checking was defined for a job (UNIX and Windows), then the event is compared to a system-wide default value for UNIX or Windows. Depending on this check, the job result can be set to `not OK`.
- In all other cases, the job is accepted as `OK`.

Creating and Viewing Online Documentation for Events

You can browse text description of active event and write or modify the text description of a master event.

➤ To add, view or change an event description

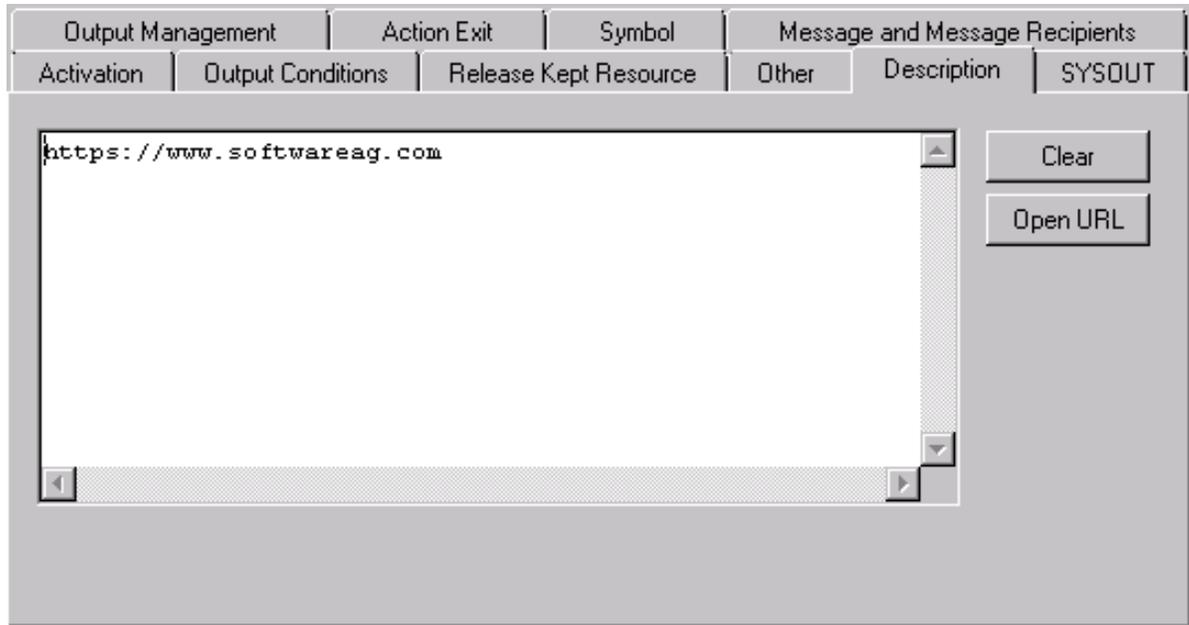

- 1 On the [EOJ Checking page](#) select the event for which you want to add a description or whose description you want to view or change and choose **Modify**.

The letter **P** in the **Action** column indicates whether a description already exists for the event.

The [EOJ Checking window](#) opens.

- 2 Open the tabbed page **Description**.

The page contains either descriptive text for the event or an URL address as shown in the example below:

If an URL address is displayed, you can choose **Open URL** to open the page associated with the URL.

- 3 Write new or replace existing text as required.

Choose **Clear** if you want to remove the whole text contained in the editor area.

- 4 Choose **OK** when you are finished.

Note: After you add or modify an output condition definition, a loop check is performed on the affected network. The same conditions apply as described in [Checking for a Loop in a Job Network](#) in the section *Network Maintenance* with one exception: if a loop is detected in the job flow, no corresponding message appears.

Examples of Event Definitions

This section contains examples of event definitions:

- Example of an Additional Job OK/not OK Event (Event Type A)
- Example of a Termination Code Event (Event Type C)
- Example of a Job Special Event (Event Type J)
- Example of a User Exit Event (Event Type R)
- Example of a String Event (Event Type S)
- Example of a User Switch Event (Event Type U)
- Example of a Job Variable Event (Event Type V)

- Example of an Exit Code Event (Event Type X)

Example of an Additional Job OK/not OK Event (Event Type A)

The screenshot shows a dialog box titled "OGC - Add new EOJ checking [EXAMPLE.B60-FLOW_JOB-01]". It contains two main sections: "Event type" and "Means".

Event type:

- Add. Job-ok, Job-not-ok
- Exit code
- Job special event
- Job variable
- String
- Termination code
- User exit
- User switch

Means:

- OK
- Not OK
- No influence

Event type specific settings:

No specific settings

Explanation:

This example defines an additional Job OK event to execute another End-of-Job action of the same type.

Example of a Termination Code Event (Event Type C)

The screenshot shows a dialog box titled "OGC - Modify EOJ checking Condition Code EQ C 0003 [EXAMPLE.B60-FLOW_JOB-1-...]". It contains two main sections: "Event type" and "Means".

Event type:

- Add. Job-ok, Job-not-ok
- Exit code
- Job special event
- Job variable
- String
- Termination code
- User exit
- User switch

Means:

- OK
- Not OK
- No influence

Event type specific settings:

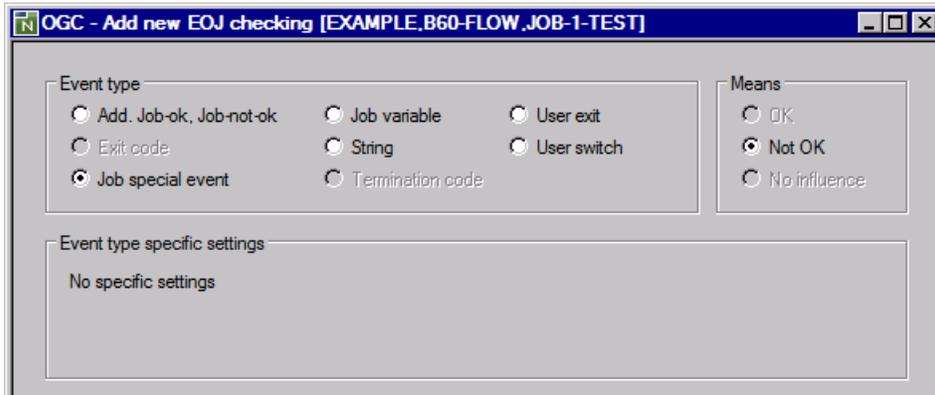

Stepname:

Operator: Event:

Explanation:

If Condition Code 3 is received at any step (ANYPSTEP) during job execution, the event result is not OK.

Example of a Job Special Event (Event Type J)

Explanation:

This event occurs if an operating system abend or hardware failure occurs during job execution.

Example of a User Exit Event (Event Type R)

The screenshot shows a dialog box titled "OGC - Modify EOJ checking Status by Exit SYSEORU/E01-J01 [EXAMPLE.B60-FLOW,J...]. The dialog is divided into two main sections: "Event type" and "Event type specific settings".

Event type: This section contains three columns of radio buttons. The first column has "Add. Job-ok, Job-not-ok", "Exit code", and "Job special event". The second column has "Job variable", "String", and "Termination code". The third column has "User exit" (which is selected), "User switch", and "User switch".

Means: This section contains three radio buttons: "OK" (selected), "Not OK", and "No influence".

Event type specific settings: This section contains a text field for "Natural library" with the value "SYSEORU", a checkbox for "Execute user exit asynchronously" which is unchecked, and a dropdown menu for "User exit" with the value "E01-J01".

Explanation:

User exit E01 - J01 checks the job SYSEORU at job completion. This user exit resides in the Natural library SYSEORU.

Example of a String Event (Event Type S)

Example for z/OS:

The screenshot shows a dialog box titled "OGC - Modify EOJ checking Occurrence of String 'EXCEEDS' [EXAMPLE.B60-FLOW,JO...]. The dialog is divided into two main sections: "Event type" and "Event type specific settings".

Event type: This section contains three columns of radio buttons. The first column has "Add. Job-ok, Job-not-ok", "Exit code", and "Job special event". The second column has "Job variable", "String" (which is selected), and "Termination code". The third column has "User exit", "User switch", and "User switch".

Means: This section contains three radio buttons: "OK", "Not OK" (selected), and "No influence".

Event type specific settings: This section contains a text field for "String" with the value "EXCEEDS", a checkbox for "missing" which is unchecked, and a "Select:" table. The table has one row with the value "SM *" in the first cell.

| | | | | |
|------|--|--|--|--|
| SM * | | | | |
|------|--|--|--|--|

Example for BS2000:

OGC - Add new EOJ checking [EXAMPLE.B60-FLOW.JOB-1-TEST]

Event type

Add. Job-ok, Job-not-ok Job variable User exit

Exit code String User switch

Job special event Termination code

Means

OK

Not OK

No influence

Event type specific settings

String: missing Perform string search also if temporary dummy

File: Password:

Explanation:

- Example for z/OS: If the string EXCEEDS is found in any system message (SM *), the event result is not OK.
- Example for BS2000: If the string ITEM531 is found in the BS2000 file DEPOT-INVENTORY-MAY, the event result is OK.

Example of a User Switch Event (Event Type U)

The screenshot shows a dialog box titled "OGC - Modify EOJ checking User Switch 11 of User ID DC1 is on [EXAMPLE,B60-FLO...". The dialog is divided into three main sections:

- Event type:** A group box containing seven radio button options: "Add. Job-ok, Job-not-ok", "Exit code", "Job special event", "Job variable", "String", "Termination code", "User exit", and "User switch". The "User switch" option is selected.
- Means:** A group box containing three radio button options: "OK", "Not OK", and "No influence". The "OK" option is selected.
- Event type specific settings:** A group box containing two text input fields: "User switch:" with the value "11" and "BS2000 user id:" with the value "DC1".

Explanation:

The event is OK if user switch 11 of the BS2000 user ID DC1 is on at job termination time.

Example of a Job Variable Event (Event Type V)

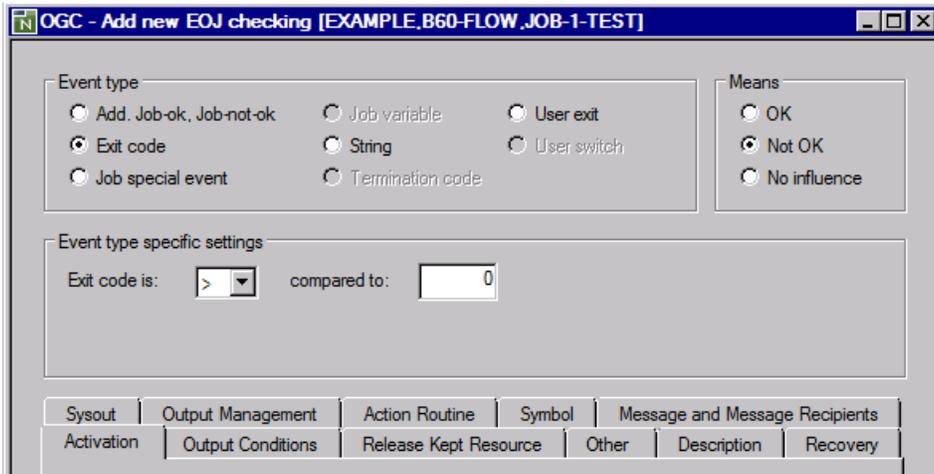

The screenshot shows a dialog box titled "OGC - Modify EOJ checking Job Variable \$DC1.JV.DEMO [EXAMPLE.B60-FLOW, JOB-1...". It contains three main sections:

- Event type:** A group of radio buttons where "Job variable" is selected. Other options include "Add. Job-ok, Job-not-ok", "Exit code", "Job special event", "String", "Termination code", "User exit", and "User switch".
- Means:** A group of radio buttons where "OK" is selected. Other options include "Not OK" and "No influence".
- Event type specific settings:** A section with several input fields:
 - Job variable:** A text box containing "\$DC1.JV.DEMO".
 - Position:** A text box containing "10".
 - Length:** A text box containing "20".
 - Format:** A dropdown menu showing "A".
 - is:** A dropdown menu showing "EQ".
 - compared to:** A text box containing "Result is 100".
 - Password:** An empty text box.

Explanation:

The event is OK if the job variable \$DC1.JV.DEMO contains Result is 100 at the position 10, in the length 20, in alphanumeric (A) format.

Example of an Exit Code Event (Event Type X)

Explanation:

The event is OK if an exit code greater than 0 (zero) occurs.

Handling End-of-Job Actions

An End-of-Job action can be performed for a check event defined at the job step level and/or the default check event **All Checks ok** or **Any Check not ok** defined at the job level.

The default check events are always provided in the last two table rows of the [EOJ Checking page](#).

All checks ok can be used to define actions to perform if no error occurred during job execution.

Any Check not ok can be used to define actions to perform if at least one error occurred during job execution.

This section covers the following topics:

- [Defining Actions](#)
- [Changing Execute if Temporary Dummy Settings for Multiple Jobs](#)

- [Removing Actions](#)

Defining Actions

➤ **To define an action**

- 1 On the [EOJ Checking page](#), select an event at the job step level for which you want to define an action, or select the default event check **All Checks ok** or **Any Check not ok**
- 2 Choose **Add** or **Modify** depending on whether you want to add or change an action, and proceed as described in the action-specific instructions in the remainder of this chapter.

The example below demonstrates how the same action can be defined for several purposes:

| Action | Step | will be checked for | means |
|--------|---------|-------------------------------|-------|
| U | | Additional Actions for Job-ok | ok |
| U | ANYSTEP | Condition Code = C0004 | n.ok |
| | | All Checks ok | |
| U | | Any Check not ok | |

In the example above, a notification message (**U**) is sent after job termination if

- No error occurred during job execution (Additional Actions for Job-ok),
- Condition Code 4 occurred during job execution, and
- Any error occurred during job execution (Any Check not ok).

Changing Execute if Temporary Dummy Settings for Multiple Jobs

You can modify the setting of **Execute if temporary dummy** for all relevant End-of-Job actions defined for a selected set of job masters.

Prerequisite: Read and write permissions must be checked in the **EOJ Checking + Action** option of your user profile (see *Network Maintenance Functions* described in the *Administration* document-ation).

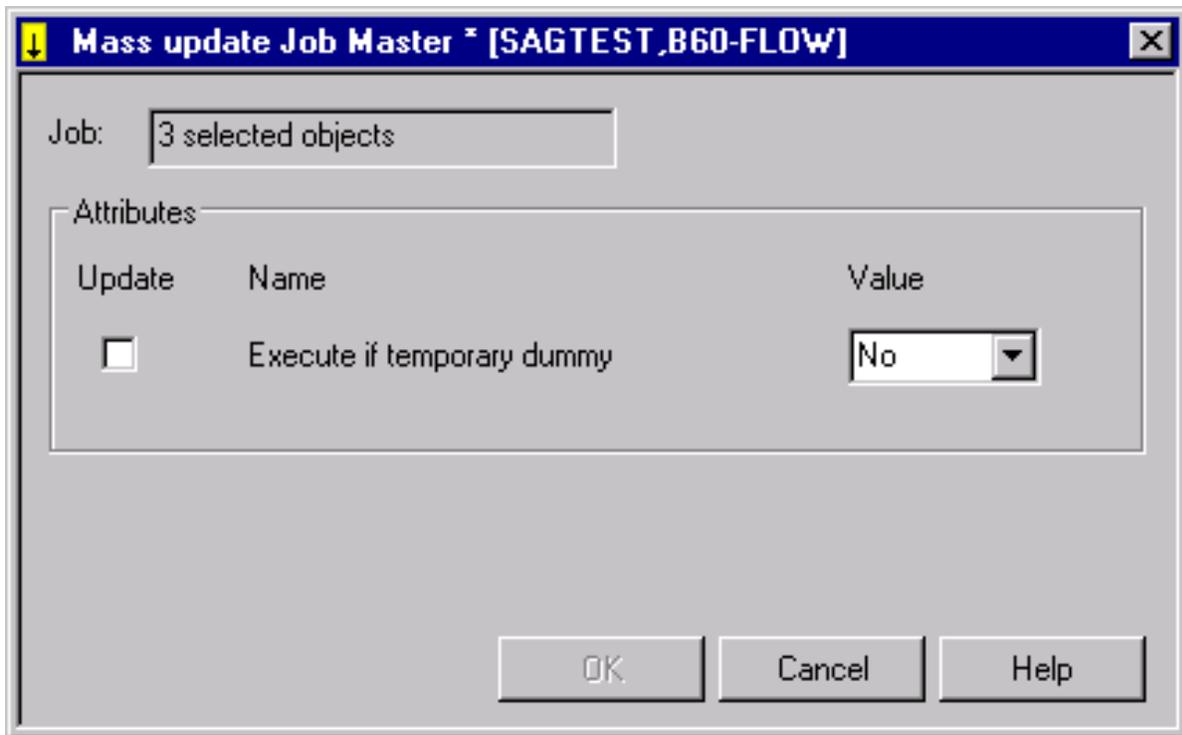

➤ **To update "Execute if temporary dummy" for multiple jobs**

- 1 From the table in the **Job Master List window**, select the jobs whose **Execute if temporary dummy** settings you want to change and choose **Mass update** from the context menu.

Or:

Open the diagram of the network master containing the jobs to be updated, select the job masters whose **Execute if temporary dummy** settings you want to change and choose **Mass update** from the context menu (see also *Maintenance Functions for Diagrams*).

A **Mass update Job Master** (or **Diagram Job Master**, respectively) dialog similar to the following opens:

The **Job** field indicates the number of job masters selected for the update operation.

- 2 If you want to perform the execute operation, select the **Update** check box (not selected by default) and choose **Yes** from the drop-down list box to check the **Execute if temporary dummy** option for all End-of-Job actions of the selected jobs.

Or:

If you do not want to perform the execute operation, select the **Update** check box and choose **No** (default) from the drop-down list box to uncheck the **Execute if temporary dummy** option for all End-of-Job actions of the selected jobs.

- 3 Choose **OK**.

The setting of the **Execute if temporary dummy** option is changed for the following End-of-Job actions:

- **Activation**
- **Action User Exits**
- **Job Variable**
- **Symbol**
- **Release Kept Resource**
- **Message and Message Recipients**

Removing Actions

Related Topic:

- *Deleting an Output Condition*

➤ To remove an action

- 1 On the **EOJ Checking page** select the event for which you want to remove an action and choose **Modify**.

The **EOJ checking window** opens.

- 2 Open the page that contains the action you want to remove.
- 3 On the appropriate action page, choose **Clear**.

The entries in the window are removed.

Choose **OK**.

Or:

On the appropriate action page, choose **Delete** (if available).

A confirmation window opens.

Choose **Yes**.

(**No** cancels the action.)

The page closes and the action is removed.

➤ **To remove an event with a single action**

- If a single action is defined for an event, you may want to remove the entire event by selecting the required event on the [EOJ Checking page](#) and choosing **Delete**.

End-of-Job Actions after Execution as a Temporary Dummy Job

For [temporary dummy jobs](#), End-of-Job actions are partially carried out as if the jobs were running in normal mode.

Several End-of-Job action definitions contain a field **Execute if temporary dummy** which can be used to execute the End-of-Job action according to this definition if the job was executed as a temporary dummy job.

Possible check-box settings:

| | |
|------------------|--|
| <i>checked</i> | Perform the End-of-Job action if the job executed as a temporary dummy job. |
| <i>unchecked</i> | Do not perform the End-of-Job action if the job executed as a temporary dummy job (default). |

 **Note:** You can check or uncheck the **Execute if temporary dummy** option for multiple jobs at the same time: see [Changing Execute if Temporary Dummy Settings for Multiple Jobs](#).

This section covers the following topics:

- [Default End-of-Job Actions for Temporary Dummy Jobs](#)
- [SYSOUT Actions](#)

- [End-of-Job Action User Exit](#)

Default End-of-Job Actions for Temporary Dummy Jobs

If the **Execute if temporary dummy** option is not selected in an event action definition, the following defaults apply:

| | |
|--------------------------------------|---|
| Output conditions | Output conditions are always set or deleted even if the job is a temporary dummy job. |
| Dummy due to schedule changes | Additional End-of-Job actions are not executed. |
| Dummy for other reasons | Additional End-of-Job actions are executed. |

SYSOUT Actions

Actions that refer to the SYSOUT file cannot be executed if no SYSOUT file exists. This case applies if the job is executed as a temporary dummy job.

End-of-Job Action User Exit

End-of-Job action user exits are not performed for temporary dummy jobs.

Defining Output Condition Actions

You can set or reset output conditions as End-of-Job actions for any job events.

You can define up to 50 output conditions for any event at the job step level or at the job level according to **All checks ok** and **Any check not ok**.

- [Adding and Modifying an Output Condition](#)
- [Deleting an Output Condition](#)

Adding and Modifying an Output Condition

➤ **To add, view or change an output condition**

- 1 On the [EOJ Checking page](#), select the event for which you want to create a condition and choose **Add**.

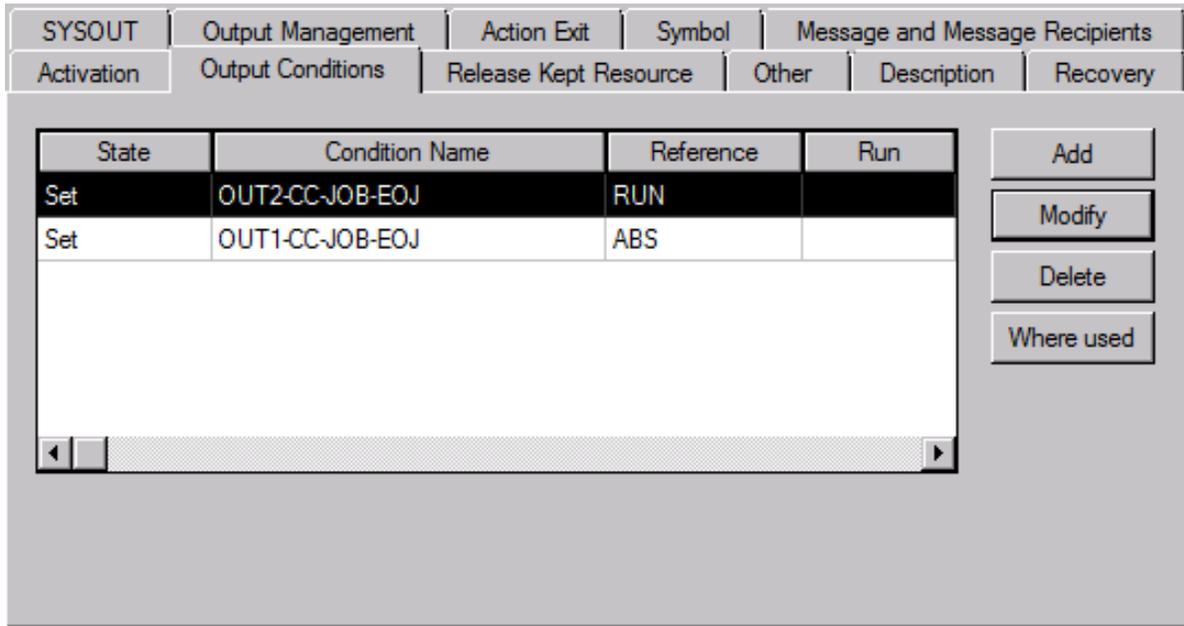

Or:

On the [EOJ Checking page](#), select the event whose output condition you want to view or change and choose **Modify**.

The letter **C** in the **Action** column indicates whether an output condition exists for the defined event.

The **EOJ checking window** opens.

- Open the tabbed page **Output Conditions** show in the following example:

If output conditions already exist, they are listed in the table. In the example above two conditions are set for a selected **Termination code** event.

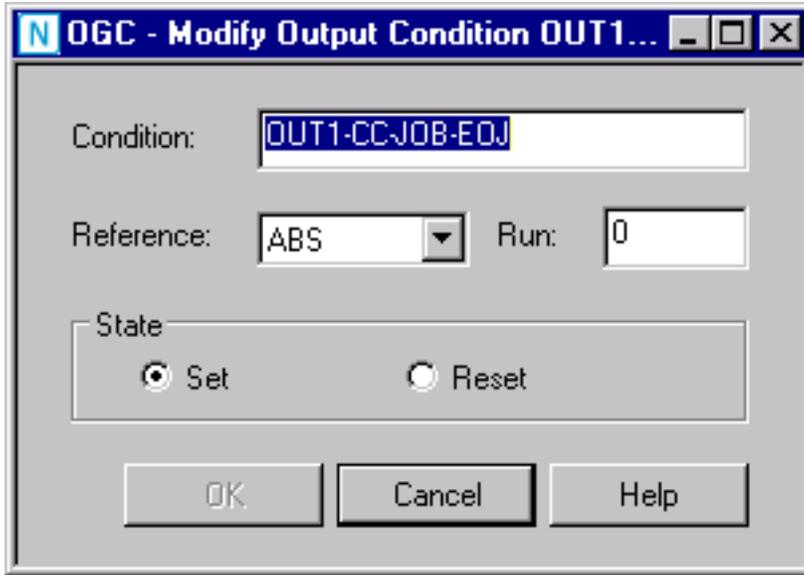

The column headings are explained in *Columns and Fields: Output Conditions*. The commands are explained in *Commands: Output Conditions*.

- Choose **Add** to define a new condition.

Or:

Select an existing output condition (here: OUT1-CC-JOB-EOJ) and choose **Modify**.

An **Output Condition** window similar to the example below opens:

- 4 Enter the required values.

The fields and valid input values are explained in [Columns and Fields: Output Conditions](#).

- 5 Choose **OK** when you are finished.

The **Output Condition** window closes.

- 6 On the **Output Conditions** page, choose **OK**.

- 7 On the **EOJ Checking** page, choose **OK**.

The definition of the new or modified output condition is saved.

Columns and Fields: Output Conditions

The columns available on the [Output Conditions page](#) and the corresponding fields in the [Output Condition window](#) are explained in the following table.

| Column/Field | Description | | | |
|-----------------------------------|--|------------|------------------------------|--------------|
| State Set/Reset | Determines whether the defined output condition must be true (Set) or false (Reset) if the associated event occurs. | | | |
| | Possible values: | | | |
| | <table border="1"> <tr> <td>Set</td> <td>Condition is true (default).</td> </tr> <tr> <td>Reset</td> <td>Condition is false (ignored).</td> </tr> </table> | Set | Condition is true (default). | Reset |
| Set | Condition is true (default). | | | |
| Reset | Condition is false (ignored). | | | |
| Condition Name Condition | <p>User-defined name for the condition.</p> <p>Use this name if you wish to define this output condition as an input condition for another job. Symbol replacement is possible. The submission escape character is to be used.</p> | | | |

| Column/Field | Description | |
|------------------|--|---|
| | If you want to add or modify a global condition that can be used across networks, consider the rules and restrictions for global conditions described in the section Global Conditions . | |
| Reference | An output condition can be set with different references (usually the current network run number). The reference is evaluated and set when the active condition is created by the Monitor according to the End-of-Job definition. Possible values: | |
| | ABS | Absolute condition. Exists only once, because it is independent of run numbers. |
| | RCM | Sets an active condition with owner, network, run number of the calling network and appends multiple suffixes. RCM can be used to determine that the conditions defined for a predecessor job apply to all jobs that reference this predecessor in multiple activated subnetworks. In this case, the input condition of the corresponding successor job must be referenced with RCA: see RCA in the section Possible References for Input Conditions . |
| | RUN or blank | Current run number of the job network is assigned (default). |
| Run | Run number of the job to which this condition applies when modifying the condition for an active job. If left blank, the current run number is assumed by default. | |

Commands: Output Conditions

The commands available on the [Output Conditions page](#) are explained in the following table.

| Function | Description |
|-------------------|---|
| Add | Create a new output condition. See Adding, Displaying and Modifying an Output Condition . |
| Delete | Delete the condition as an output condition for the job. See Deleting an Output Condition . |
| Modify | Modify the output condition definition. See Adding, Displaying and Modifying Output Condition . |
| Where used | Open a Where used Condition window with a list of jobs for which this condition is defined as an input or output condition. For more information, see the corresponding function for input conditions described in Listing Jobs Linked to an Input Condition . |

Deleting an Output Condition

› To delete an output condition

- 1 On the **Output Conditions page**, select the output condition you want to delete and choose **Delete**.

A confirmation window opens.

- 2 Choose **Yes**.

(**No** cancels the action.)

The confirmation window closes and the selected output condition is removed.

Defining Actions for Symbol Value Modification

You can define a value to be assigned to a symbol or the substring of a symbol value (analogous to a BS2000 job variable) as End-of-Job action depending on the occurrence of an event. The value assignment can be performed in the master or active symbol table, or in both tables. It is possible to modify symbol tables different from the ones specified for the job or the network.

› To add, view or change a symbol value setting

- 1 On the **EOJ Checking page**, select the event for which you want to set a symbol value and choose **Add**.

Or:

On the **EOJ Checking page**, select the event whose symbol setting you want to view or change and choose **Modify**.

The letter **Y** in the **Action** column indicates whether a symbol value has already been set for the event.

The **EOJ checking window** opens.

- 2 Open the tabbed page **Symbol** similar to the example below:

- [Fields: Symbol Modification](#)

Fields: Symbol Modification

The fields available on the [Symbol page](#) are explained in the following table.

| Field | Description | | | | | | |
|------------------------|---|---------------|--|---------------|--|-------------|---|
| Owner | <p>Owner of the symbol table.</p> <p>When a symbol is set to Active or Both, the owner of the symbol table and the owner of the job must be the same. This is indicated by (SAME) or an empty field, which is the default value.</p> | | | | | | |
| Symbol table | <p>Name of the symbol table that contains the symbol whose value you want to set or change. The symbol table must be defined for the network master of the job master.</p> <p>(SAME) or an empty field indicates that the owner of the symbol table is also the owner of the job.</p> | | | | | | |
| Version | <p>Version of the specified symbol table.</p> <p>The current version (empty field) is the default.</p> | | | | | | |
| Set contents of | <p>Instance of the symbol/symbol table where to perform the symbol value setting/modification.</p> <p>Valid selection options:</p> <table border="1"> <tr> <td>Active</td> <td>Perform modification in the active symbol table (default).</td> </tr> <tr> <td>Master</td> <td>Perform modification in the master symbol table.</td> </tr> <tr> <td>Both</td> <td>Perform modification in both the active and the master symbol tables.</td> </tr> </table> | Active | Perform modification in the active symbol table (default). | Master | Perform modification in the master symbol table. | Both | Perform modification in both the active and the master symbol tables. |
| Active | Perform modification in the active symbol table (default). | | | | | | |
| Master | Perform modification in the master symbol table. | | | | | | |
| Both | Perform modification in both the active and the master symbol tables. | | | | | | |
| Symbol | <p>Name of the symbol.</p> <p>Symbol replacement is possible.</p> <p>Example:</p> <p>@P - JOB . - STATUS</p> <p>If @ (commercial at) is used as the submission escape character, for a job with the name JOB - 1, a symbol with the name JOB - 1 - STATUS is set.</p> | | | | | | |
| Value | <p>Value to be set into the complete symbol value or a substring of the symbol value.</p> <p>Symbol replacement is possible.</p> <p>If the effective value length (after symbol replacement) is longer than the value specified in Length, the value will be shortened to the length specified there.</p> | | | | | | |
| Position | <p>Position at which the specified symbol value or a substring of the symbol value is set.</p> <p>Possible values: 1 (default) to 120 characters.</p> | | | | | | |

| Field | Description | | | | | | | | |
|-----------------------------------|--|---|---------------|---|----------------------------|---|----------------------------|---|----------|
| Length | <p>Length of the substring of the symbol value to be set.</p> <p>Possible values: 1 to 120 characters.</p> <p>Note: The effective value length may be shortened due to this definition.</p> <p>If you want to make sure that an old value is entirely replaced, enter a new value of 120 characters.</p> | | | | | | | | |
| Format | <p>Format in which the substring of the symbol value is to be set. Possible selection options:</p> <table border="1"> <tbody> <tr> <td>A</td> <td>Alphanumeric.</td> </tr> <tr> <td>L</td> <td>Alphanumeric (lower case).</td> </tr> <tr> <td>U</td> <td>Alphanumeric (upper case).</td> </tr> <tr> <td>N</td> <td>Numeric.</td> </tr> </tbody> </table> | A | Alphanumeric. | L | Alphanumeric (lower case). | U | Alphanumeric (upper case). | N | Numeric. |
| A | Alphanumeric. | | | | | | | | |
| L | Alphanumeric (lower case). | | | | | | | | |
| U | Alphanumeric (upper case). | | | | | | | | |
| N | Numeric. | | | | | | | | |
| Execute if temporary dummy | See <i>End-of-Job Actions after Execution as a Temporary Dummy Job</i> . | | | | | | | | |

Defining Actions for Modifying Job Variable Values

(Applies to BS2000 only)

You can define a value to be assigned to a job variable (analogous to a symbol) as End-of-Job action depending on the occurrence of an event.

➤ To add, view or change a job variable setting

- 1 On the **EOJ Checking page**, select the event for which you want to define a job variable setting and choose **Add**.

Or:

On the **EOJ Checking page**, select the event whose job variable setting you want to view or change and choose **Modify**.

The letter **J** in the **Action** column indicates whether a variable setting has already been defined for the event.

The **EOJ checking window** opens.

- 2 Open the tabbed page **Job Variable** similar to the example below:

| | | | | |
|-------------|-------------------|--------------|-----------------------|--------------------------------|
| SYSOUT | Output Management | Action Exit | Symbol | Message and Message Recipients |
| Activation | Output Conditions | Job Variable | Release Kept Resource | Other |
| Description | | | | |

Job variable:

Position: Length: Format:

set to:

Password:

Execute if temporary dummy

In the example above, the string `-USER-ID` replaces or sets the value for the job variable HUGO:

- Assuming the old value is NOP, the new value will be NOP-USER-ID.
- Assuming the old value is VVVVVVVVVVVVVVVVVVVVVVV, the new value will be VVV-USER-IDVVVVVVVVVV.
- Assuming an old value does not exist (empty value), the value will be

-USER-ID

(with three leading blanks).

If no job variable has been defined, the fields in this window are empty; you can set a job variable, by entering the values here.

- 3 In the input fields, enter the required values. They are described in [Fields: Job Variable Modification](#).

You can remove all current entries from the window by choosing **Clear**.

- 4 Choose **OK** when you are finished.

The job variable setting is saved and the **Symbol** page closes.

➤ **To remove a job variable setting**

- Proceed as described in [Removing Actions](#).

Related Topics:

- [User Exits for End-of-Job Checking and Actions](#) in the section [User Exits](#)

» **To add, view or change an action user exit definition**

- 1 On the [EOJ Checking page](#), select the event for which you want to define an action user exit and choose **Add**.

Or:

On the [EOJ Checking page](#), select the event whose user exit definition you want to view or change and choose **Modify**.

The letter **X** in the **Action** column indicates whether an action user exit.

The [EOJ checking window](#) opens.

- 2 Open the tabbed page **Action Exit** similar to the example below:

| Activation | Output Conditions | Job Variable | Release Kept Resource | Other | Description |
|------------|-------------------|--------------|-----------------------|--------------------------------|-------------|
| SYSOUT | Output Management | Action Exit | Symbol | Message and Message Recipients | |

Natural library:

User exit:

Execute user exit asynchronously

Execute if temporary dummy

- 3 In the input fields, enter the required values. They are described in [Fields: Action User Exit](#).

If required, choose **Clear** to remove all current entries from the window.

You can also specify the name of a user exit that does not yet exist. Entire Operations saves the definition assuming that you will create the user exit at a later time.

For information on coding user exits, see [User Exits for End-of-Job Checking and Actions](#) (section [User Exits](#)) and [Editing Master JCL and Natural Sources](#).

4 When you are finished, choose **OK** to save your entries.

➤ **To remove an action user exit definition**

- Proceed as described in [Removing Actions](#).

This section covers the following topics:

- [Fields: Action User Exit](#)

Fields: Action User Exit

The fields available on the [Action Exit page](#) correspond to the fields available for a checking user exit (event type **User exit** in the **Event type specific settings** section of the [EOJ checking window](#).

| Field | Description |
|----------------------------------|--|
| Natural library | Name of the Natural library that contains the user exit. See also Natural library in <i>Fields: EOJ Checking Window</i> . |
| User exit | Name of the user exit. See also User exit in <i>Fields: EOJ Checking Window</i> . |
| Execute user exit asynchronously | See Execute user exit asynchronously in <i>Fields: EOJ Checking Window</i> . |
| Execute if temporary dummy | See End-of-Job Actions after Execution as a Temporary Dummy Job . |

Defining Other Actions: Deactivate Job Automatically

The [tabbed page Other](#) is used to deactivate a job automatically, even if it ended not OK.

Select **Accept** from the drop-down list box if you want to deactivate the active job after termination even when it terminates with not OK. If you select **Do not accept**, the job remains active until you have corrected or manually deactivated it.

Choose **Clear** if you want to reset the selection box to its default (blank) value **Do not accept**. See also [Removing Actions](#).

Defining Network and Job Activation Actions

Related Topic:

■ [Removing End-of-Job Actions](#)

The occurrence of a defined event during job execution can trigger the activation of a specified single job or a whole job network. You can define activation of a job or network for specific events or at the job level for **All checks ok** and **Any check not ok**.

Activation is only possible if the network belongs to the defining user or if the defining user is authorized to activate the network of another user. The user defining the network to be activated must at least have authorization to activate this network (see [Authorizing Other Users or Owners to Access a Network \(Granting Access\)](#) in the section *Network Maintenance*).

➤ To add, view or change an activation definition

- 1 On the [EOJ Checking page](#), select the event for which you want to define an activation action and choose **Add**.

Or:

On the [EOJ Checking page](#), select the event whose activation definition you want to view or change and choose **Modify**.

The letter **A** in the **Action** column indicates whether an activation action has already been defined for the event.

The [EOJ checking window](#) opens.

- 2 Open the tabbed page **Activation** similar to the example below:

| SYSOUT | Output Management | Action Exit | Symbol | Message and Message Recipients |
|---|---------------------------------------|-----------------|---|--------------------------------------|
| Activation | Output Conditions | Job Variable | Release Kept Resource | Description |
| Owner: | <input type="text" value="EXAMPLE"/> | Schedule owner: | <input type="text"/> | <input type="button" value="Clear"/> |
| Network: | <input type="text" value="B60-FLOW"/> | Schedule: | <input type="text" value="MAY-DATES"/> | |
| Version: | <input type="text"/> | Use timeframe: | <input type="text" value="Activate immediately"/> | |
| Job: | <input type="text" value="JOB-01"/> | Schedule usage: | <input type="text" value="Activate always"/> | |
| <input type="checkbox"/> Execute if temporary dummy | | | | |

3 Enter the required values. The input fields and options are explained in [Fields: Network and Job Activation](#).

If required, choose **Clear** to remove all current entries.

4 Choose **OK** when you are finished.

Your action definition is saved and the window closes.

This section covers the following topics:

- [Fields: Network and Job Activation](#)

Fields: Network and Job Activation

| Field | Description |
|----------------|--|
| Owner | Name of the owner of the network to be activated. For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . |
| Network | Name of the network to be activated. For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . |
| Version | Version of the network to be activated. The current version (empty field) is the default. |

| Field | Description | |
|-----------------------------------|---|---|
| | For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . | |
| Job | Job to be activated. If the field is empty (default), the whole network is activated. For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . | |
| Use timeframe | Valid selection options: | |
| | Use time frame of called network | Activate the End-of-Job action according to the time frame/schedule defined for the called network. |
| | Activate immediately | Activate the job immediately (default). |
| Schedule usage | Valid selection options: | |
| | Explicitly defined schedule | Activate the End-of-Job action only if the current day is defined in the network's resp. explicitly defined schedule. |
| | Activate always | Always activate the End-of-Job action (default). |
| Schedule owner | Name of the owner of the schedule to be used for activation. | |
| | If this field is empty (default), the owner of the network to be activated is used. | |
| Schedule | Name of the schedule to be used for activation. | |
| | If this field is empty (default), the schedule of the network to be activated is used. | |
| Execute if temporary dummy | See End-of-Job Actions after Execution as a Temporary Dummy Job . | |

Defining Recovery Actions

You can define a recovery process to be started as the result of a defined event during job execution. You can also define recovery action at the job level according to **Any check not ok**.

Usually, recovery is used in case of job failure. For example, a recovery job can be a compression job started after the message `Library full` is received. The string `Library full` should be defined as a string event (event type **S**). Entire Operations starts the recovery job automatically when the event occurs.

The recovery process comprises the following tasks:

- Activation of a recovery network or a recovery job.
- Creation of an internal condition to provide a correct return to the calling network.

- Rescheduling of the job to be recovered.

One recovery network can be used in multiple recovery definitions.

It always returns to the calling network.

It is possible to stop the calling network after the recovery.

The conventional way to trigger a recovery network would be to define an event which activates the recovery network. Recovery is then started only if the event occurs or if any check is not OK. The recovery network must be defined as a network master.

➤ **To add, view or change a recovery definition**

- 1 On the **EOJ Checking page**, select the event for which you want to define a recovery definition and choose **Add**.

Or:

On the **EOJ Checking page**, select the event whose activation definition you want to view or change and choose **Modify**.

The letter **R** in the **Action** column indicates whether an activation action has already been defined for the event.

The **EOJ checking window** opens.

- 2 Open the tabbed page **Recovery** similar to the example below:

| SYSOUT | Output Management | Action Exit | Symbol | Message and Message Recipients | | |
|-----------------------------------|-------------------|--------------|----------------------------------|--------------------------------|-------------|----------|
| Activation | Output Conditions | Job Variable | Release Kept Resource | Other | Description | Recovery |
| Owner: | (SAME) ▼ | Wait time: | 0 minutes | Clear | | |
| Network: | E60-FLOW ▼ | Repeat: | 1 | | | |
| Version: | ▼ | Reschedule: | Do not reschedule original job ▼ | | | |
| Job: | JOB-01 ▼ | | | | | |
| <input type="checkbox"/> Same run | | | | | | |

- 3 Specify the recovery network to be started. The input fields and valid values are explained in [Fields: Network and Job Activation](#).

If required, choose **Clear** to remove current entries.

- 4 Choose **OK** when you are finished.

Your recovery definition is saved and the window closes.

➤ To remove a recovery definition

- Proceed as described in [Removing Actions](#).

This section covers the following topics:

- [Fields: Recovery Definition](#)
- [System Symbols for Recovery Actions](#)

Fields: Recovery Definition

The fields on the [Recovery page](#) are described in the following table:

| Field | Description | |
|----------------|--|---|
| Owner | Owner of the network that contains the recovery job(s). | |
| | selection options: | |
| | <i>owner-name</i> | Owner name other than the current owner. For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . |
| | (SAME) | Owner of the current network is used (default). The default value is replaced at execution time. |
| Network | Network that contains the recovery job(s). The recovery network must be defined in the Network Maintenance facility. | |
| | selection options: | |
| | <i>network-name</i> | Name of the network to be recovered. For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . |
| | (SAME) | (Only applies to single recovery jobs.) Same name (default) as the current network that contains the job to be recovered. The default value is replaced at execution time. |

| Field | Description |
|-------------------|--|
| | When you copy a recovery job to another network, the default values (SAME) for owner, network, and network version remain unchanged, so that the recovery job can be used unchanged in the network to which it was copied. |
| Version | Version of the network that contains the recovery job(s). selection options: |
| | <i>network-version</i> Version of the network that contains the job(s) to be recovered. For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . |
| | (SAME) or empty field Same version (default) as the version of the network that contains the job(s) to be recovered. The default value is replaced at execution time. When you copy a recovery job to another network, the default values (SAME) for owner, network, and network version remain unchanged, so that the recovery job can be used unchanged in the network to which it was copied. |
| | (CURRENT) Current version of the network that contains the job(s) to be recovered. |
| Job | Name of the last job in the recovery network to be executed upon job failure. This job must terminate successfully to start rescheduling. For possible input values to list a specified name range from the drop-down list box (if available), see Specifying Filter Criteria . |
| Same run | Single recovery jobs can be defined in the same network and can be executed under the same run number as the network to be recovered. All active objects of the network are then accessible for the recovery job with this run number. Possible check-box settings: |
| | <i>checked</i> Use same run number (default for single jobs). |
| | <i>unchecked</i> Use a separate run number for the recovery (default for whole network). |
| Reschedule | Specifies whether the job is to be rescheduled for submission after recovery. Possible selection options: |
| | Reschedule original job Resubmit the job. |
| | Do not reschedule original job Do not resubmit the job (default). |
| | Stop active network after recovery Stop the original network after recovery. |
| Repeat | Maximum number of times the original job is to be rescheduled after a recovery. Possible values: 1 (default) to 99. |

| Field | Description |
|------------------|---|
| | The Entire Operations Monitor sets the reserved condition <i>jobname</i> -MAX-RETRY if the retry limit was reached with unsuccessful rescheduling attempts. Repeat is meaningful only if Reschedule is set to Reschedule original job . |
| Wait time | Time to wait in minutes until the recovery is started, and between the recovery attempts. |

System Symbols for Recovery Actions

When defining a recovery action, the following Entire Operations system symbols can be prefixed with the escape symbol for symbol prompting and used, for example, in a comment line in the JCL of the recovery job:

| Field | Description |
|---------------------|--|
| P-C-OWNER | Owner of the job making the call. |
| P-C-NETWORK | Network of the job making the call. |
| P-C-NETWORK-VERSION | Version of the network of the job making the call. |
| P-C-JOB | Name of job making the call. |
| P-C-RUN | Run number of the job making the call. |
| P-C-SUFFIX | Value of the suffix symbol of the job making the call. |

They are substituted at JCL load with their current values. In the SYSOUT of the recovery job, you can then find the substitution of the parameters:

```

*** Symbol   : P-C-OWNER
***   Value  : GFR
*** Symbol   : P-C-NETWORK
***   Value  : NET-1
*** Symbol   : P-C-JOB
***   Value  : JOB-6
*** Symbol   : P-C-RUN
***   Value  : 208
*** =====
2 //STEP1    EXEC PGM=NOPCONTI
3 //STEPLIB DD  DISP=SHR,DSN=NOP.DEV.LOAD
*** CALLER OWNER   GFR
*** CALLER NETWORK NET-1
*** CALLER JOB     JOB-6
*** CALLER RUN     208
***

```

In this way, you can find out the job making the call, that is, the job to be recovered by the recovery job.

Defining SYSOUT Actions

You can define SYSOUT actions to be performed at job completion if the associated event occurs.

You can define the job SYSOUT to be cancelled or printed as the result of a defined event or the End-of-Job status (**All checks ok** and **Any check not ok**).

End-of-Job user exits are available for more complex actions, for example for obtaining selected information from the job SYSOUT. See also [User Exits for End-of-Job Checking and Actions](#) in the section *User Exits*.

➤ To add, view or change a SYSOUT action

- 1 On the [EOJ Checking page](#), select the event for which you want to define a SYSOUT action and choose **Add**.

Or:

On the [EOJ Checking page](#), select the event whose SYSOUT action you want to view or change and choose **Modify**.

The letter **S** in the **Action** column indicates whether an activation action has already been defined for the event.

The [EOJ checking window](#) opens.

- 2 Open the tabbed page **SYSOUT**.

The fields and options available in the window are explained in [Fields: Network and Job Activation](#).

- 3 Select the SYSOUT action that corresponds to the function you want to perform.

If required, choose **Clear** to remove current entries.

- 4 Choose **OK** when you are finished.

The specified SYSOUT action is saved and the window closes.

➤ To remove a SYSOUT action

- Proceed as described in [Removing Actions](#).

This section covers the following topics:

▪ [Fields and Options: SYSOUT Actions](#)

Fields and Options: SYSOUT Actions

| Field | Description |
|----------------------|---|
| SYSOUT action | Select one of the following options to perform the required function: |
| | Delete Delete SYSOUT on job completion. |
| | Print Release SYSOUT for printing. |
| | Log Log SYSOUT in the Entire Operations log file. |
| | Log, then delete Log SYSOUT and then delete it. |
| | Log, then print Log SYSOUT and then print it. |
| | Pass to Entire Output Management Pass SYSOUT to Entire Output Management (NOM) . |
| | Pass to OPO Pass SYSOUT to the Open Print Option (OPO). |
| Spool class | <p>You can specify that the spool class of a job is to be modified after completion. The definition created here overrides the default setting.</p> <p>Note:</p> <ol style="list-style-type: none"> 1. This field only appears if the executing operating system is z/OS or z/VSE. 2. The class defined here has priority over other definitions. 3. If no definition is made on the job level, the default for the node level is used: see <i>Other Definitions for a Node (Mainframe)</i> in the <i>Administration</i> documentation. 4. If no other definition is found, the system-wide default for the operating system is used (see <i>Defaults for z/OS and z/VSE</i> in the <i>Administration</i> documentation). 5. We recommend that you only define SYSOUT class changes under All checks ok or Any check not ok. 6. The spool class change is allowed only if the job is in the OUT queue. |

Defining Notification Messages

You can define a notification message to be sent as the result of a defined event, or if the job terminated OK or not OK. This is especially useful to inform appropriate user of job failures.

A user-defined message comes along with job execution information generated by Entire Operations. This information is more comprehensive if e-mails are used for sending; mailboxes have less information because they are limited to a single line. For example:

Mailbox message:

```
This line is the user-defined text.  
==> EXAMPLE / EXA-NET3 / 10 / EXA-JOB1
```

Corresponding e-mail message:

```
Owner EXAMPLE - Network EXA-NET3 - Run 10 - Job EXA-JOB1  
... Execution Node 123 (DAEF-123)  
Event: Additional Actions for Job-ok  
  
Ended ok  
This line is the user-defined text.
```

A message can be defined for any event or at the job level according to **All checks ok** and **Any check not ok**.

The Entire Operations Monitor continues to send a message until it has been successfully transmitted.

This section covers the following topics:

- [Displaying, Modifying and Adding Notification Messages](#)
- [Deleting Notification Messages](#)
- [Fields and Columns: Message and Message Recipients](#)
- [Rules for Message Text](#)
- [Rules for E-Mail Attachments](#)
- [Available Functions: Message and Message Recipients](#)
- [E-Mails on z/OS and z/VSE](#)
- [E-Mails on BS2000](#)
- [E-Mails on UNIX and Windows](#)

Related Topic:

Displaying, Modifying and Adding Notification Messages

➤ To view or change a notification message

- 1 On the [EOJ Checking page](#), select the event whose message you want to view or change and choose **Modify**.

The letter **U** in the **Action** column indicates whether a message has already been defined for the event.

The [EOJ checking window](#) opens.

- 2 Open the tabbed page **Message and Message Recipients**:

| Activation | Output Conditions | Release Kept Resource | Other | Long Description | Recovery | | | | | | |
|---|--|-----------------------|--------|--------------------------------------|----------|------|---------|----------|-----------------------|--|--|
| SYSOUT | Output Management | Action Exit | Symbol | Message and Message Recipients | | | | | | | |
| Text: | Repair Job | | | <input type="checkbox"/> Text | | | | | | | |
| To: | <table border="1"> <thead> <tr> <th>Destination</th> <th>Type</th> <th>Node</th> </tr> </thead> <tbody> <tr> <td>SAGTEST</td> <td>=MAILBOX</td> <td>42 QANODE42 (MVS/ESA)</td> </tr> </tbody> </table> | | | Destination | Type | Node | SAGTEST | =MAILBOX | 42 QANODE42 (MVS/ESA) | <input type="button" value="Add"/> <input type="button" value="Modify"/> <input type="button" value="Delete"/> | |
| Destination | Type | Node | | | | | | | | | |
| SAGTEST | =MAILBOX | 42 QANODE42 (MVS/ESA) | | | | | | | | | |
| E-Mail Attachments: | | | | <input type="checkbox"/> Attachments | | | | | | | |
| <input type="checkbox"/> Execute if temporary dummy | | | | | | | | | | | |
| <input type="button" value="Clear All"/> | | | | | | | | | | | |

The page shows the short message text and the recipient(s) defined for the message.

All fields contained on the page are described in [Fields and Columns: Message and Message Recipients](#).

All functions provided on the page are described in [Available Functions: Message and Message Recipients](#)

3 Message texts

If required, write new message text or replace the current text in the **Text** field.

Or:

Choose **Text** to open a **Text** dialog to write or display text that exceeds the length of the **Text** field.

In the **Text** dialog, you can choose **Clear** to remove all current text entries.

See also [Rules for Message Text](#).

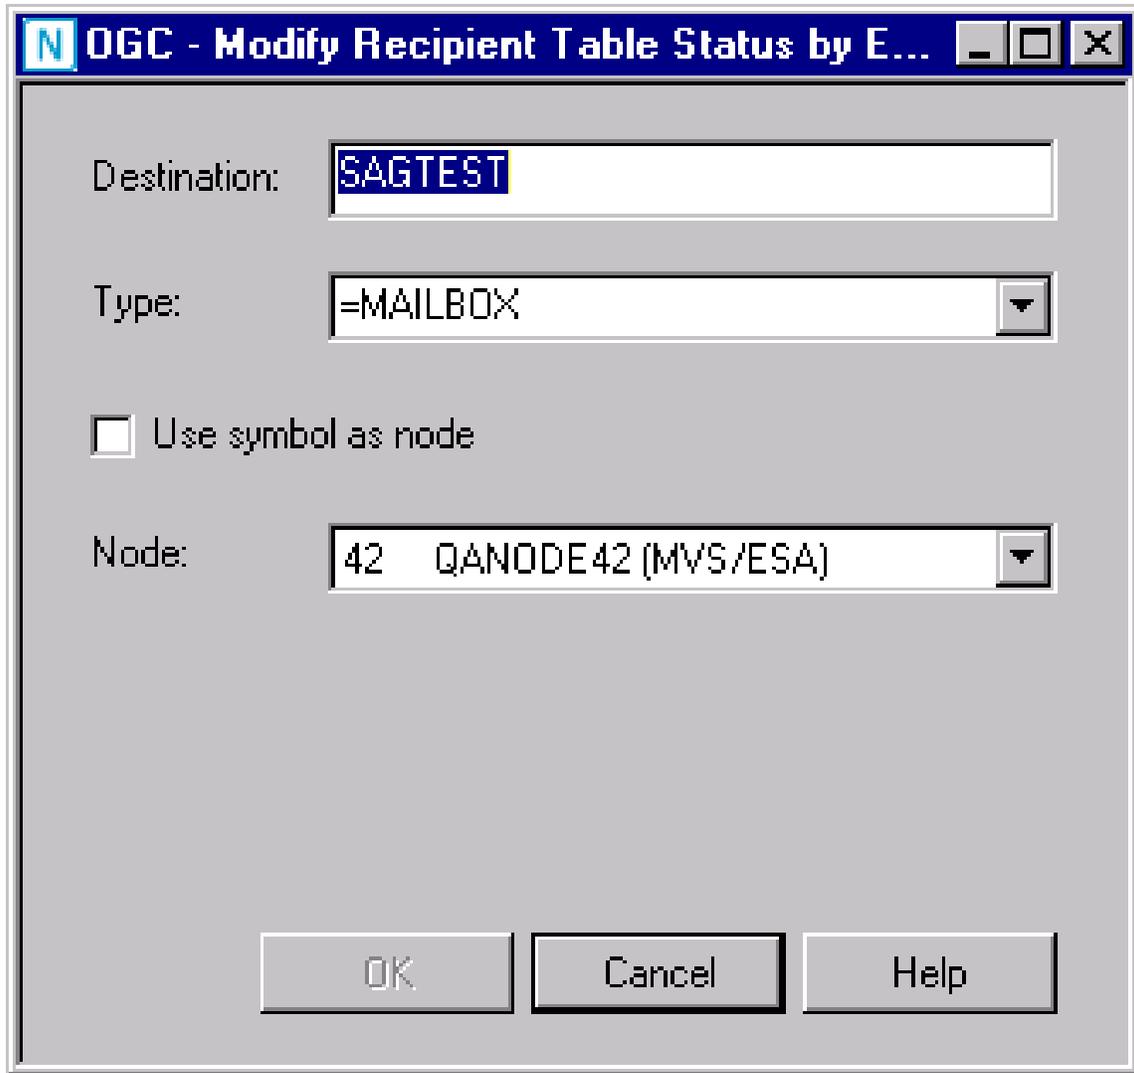

Recipients

If you want to add a recipient definition, choose **Add**.

Or:

If you want to change a recipient definition, in the **To:** section, select the table row that contains the required definition and choose **Modify**.

A **Recipient Table** window similar to the following opens:

Add or change the definition as required and choose **OK**.

The input fields are described in *Fields and Columns: Message and Message Recipients*.

Or:

If you want to delete a recipient definition, in the **To:** section, select the table row that contains the required recipient and choose **Delete**.

Caution: Use this function with care.

E-mail attachments

If you want to attach a file to the message, choose **Attachments**.

An **E-Mail Attachments** dialog opens where you can enter one or more addresses of files to be attached to the message.

See also [Rules for E-Mail Attachments](#).

You can choose **Delete** to remove all current entries.

- 4 Choose **OK** when you are finished.

The specified notification message is saved and the window closes.

Or:

Choose **Clear All** if you want to remove all current text entries (message text and all recipient definitions).

➤ To add a notification message

- 1 On the [EOJ Checking page](#), select the event for which you want to define a message and choose **Add**.

The [EOJ checking window](#) opens.

- 2 Open the tabbed page [Message and Message Recipients](#), enter message text in the **Text** field and choose **Add** to define message recipients.

All fields contained on the page are described in [Fields and Columns: Message and Message Recipients](#).

All functions provided on the page are described in [Available Functions: Message and Message Recipients](#)

- 3 Proceed as described in [Steps 3 to 4](#) of *To view or change a notification message*.

Deleting Notification Messages

➤ To remove a notification message

- Proceed as described in [Removing Actions](#).

Fields and Columns: Message and Message Recipients

The fields and columns on the [Message and Message Recipients page](#) and in the [Recipient Table](#) window are described in the following table.

Note: The fields are mandatory unless indicated otherwise in the table. All fields are cleared if you leave a mandatory field empty and you cannot save the message definition.

| Field/Column | Description | | | | | | |
|---------------------------|--|--------|---|------|--|-------|---|
| Text | <p>One-line text of the message to be sent if the associated event occurs.</p> <p>The text in the Text field is dimmed if additional text exists.</p> <p>See also Rules for Message Text.</p> | | | | | | |
| E-Mail Attachments | <p>Shows the address of the file attached to an e-mail.</p> <p>The address in the E-Mail Attachments field is dimmed if more than one address exists.</p> <p>See also Rules for E-Mail Attachments.</p> | | | | | | |
| Destination | <p>Message destination or recipient, respectively.</p> <p>In z/OS and z/VSE: enter the user ID of a TP system user.</p> <p>In BS2000: enter a terminal name and the related processor name in the Type field.</p> <p>In UNIX: enter a UNIX user ID valid in the UNIX environment of the addressed server. The message is sent with the UNIX mail function.</p> <p>Since the Destination field is usually too short for an e-mail address, it is recommended to put a symbol into this field, preceded by the submission escape character (in the previous example, \$EMAIL-ID). The effective e-mail address must be defined as symbol value in the symbol table used by the job.</p> <p>If e-mail addresses are to be defined (in an EBCDIC character set) on the mainframe, the string (a) must be used instead of the @ (commercial at) sign, for example: user(a)any . host</p> | | | | | | |
| Type | <p>Message recipient (destination) type.</p> <p>Possible selection options:</p> <table border="1"> <tbody> <tr> <td>=EMAIL</td> <td> <p>Sends the message by e-mail to any recipient in the intranet or internet.</p> <p>The e-mail is sent in plain text mode.</p> <p>As Windows does not have a built-in <code>sendmail</code> command, a command line tool must be specified in the node definition.</p> <p>See also E-Mails on UNIX and Windows.</p> </td> </tr> <tr> <td>=EMH</td> <td> <p>Sends the message by e-mail to any recipient in the intranet or internet.</p> <p>The e-mail is sent in HTML format.</p> <p>See =EMAIL for more information on sending e-mail.</p> </td> </tr> <tr> <td>=EXIT</td> <td> <p>Use the global message sending exit.</p> <p>See <i>Global Message Sending Exit</i> in section <i>Global User Exits</i> of the <i>Administration</i> documentation.</p> </td> </tr> </tbody> </table> | =EMAIL | <p>Sends the message by e-mail to any recipient in the intranet or internet.</p> <p>The e-mail is sent in plain text mode.</p> <p>As Windows does not have a built-in <code>sendmail</code> command, a command line tool must be specified in the node definition.</p> <p>See also E-Mails on UNIX and Windows.</p> | =EMH | <p>Sends the message by e-mail to any recipient in the intranet or internet.</p> <p>The e-mail is sent in HTML format.</p> <p>See =EMAIL for more information on sending e-mail.</p> | =EXIT | <p>Use the global message sending exit.</p> <p>See <i>Global Message Sending Exit</i> in section <i>Global User Exits</i> of the <i>Administration</i> documentation.</p> |
| =EMAIL | <p>Sends the message by e-mail to any recipient in the intranet or internet.</p> <p>The e-mail is sent in plain text mode.</p> <p>As Windows does not have a built-in <code>sendmail</code> command, a command line tool must be specified in the node definition.</p> <p>See also E-Mails on UNIX and Windows.</p> | | | | | | |
| =EMH | <p>Sends the message by e-mail to any recipient in the intranet or internet.</p> <p>The e-mail is sent in HTML format.</p> <p>See =EMAIL for more information on sending e-mail.</p> | | | | | | |
| =EXIT | <p>Use the global message sending exit.</p> <p>See <i>Global Message Sending Exit</i> in section <i>Global User Exits</i> of the <i>Administration</i> documentation.</p> | | | | | | |

| Field/Column | Description | | | | | | | | | | |
|-----------------------------------|--|----------|---|----------|--|------|---|----------|---|-----------------------|--|
| | <table border="1"> <tr> <td>=MAILBOX</td> <td>Sends the message to the internal Entire Operations mailbox specified in Destination.</td> </tr> <tr> <td>=COMPLET</td> <td>Sends the message explicitly to a Complete user (z/OS only).</td> </tr> <tr> <td>=TSO</td> <td>Sends the message explicitly to a TSO user (z/OS only).</td> </tr> <tr> <td>=CONSOLE</td> <td>Sends the message to the operator console (mainframes only). An entry in the Destination field is not required.</td> </tr> <tr> <td><i>processor-name</i></td> <td>BS2000: The processor name related to the BS2000 terminal name specified in Destination.</td> </tr> </table> | =MAILBOX | Sends the message to the internal Entire Operations mailbox specified in Destination . | =COMPLET | Sends the message explicitly to a Complete user (z/OS only). | =TSO | Sends the message explicitly to a TSO user (z/OS only). | =CONSOLE | Sends the message to the operator console (mainframes only). An entry in the Destination field is not required. | <i>processor-name</i> | BS2000: The processor name related to the BS2000 terminal name specified in Destination . |
| =MAILBOX | Sends the message to the internal Entire Operations mailbox specified in Destination . | | | | | | | | | | |
| =COMPLET | Sends the message explicitly to a Complete user (z/OS only). | | | | | | | | | | |
| =TSO | Sends the message explicitly to a TSO user (z/OS only). | | | | | | | | | | |
| =CONSOLE | Sends the message to the operator console (mainframes only). An entry in the Destination field is not required. | | | | | | | | | | |
| <i>processor-name</i> | BS2000: The processor name related to the BS2000 terminal name specified in Destination . | | | | | | | | | | |
| Node | <p>Message sending node.</p> <p>Enter the Entire System Server node through which the message is routed.</p> <p>You can define the message sending node as a symbol if the Use symbol as node option is selected.</p> <p>For details, see Symbols in Node Definitions in the section <i>Symbol Table and Symbol Maintenance</i>.</p> <p>Default is the execution node of the job.</p> | | | | | | | | | | |
| Use symbol as node | Select this option to define the message sending node as a symbol. | | | | | | | | | | |
| Execute if temporary dummy | See End-of-Job Actions after Execution as a Temporary Dummy Job . | | | | | | | | | | |

Rules for Message Text

The following rules apply when writing message text on the [Message and Message Recipients](#) page:

Message Text Field

- The **Text** field can contain up to 120 characters on a GUI client and 45 characters on a CUI client. Characters that exceed the CUI limit are truncated on the CUI screen.
- If the text contains an **activation escape character**, text replacement is performed from the active symbol table.

Message Text Window

- If the **Text** field contains text, the first input line of the **Text** window is filled with this text by default.

If no text is entered in the **Text** field, the first input line of the **Text** window is copied into the **Text** field by default. Text that exceeds the 45-character limit of the **Text** field is truncated.

Text can be entered on 10 input lines with a maximum of 120 characters per line on a GUI client and 76 characters on a CUI client. Characters that exceed the CUI limit are truncated on the CUI screen. Empty lines are removed from the text.

- If the text contains an **activation escape character**, text replacement is performed from the active symbol table.
- The text in the **Text** field is removed when the text in the **Text** dialog is deleted.

Note: If the text on the **Message and Message Recipients** page is not modifiable, the effective message text is automatically generated for the event by Entire Operations.

Rules for E-Mail Attachments

The following rules apply when attaching a file to an e-mail from the **Message and Message Recipients** page:

Send Limits

You can attach up to 5 files to a message for e-mails sent through UNIX or Windows execution nodes.

You can attach only one file to e-mails sent through mainframe nodes.

There is no limitation for the size of an attachment. However, consider that large attachments, for example, consume large database space and may need more time to send the message. This can have an impact on the Entire Operations Monitor task used for message sending.

Node Usage

Attachments are always taken from the execution node of the job, for which the message is sent.

For e-mails sent through UNIX nodes: Attachments from any execution node can be sent.

For e-mails sent through mainframe and Windows nodes: Attachments can be sent only if they are located on the e-mail sending node (recipient node).

If an attachment cannot be found, a notification is appended to the e-mail body, and a message is written to the **Entire Operations log**.

File Format

Attachments from z/OS can be sequential text files and PDS members only. They are sent with Content-Transfer-Encoding: 8bit.

Attachments from BS2000 can be sequential text files only. They are sent with Content-Transfer-Encoding: 8bit.

Attachments from UNIX and Windows can be files of any type. They are sent with Content-Transfer-Encoding: base64.

File Name

The file name can contain symbols.

Symbols preceded by the **activation escape character** are replaced at job activation time.

Symbols preceded by the **submission escape character** are replaced during message sending.

The SYSOUT file of a job can be attached by using the activation escape character defined for the job or containing network. Example:

```
^P-SYSOUT
```

(assuming ^ is the escape character)

File Address

The maximum file address is 120 characters on a GUI client and 76 characters on a CUI client. Characters that exceed the CUI limit are truncated on the CUI screen.

Each file name must begin on a new line.

Files must be specified with their full path name. Example:

```
/home/sag/work/NOP 551 Adabas Files.docx
```

A Windows path name can be specified with a slash (/) or a back slash (\).

For mainframes, the file address can be specified using the syntax *file-name(member-name)*, where *member-name* is the name of a source file. Example:

```
PDS.SOURCE1(IEFBR12)
```

A mainframe file address is converted to upper case during job activation.

Available Functions: Message and Message Recipients

The following functions are provided on the [Message and Message Recipients page](#):

| Function | Shortcut | Description |
|------------------|----------|---|
| Add | --- | Add a recipient definition to the To: section of the page. |
| Modify | --- | Modify the recipient definition selected in the To: section of the page. |
| Delete | --- | Delete the recipient definition selected in the To: section of the page. Caution: Use this function with care. |
| Clear All | --- | Clear all fields on the page. |
| Text | --- | Add additional message text. See Rules for Message Text . |

| Function | Shortcut | Description |
|-------------|----------|--|
| Attachments | --- | Attach one or more files to an e-mail message. See Rules for E-Mail Attachments . |

E-Mails on z/OS and z/VSE

1. The sender name contains `Entire Operations` for all sending platforms.
2. An additional line with the Entire Operations event text is added to the mail.

Usage Notes:

- Before using a z/OS Entire System Server node for sending e-mails, you must invoke the node definition in Entire Operations and enter the line command 0 (Other) for that node.

For further information, see *Special Definitions for a Node (Mainframe)* in the section *Definition of Nodes* in the *Administration* documentation.

- You must define at least the mail destination and the SYSOUT class for the node through which the e-mail is to be routed.
- The e-mail send routine for z/OS performs an Entire System Server logon, if necessary. The user ID for the logon is the submit user ID for the active job. If no submit user ID is defined for the job, the default user ID for the node is used.
- To use a z/OS Entire System Server for sending e-mails, make sure that all users who send e-mail are correctly defined in the security systems (if applicable). It might be necessary to define user IDs as USS users.

For more information, see the appropriate *Entire System Server* documentation for your operating and security system.

E-Mails on BS2000

E-mails can be sent via BS2000 nodes if Entire System Server nodes are used.

- Before using a BS2000 Entire System Server node for sending e-mails, you must invoke the node definition in Entire Operations and enter the line command 0 (Other) for that node.

For further information, see *Special Definitions for a Node (Mainframe)* in the section *Definition of Nodes* in the *Administration* documentation.

- The e-mail send routine for BS2000 performs an Entire System Server logon, if necessary. The user ID for the logon is the submit user ID for the active job. If no submit user ID is defined for the job, the default user ID for the node is used.

E-Mails on UNIX and Windows

- UNIX: To be able to send e-mails on UNIX machines from Entire System Server, the following mail programs must be available there:

AIX, HP-UX, Linux, Sun Solaris: sendmail

Others: rmail

- Windows: To be able to send e-mails on Windows machines from Entire System Server, you must define a message command. This is a (third-party) command line tool to be used for sending e-mails via Entire System Server/Windows.
- Before using a UNIX or Windows node for sending e-mails, you must invoke the node definition in Entire Operations and enter the line command 0 (Other) for that node.

The return address of the e-mail is set to the same value as **E-Mail Reply-To**.

For further information, see *Special Definitions for a Node (UNIX and Windows)* in the section *Definition of Nodes* in the *Administration* documentation.

Defining Release Actions for Kept Resources

You can define an End-of-job action to explicitly release the resource held by another job of this network. The quantity released for the resource is equal to the quantity defined in the [prerequisite resource definition](#) of the respective job (that is, the quantity that was allocated).

It is possible to release a resource held by any other job of this network with the **Release Kept Resource** option.

➤ To add, view or change a resource release definition

- 1 On the [EOJ Checking page](#), select the event for which you want to define a resource release action and choose **Add**.

Or:

On the [EOJ Checking page](#), select the event whose resource release definition you want to view or change and choose **Modify**.

The letter **L** in the **Action** column indicates whether a resource release definition already exists for a defined event.

The [EOJ checking window](#) opens.

- 2 Open the tabbed page **Release Kept Resource** shown in the following example:

| | | | | |
|------------|-------------------|--------------|-----------------------|--------------------------------|
| SYSOUT | Output Management | Action Exit | Symbol | Message and Message Recipients |
| Activation | Output Conditions | Job Variable | Release Kept Resource | Description |

Resource

Execute if temporary dummy

3 Enter the required values. The fields are explained in [Fields: Release Kept Resource](#).

If required, choose **Clear** to remove the current entries.

4 Choose **OK** when you are finished.

The resource release definition is saved.

➤ **To remove a release kept resource definition**

■ Proceed as described in [Removing Actions](#).

This section covers the following topics:

- [Fields: Release Kept Resource](#)

Fields: Release Kept Resource

The fields in the [Release Kept Resource page](#) are explained in the following table.

| Field | Description |
|----------------------------|--|
| Resource | Name of the resource to be released. You can select a name from the drop-down list box. |
| Execute if temporary dummy | See End-of-Job Actions after Execution as a Temporary Dummy Job . |

37 Viewing Job/Network Accounting Information

- Displaying Accounting Data 458
- Fields: Range Specification for Accounting Data 460

You can view the start and end times, elapsed time and CPU time for previous runs of a job. The information is taken from the Entire Operations log file.

Note: You can also generate reports from accounting data (see [Example of Accounting Information](#) in the section *Reporting*).

Displaying Accounting Data

➤ To view accounting data

- 1 In a [Maintenance Job Master](#) or [Maintenance Job Active](#) window, open the tabbed page [Scheduling Parameters](#) and choose **Account Info**.

An **Accounting Data List Info** window similar to the following example opens.

- 2 If required, changes the field entries to specify the period and number range for which you want to view accounting data: see [Fields: Range Specification for Accounting Data](#).
- 3 Choose **Refresh**.

The **Accounting Data List Info** window is refreshed and the accounting information is displayed as shown below:

OGC - Accounting Data List Info [SAGTEST,SAGNET,JOB-SYMBOL]

From date: 29.01.2019 From run: 2 To date: 29.01.2019 To run: 2

Time: 00:00:00 Time: 16:23:51 Refresh

| Job | Run | Step | JobId | Date | Start | Stop | Elapsed min | CPU Tm sec |
|------------|-----|------|-------|---------|----------|----------|-------------|------------|
| JOB-SYMBOL | 2 | | | 19-01-2 | 15:47:16 | 15:47:16 | 0.00 | 0.00 |

Averages from: 19-01-29 15:47 to: 19-01-29 15:47 are: 0.00 0.00

OK Help

The window contains job execution time information collected by the Entire Operations Monitor. The job elapsed time is in minutes and the CPU time is in seconds. Average values are available at the bottom of the window. For further information, see [Accounting Information/Schedule of Jobs reports only](#) under *Fields and Columns: Reports* in the section *Reporting*.

- 4 Choose **OK**.

Note: Step data is only displayed if the **Collect z/OS step accounting data** option is enabled in the Entire Operations default settings: see *Defaults for Operating System Specials* in the *Administration* documentation.

Fields: Range Specification for Accounting Data

The fields of the [Accounting Data List Info](#) window are described in the following table:

| Field | Description |
|-------------------------------------|--|
| From Date/Time | Enter or select start (From) and end (To) dates and times to specify the time frame for which to display accounting data. |
| To Date/Time | Default is the current date, from midnight until the current time. |
| From Run/To Run | Enter or select start (From) and end (To) run numbers to specify the number range for which to display accounting data. Default is from 1 to 99999. |
| Averages from ... to ... are | Read-only field at the bottom of the window listing average consumption values which correspond to the values in the field History Elapsed Time (min.) . |

XI

Maintaining Active Jobs and Networks

When Entire Operations activates a job or job network, the job or job network defined in the master database is copied to the active database and assigned a run number. Several copies of the same job or job network can be in the active database, each distinguished by their run numbers. All copies and run numbers are listed under the **Active Run** node of a **Job Master** or **Network Active** node.

Entire Operations allows extensive modification of job networks and jobs after activation. All current information pertaining to condition status, job status, active JCL and symbols is contained in and can be modified on the active database.

This section explains the maintenance functions you can perform on active jobs and networks.

For example, you can modify active copies of a job definition including associated logical conditions, resources and JCL. All modifications to active jobs take place on the active database and are valid for the current job run only, so that all original definitions on the master database remain unchanged.

Note: Your user profile must contain the appropriate authorization to access active networks. See the **Monitoring Functions** permissions your administrator can set to control access.

Maintaining Active Job Networks

- Available Functions: Network Active 464
- Listing Active Job Networks 464
- Deactivating Active Job Networks 465
- Viewing the Execution History of a Network Active 467
- Maintaining Active Runs 468

Available Functions: Network Active

➤ To list all functions available for a Network Active node

- In the object workspace, select a **Network Active** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| List | F8 | See Listing Active Job Networks . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | See Filtering Objects . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all functions available for a Network Active instance

- Select a **Network Active** instance and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| History | CTRL+C | See Viewing the Execution History of a Network Active . |
| List Active Jobs | --- | See Listing Active Jobs . |
| Browse Log | --- | See Displaying Logged Information - Browse Log Function . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

Listing Active Job Networks

➤ To list all active job networks of an owner

- 1 In the object workspace, select the **Network Active** node of an owner.
- 2 From the context menu, choose **List**.

Or:

Press F8.

An **Active Network List** window similar to the example below opens:

| Network | Runs | Node | Description |
|----------|------|-------|-----------------|
| B60-FLOW | * | 31 | BS2000 Job Flow |
| E51-MAIL | * | 148 | Mailbox Usage |
| E52-RES | * | 148 | Resources |
| E60-FLOW | * | 148 | Job Flow MVS |
| SAGNET | * | 55522 | |

- [Columns: Active Job Networks](#)

Columns: Active Job Networks

The following table explains the column headings for the data listed in the [Active Network List window](#):

| Field | Description |
|--------------------|---|
| Runs | Asterisk (*) in this column indicates that one or more active job runs exist for the network. |
| Network | Network name. |
| Node | Execution node specified for the network as the default for its jobs. |
| Description | Short description of network as defined in the job network definition on the master database. |

Deactivating Active Job Networks

There are several ways of preventing or interrupting the execution of an active job network. These are described in the following section.

- [Deactivation User Rights \(Profile Settings\)](#)
- [Deactivating Active Runs for a Network](#)
- [Deactivating all Networks](#)

- [Stopping a Running Network](#)

Deactivation User Rights (Profile Settings)

Deactivation requires active job deletion user rights and either network master deletion rights or network activation rights. See *User Definitions and Profile Settings* in the *Administration* documentation.

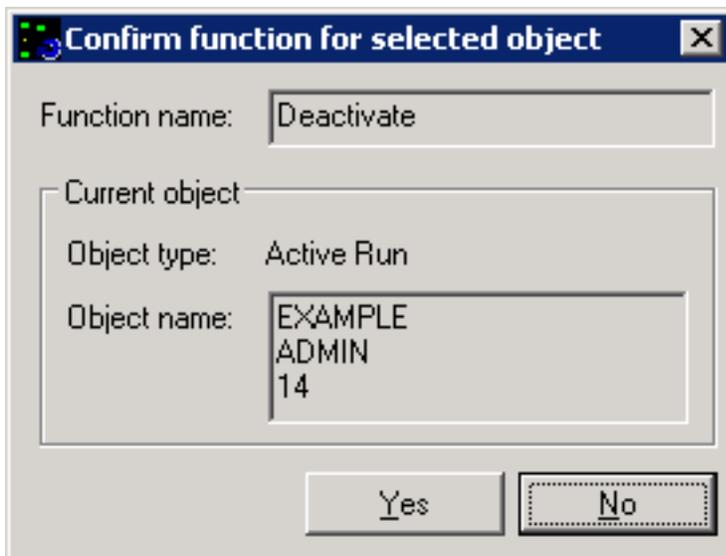

Deactivating Active Runs for a Network

If you wish to prevent Entire Operations from submitting active jobs for a network, you can deactivate a network before the first job run is performed.

➤ To deactivate single or multiple active runs

- 1 In the object workspace, select an **Active Run** and choose **Deactivate** from the context menu.

A confirmation dialog similar to the example below opens:

- 2 Choose **Yes**.

The currently selected active run is deactivated.

➤ To deactivate multiple active runs

- 1 In the object workspace, select an **Active Run** node and choose **List** from the context menu.

An **Active Run List** window opens with a table of all active runs.

- 2 Select multiple active runs and choose **Deactivate** from the table's context menu.

In the **confirmation dialog** that opens, choose **Yes** to deactivate one active run after the other, or choose **Yes to All** to delete all active runs at once.

Deactivating all Networks

The system administrator can stop the Entire Operations Monitor to halt the execution of all job networks. Jobs currently being executed continue until normal termination, unless they are explicitly cancelled from the operating system.

Stopping a Running Network

To interrupt a running network, add an input condition, e.g. WAIT-HERE, for the job before which the network is to stop running, and ensure that it will not be set. For more information, see [Adding an Active Condition](#).

To restart the network at the point of interruption, you can manually set the input condition, or remove it from the active job definition (see [Displaying and Modifying an Active Job Definition](#)).

Viewing the Execution History of a Network Active

➤ To view the history of a Network Active instance

- 1 In the object workspace, select a **Network Active** instance and choose **History** from the context menu.

A **History Network Active** window opens for the selected network. This window corresponds to the **History Network Master window** described in [Displaying the Network Execution History](#) in the section *Schedule Maintenance*.

- 2 In the calendar, click on the scheduled date for which you want to view the history data.

If history data exists for the selected network and date, execution information on all network starts is contained in the right-hand table columns of the window. The columns are explained in [Columns: Network History](#) in the section *Schedule Maintenance*.

Maintaining Active Runs

An active run is identified by owner, network and run number. Run numbers are unique per network. If a single job is activated, it will get a run number of the network to which it belongs.

Note: You can maintain active runs from either the **Active Run** node under **Network Active** or the **Active Run** node under **Network Master**. Both nodes control the same active runs. If you use both nodes to change active runs during a session, consider refreshing them manually to make sure that you view the latest status.

This section covers the following topics

- [Available Functions: Active Run](#)
- [Using Filter Criteria to List Active Runs in a Network](#)
- [Viewing a Network Diagram](#)
- [Repeating an Active Run](#)
- [Modifying the Latest Start Time for an Active Run](#)

Available Functions: Active Run

➤ To list all functions available for an Active Run node

- In the object workspace, select an **Active Run** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|--|
| List | F8 | List all active runs in a network: see Listing Objects . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | See Using Filter Criteria to list Active Runs in a Network . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all functions available for an Active Run instance

- Select an **Active Run** instance and open the context menu.

The following functions are available:

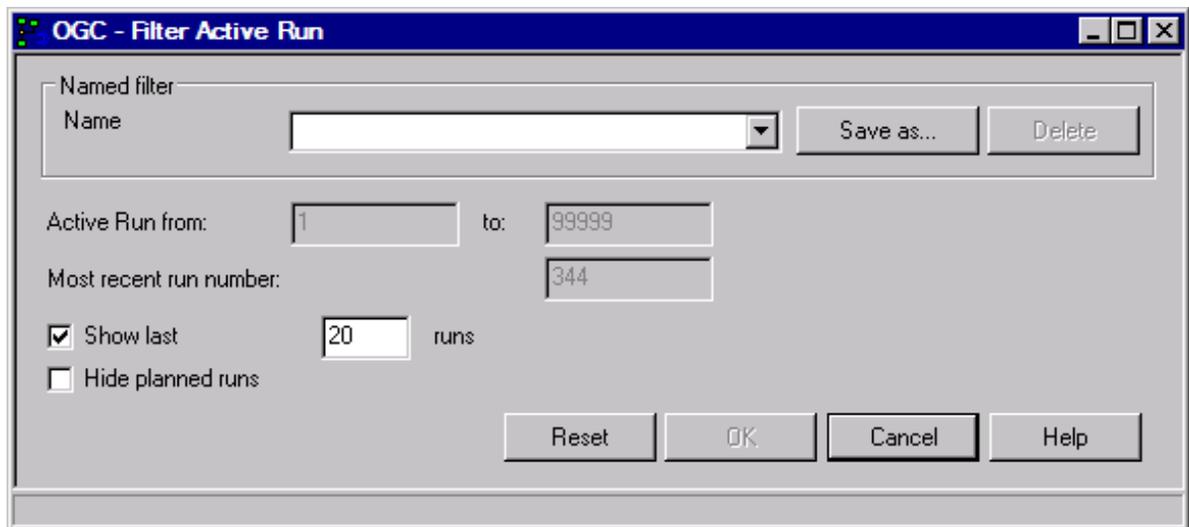

| Function | Description |
|----------------------------|--|
| Diagram | See Viewing a Network Diagram . |
| Deactivate | See Deactivating Active Runs for a Network . |
| Release | Release job(s) from hold status for the selected active run. See Releasing an Active Job . |
| Repeat | See Repeating an Active Run . |
| Modify Latest Start | See Modifying the Latest Start Time for an Active Run . |
| List Active Jobs | See Listing Active Jobs . |
| Browse Log | See Displaying Logged Information - Browse Log Function . |
| Add to Workplan | See Add to Workplan . |
| Set Drag And Drop Function | See Drag & Drop . |

Using Filter Criteria to List Active Runs in a Network

> To filter active runs

- 1 Select an **Active Run** node and choose **Filter** from the context menu.

A **Filter Active Run** window similar to the example below opens:

- 2 In the **Show last** input field, enter the number of latest active runs you want to view.

Or:

Remove the mark from the **Show last** check box and enter the range of run numbers you want to view in the **Active Run from/to** input fields (default is 1 to 99999). The most recent run number is indicated for orientation.

- 3 In addition, you can mark the **Hide planned runs** check box to hide planned runs from the display list.

You can set default values for an active run filter in your user profile by using the **Filter** option (see the *Administration* documentation).

For information on naming a filter, see [Filtering Objects](#).

Viewing a Network Diagram

Diagrams are provided for network masters and active networks. In case of active networks, they can be used to define an active run within a network and to monitor the progress within the network.

› To view a network diagram

- 1 In the object workspace, select an instance of **Active Run** and choose **Diagram** from the context menu.

Or:

In the object workspace, select an instance of **Job Active** and choose **Network Diagram**.

- 2 Open the context menu and choose **Diagram** or **Network Diagram**, respectively.

A **Diagram Active Run window** with a network diagram opens similar to the example shown in the [Network Maintenance](#) section.

Here you can see all network components available for the currently selected **Active Run** in a graphical view.

For explanations of the symbols used in the diagram and the functions provided, see [Explanations of Diagram Symbols](#) and [Maintenance Functions for Diagrams](#) in the section *Network Maintenance*.

Repeating an Active Run

› To repeat an Active Run

- 1 In the object workspace, select an instance of **Active Run**.
- 2 Invoke the context menu and select **Repeat**.

- 3 You can adapt job time frames for the repetition.

If you select this option, then the time frames are adapted as follows:

| Formula | Example |
|--|-------------------------|
| time delay = current time - old earliest start | 13:00 - 9:00 = 4 hours |
| new earliest start = current time | 13:00 |
| new latest start = old latest start + time delay | 17:00 + 4 hours = 21:00 |
| new deadline = old deadline + time delay | 18:00 + 4 hours = 22:00 |

- 4 Choose **OK**.

The active run is repeated immediately.

Modifying the Latest Start Time for an Active Run

You can change the latest start time for all jobs of an active run where the active job status permits it. The latest start time may be changed for an active job that is not started or is already terminated.

➤ To modify the latest start for an active run

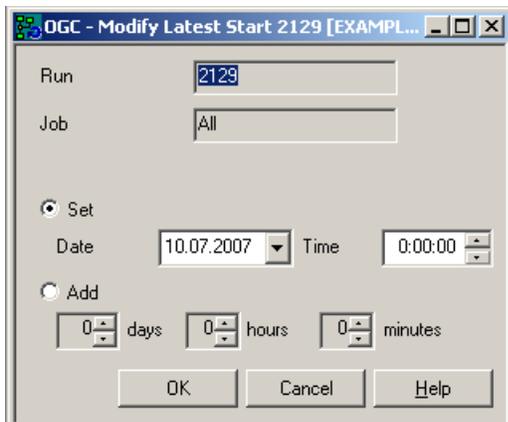

- 1 In the object workspace, select an instance of **Active Run**.
- 2 Invoke the context menu and select **Modify Latest Start**.

A window similar to the following opens:

You may choose only one of two methods to modify the latest start time:

- **Set:** Enter date and time values of new latest start;
- **Add:** Enter days, hours and minutes that shall be added to the latest start time value of active job.

The deadline value may get changed during this modification to ensure the following rule is honored: latest start time + estimated elapsed time <= Deadline.

All actions are logged in the Entire Operations log file.

Listing Active Jobs

You can access active runs of a network to list and maintain active jobs from different nodes in the object workspace. The result list of active jobs depends on the node and the node instance selected.

User Restrictions for Active Jobs Lists

Users can be restricted to view jobs in the **List Active Jobs** window.

If the user is of type **Administrator** (A) or if the user has access to the owner SYSDBA, then all active jobs are displayed. In all other cases, the following active jobs are displayed:

- From networks of the current owner,
- From networks of owners to which the user has access,
- From networks to which the user has access.

See also [Granting Definition: Authorizing Other Users or Owners to Access a Network](#) in the section *Network Maintenance*.

» To list active jobs

- 1 In the object workspace, select an instance from a **Network Active** or an **Active Run** node to list all active jobs of this particular network or active run, respectively.

Or:

In the object workspace, select an instance from an **Owner** or a **Network Master** node to list all active jobs of this particular owner or network, respectively.

Or:

In the object workspace, select the **General** node to list all active jobs running in your environment.

- Open the context menu and choose the **List Active Jobs** function.

A **List Active Jobs** window similar to the example below opens with a list of active jobs:

| Owner | Network | Run | Job | Node | JobId | Time | Message |
|---------|------------|-----|------------|-------|--------|-------------|----------------------------------|
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO7 | 55522 | 503941 | 05-11 08:34 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO5 | 55522 | 503940 | 05-11 08:34 | Ended not ok - STEP01 U4095 |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO4 | 55522 | 503939 | 05-11 08:34 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO3 | 55522 | 503938 | 05-11 08:33 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO2 | 55522 | 503937 | 05-11 08:33 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO1 | 55522 | 503936 | 05-11 08:33 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | NAT | 55522 | 503934 | 05-11 08:33 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO | 55522 | 503933 | 05-11 08:33 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO6 | 55522 | | 05-11 08:33 | OGC-DEMO5-OK - 870 - RUN n |
| SAGTEST | SAGNETSUB2 | 69 | JOB-A | 42 | | 05-11 08:30 | No JCL found for ALL1338 |
| SAGTEST | SAGNETSUB1 | 63 | SUBNETJOB2 | 42 | | 05-11 08:30 | Subnetwork activation error, job |

This list displays all active jobs available showing the owner, network, run, job node, job ID, time and a message.

The columns and input fields are explained in [Columns and Filter Criteria: List Active Jobs](#).

Notes:

- For performance reasons, the table view is filled dynamically with data if scrolled to the end of the table.
- For a comprehensive overview of the job list, the **Latest Start**, **Deadline** and **Version** columns and the **Filter** section are hidden.

» To display the Latest Start and Deadline columns

- Select the **Show schedule** check box.

The columns with the latest start times and deadlines are displayed as shown in the following example:

| Owner | Network | Run | Job | Node | JobId | Latest Start | Deadline | Time | |
|--------|-----------|-----|------------|-------|--------|--------------|-------------|-------------|----------|
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO7 | 55522 | 503941 | 05-12 08:33 | 05-13 08:33 | 05-11 08:34 | Ended ok |
| NATQA5 | A-OGCDEMO | 870 | J-OGCDEMO5 | 55522 | 503940 | 05-12 08:33 | 05-13 08:33 | 05-11 08:34 | Ended ok |

> To display the Version column

- Select the **Show version** check box.

The column with the job version is displayed as shown in the following example:

| Owner | Network | Version | Run | Job | Node | JobId | Time | Messa |
|--------|-----------|---------|-----|------------|-------|--------|-------------|--------------------|
| NATQA5 | A-OGCDEMO | | 871 | J-OGCDEMO7 | 55522 | 503950 | 05-11 08:37 | Ended ok |
| NATQA5 | A-OGCDEMO | | 871 | J-OGCDEMO5 | 55522 | 503949 | 05-11 08:36 | Ended not ok - STE |
| NATQA5 | A-OGCDEMO | | 871 | J-OGCDEMO4 | 55522 | 503948 | 05-11 08:36 | Ended ok |

> To change the sort order

- 1 Click on the column header area of any column in the table to sort by that column.

The list is then sorted by that column. The current sorting state is shown above the table.

The first time a user requests sorting, all data is retrieved from the server if it has not been done before. Therefore, some delay is possible, depending on the count of active jobs. Changing the preselection causes to re-read data again and initial sorting settings are applied.

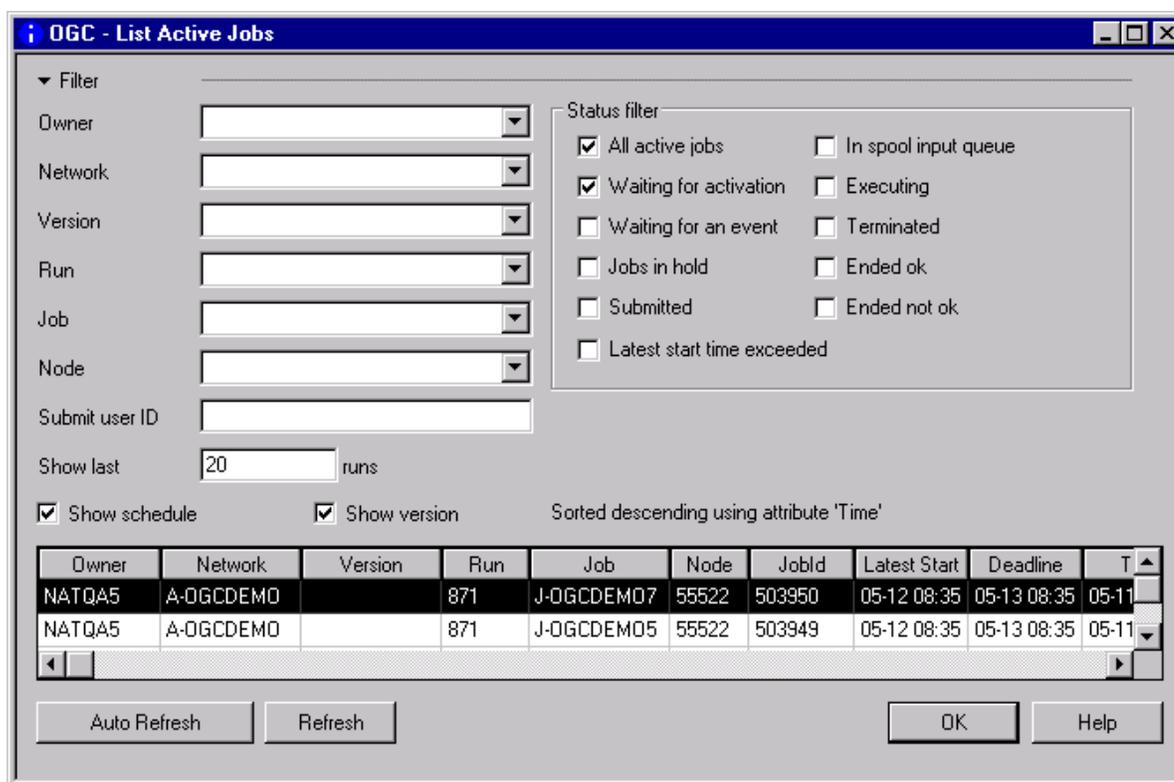

- 2 Click on the column header again if you want to change the sort sequence from ascending (default) to descending.

The initial sort order can be changed on the tabbed page **Other Settings** of the **Create new User** or **Maintenance User** window (see *User Maintenance* in the *Administration* documentation).

> To filter the job list

- 1 Click on **Filter** ▶ **Filter** to expand (or collapse) the **Filter** section.

The **Filter** section is expanded as shown in the following example:

- Specify or select the required filter criteria and choose **OK** when finished.

The columns and input fields are explained in [Columns and Filter Criteria: List Active Jobs](#).

➤ To refresh the list contents

- Proceed as described [Refreshing Object Lists](#).

This section covers the following topics:

- [Columns and Filter Criteria: List Active Jobs](#)
- [Listing Active Jobs by Process Status](#)

Columns and Filter Criteria: List Active Jobs

The columns and input fields available in the [List Active Jobs](#) window are explained in the following section.

Depending on the node or node instance for which the **List Active Jobs** function is used, the fields below **Filter** are either read-only or can be used to specify filter criteria to reduce the number of active jobs listed in the window.

| Column/Field | Description |
|--------------------------------|---|
| Owner | The name of the owner whose active jobs are shown. If available as input field, you can select an owner out of the drop-down-box to show only its active jobs. |
| Network | The name of the network for which the active jobs are shown. If available as input field, you can select a network out of the drop-down-box to show only its active jobs. |
| Version | The network version for which the active jobs are shown. If available as input field, you can select a version out of the drop-down list box to show only its active jobs (see also Maintaining Job Network Versions in the section <i>Network Maintenance</i>). |
| Run | The run number for which the active jobs are shown. The run number is automatically assigned at activation time. The job run number uniquely identifies an active copy of a job together with the job name. If available as input field, you can select the run number of the network to show only its active jobs. |
| Job | The job name as defined to Entire Operations. If available as input field, you can select a job out of the drop-down-box to show only its active jobs. |
| Node | Execution node of the machine designated for the job. If available as input field, you can select a node out of the drop-down-box to show only its active jobs. |
| JobId | The job identifier as assigned by the operating system or by the job entry subsystem. |
| Time | Last action or check date/time for the job. |
| Message | Last message issued for the job by Entire Operations. For a list of possible messages and their meaning, see <i>Messages in Active Jobs Lists</i> in the <i>Messages and Codes</i> documentation. |
| Submit user ID | Select a user ID out of the drop-down-box to show only its active jobs. |
| Show last <i>n</i> runs | Enter a number to restrict the list of active jobs to the last <i>n</i> runs where <i>n</i> is a number in the range from 1 to 999999999. |
| Show schedule | See To display the Latest Start and Deadline columns . |
| Show version | See To display the Version column . |
| Status filter | Select job status filters to additionally reduce the list of active jobs: see Listing Active Jobs by Process Status . |

Listing Active Jobs by Process Status

You can list active jobs according to their processing status by opening the **Filter** section of the **List Active Jobs Network Active** window and selecting one or more **Status filter** options:

| Selection Option | Description |
|----------------------------|---|
| All active jobs | All active jobs (default). |
| Waiting for an event | All active jobs waiting for at least one event. |
| Jobs in hold | All jobs in hold. |
| In spool input queue | All jobs in the scheduling system input queue. |
| Ended not ok | All jobs with job not ok terminating status. |
| Ended ok | All jobs with job ok terminating status. |
| Submitted | All submitted jobs. |
| Terminated | All terminated jobs. |
| Waiting for activation | Planned network runs waiting for activation. |
| Executing | All jobs in execution. |
| Latest start time exceeded | All jobs that exceed the Latest Start Time : see Modifying the Latest Start Time for an Active Job . |

Listing Jobs of an Active Subnetwork

› To list jobs of an active subnetwork

- From a **Job Active** node, select a job of the type **Subnetwork** (NET), and choose **Zoom Subnetwork** from the context menu.

Or:

From the table in an **Active Job List** window, select a job of the **Type** NET, and choose **Zoom Subnetwork** from the context menu.

The jobs of the subnetwork defined for the selected NET-type job are listed in a (separate) **Active Job List** window, as shown in the following example:

| Job | Type | Loc | JobID | Node | Time | Message |
|------------|------|-----|-------|------|---------------------|------------------------------|
| JOB-1 | JOB | NAT | | 42 | 2017-04-03 15:13:15 | No JCL found for JCLJOB |
| SUBNETJOB2 | NET | | | 42 | 2017-04-03 15:13:15 | Prerequisite Check requested |

Adding a New Job to the Active Network

➤ To add a job to the active database for the current run of an active job network

- Select a **Job Active** node and choose **New** from the context menu.

A **Create new Job Active** window (similar to the [Maintenance Job Active](#)) opens where you can enter the required definitions as described for a job master in the section [Adding a Job Definition](#).

Adding a job to an active job network involves temporarily changing the network structure and job flow. This is achieved with the minimum of effort, as the following [example](#) shows.

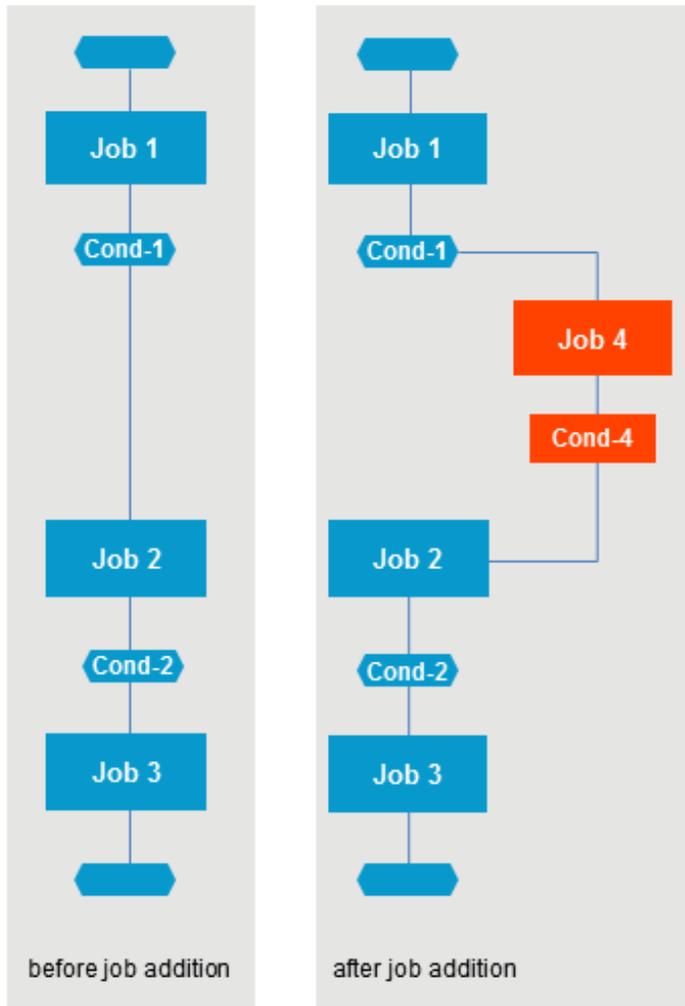

This section covers the following topics:

- [Example](#)
- [Achieving a Sequential Flow](#)

Example

You may wish to add a job to a network for one specific run.

This example illustrates the addition of a job to a network consisting of 3 sequential jobs. The new job (Job 4) is to be inserted between Job 1 and Job 2:

 condition

Achieving a Sequential Flow

> To achieve a sequential job flow

- 1 Add the new active job using the **Create new Job Active** window;
- 2 Define Cond-1 as input condition for Job 4;
- 3 Define Cond-4 as output condition in End-of-Job handling for Job 4;
- 4 Change the input condition defined for Job 2 (Cond-1) to Cond-4.

Job 4 is executed for the current run of the job network only.

If you wish this change to be permanent, use this procedure on the master database.

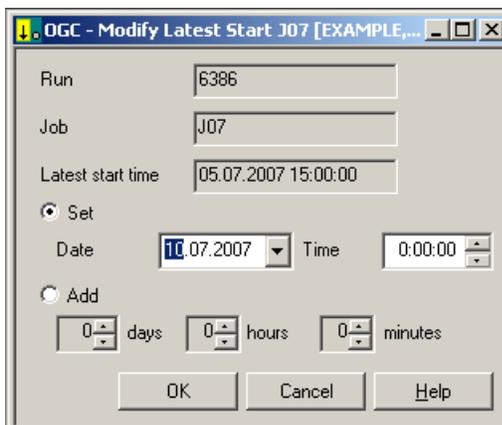

Modifying the Latest Start Time for an Active Job

You can change the latest start time or an active job instance where the active job status permits it. The latest start time may be changed for an active job that is not started or is already terminated.

> To modify the latest start time for an active job

- 1 In the object workspace, select an instance of **Job Active**.
- 2 Invoke the context menu and choose **Modify Latest Start**.

A window similar to the following opens:

The options available correspond to the methods described for an [active job run](#).

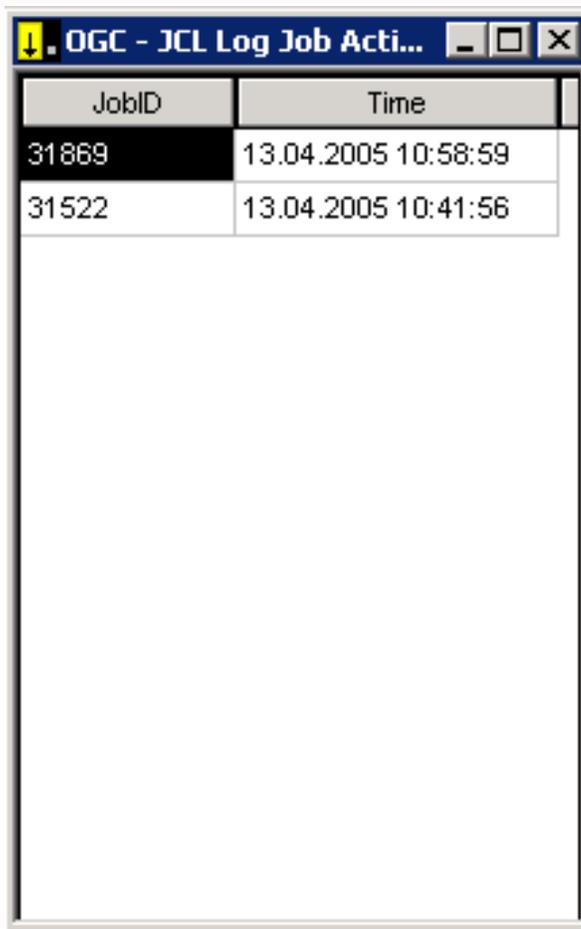

Choosing the Job ID of a Job for Logging

If you have several instances of one job running, for example, after resubmitting a job, you receive a selection window for selecting the job ID of the job whose log you want to view.

> To choose the log

- 1 Select a job from the **Job Active** node and choose **Extended Log / Active JCL changes** or **Extended Log / JCL** from the context menu.

The following window opens:

| JobID | Time |
|-------|---------------------|
| 31869 | 13.04.2005 10:58:59 |
| 31522 | 13.04.2005 10:41:56 |

- 2 Select a job by double-clicking on a job ID in the **JobID** column.

The selected log is displayed:

```

OGC - Extended Log Job Active JOB-LONG [XSETAB0,TBOA3,240]
New TBOA3 Jb JOB-LONG Run 240 (11.04.2005 17:46:17) Act.JCL chng. -----

Cancelling, Holding and Releasing Active Jobs

- [Operating System Jobs Handling](#)
- [Cancelling an Active Job](#)
- [Holding an Active Job](#)
- [Releasing an Active Job](#)

Operating System Jobs Handling

Operating system jobs in the Entire Operations active database can be handled directly from a **Job Active** instance.

When Entire Operations submits jobs to the operating system, they are assigned a job number which appears, for example, in the **Maintenance Job Active** window. In z/OS systems, JES operator commands are issued.

 **Note:** In BS2000, console commands are issued.

Canceling an Active Job

You can cancel the planned activation of a job in a planned network run that is waiting for activation. The job is then not executed within the active network.

➤ To cancel an active job from the operating system

- In the object workspace, select a **Job Active** instance and choose **Cancel** from the context menu.

A **confirmation dialog** prompts you to choose **Yes** to cancel the job.

The job is cancelled from the operating system.

Notes:

1. A cancelled job cannot be released for further processing.
2. For BS2000 jobs, you can only use the **Cancel** function if the following conditions are fulfilled:

- The BS2000 user ID in effect is allowed to issue a cancel command for the Entire System Server node(s) in use. If required, specify the following in the Entire System Server parameter file and restart Entire System Server:

```
SYSTEM-COMMAND-USER=TSOS, user-id[ , ... ]
```

For example:

```
SYSTEM-COMMAND-USER=TSOS, SAG1, SAG2, SAG3
```

- The active and passive Entire System Server console servers are available (see the Entire System Server *User's Guide*).
3. UNIX jobs are cancelled by the SIGTERM signal.

Holding an Active Job

You can stop an active job and place it in hold status.

➤ To stop a job and place it in hold status

- In the object workspace, select a **Job Active** instance and choose **Hold** from the context menu.

The message `Job set to Hold` appears in the **Message** column for the job

Notes:

1. If the job has already been submitted to the operating system, it will be held in the operating system.
2. Operating system hold does not work for Windows jobs.
3. For UNIX jobs, the whole process group belonging to the job ID will be held.

Releasing an Active Job

You can release a job from hold status.

➤ To release a job from hold status and allow it to continue

- In the object workspace, select a **Job Active** instance and choose **Release** from the context menu.

The message `Job released from Hold` appears in the **Message** column for the job.

Notes:

1. If the command is used for a job of the type **NET** (subnetwork): during a release, no new activation of the subnetwork will be performed.
2. The release from hold command is available for networks in the status `to be activated too`.

Resubmitting an Active Job

After a job has terminated, you can modify and resubmit it while it is still in the active database. This function is useful after a job has failed.

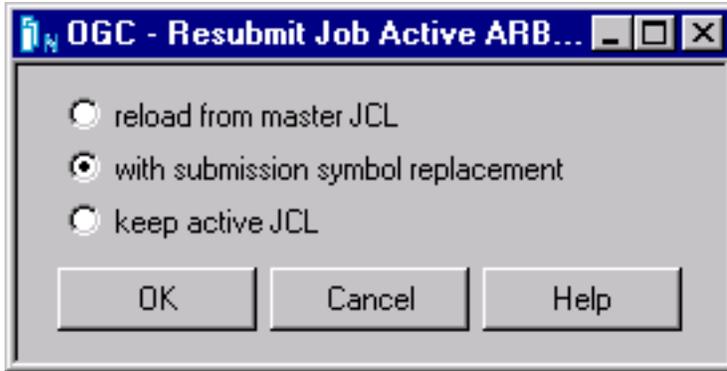

For example, if a JCL error has occurred, you can modify the active JCL (see [Editing Active JCL](#)) and resubmit the job. The resubmitted job uses the old input conditions for submission, but can set different output conditions, depending on the End-of-Job analysis.

Any output conditions set by the job's first run can be reset by the second run if this feature is defined in the job's original End-of-Job handling.

➤ To resubmit an active job

- 1 In the object workspace, select a **Job Active** instance.
- 2 Invoke the context menu and choose the **Resubmit** function.

The following window opens:

Select a resubmission option and choose **OK**.

The options are explained in *Options for Resubmission*.

This section covers the following topics:

- [Options for Resubmission](#)
- [Resubmitting an Active Job of NET type \(Subnetwork\)](#)
- [No Reloading after Editing](#)
- [Job Resubmission under BS2000](#)

Options for Resubmission

You have one of the following options to resubmit a job:

| | |
|---|---|
| reload from master JCL | Reload the JCL from the master JCL definition and resubmit the job. |
| with submission symbol replacement | Reload the active JCL with symbol replacement (default) and resubmit the job. Symbols and symbol function values are updated depending on the setting of the Entire Operations default Submit symbol/function recalculation at resubmit in the Defaults for Other Settings window described in the <i>Administration</i> |
| keep active JCL | Reload the active JCL from the previous job submission and resubmit the job exactly as before. Symbol replacement is not repeated. |

Note: Jobs of the types [NAT](#) (Natural Program) or [STC](#) (Started Task) are always resubmitted with **keep active JCL**; a different option selected for resubmission is ignored.

Resubmitting an Active Job of NET type (Subnetwork)

If the **Repeat** function is used for jobs with **NET** type (subnetwork), the subnetwork will be repeated with the same subnetwork run number. However, this is only allowed if the subnetwork has not started yet.

No Reloading after Editing

In case of a resubmission of the active job, the **pregenerated JCL** is not reloaded if the active JCL of the job has been edited in the meantime.

Job Resubmission under BS2000

The SYSOUT file copy attempts are limited if the SYSOUT file is locked. The limit is 10 times the task (Monitor) wait time. If the task wait time is smaller than 30 seconds, the limit is $10 * 30 = 300$ seconds.

If the SYSOUT file is still locked when the limit is reached, the active job will be set to a permanent error status, with the message text 10 SYSOUT Renaming Attempts failed.

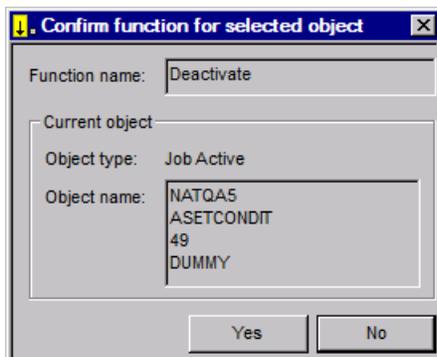

For each unsuccessful attempt, the message text will be set to SYSOUT File Renaming - File in use. In addition, the event will be logged with the SYSOUT file name.

Deactivating a Job in an Active Network

➤ To prevent the execution of a certain job in an active network for the current run

- 1 From a **Job Active** node in the object workspace, select an active job and choose **Deactivate** from the context menu.

A confirmation dialog similar to the example below opens for the selected job:

The window indicates the name of the owner (here: NATQA5), the name of the active network (here: ASETCONDIT), the run number (here: 49) and name of the active job (here: DUMMY).

- 2 Choose **Yes** to deactivate the job or **No** to cancel the action.

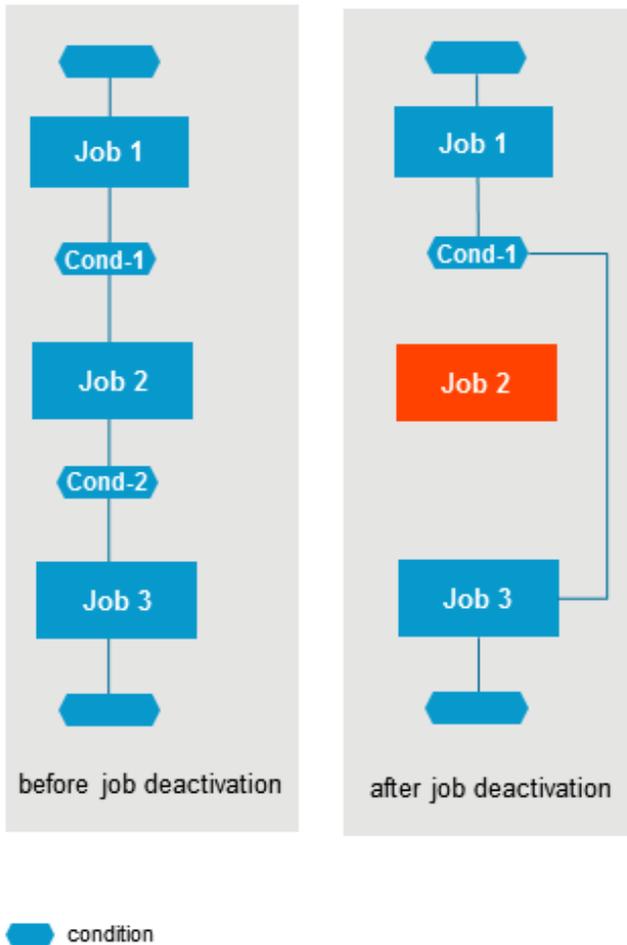

Deactivation is performed by the Entire Operations Monitor in the background. Deactivating a job from the active network involves deleting it from the active job network and restructuring the active network in order to ensure uninterrupted job flow. The following **example** illustrates job deactivation by bypassing a job in an active network consisting of three sequential jobs.

This section covers the following topics:

- [Example: Deactivation of a Job](#)
- [Ensuring Uninterrupted Job Flow](#)

Example: Deactivation of a Job

The network in the following figure is to run without Job 2:

Ensuring Uninterrupted Job Flow

➤ To ensure uninterrupted job flow

- 1 To prevent Job 2 from running, it is sufficient to delete its input condition Cond-1. If you deactivate Job 2 with the **Deactivate** function, the input condition is automatically deleted.;
- 2 Replace the input condition for Job 3 (Cond-2) by the input condition Cond-1.

The current run of the job network skips Job 2.

If you wish to deactivate a job that is currently running (interrupt its execution), you must cancel it from the operating system before deactivation (see *Canceling an Active Job*).

Reactivating an Active Job

This function is used to deactivate an active job and then reactivate it completely.

This function can be used to restore an inconsistent active job (for example, if a symbol was missing during the original activation).

➤ To reactivate an active job

- In the object workspace, select a **Job Active** instance and choose **Reactivate** from the context menu.

A **confirmation dialog** prompts you to choose **Yes** to reactivate the job.

Reactivation is performed in the background by the Entire Operations Monitor, whereby:

- The active job is deactivated and activated again.

After deactivation, the job may temporarily disappear from the active jobs list or active diagram.

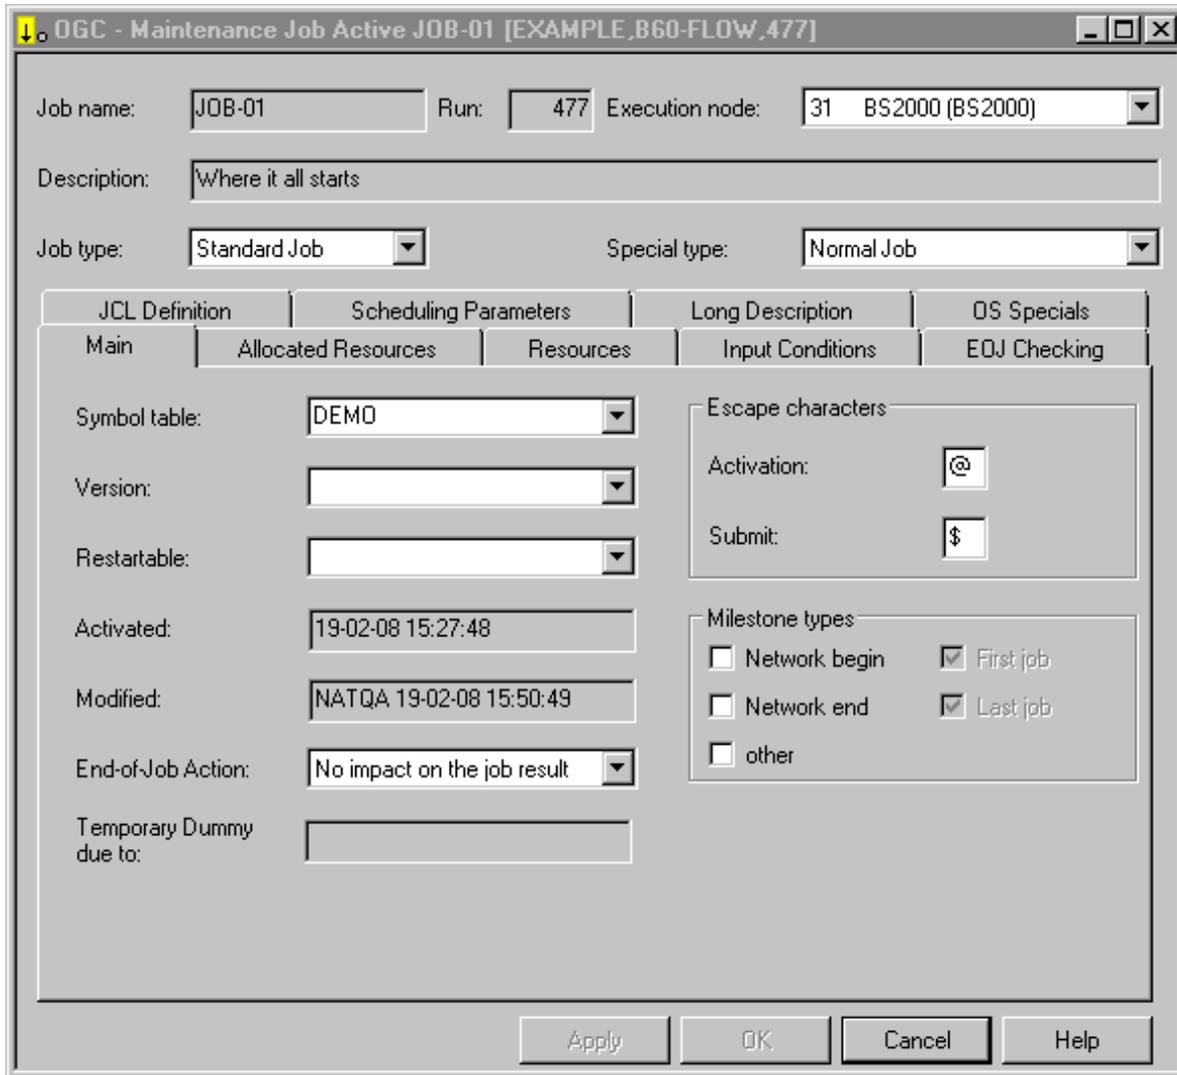

- All input and output definitions are recreated.
- The active JCL is newly generated.
- A prerequisite check is performed after reactivation.

Displaying and Modifying an Active Job Definition

➤ To view and modify an active job

- 1 In the object workspace, select a **Job Active** instance.
- 2 Invoke the context menu and choose **Open** or **Display**.

Open opens a **Maintenance Job Active** window similar to the example below:

Display opens a **Display Job Active** window which corresponds to the **Maintenance Job Active** window above but is write-protected.

The following applies when you modify a job definition in an active job network definition:

- The current user ID is stored as the last modifying user of the job for all definition and JCL modifications. This user ID is taken as the submit security user ID. If the Monitor does not use its own user ID, see *Monitor Defaults - Submit Security User Type* in the *Administration* documentation.
- It may be necessary to release the active job after the modification with the **Resubmit** function. This causes a new check of all prerequisites.

This section covers the following topics:

- [Fields: Maintenance Job Active](#)

- Special Job Type D - Execution as a Dummy

Fields: Maintenance Job Active

The input fields in the **Maintenance Job Active** window mostly have the same meaning as in the maintenance window of a job master definition; see *Fields: Job Definition (Master)* in the section *Job Maintenance*. However, the **Maintenance Job Active** window contains the following additional fields which are protected:

| Field | Description | |
|-------------------------------|--|--|
| Temporary Dummy due to | Indicates why a job executed as a temporary dummy. Possible flags/entries: | |
| | C Condition | Dummy due to condition. |
| | D Definition | Dummy due to definition. |
| | E Empty JCL | Empty JCL (no JCL statement generated on purpose). |
| | J JCL check | JCL check. |
| | K Deactivation | Job is deactivated. |
| | M Multiple suffix | Dummy due to multiple suffixes. |
| | R Recovery | Dummy due to recovery. |
| | S Schedule dependency | Dummy due to schedule dependency. |
| | T Repetition | Dummy due to repetition. |
| | Note: A job that executes as a temporary dummy can have an impact on the execution of End-of-Job actions defined for the job. | |
| Activated | Activation date and time of the network. | |
| Modified | User ID and time stamp of the last modification. | |
| Run | Run number of the current job run. | |

Special Job Type D - Execution as a Dummy

In the **Maintenance Job Active** window, it is possible to modify the field **Special Type** to **Execute as dummy**.

- If **Execute as dummy** is not set, an automatic reloading of the JCL is performed. In case of active jobs of the type **NET**, the subnetwork is activated.
- If **Execute as dummy** is set, the job is executed as a dummy job. In this case, it does not play any role, whether already active JCL or an active subnetwork were loaded.

See also: [Job Execution as a Dummy Job](#).

Modifying EOJ Checking and Actions

➤ To modify the End-of-Job checking and actions for the current run of a specific job

- In the **Maintenance Job Active** window, open the **EOJ Checking** page.

The current definitions are displayed on the page similar to the **example** shown in the section *Defining and Managing End-of-Job (EOJ) Checking and Actions*. You can modify event and action definitions in the same way as described in this section.

Note: Any modifications made to End-of-Job handling parameters of an active job are valid for the current job run only.

Viewing Long Descriptions of Active Jobs

➤ To view the long text description of an active job

- In the **Maintenance Job Active** window, open the **Long Description** page.

The **Long Description** page contains either descriptive text for the job (see the **example** in the section *Job Maintenance*) or an URL address as shown in the example below:

If an URL address is displayed, you can choose **Open URL** to open the page associated with the URL.

The page contains text, provided a long description exists for the job master. The text is displayed in Editor format. No modification is possible. The text can only be modified on the master database by using the appropriate job maintenance function as described in [Writing and Viewing Online Documentation for a Job](#).

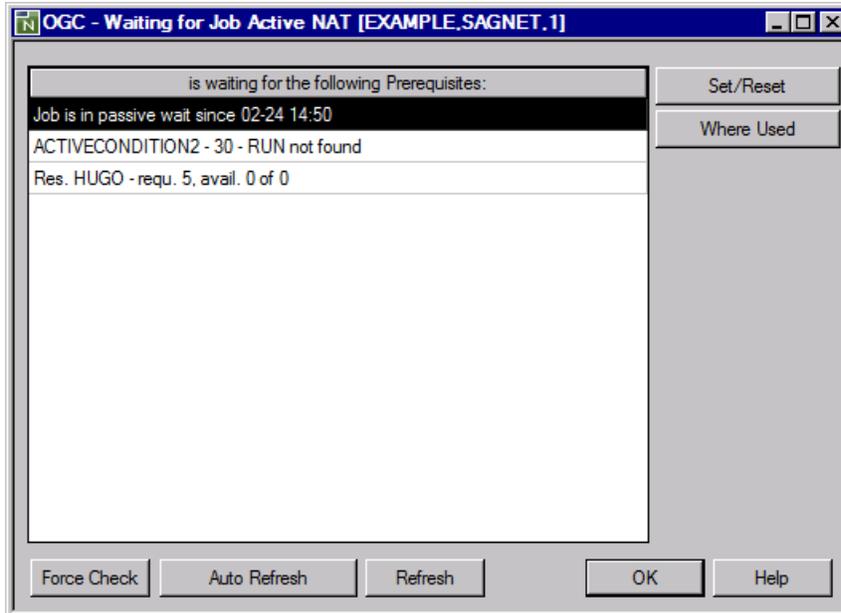

Displaying Prerequisites for Active Jobs: Waiting for

The **Waiting for** function is used to display all events pending for an active job.

➤ To display all waiting prerequisites for an active Job

- 1 In the object workspace, select a **Job Active**.
- 2 Invoke the context menu and choose the **Waiting for** function.

A **Waiting for Job Active** window similar to the example below opens:

The window lists the events an active job is waiting to complete.

The listed messages indicate that the current run of the job (run number 1) is waiting for the input condition ACTIVECONDITION2 from the run number 30, and the availability of the resource HUGO. A resource is indicated by a Res. prefix.

The text Job is in passive wait since 02-24 14:50 shows since when the job has been in passive wait for the input condition and the resources.

In this case, the job is automatically returned to the active wait by setting the correct input condition and making sure that the resource can be allocated; that is, the Monitor will execute a prerequisite check.

For a complete list of possible messages and their meaning, see *Messages in Active Jobs Lists* in the *Messages and Codes* documentation.

All functions available in the **Waiting for** window are explained in [Functions: Prerequisites for an Active Job](#).

Functions: Prerequisites for an Active Job

The following functions are available in the [Waiting for Job Active](#) window:

| Function | Description |
|---------------------|---|
| Force Check | Force an active prerequisite check. Only before the message <code>Job is in passive wait since ...</code> |
| Auto Refresh | See Refreshing Object Lists . |
| Refresh | |
| Set/Reset | <p>Set:</p> <ul style="list-style-type: none"> ■ Used for a condition wait: set the condition to true. <p>Reset:</p> <ul style="list-style-type: none"> ■ If used for a condition wait: reset the condition to false. ■ If used for a resource wait: delete the active prerequisite resource definition. The active job will then no longer wait for the resource. |
| Where Used | <p>Where used:</p> <ul style="list-style-type: none"> ■ If used for a condition wait: display the usage of the active condition. For further information, see Displaying Conditions for an Active Job. ■ If used for a resource wait: display the usage of the resource. For further information, see Viewing and Modifying Resources Used by Active Jobs. |

Viewing and Modifying Resources Used by Active Jobs

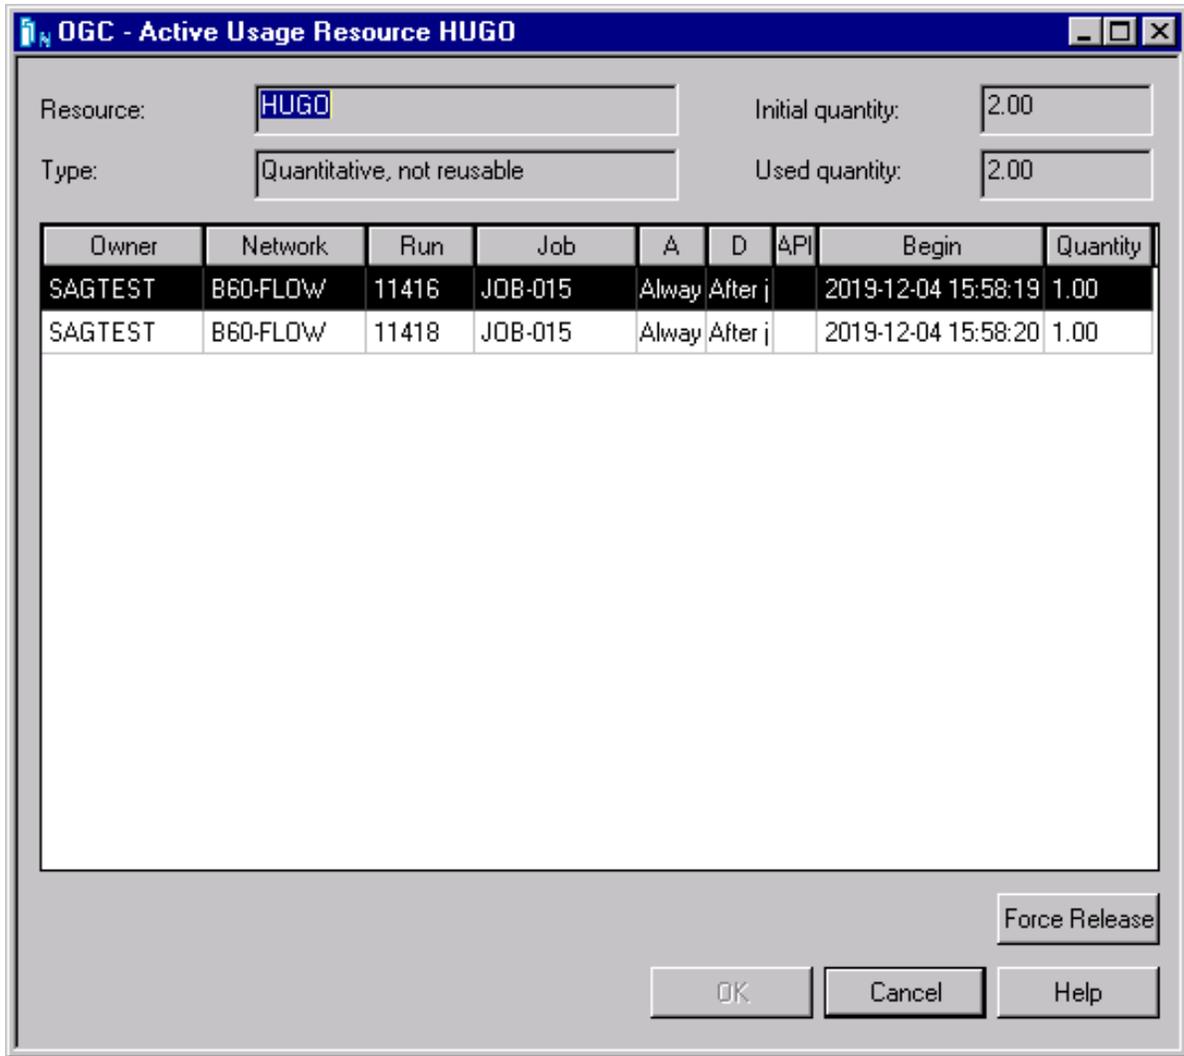

You can display the resources used by active jobs.

You can also modify resources for the current run of an active job without changing the original resource specification on the master database for future job runs. This can be useful if different job runs require different amounts of a specific resource, for example paper or tape drives.

➤ To view resources used by an active job

- In the [Waiting for Job Active](#) window, select the required resource and choose **Where Used**.

An **Active Usage Resource** window similar to the example below opens:

The window lists other active jobs in your active network environment which are currently using partial quantities of the resource for which your active job is waiting.

The fields and columns in the window are described in *Fields and Columns: Active Resource Usage* in the *Administration* documentation.

Browsing Active Job SYSOUT

You can view SYSOUT of an active job depending on the operating system installed at your site:

| Operating System | SYSOUT Availability |
|------------------|---|
| z/OS | SYSOUT can be browsed immediately after job submission. It is readable until the current last line readable from the spooling system (for example, JES2). |
| BS2000 | The SYSOUT file can be browsed only after job termination. This is because the SYSOUT file is open during execution and cannot be read. |
| UNIX/Windows | The SYSOUT file can be browsed immediately after job submission. It is readable up to its current last line. |

This section covers the following topics:

- [Viewing Job SYSOUT](#)
- [SYSOUT File Types on z/OS and z/VSE](#)
- [Available Functions: Browse SYSOUT](#)

Viewing Job SYSOUT

› To view job SYSOUT

- 1 In the object workspace, select a **Job Active** instance and choose **Browse SYSOUT** from the context menu.

Depending on your access rights, a **Logon Node window** opens.

- 2 Enter your user ID and password and choose **OK**.

A **Browse** window similar to the example below opens:

On UNIX:

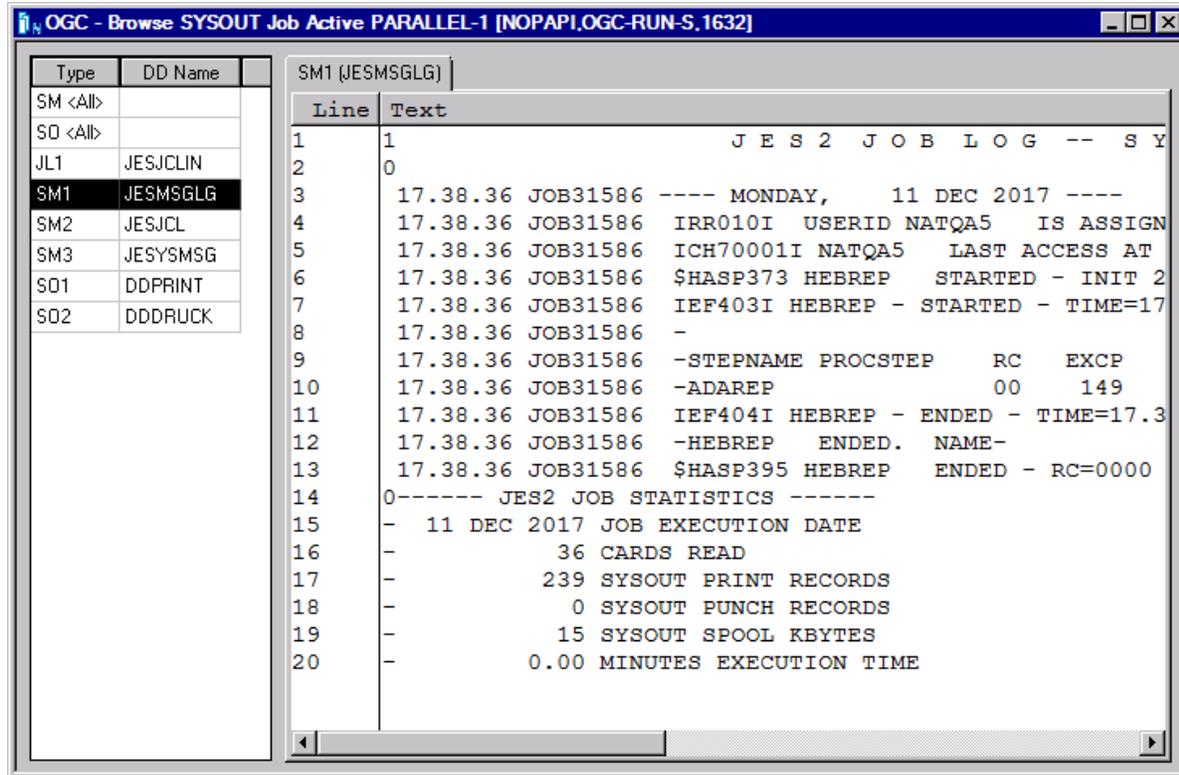

| Line | Text |
|------|---|
| 1 | %% EOR0301 - PID 32532 Start 20171214-114346 +0100 |

The window displays active SYSOUT produced for the DD statements processed by the selected job (here: PARALLEL-1, owner NOPAPI, network OGC-RUN-S, run number 1628 (UNIX) or 1652 (BS2000)). SYSOUT output data is contained in numbered text lines sorted in ascending order.

On z/OS and z/VSE:

If more than one SYSOUT file exists, a table in the left window section lists all DD statements produced by the job and the **type of the SYSOUT file**. For each file you select in this table, a tabbed page opens in the right window section showing the SYSOUT of the corresponding DD statement. Several files of the same file type are numbered sequentially from one (SM1, SM2, and so on). Files of the same type are combined in an <All> collection file, for example, SM <All>.

The browse functions available are explained in [Available Functions: Browse SYSOUT](#).

Notes about SYSOUT File Display

The following applies when viewing SYSOUT:

- **Name of the SYSOUT file**

In BS2000, UNIX and Windows, the SYSOUT file name is indicated in the first line of the SYSOUT text.

- **Automatic Logon to the Operating System Server**

Before a SYSOUT file is displayed, Entire Operations checks whether the user is allowed to access the SYSOUT file. If necessary, an automatic logon is carried out with the user ID, which is entered for the user as a standard user ID for the operating system server (see *Defining Node Default User IDs* in the *Administration* documentation). If this automatic logon does not function, for BS2000 files, a further attempt will be made with the BS2000 user ID from the fully qualified file name. If this was successful, the current user ID is set accordingly for the operating system node. If the user does not (implicitly or explicitly) log on to the

operating system server with the credentials required to access SYSOUT, the SYSOUT file cannot be displayed.

- **Line Length under UNIX and Windows**

Lines longer than 250 characters will be abbreviated in the SYSOUT display. They will be marked with >>> in the columns 247 to 250 of the display.

- **File Truncation**

If the SYSOUT file or spool data set exceeds a given line limit, the display will be truncated: see **SYSOUT line limit** in *Defaults for Network Options* in the *Administration* documentation.

- **Number of Previous Executions**

Entire Operations can display SYSOUT of up to 180 previous executions of the job (e.g., repetitions, cyclic executions).

SYSOUT File Types on z/OS and z/VSE

On z/OS and z/VSE, SYSOUT files are identified by the following output types to distinguish their contents:

| File Type | Purpose | Applies on |
|-----------|---|-------------|
| CC | Summary of job steps and condition codes. | |
| JL | JCL of selected job. | |
| SI | SYSIN data. | |
| SM | System messages. | |
| S0 | SYSOUT data. | |
| LST | List queue. | z/VSE only. |
| PUN | Punch queue. | z/VSE only. |
| RDR | Reader queue. | z/VSE only. |
| XMT | Transmit queue. | z/VSE only. |
| <A11> | Identifies a collection file that combines all files that belong to a certain file type, for example, SM <A11>. | |

Available Functions: Browse SYSOUT

The following functions are available from the context menu of the **Browse SYSOUT** window:

| Function | Shortcut | Description |
|----------------------|----------|---|
| Copy | CTRL+C | Copy the text lines selected in the SYSOUT file to the clipboard to be pasted into another file. |
| Reverse Order | CTRL+R | Display SYSOUT text in descending order of line numbers (last line first). The text is sorted in ascending order by default. |
| Refresh | F5 | See Refreshing Object Lists . |

| Function | Shortcut | Description |
|------------------|----------|---|
| Find | CTRL+F | Open the Find dialog to enter a search string and specify search options (case sensitive and/or whole word only) and the search direction backward (scrolls up in the source) or forward (scrolls down in the source). |
| Find Next | F3 | Find the next occurrence of the search string specified in the Find dialog. |
| Go To | CTRL+G | Scan the SYSOUT file for a specified line number and highlight this line. |
| Print | CTRL+P | Output the SYSOUT file on a printer. |

40

Maintaining Active Job Conditions

- Available Functions: Condition Active 508
- Listing Active Conditions 509
- Viewing an Active Condition and Changing Its Status 511
- Adding an Active Condition 511
- Using Global Active Conditions 512
- Displaying Conditions for an Active Job 516
- Viewing Job Usage of an Active Condition 516

Logical conditions are defined on the master database when linking jobs within a job network. When a job network is activated and running, Entire Operations sets logical conditions automatically (active conditions) according to the occurrence of system events. Alternatively, you can set active conditions manually. You can display and maintain active conditions.

An active condition reflects the current value of the condition for a given job network activation. It can have the value true (the condition exists) or false (the condition does not exist). The **run number** assigned to the job network at activation is automatically passed to the active conditions defined for the jobs in the network. An active condition is uniquely identified by owner, network, run number and condition name.

Notes:

1. You can define new input conditions for an active job, or delete or modify existing conditions. Any changes to active conditions for active jobs are valid for the current job run only.
2. You can maintain active input conditions in the same way as described for master input conditions in *Defining and Managing Job Conditions* in the section *Job Maintenance*.

- *Logical Conditions - Concepts and Facilities* documentation

Available Functions: Condition Active

➤ **To list all available functions for a Condition Active**

- In the object workspace, select a **Condition Active** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------|----------|--|
| List | F8 | See <i>Listing Active Conditions</i> . |
| New | CTRL+N | See <i>Adding an Active Condition</i> . |
| Refresh | F5 | See <i>Refreshing Object Lists</i> . |
| Filter | F3 | Use filter criteria to list conditions active: see <i>Filtering Objects</i> |
| Export | --- | Opens the Export Objects window to export all items of the metanode Condition Active : see <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |

➤ **To list all available functions for a Condition Active instance**

- Select an active condition from a **Condition Active** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|-----------------|----------|---|
| Open | CTRL+O | See Viewing an Active Condition and Changing Its Status . |
| Display | CTRL+D | Display condition active information: see Viewing an Active Condition and Changing Its Status . |
| Active Usage | --- | See Viewing Job Usage of an Active Condition . |
| Delete | DELETE | Delete a condition active: see Deleting Objects - Delete Function . |
| Add to Workplan | --- | See Add to Workplan . |

Listing Active Conditions

> To list active job conditions

- In the object workspace, select a **Condition Active** node from a **Network Active** node or an **Active Run** instance and choose **List** from the context menu, or press F8.

A **Condition List** window similar to the example below opens:

| Condition | Reference Date | Run | Status | Special |
|---------------|---------------------|-----|--------|---------|
| DUMMY-OK 198 | 2019-08-26 11:40:51 | 198 | free | |
| NET-BEGIN 198 | 2019-08-26 11:40:51 | 198 | free | |
| NET-END 198 | 2019-08-26 11:40:51 | 198 | free | |
| SETCON-OK 198 | 2019-08-26 11:40:51 | 198 | free | |

Depending on the **Condition Active** node selected, the window lists all active conditions of the selected network active or network active run, respectively.

The example above lists all active conditions of the active job run 198 of the network ASETCONDIT which belongs to the owner NATQA5.

The columns contained in the window are explained in [Columns and Fields: Active Conditions](#).

> To list global active conditions

- See [Listing Global Active Conditions](#).

This section covers the following topics:

■ Columns and Fields: Active Conditions

Columns and Fields: Active Conditions

The following table explains the columns of the **Condition List** window. The names of the columns correspond to the names of the fields available when adding or viewing an active condition in the **Condition Active or Global Active Condition** window, unless indicated otherwise in the **Field** column of the following table.

| Column | Field | Description | |
|-----------------------|-----------------------|---|---|
| Condition | Condition | <p>Active condition name as defined on the master database.</p> <p>Note: In the object workspace, an active condition that is being used for JCL checking only has the suffix <i>C</i> or <i>run-number C</i> (for example, TESTCONDITION 2 C).</p> <p>When adding or modifying a condition:</p> <ul style="list-style-type: none"> ■ Pay attention to the restrictions for condition names described in the section <i>Job Maintenance</i>. ■ For global active conditions, use the functions provided for the Global Active Condition metanode. | |
| Reference Date | Reference date | <p>Date and time when this condition was set. The date and time serve as search criteria for Entire Operations if no run number is specified.</p> <p>See also <i>Date and Time Formats</i>.</p> | |
| Run | Run | <p>Run number of the job which sets this condition, or the value <i>abs.</i> (absolute) or <i>void</i>.</p> <p><i>void</i> is displayed if a run number is not relevant for a job run.</p> <p>For information on <i>abs.</i>, see ABS in <i>Possible References for Input Conditions</i>.</p> | |
| Status | Status | Status of the condition. Possible selection options: | |
| | | free | Can be used by any job. |
| | | in use | Can be used by jobs which do not require exclusive usage. |
| | | exclusive | Currently in use by a job; not usable by other jobs. |
| Special Type | Special Type | Usage of the condition. | |
| | | Possible selection options for input fields: | |
| | Normal usage | Condition is not used for checking JCL. | |

| Column | Field | Description | |
|--------|-------|------------------------|---|
| | | Use only for JCL check | Condition is only used for checking JCL . If this option is selected, the letter C is shown in this column. |

Viewing an Active Condition and Changing Its Status

You can view an active condition and modify its status to change the use made of it by future runs of the job for which it is defined.

➤ To view a condition active and change its status

- In the object workspace, select a **Condition Active** instance and choose **Display** (CTRL+D) or **Open** (CTRL+O) from the context menu.

If you choose **Open**, you can change the **status** of the condition, if required.

A **Condition Active** window opens.

The fields in the window have the same meaning as the corresponding table columns in the **Condition List** window. They are explained in [Columns and Fields: Active Conditions](#).

Adding an Active Condition

You can add an active condition to change the job flow by defining if for a job before submission.

➤ To create a new condition active

- 1 In the object workspace, select a **Condition Active** node.
- 2 Open the context menu and choose **New**, or press CTRL+N.

A **Condition Active** window similar to the example below opens:

The input fields have the same meaning as the corresponding columns in the **Active Conditions** window. They are explained in [Columns and Fields: Active Conditions](#).

- 3 Make your definitions and choose **OK** when finished.

The condition is created.

Using Global Active Conditions

This section covers the following topics

- [Available Functions: Global Active Conditions](#)
- [Listing Global Active Conditions](#)
- [Viewing a Global Active Condition and Modifying Its Status](#)

- [Adding a Global Active Condition](#)

Available Functions: Global Active Conditions

➤ To list all available functions for the Global Active Condition metanode

- In the object workspace, select the **Global Active Condition** metanode and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|-----------------------------------|----------|---|
| List | F8 | See Listing Global Active Conditions . |
| New | CTRL+N | See Adding a Global Active Condition . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | Specifies selection criteria for listing global active conditions. See Filtering Objects . |
| Export | --- | Exports global active conditions. See Exporting Objects in the <i>Import/Export Functions</i> documentation. |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all available functions for a global active condition

- In the object workspace, select a **Global Active Condition** instance and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|---------------------|----------|---|
| Open | CTRL+O | View a global active condition and change its status. See Viewing a Global Active Condition and Modifying Its Status . |
| Display | CTRL+D | View a global active condition (no status change possible). See Viewing a Global Active Condition and Modifying Its Status . |
| Active Usage | --- | See Viewing Job Usage of an Active Condition . |

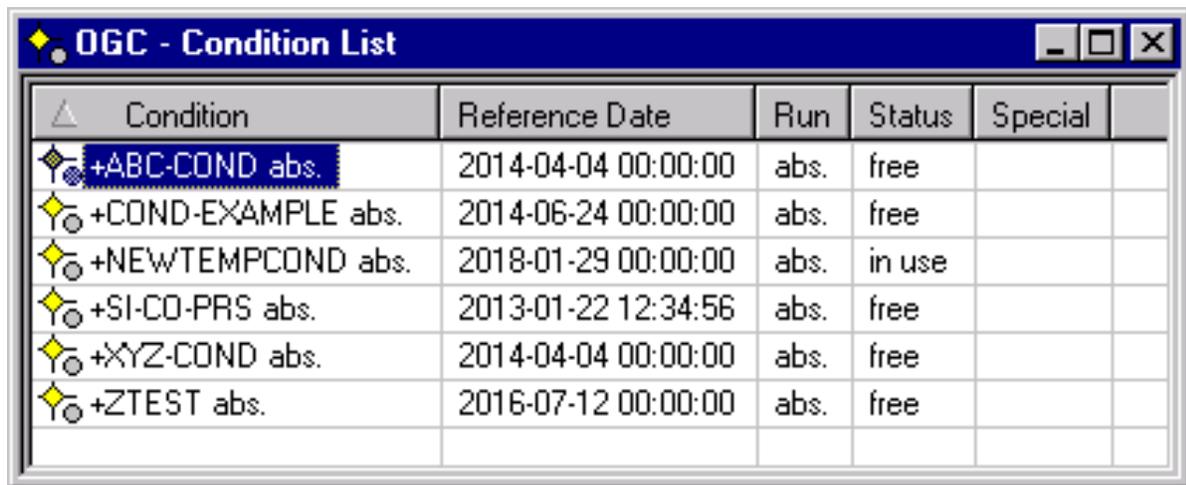

| Function | Shortcut | Description |
|----------------------------|----------|---|
| Delete | DELETE | Delete a global active condition. See also <i>Deleting Objects</i> . |
| Add to Workplan | --- | See <i>Add to Workplan</i> . |
| Set Drag And Drop Function | --- | See <i>Drag & Drop</i> . |

Listing Global Active Conditions

➤ To list global active job conditions

- In the object workspace, select the **Global Active Condition** metanode and choose **List** from the context menu, or press F8.

A **Condition List** window similar to the example below opens:

The screenshot shows a window titled "OGC - Condition List" with a table containing the following data:

| Condition | Reference Date | Run | Status | Special |
|--------------------|---------------------|------|--------|---------|
| +ABC-COND abs. | 2014-04-04 00:00:00 | abs. | free | |
| +COND-EXAMPLE abs. | 2014-06-24 00:00:00 | abs. | free | |
| +NEWTEMPCOND abs. | 2018-01-29 00:00:00 | abs. | in use | |
| +SI-CO-PRS abs. | 2013-01-22 12:34:56 | abs. | free | |
| +XYZ-COND abs. | 2014-04-04 00:00:00 | abs. | free | |
| +ZTEST abs. | 2016-07-12 00:00:00 | abs. | free | |

This window lists all global active conditions defined in your environment.

The fields contained in the window correspond to the fields in the **Condition List** window for a single owner. They are explained in *Columns and Fields: Active Conditions*.

Viewing a Global Active Condition and Modifying Its Status

> To view a global active condition and change its status

- 1 In the object workspace, select a **Global Active Condition** instance
- 2 From the context menu, choose **Display** (CTRL+D) or **Open** (CTRL+O).

If you choose **Open**, you can change the **status** of the condition, if required.

A **Global Active Condition** window opens.

The fields in the window have the same meaning as the corresponding table columns in the **Condition List** window. They are explained in *Columns and Fields: Active Conditions*.

Adding a Global Active Condition

> To add a global condition

- 1 In the object workspace, select the **Global Active Condition** metanode and choose **New** from the context menu, or press CTRL+N.

A **Global Active Condition** window similar to the example below opens:

The screenshot shows a dialog box titled "OGC - Create new Global Active Condition". It contains the following fields and controls:

- Condition:** Text input field containing "+GLOBALCONDITION".
- Run:** Text input field containing "abs."
- Reference date:** Two date/time input fields. The first contains "26.08.2019" and the second contains "00:00:00".
- Special type:** Dropdown menu showing "Normal usage".
- Status:** Dropdown menu showing "free".
- Buttons:** "Apply", "OK", "Cancel", and "Help" at the bottom.

The fields contained in the window correspond to the fields in a **Condition Active** window. They are explained in *Columns and Fields: Active Conditions*.

For the rules and restrictions that apply to global active conditions, see *Global Conditions* in the section *Job Maintenance*.

- 2 Change or add the required values and choose **OK** when you are finished.

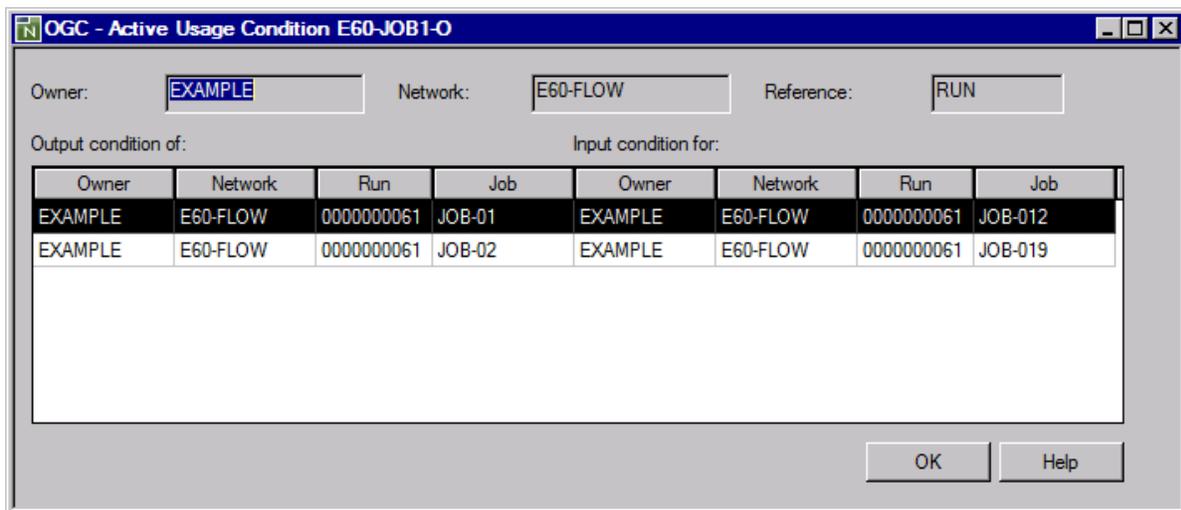

The global condition is created and can be used in further networks.

Displaying Conditions for an Active Job

> To view condition usage of an active job

- From the list of items on the **Input Conditions** page of the **Maintenance Job Active** window, select the required condition and choose **Where Used**.

An **Active Usage Condition** window similar to following example opens:

The columns contained in the window correspond to the columns in the **Where used Condition** window described in *Input Condition Maintenance*.

Viewing Job Usage of an Active Condition

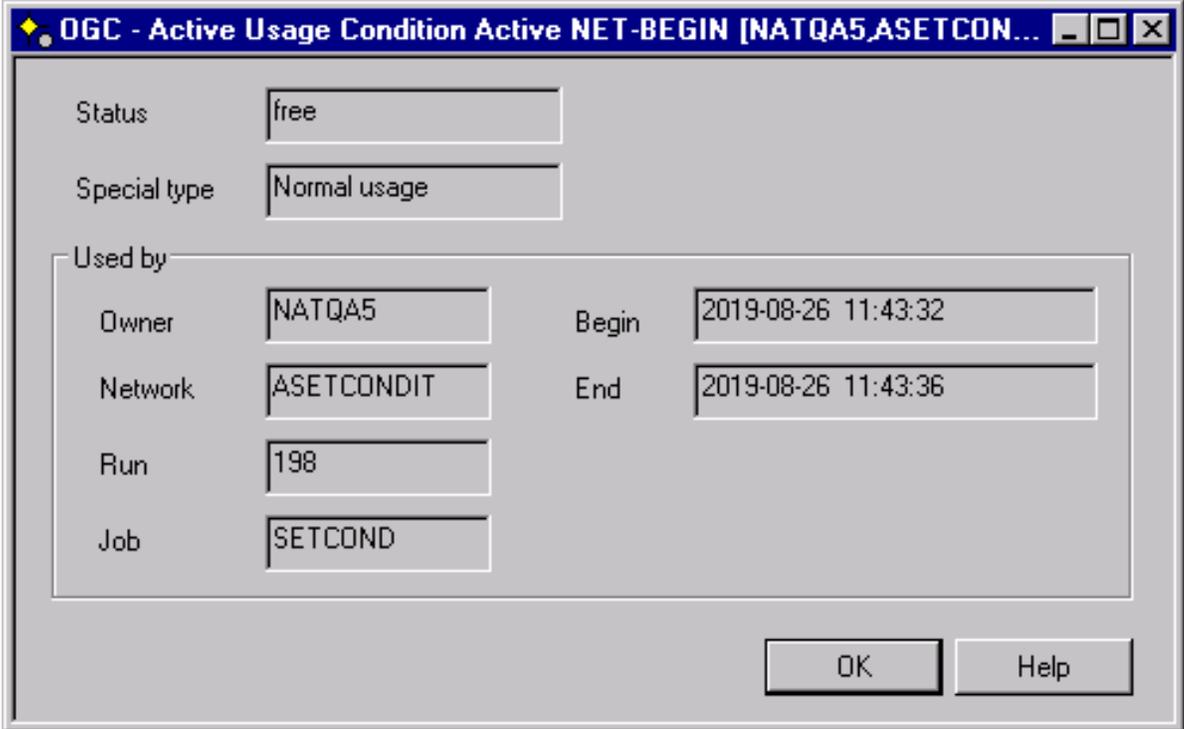

This function is used to display the job that uses or last used an active condition.

> To view the job that uses or last used an active condition

- 1 In the object workspace, select a **Condition Active** instance.

- 2 Open the context menu and choose **Active Usage**.

An **Active Usage** window similar to the example below opens:

| | |
|--------------|---------------------|
| Status | free |
| Special type | Normal usage |
| Used by | |
| Owner | NATQA5 |
| Network | ASETCONDIT |
| Run | 198 |
| Job | SETCOND |
| Begin | 2019-08-26 11:43:32 |
| End | 2019-08-26 11:43:36 |

OK Help

This window displays the job that currently uses the active condition, or the job that used the condition most recently. If the field **End** is empty, the condition is currently in use. If a date and time is entered, it indicates when the job stopped using the condition.

The **Begin** field shows the date and time since when the job started using the condition.

If several jobs use the condition simultaneously, only one job is displayed.

For explanations of other fields contained in the window, see [Columns and Fields: Active Conditions](#).

41 Maintaining Active JCL (Job Control Language)

| | |
|--|-----|
| ▪ Browsing Active JCL | 520 |
| ▪ Editing Active JCL | 521 |
| ▪ Viewing the Extended Log with Active JCL Changes | 522 |
| ▪ Exchanging Active JCL | 523 |
| ▪ Regenerating Active JCL | 524 |

Related Topics:

See also the following in the section *Job Maintenance*:

- [Pregenerating Active JCL](#)
- [Defining and Managing JCL for a Job](#)
- [Editing Master JCL and Natural Sources](#)

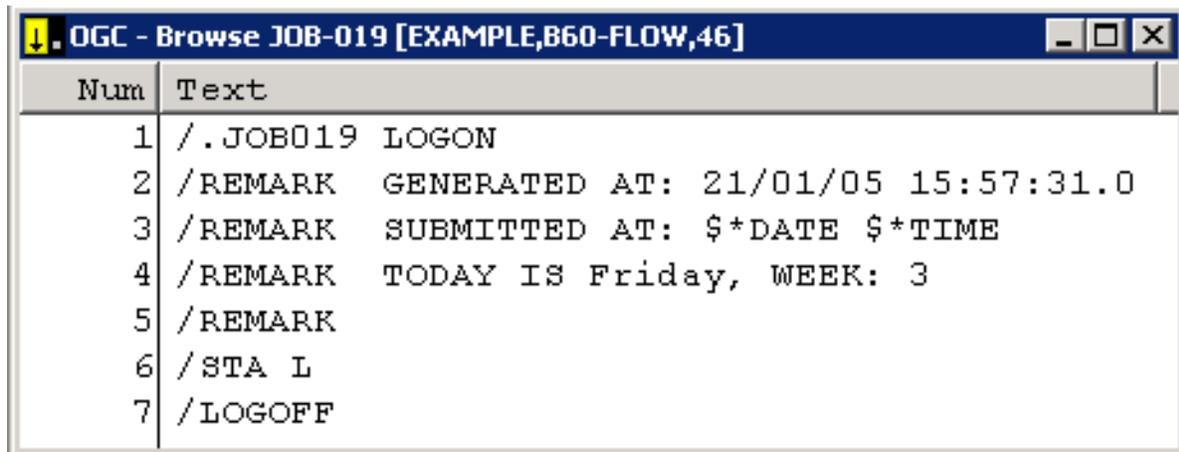

Browsing Active JCL

You can view the actual JCL submitted to the operating system for execution. It is produced from the master JCL when the job or network is activated. The symbols are replaced with values from the active symbol table. If it is dynamic JCL, the generation is performed at this time. The active JCL is stored in the active Entire Operations database.

➤ **To browse active JCL**

- 1 In the object workspace, select a **Job Active** instance.
- 2 Invoke the context menu and choose the **Browse Active JCL** function.

The following window appears:

- 3 Here, you can see the actual JCL submitted to the operating system for execution. It is produced from the Master JCL when the job or network is activated. The symbols are replaced with values from the active symbol table. If it is dynamic JCL, the generation is performed at this time. The active JCL is stored in the active Entire Operations database.

Editing Active JCL

For the current job run, you can edit the active JCL of an active job. Editing active JCL is useful, for example, for correcting JCL errors after job failure.

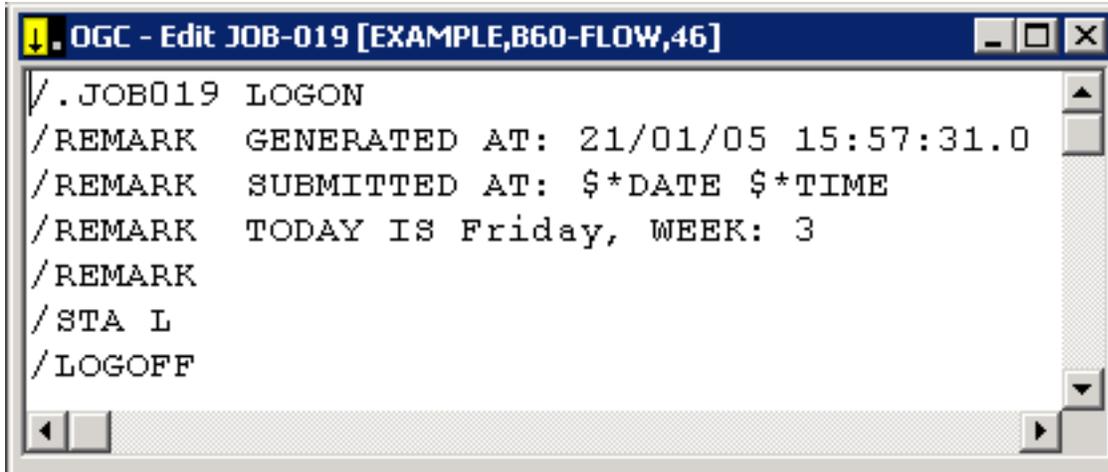

The following applies when editing active JCL:

- While editing active JCL, an implicit logon is triggered to establish the connection to the required node. The logon is not prompted if you have already logged on to the node within this session. For further information on logging on a node, see [Logon Function](#) in the section *Using Entire Operations GUI Client*.
- The source changes for the current job run only. The master JCL definition remains unchanged. If you want to edit the JCL for all runs, you must edit the master JCL.
- For jobs of the type NAT (Natural program) with JCL location NAT (Natural source), the original Natural source object is edited.
- Any changes to JCL made from the **Job Active** node affect the current job run only.
- Browsing or editing of active JCL is prohibited, while **JCL regeneration** for the same active job is in progress.
- If you modify active JCL before the job is submitted, Entire Operations submits the job automatically according to its defined prerequisites.
- If you modify the JCL after the job terminated and want to resubmit the job with the new JCL, use the **Resubmit** function from the context menu (see [Resubmitting an Active Job](#)).

> To edit active JCL

- 1 From a **Job Active** node in the object workspace, select an active job and choose **Edit Active JCL** from the context menu.

An editor window similar to the example below opens:

The window contains the source of an active JCL.

- 2 Modify the source as required and confirm the changes when closing the window. See also [Editing Master JCL and Natural Sources](#) in the section *Job Maintenance*.

Viewing the Extended Log with Active JCL Changes

➤ To view the Extended Log / Active JCL Changes

- 1 In the object workspace, select a **Job Active** instance.
- 2 Invoke the context menu and choose the **Extended Log / Active JCL Changes** function.

The following window appears:

```

OGC - Extended Log Job Active JOB-LONG [XSETAB0,TBOA3,240]

```

All **Extended Log / Active JCL Changes** which were made since the last editing process are listed.

For further information, see [Editing Master JCL and Natural Sources](#) in the section *Job Maintenance*.

See also [Choosing the Job ID of a Job for Logging](#).

Note:

Exchanging Active JCL

When modifying an active job, you can specify another JCL member and library by overtyping the current values in the corresponding input fields. This allows you to run a different job in place of the old one using the same input conditions, End-of-Job handling, etc. The replacement is valid for the current network run only.

When you have specified a different JCL member and/or library, Entire Operations replaces the old JCL with the new and notifies you of the replacement with a message. The new member can use dynamically generated JCL as described in [Dynamic JCL Generation \(JCL Location MAC\)](#).

Note: After exchanging the JCL, the job must be restarted with the **Resubmit** function. For further information, see [Resubmitting an Active Job](#).

Regenerating Active JCL

The JCL for operating system jobs is generated (copied to the active database) when Entire Operations activates a job network. Entire Operations allows you to regenerate the JCL while the job is in the active database. This is useful when you wish to refresh the variables in dynamically generated JCL in MAC-type jobs or when you wish to (re)submit active jobs with their original JCL after editing their JCL for a specific job run.

Even if pregenerated JCL exists, this command regenerates the active JCL from the master JCL. Symbol values are taken in their current status from the active symbol table. If necessary, the active symbol table should be checked beforehand.

This section covers the following topics:

- [Symbol Prompting During JCL Regeneration](#)
- [Regenerating Active JCL](#)
- [Resubmitting the Active Job after JCL Regeneration](#)

Related Topic:

- [Pregenerating Active JCL](#) in the section *Job Maintenance*

Symbol Prompting During JCL Regeneration

If a symbol entry is defined for at least one symbol of the symbol table of the job, the symbol is prompted now and a **Symbol Prompting window** opens. If you choose **Cancel Activation**, prompting is cancelled and the JCL is not regenerated.

Symbol prompting during the JCL regeneration can be switched on or off by a global switch in the Entire Operations defaults. See the corresponding option setting described in *Defaults for Other Settings* in the *Administration* documentation.

The (re)generation of active JCL is always being performed online, i.e., not by the Entire Operations Monitor. This also applies to MAC-type jobs.

See also [Symbol Prompting during Network or Job Activation](#) in the section *Symbol Table and Symbol Maintenance*.

Regenerating Active JCL

➤ To regenerate active JCL

- 1 In the object workspace, select a Job Active instance.
- 2 Invoke the context menu and choose the **Regenerate active JCL** function.

The job is regenerated and ready to execute.

Resubmitting the Active Job after JCL Regeneration

After regeneration of the JCL with the **Re-generate Active JCL** function, the active job is *not* automatically restarted. You have to resubmit the job.

In addition, regenerating JCL for a NET type job (re)activates the subnetwork. However, it does not automatically start a subnetwork as a consequence. The subnetwork receives a new run number because of this action.

➤ To start a job (and a subnetwork) after regeneration of the JCL

- Select the job with the regenerated JCL and choose **Resubmit** from the context menu.

See also *Resubmitting an Active Job of NET type (Subnetwork)*.

XII

Schedule Maintenance

Schedules contain the planned execution dates of job networks. They can contain periodic and/or explicit schedule dates. You can define an unlimited number of schedules, and one schedule can be referenced in different job networks.

[General Scheduling Considerations](#)

[Maintaining a Schedule Master](#)

[Scheduling a Network](#)

[Scheduling a Job](#)

42

General Scheduling Considerations

- Use of Schedules 530
- Possible Schedule Definitions 530
- Schedule Extraction Times 532
- Manual and Automatic Activations on the Same Day 532
- Multiple Network Activations 532
- Influence of Deactivations on Schedules 532
- Imported Schedules 533
- Schedule Dependencies across the Turn of the Year 533
- Using Calendars 533

Use of Schedules

A schedule is a predefined time table according to which a job network is activated. Entire Operations monitors schedules to determine which job networks are to be activated.

You can define activation dates in a schedule as explicit dates and/or periodic dates (days of the week, days of the month or a combination of days and months).

Entire Operations can optionally account for holidays (non-working days) in a schedule. For example, if you schedule a job network to run on every first day of a month and the schedule table is based on a calendar in which Saturdays and Sundays are defined as holidays, then Entire Operations does not start the job network if the first day of the month is a Saturday or Sunday. Activation can be postponed until the following workday (working day), Monday. In other words, Entire Operations can automatically interpret the first day of a month as the first workday of a month.

A schedule can be based on a predefined calendar which distinguishes between workdays and holidays (see the section [Calendar Maintenance](#)). If a schedule does not depend on a predefined calendar, a calendar of workdays only is assumed.

You can inspect the defined schedule in calendar format, irrespective of whether activation dates are defined as explicit or relative dates: Entire Operations automatically translates relative dates into explicit dates.

You can make the execution of single jobs in a network dependent on their position in the schedule (for example, first schedule day of the week) or in the calendar (for example, last workday of the year).

Possible Schedule Definitions

Schedule definitions are optional. You need not define a schedule for a network. If no schedule is defined and all schedule definitions are left empty, the network is never activated automatically by the Entire Operations Monitor.

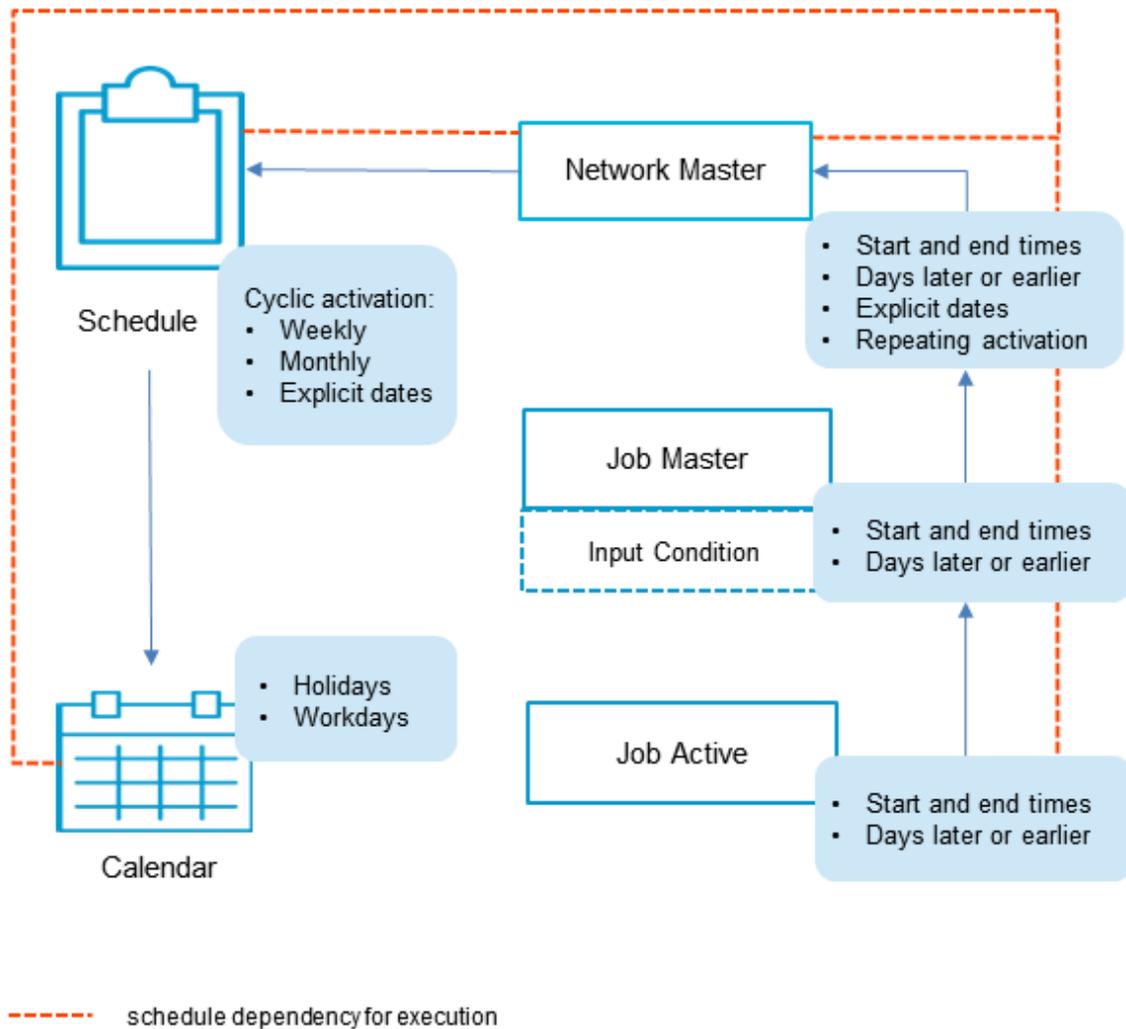

You can use a schedule master that defines daily, weekly or monthly activation cycles. This schedule can be linked to all networks that belong to the schedule owner.

In addition, you can specify activation days and cycles for individual jobs, and time frames with start and end time definitions for individual jobs and networks.

Network schedules can be combined with a schedule master.

In general, job schedules override network schedules, and network schedules override schedule master definitions.

The following graphic is an overview of scheduling options:

All options indicated in the overview are explained in the remainder of this chapter.

Schedule Extraction Times

All network schedules are checked by the Monitor at least once a day, usually at midnight or after the first start of the Monitor on a new day. The networks with a schedule entry for the current day are activated. If no **Earliest Start Time** is defined at the network or job level, execution starts immediately after activation. New or modified networks or jobs with a schedule entry for the current day are activated also if the activation time is not reached already.

The extraction date is always used for the job time frame calculation, even if the network is activated some time later than planned, because the Monitor was down.

For more information, see [Processing of Time Frame Definitions](#).

Manual and Automatic Activations on the Same Day

A scheduled activation will not be rejected if a manual or API activation of the same network has already been made for the same day.

Multiple Network Activations

You can define multiple network activations in a network schedule.

For detailed information, see [Defining Multiple Network Activations](#).

Influence of Deactivations on Schedules

The day of the activation is removed during a deactivation from the schedule only if the planned activation was originated by a schedule extraction by the Monitor. The day of the activation is not removed from the schedule if a manual activation is deactivated.

Imported Schedules

If a schedule is imported by using import/export functions, a check for the current day in the schedule will be performed. If the current day is a schedule day, it will be excluded explicitly from the schedule automatically. If you want make the schedule active for the current day, you must remove this explicit exclusion definition from the schedule.

Reason: The exclusion of the current day during import is done to prevent an unwanted automatic start of an imported job network by the Entire Operations Monitor.

Schedule Dependencies across the Turn of the Year

Schedule dependencies can also be defined across the turn of the year. This applies in particular to the week, which begins in the old year and ends in the new year.

This functions only if the schedules and calendars used are defined for both years.

Using Calendars

You need not use calendars when defining a schedule. If no calendar is specified, all days are treated as workdays.

You may use calendars, which belong to the owner of the network, and calendars of other owners.

If a calendar is specified, a schedule definition date is used only if it is a calendar workday. Networks are not activated on holidays.

For more information on calendars, see the section [Calendar Maintenance](#).

Notes:

1. The Monitor searches for the calendar under the network owner. If it does not find the calendar, the Monitor searches for it system-wide under SYSDBA.
2. Calendars are year-dependent. If a calendar cannot be found for the current year, the network is not scheduled and an error message is issued. Be sure to define calendars for the coming year before they are needed. From the month of November of the past year onwards, the Entire Operations Monitor issues warning messages to the log.
3. Calendars are linked to schedules, not to networks.

4. A calendar modification causes the automatic recalculation of all linked schedules, and a recalculation of the current schedules of all networks linked to these schedules. This automatic recalculation is performed by the Entire Operations Monitor in the background. Be aware that this may have influence on many networks, and may take some time. To check which networks were affected, check the Entire Operations log.

43

Maintaining a Schedule Master

- Listing Schedules 536
- Displaying, Adding or Modifying a Schedule 537
- Deleting a Schedule 548

Listing Schedules

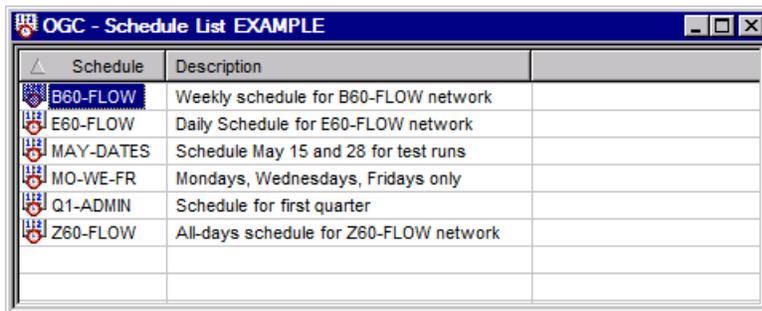

➤ **To list all schedule definitions of an owner**

- 1 In the object workspace, select the **Schedule** node of an owner.
- 2 From the context menu, choose **List**.

Or:

Press F8.

All schedules defined for the selected owner (here: EXAMPLE) are listed in the **Schedule List** window as shown in the following example:

If one or more job schedules are defined for the owner, they are listed in this window.

This section covers the following topics:

- [Fields: Schedule List Window](#)

Fields: Schedule List Window

The following fields are available in the [Schedule List window](#):

| Fields | Description |
|--------------------|------------------------------------|
| Schedule | User-defined schedule name. |
| Description | Short description of the schedule. |

Displaying, Adding or Modifying a Schedule

This section covers the following topics:

- [Available Functions: Schedule Maintenance](#)
- [Viewing a Schedule Definition](#)
- [Viewing a Schedule Definition as a Calendar](#)
- [Adding a Schedule Definition](#)
- [Modifying a Schedule Definition](#)
- [Fields: Schedule Definition](#)
- [Available Functions: Schedule Definition](#)
- [Using Day Lists](#)

Available Functions: Schedule Maintenance

➤ To list all functions available for a schedule node

- In the object workspace, select the **Schedule** node from an **Owner** instance and open the context menu.

The following functions are available for a selected **Schedule** node:

| Function | Description |
|-----------------------------------|---|
| List | List all schedules for an owner in the Schedule List window . |
| New | Add a schedule definition: see Adding a Schedule Definition . |
| Refresh | Refresh the list of schedules: see Refreshing Object Lists . |
| Filter | Use selection criteria to list schedules: see Filtering Objects . |
| Paste data | Paste a schedule: see Pasting Objects . |
| Export | Open the Export Objects window to export all items of the Schedule metanode: see Exporting Objects in the <i>Import/Export Functions</i> documentation. |
| Set Drag and Drop Function | Drag nodes and drop them in the empty working area: see Drag & Drop . |

➤ To list all functions available for a schedule

- From the **Schedule** node, select an instance and open the context menu.

The following functions are available for a selected schedule:

| Function | Description |
|----------------------------|---|
| Open | Modify the schedule: see Modifying a Schedule Definition . |
| Display | Display the schedule definition: see Viewing a Schedule Definition . |
| Display as a Calendar | Display the calendar view of the schedule definition. See Viewing a Schedule Definition as a Calendar . |
| Where used | List using networks. |
| Delete | Delete the schedule. Note: You cannot delete a schedule, which is defined (used) in at least one network. To find out which networks are using the schedule, choose the Where used function. |
| Copy data | Copy a schedule definition: see Copying Objects . |
| Export | Open the Export Objects window to export the schedule: see Exporting Objects in the <i>Import/Export Functions</i> documentation. |
| Add to Workplan | Store a reference to the schedule in a list of activities to be done: see Add to Workplan . |
| Set Drag And Drop Function | See Drag & Drop . |

Viewing a Schedule Definition

> To view a schedule definition

- In the object workspace, select a **Schedule** instance and choose **Display** from the context menu, or press CTRL+D.

A **Display Schedule** window opens showing the current date settings of the selected schedule.

The protected fields and tabbed pages in the window correspond to the input fields and tabbed pages of the **Maintenance Schedule window**. They are explained in [Fields: Schedule Definition](#).

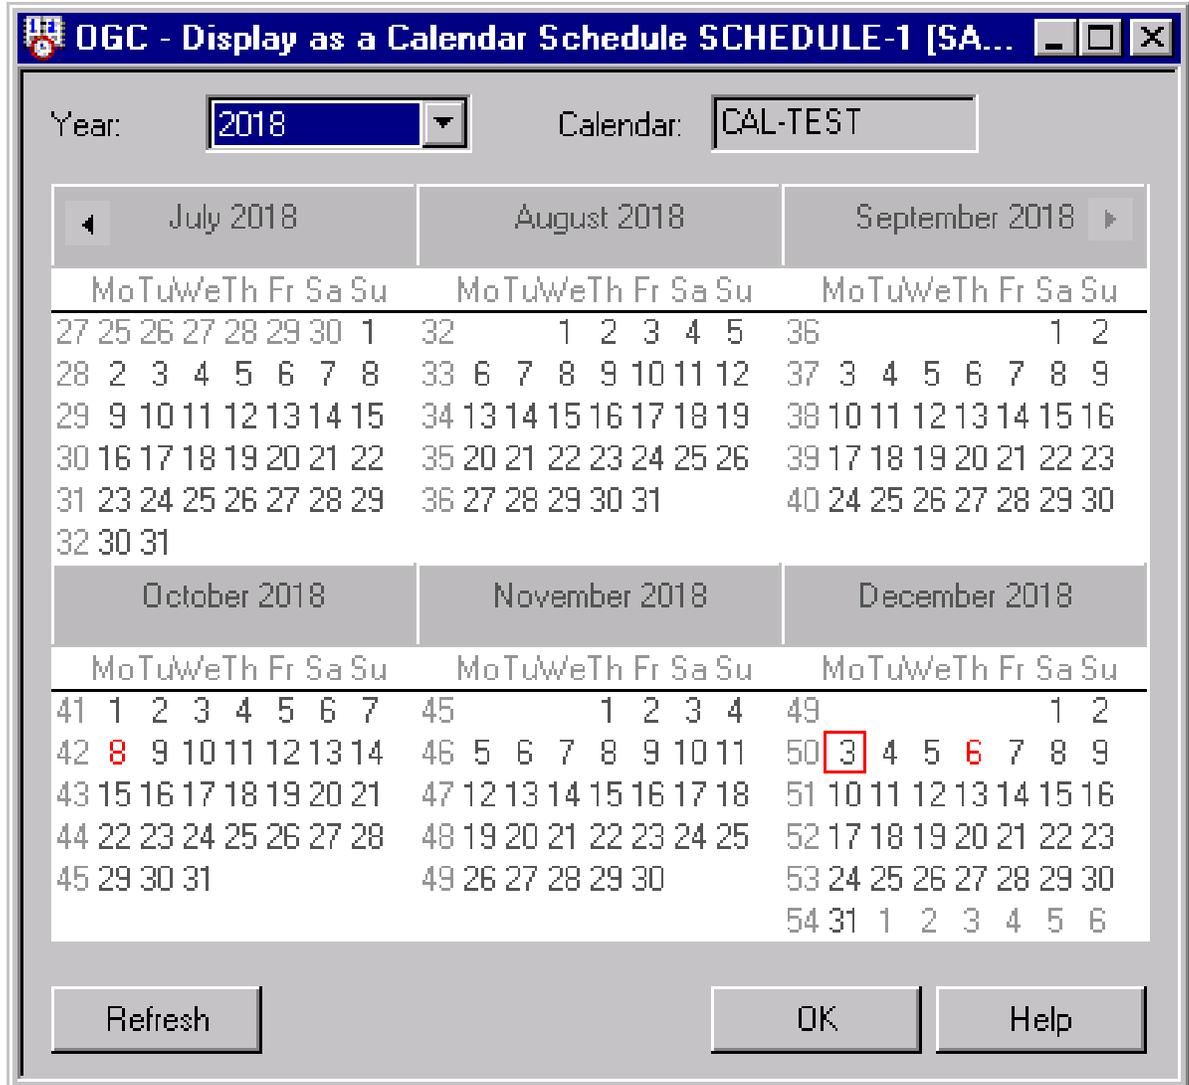

Viewing a Schedule Definition as a Calendar

If a calendar is assigned with a schedule, you can view the schedule definition as a calendar.

> To display the calendar view of a schedule

- 1 In the object workspace, select a **Schedule** instance and choose **Display as a Calendar** from the context menu.

A **Display as a Calendar** window similar to the example below opens:

The current six months defined for the schedule are shown by default. You can view additional months or all month of the year by drawing the window borders to resize the window as required.

The current date is indicated by a red square, defined dates are highlighted in red.

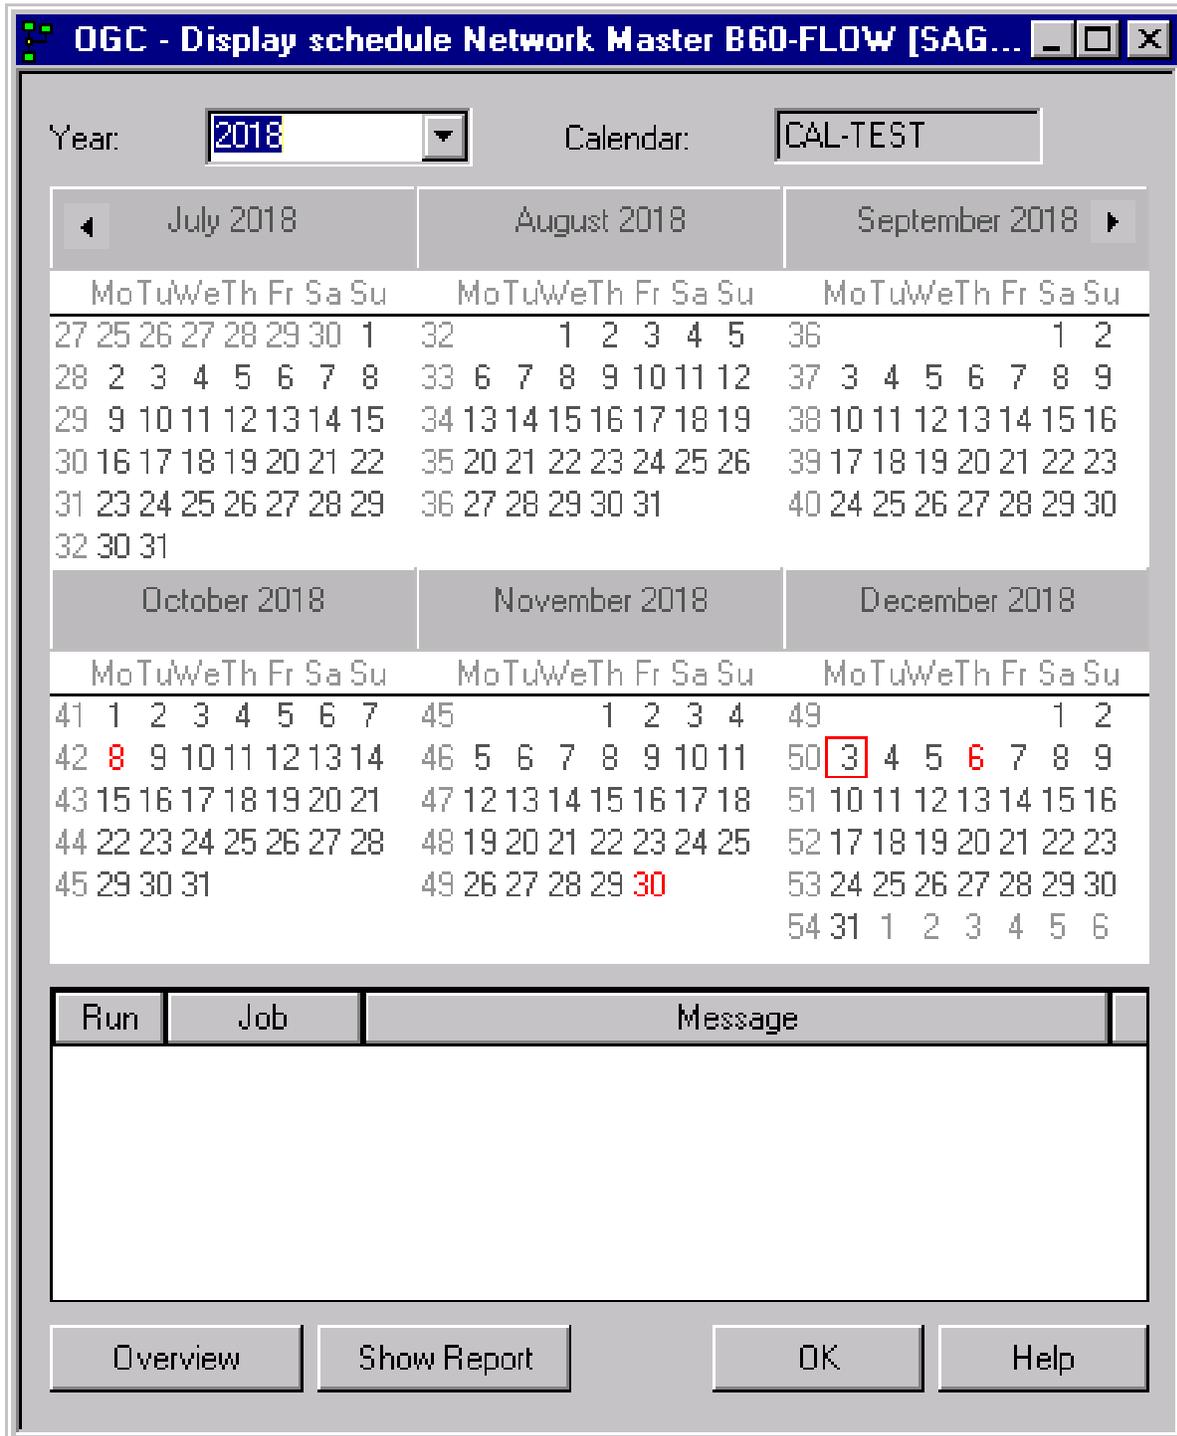

You can choose **Refresh** to update the calendar view.

- 2 If you select a year in the **Year** box that is not defined in the referenced calendar, an EOR3014 error can occur with a corresponding message.

➤ **To display the calendar view of a network schedule**

- 1 In the object workspace, select a **Network Master** instance.
- 2 Invoke the context menu and choose the **Display Schedule** function.

A **Display Schedule** window similar to the example below opens:

- 3 Select the year you want to display.

Dates that are marked in red indicate that a schedule is provided.

You can view an overview of network starts by proceeding as described in *Producing a Network Start Summary*.

Adding a Schedule Definition

➤ To add a schedule definition

- 1 In the object workspace, select a **Schedule** node.
- 2 From the context menu, choose **New**, or press CTRL+N.

A **Create new Schedule** window opens.

The fields and tabbed pages in the window correspond to the fields and tabbed pages of the **Maintenance Schedule window**.

- 3 Fill in the fields you want to define. The fields and commands available in the window are explained in *Fields: Schedule Definition* and *Available Functions: Create/Maintenance Schedule*, respectively.
- 4 Choose **OK** when you are finished.

The schedule is saved and you can use it for networks and jobs.

Modifying a Schedule Definition

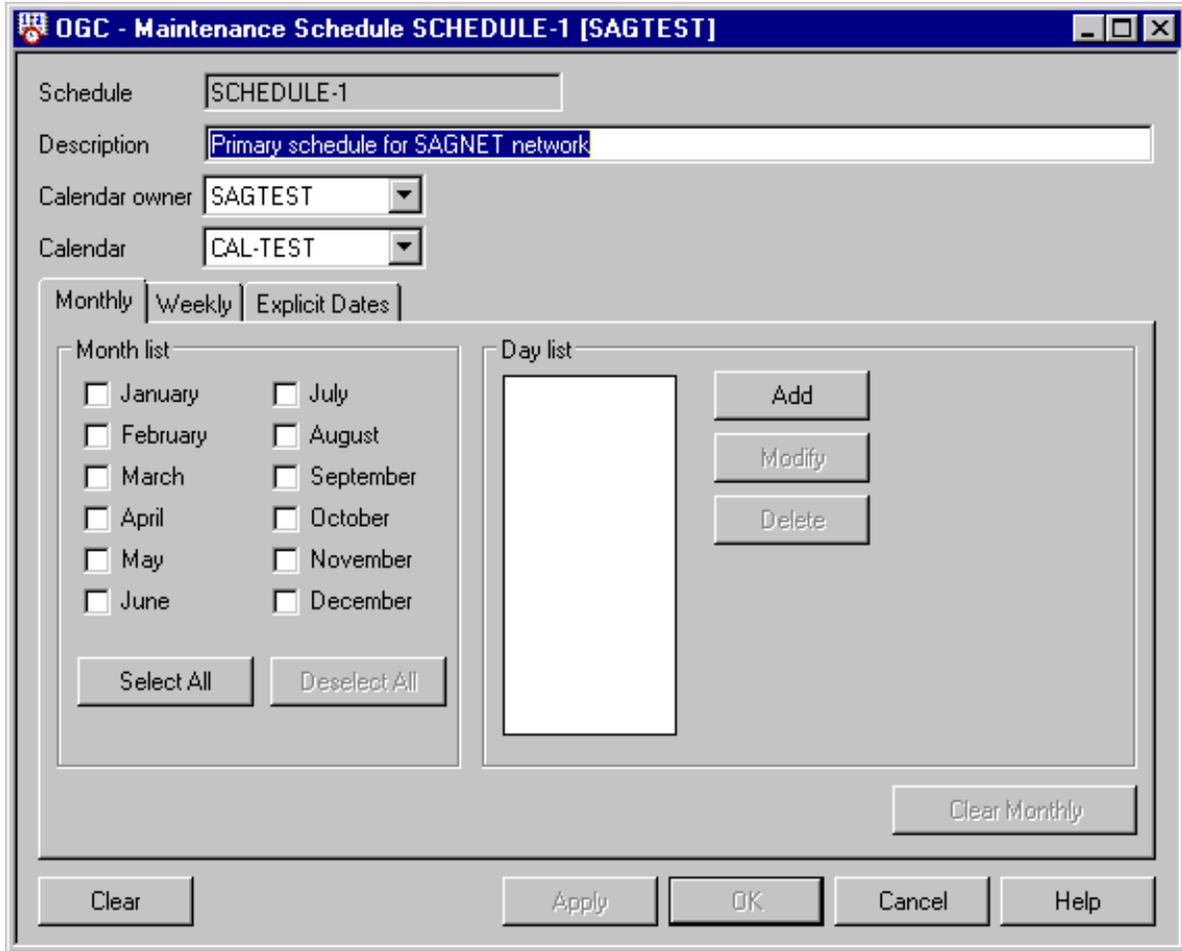

➤ To modify a schedule

- 1 In the object workspace, select a schedule from the **Schedule** metanode.
- 2 From the context menu, choose **Open**.

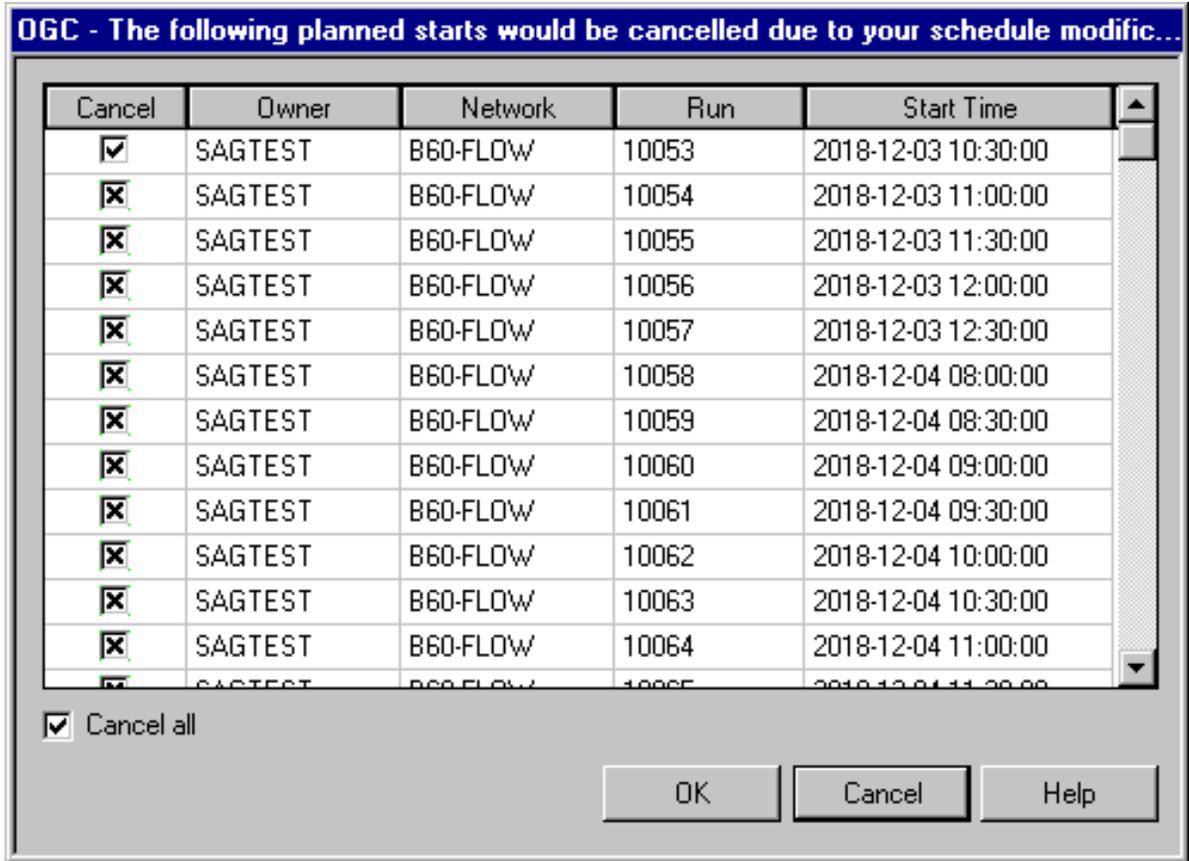

Or:

Press CTRL+O.

A **Maintenance Schedule** window similar to the example below opens:

- 3 Make your definitions. The fields and commands available in the window are explained in [Fields: Schedule Definition](#) and [Available Functions: Create/Maintenance Schedule](#), respectively.
- 4 Choose **OK** to save the definitions.
Or:
Choose **Cancel** if you want to keep the previous definitions.
- 5 If your modification of a schedule affects any planned starts, a window prompts you to cancel the starts or to keep them active.

6 Select the **Cancel all** check box if you want to cancel all starts.

Or:

Select the **Cancel** check box next to the listed start(s) you want to cancel.

Or:

Choose **Cancel** to keep all listed starts active, regardless of your schedule modifications.

Fields: Schedule Definition

The fields and tabbed pages provided in the **Create new Schedule** or **Display/Maintenance Schedule window** are explained in the following table. Each tab within this window opens a separate schedule definition time frame (monthly, weekly and explicit dates) to make your schedule the most precise.

| Field/Tabbed Page | Description |
|-----------------------------|---|
| Owner | Owner of the schedule in the window title |
| Schedule | Name of the schedule |
| Description | Description of the schedule |
| Calendar owner | Owner of the assigned calendar Default: the schedule owner You can select a name from the drop-down list box. |
| Calendar | Assigned calendar You can select a name from the drop-down list box. |
| Monthly / Month list | List of months for the schedule They always correlate with Day list . |
| Weekly / Month list | A list of months for the schedule. They always correlate with Day list . |
| Day list | Define the days to be used for the monthly and/or weekly schedule. The days specified in this list correlate with the list of months selected on the tabbed pages Weekly and/or Monthly . See Using Day Lists for the options provided to define days. |
| Explicit Dates | Define single or multiple dates for executing or not executing a network. Note: 1. Explicit dates of a schedule list have a higher priority than all periodic definitions. 2. There is another network-specific list of explicit dates, which overrides all definitions made on the schedule level. See also Defining Dates for Explicit Network Execution . |

Available Functions: Schedule Definition

The functions provided in the **Create new Schedule** or **Maintenance Schedule** window are explained in the following table.

| Function | Description |
|---------------------------------|---|
| Select All | Select all months in the current month list. |
| Deselect All | Deselect all months marked in the current month list. |
| Add/Modify (Day list) | Open the Maintenance Monthly or Maintenance Weekly window where you can select a day definition for the Day list . |

| Function | Description |
|---------------------------------------|--|
| Add/Modify (Explicit Dates) | Add a date or modifies a selected date. See also <i>Defining Dates for Explicit Network Execution</i> . |
| Delete (Day list) | Delete all entries in the Day list . |
| Delete (Explicit Dates) | Delete the selected date. See also <i>Defining Dates for Explicit Network Execution</i> . |
| Clear Weekly | Clear the Month list on the tabbed page Weekly . |
| Clear Monthly | Clear the Month list on the tabbed page Monthly . |
| Clear | Clear all existing definitions. |
| Apply | Apply changes and save the schedule. |
| OK | Save the schedule. |
| Cancel | Cancel all pending changes. |

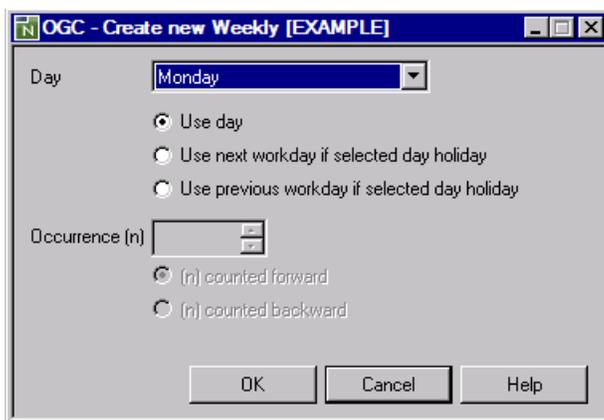

Using Day Lists

The **Day list** is used to define days for a monthly and/or a weekly schedule.

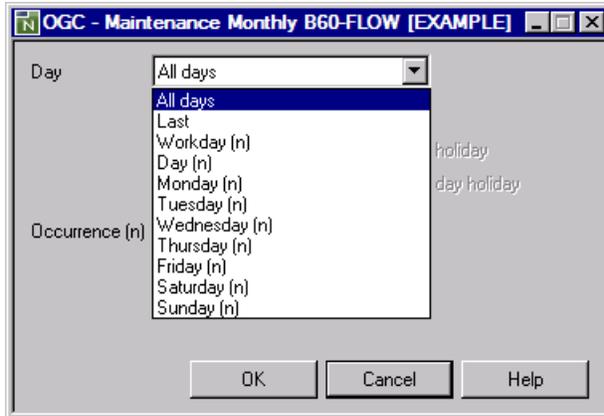

➤ **To add or modify a day definition**

- 1 In the **Day list** section of the **Create new Schedule** or **Maintenance Schedule** window, choose **Add** or **Modify**.

A **Monthly** or **Weekly** window similar to the example below opens:

- 2 Open the drop-down list box to select the required definition:

The day definitions available for selection depend on whether you use the **Day list** on the tabbed page **Weekly** or **Monthly**. For details, see [Possible Day Definitions](#).

- 3 Select a radio button if you want to define special conditions for a day:

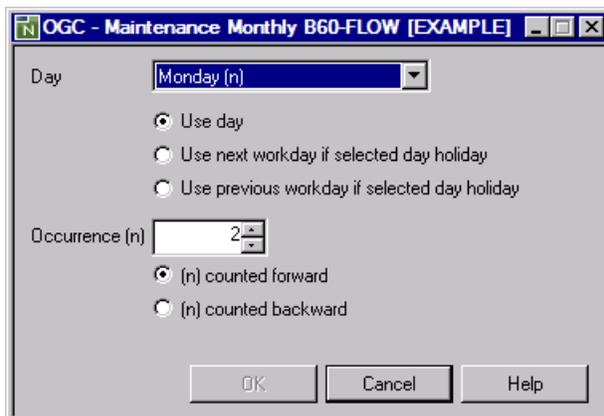

For a selected day (in the **Weekly example: Monday**) you can specify whether to use the next or previous workday if this day is a holiday.

Or:

For a monthly schedule, you can also select a day **(n)** to determine which occurrence of the weekday to use; enter a valid number in the **Occurrence (n)** box:

- **(n) counted forward:** counts *n* times forward in the given time range.
- **(n) counted backward:** counts *n* times backward in the given time range.

In the example below, 2 determines that the second Monday of the month is used:

- 4 Select the required definition and choose **OK**.

The **Day list** now contains the code Entire Operations automatically generates for the day definition you made:

Monthly
Weekly
Explicit Dates

Month list

| | |
|---|---|
| <input type="checkbox"/> January | <input type="checkbox"/> July |
| <input type="checkbox"/> February | <input type="checkbox"/> August |
| <input checked="" type="checkbox"/> March | <input type="checkbox"/> September |
| <input type="checkbox"/> April | <input checked="" type="checkbox"/> October |
| <input type="checkbox"/> May | <input type="checkbox"/> November |
| <input type="checkbox"/> June | <input type="checkbox"/> December |

Select All

Deselect All

Day list

K1+2

In the example above, the **K1+2** code indicates that you defined the second Monday for the months of March and October.

Possible Day Definitions

The day definitions available for selection depend on whether you use the **Day list** on the tabbed page **Weekly** or **Monthly**. Remember that the month(s) selected on these pages always correlate with **Day list**. Each combination of month and day is a schedule date.

The following table lists possible selection options for day definitions and provides examples of codes Entire Operations generates for the defined day into the **Day list** of a **Weekly** or **Monthly** schedule:

| Day | Example Weekly | Example Monthly |
|---|---|--|
| Weekday (Monday through Sunday) | 1 is Monday and 2 is Tuesday. | K1 is each Monday, K2 each Tuesday of the month. |
| Workday (day defined in the calendar): | | |
| Next workday if the specified day is a holiday | 1A is the next workday after Monday. | K1A is the next workday after a Monday in a month. |
| Previous workday if the specified day is a holiday | 1B is the workday before Monday. | K1B is the workday before a Monday in the month. |
| Workday (<i>n</i>), counted forward (default setting) in the given time range | 1W is the first workday of the week. | 01W is the first workday of the month. |
| Workday (<i>n</i>), counted backward in the given time range | 1V is the last workday of the week. | 01V is the last workday of the month. |
| All days of the month | n/a | AL is all days of the month. |
| Day (<i>n</i>) | n/a | 01 is the first day of the month. |
| Last day of the month | n/a | LD is the last day of the month. |

For further information on the codes generated for a day definition and weekday dependency within a month, refer to the corresponding *Schedule Maintenance* section for mainframes and UNIX.

Deleting a Schedule

➤ To delete a schedule definition

- 1 From the **Schedule** node in the object workspace, select the schedule you want to delete and choose **Delete** from the context menu.

A confirmation window opens.

- 2 Choose **Yes** to confirm the deletion (**No** cancels the action).

The schedule definition is deleted.

Note: You cannot delete a schedule, which is defined (used) in at least one network. Choose **Where used** from the context menu of the selected schedule to find out which networks are using the schedule. See also *Available Functions: Schedule Maintenance*.

Viewing a Network Schedule Definition

➤ To display the schedule defined for a network

- In a **Network Master window**, open the tabbed page **Scheduling**:

| Schedule dependency | Earliest start | Latest start | Later | Type | Deadline | Later | Type |
|---------------------|----------------|--------------|-------|------|----------|-------|------|
| + WY+001 | 08:00:00 | 09:00:00 | 1 | | 10:00:00 | 2 | |
| | 09:25:00 | 15:00:00 | 1 | | 16:00:00 | 2 | |

The fields and tabs available in the window are for information only. You cannot change any entries. Changes are performed by using the **Define Scheduling** context menu function described in the following section.

The fields and tabs are explained in [Fields and Columns: Network Scheduling](#).

You can choose **Refresh** to view the latest definition of the schedule after most recent changes performed with the [Define Scheduling](#) function.

Defining a Network Schedule

> To define a schedule for a network

- 1 In the object workspace, select a **Network Master** instance and choose **Define Scheduling** from the context menu.

A **Define Scheduling** window similar to the example below opens:

OGC - Define Scheduling Network Master SAGNET [SAGTEST]

Schedule owner: SAGTEST

Schedule: SCHEDULE-1

Schedule effective from: 01.12.2018 00:00:00

Time | Explicit dates | Repeating activation

| Schedule dep. | Earliest start | Latest start | Later | Type | Deadline | Later | Type |
|---------------|----------------|--------------|-------|------|----------|-------|------|
| +WY+001 | 08:00:00 | 09:00:00 | 1 | W | 10:00:00 | 1 | C |

Buttons: Add, Modify, Delete, Move Up, Move Down

Buttons: Clear, Apply, OK, Cancel, Help

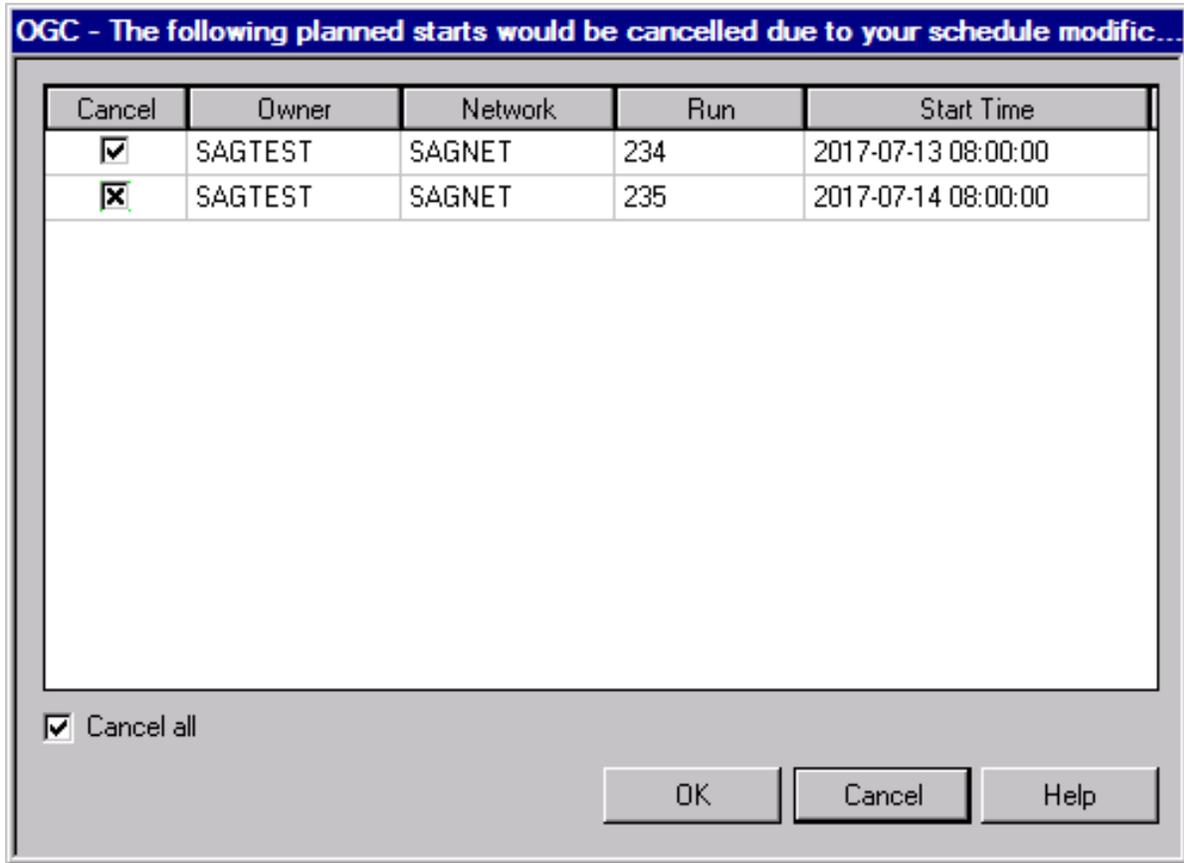

- 2 Enter the required values or replace existing entries. The fields and tabs available in the window are explained in [Fields and Columns: Network Scheduling](#).

You can choose **Clear** if you want to remove all current definitions.

- 3 Choose **OK** when you are finished.

- 4 If you modify a network schedule and this modification affects any planned starts, you have the option to cancel the starts or to keep them active.

If you select **Cancel**, a dialog similar to the example below appears:

You can select the following functions:

1. Select the **Cancel all** check box to cancel all starts.
2. In the table, select the **Cancel** check box next to starts you want to cancel .
3. Select the **Cancel** button if you do not want to cancel any starts. This keeps all listed starts active, regardless of your schedule modifications.

This section covers the following topics:

- [Fields and Columns: Network Scheduling](#)

Fields and Columns: Network Scheduling

The input fields and corresponding columns (if relevant) on the tabbed pages of the **Define Scheduling window** are described in the following table:

| Field Column | Description |
|--|--|
| Schedule Owner | Owner of the schedule to be used. Default: Owner of the network |
| Schedule | Name of the schedule to be used. Schedule comprises a link to a calendar. Definition of dates on which the network is to be executed. |
| Schedule effective from | Schedule effective from (date and time) Select this field (not selected by default) to activate the schedule and/or change the date and time. If a schedule should not become effective immediately, enter the date (and time) of the validity begin here. If no time is specified, the schedule becomes effective at 00:00. |
| Time page: | |
| Schedule dependency Schedule dep. | This option is used to specify days when the network is deactivated and not executed. See Adding and Modifying a Time Frame Definition . |
| Earliest Start | Earliest start time for the network. No job in the network can start before this time. The Earliest Start time is used to compute network schedule times. See also Processing of Time Frame Definitions . |
| Latest Start | Latest start time for the network. The first job in the network must start by this time, if possible. If not, a warning message is sent and the job is not submitted. You can specify the number of workdays or calendar days to be used for later starts: see Calendar days later Workdays later below. See also Processing of Time Frame Definitions . |
| Deadline | Time by which the last job in the network must be finished. The deadline is used to compute the earliest and latest start times for the jobs in the network. |

| Field Column | Description | | | | |
|---|---|--------------------------------------|-------------------------|--------------------|--|
| | See also Processing of Time Frame Definitions . | | | | |
| Calendar days later Later Workdays later Later | <p>This field is to be used if Latest Start and/or Deadline are later than 24 hours after the Earliest Start.</p> <p>Valid values: 1 - 999 days.</p> <p>Default for Deadline: 2 calendar days later.</p> <p>See also Processing of Time Frame Definitions.</p> <p>Note: The Entire Operation default settings provide the option to define later start times in units of hours instead of integer days, for time ranges that are not a multiple of 24.</p> | | | | |
| Calendar days later Type Workdays later Type | <p>Specifies the day type:</p> <table border="1"> <tr> <td>Column entry: C (or empty)</td> <td>Calendar day (default).</td> </tr> <tr> <td>Column entry: W</td> <td>Workday as defined in the calendar linked to the schedule.</td> </tr> </table> | Column entry: C (or empty) | Calendar day (default). | Column entry: W | Workday as defined in the calendar linked to the schedule. |
| Column entry: C (or empty) | Calendar day (default). | | | | |
| Column entry: W | Workday as defined in the calendar linked to the schedule. | | | | |
| Explicit Dates page: | See Defining Explicit Dates for a Single Network only . | | | | |
| Repeating Activation page: | See Defining Multiple Network Activations . | | | | |
| Number of Activations | <p>This field is used to activate a network more than once a day. In this case, select the button next to this field and enter the number of activations per day.</p> <p>If the network is to be activated once per schedule day only, leave this field blank.</p> <p>Valid input values: 2 to 999</p> <p>every ... minutes:</p> <p>If a network is to be activated more than once per day, you can enter the time interval between two subsequent network activations.</p> <p>This field can be used without Number of Activations, too. In this case, the number of activations will be limited by the defined latest network start time.</p> <p>Unit: minutes</p> <p>See also Defining Multiple Network Activations for further information.</p> | | | | |
| Activate at | <p>In these fields, you can enter up to 10 activation times, as an alternative to Number of Activations.</p> <p>Format: HH:MM or H:MM</p> <p>Examples: 20:11, 1:31</p> | | | | |

| Field Column | Description |
|----------------|--|
| | <p>Note: If activation times are defined for a network, the job-specific time frames will be adapted to fit into the network time frame.</p> <p>See also Defining Multiple Network Activations for further information.</p> |
| Day Deadline | <p>If a Day Deadline is defined, the Deadline of multiple activations (every ... minutes or Activate at) is limited to this time on the day of the activation.</p> <p>Format: HH:MM</p> |

Processing of Time Frame Definitions

This section describes the rules and processes that apply when specifying time frames for a network or job schedule on the [Time page](#) of a **Define Scheduling Network** window or the [Scheduling Parameters](#) page of a job master or job active:

- [Hierarchical Order](#)
- [Changes to Time Frames of Active Jobs](#)
- [Time Frame Selection Rules for a Network](#)
- [Time Frame Rules for Start/End Times and Day Later Definitions](#)

Hierarchical Order

Time frames defined on the job level override time frame definitions made on the network level for this job. If no time frames are defined here, the job network defaults apply.

Changes to Time Frames of Active Jobs

All modifications to time frames of an active job affect the active database and the current job run only. Time frame definitions for the job master remain unchanged.

Time Frame Selection Rules for a Network

Time frames are selected according to the following rules:

- A table row with no time frame dependency entry is applied as the network start date if no other time frame dependency entry matches the network start date.
- From top to bottom, each table row with a defined schedule dependency condition is applied to the network. If a condition is satisfied, the respective time frame values are used for the active network.

Example: The definition +CW+3 means this definition applies if the network starts on Wednesday. -CW+3 means this definition applies if the network starts on all other weekdays except Wednesday.

- If none of the defined table rows is selected, the network uses the default time settings. See also *Defaults for Time Ranges* in the *Administration* documentation.

Time Frame Rules for Start/End Times and Day Later Definitions

- If both **Latest Start** or **Deadline** and **Days later** are not specified, the Entire Operation defaults specified for **Default Latest Start after Earliest Start** and **Default Deadline after Earliest Start** on the **Time Ranges** page apply (see the *Administration* documentation).
- If **Latest Start** or **Deadline** is given and **Days later** is not specified, **Days later** is automatically filled as described above.
- If applying any of the above rules and **Days later** of **Latest Start** or **Deadline** becomes greater than 999, it remains empty and an error message is issued.
- If **Latest Start** is before **Earliest Start** and **Days later** is not specified, the **Days later** value for **Latest Start** is set to 1 by default.
- If **Deadline** is before **Earliest Start** and **Days later** is not specified, **Days later** is set to 1 so that this time follows the earliest start time.

Defining and Deleting Time Frames for a Network

- [Adding and Modifying a Time Frame Definition](#)
- [Deleting Time Frame Definitions for a Network](#)

Adding and Modifying a Time Frame Definition

➤ To add or modify a time frame definition for a network

- 1 In the **Define Scheduling window**, open the **Time page**.

The table columns are explained in *Fields and Columns: Network Scheduling*.

- 2 Choose **Add** to add a new time frame definition.

Or:

Select a time frame definition from the table and choose **Modify**.

Depending on the function chosen, a **Create new Time Frame** or **Maintenance Time Frame** window similar to the example below opens:

- 3 Entire the required values. The input fields contained in the window are described in [Fields and Columns: Network Scheduling](#).

See also [Time Frame Selection Rules for a Network](#) and [Processing of Time Frame Definitions](#).

- 4 If you want to add or modify the schedule dependency for a time frame, choose **Modify** next to **Schedule dependency**.

A [Schedule Dependency Definition](#) window similar to the window provided for a job opens.

The input fields contained in the window are described in [Fields: Schedule Dependency Definition](#).

- 5 Choose **OK** when you are finished.

The time frame definition is shown in the table of the **Time** page as shown in the example below:

| Time | | | | | | | | Explicit dates | | Repeating activation | |
|---------------|----------------|--------------|-------|------|----------|-------|------|----------------|--|----------------------|--|
| Schedule dep. | Earliest start | Latest start | Later | Type | Deadline | Later | Type | | | | |
| +WY+001 | 08:00:00 | 07:00:00 | 1 | C | 08:00:00 | 2 | C | | | | |
| | | | | | | | | Add | | | |
| | | | | | | | | Modify | | | |
| | | | | | | | | Delete | | | |
| | | | | | | | | Move Up | | | |
| | | | | | | | | Move Down | | | |

If a schedule dependency is defined for the time frame definition, a code is shown in the **Schedule dep.** column (here: +WY+001).

- You can move up or down a selected column row by choosing **Move up** or **Move down**, respectively.

You can choose **Delete** for a selected column row to remove a time frame definition.

Choose **Clear** to remove all entries from the table.

- Choose **OK** when you are finished.

Deleting Time Frame Definitions for a Network

> To delete a time frame dependency from a time frame definition

- Open the tabbed page **Time** of the tabbed page **Scheduling**.
- Select the table row that contains the definition you want to delete and choose **Delete**.

Note: **Clear** removes all **Scheduling** entries as described in [Deleting a Schedule Definition](#).

- Choose **Apply** or **OK** to confirm the deletion and close the window.

The time frame definition is removed from the table.

Defining Dates for Explicit Network Execution

You can define explicit dates on which a network always or never executes, regardless of any other schedule definitions. Explicit dates supersede all other schedule definitions.

You can define explicit dates for all networks linked to a schedule or for a single network only.

This section covers the following topics:

- [Defining Explicit Dates for a Schedule](#)
- [Defining Explicit Dates for a Single Network only](#)

Defining Explicit Dates for a Schedule

➤ **To add or modify explicit dates for a schedule**

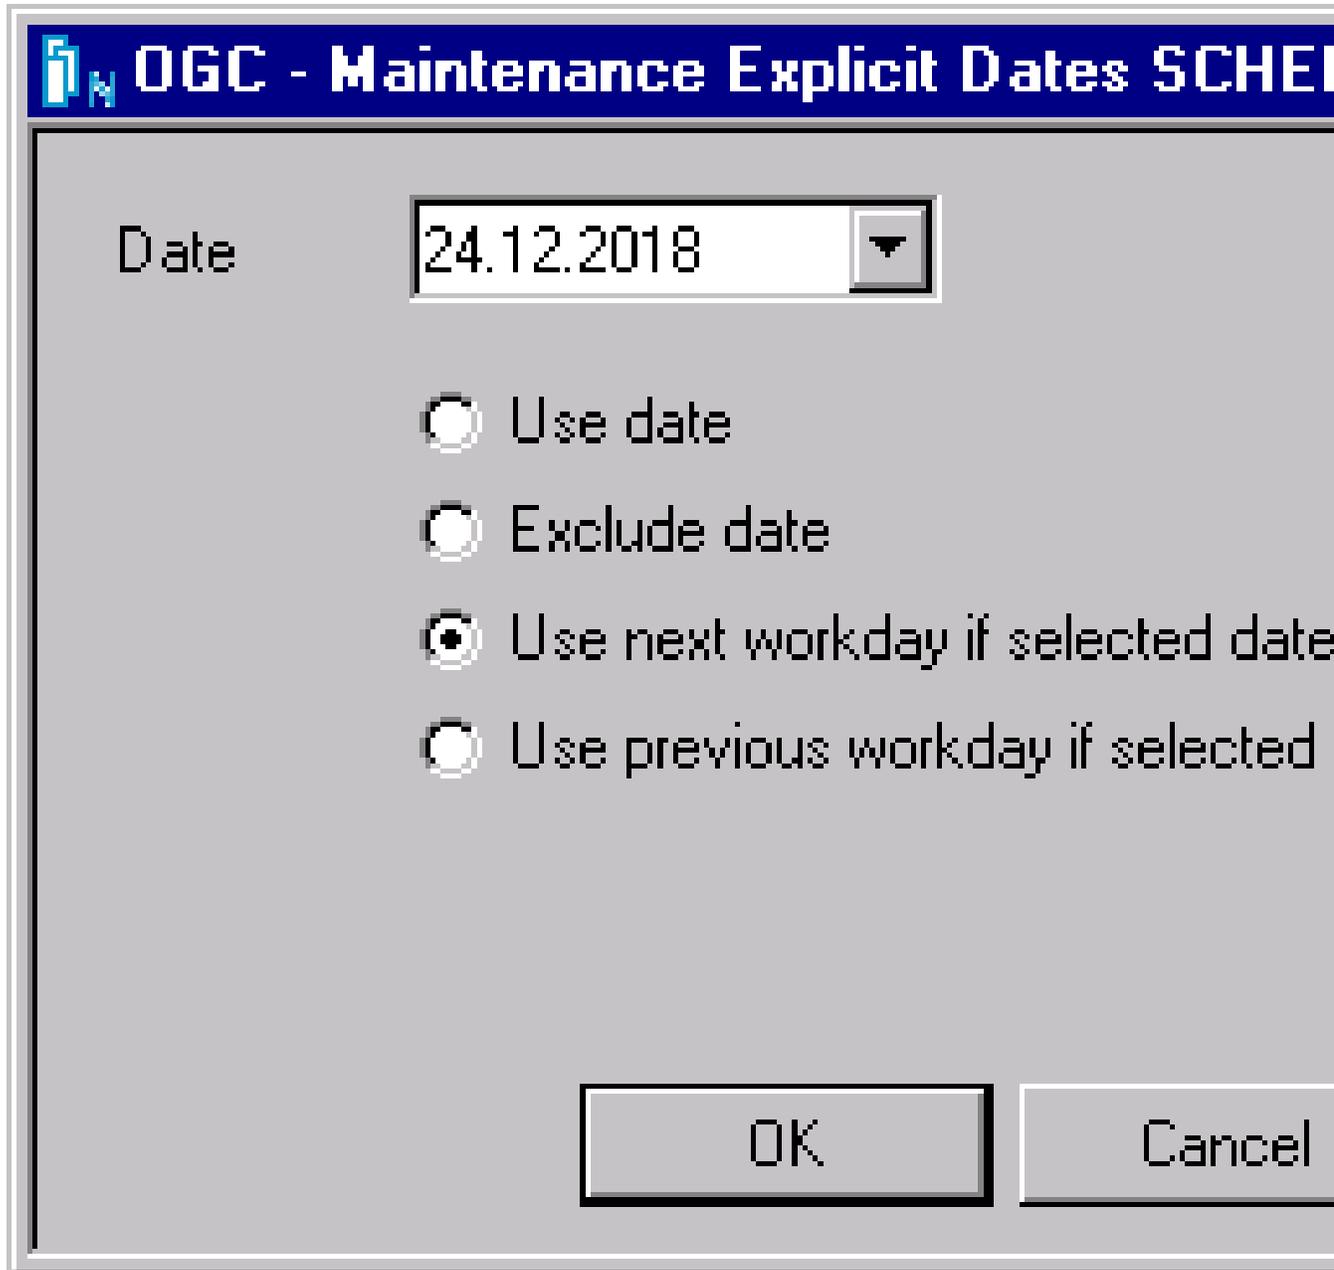

- 1 In the **Create new Schedule** or **Maintenance Schedule window**, open the tabbed page **Explicit Dates** shown in the following example:

| Calendar | Explicit Dates |
|------------|---|
| 2018-12-01 | |
| 2018-12-06 | Exclude date |
| 2018-12-24 | Use next workday if selected date holiday |

- 2 Choose **Add** for a new definition or select an existing entry and choose **Modify**.

You can choose **Clear** to remove all table entries or **Delete** to remove a selected table entry only.

When adding or modifying a definition, an **Explicit Dates** window similar to the example below opens:

- 3 Open the drop-down list box and select the required date or replace the date entered in the date format specified within Entire Operations defaults (here: DD.MM.YYYY).

If you want to associate the date with a special condition, select one of the following options:

- Use date: Execute a network on the specified date (default).
- Exclude date: Do not execute a network on the specified date.
- Use the next workday if the specified date is a holiday: Execute a network on the workday that follows the specified date.

- Use the previous workday if the specified date is a holiday: Do not execute a network on the specified date.

4 Choose **OK** when you are finished.

The **Explicit Dates** window closes and the specified dates are shown on the **Explicit Dates** page.

A date highlighted in red denotes that the date entered is past the date currently set as default in the **Explicit Dates** window.

On the **Explicit Dates** page above, the date 2018-12-01, was entered in the **Explicit Dates** window on December 3, 2018, for example.

5 Choose **OK** to save the date specification.

Defining Explicit Dates for a Single Network only

You can define explicit schedule dates on the network level. Dates defined here are network-specific in contrast to schedule definitions which affect all linked networks.

Notes:

1. Any modification made with this function causes the recalculation of the current schedule of the network.
2. Explicit dates override all definitions made in schedule(s) linked to the network.
3. Deletions of planned activations can cause that the day of deletion is added to the dates to be excluded on the **Explicit Dates** page. This is to avoid that the network is again activated on this day. (Explicit exclusion dates on the network level are set implicitly by the network activation cancelling function.)

» To define explicit dates for a single network

- 1 In the **Define Scheduling window**, open the **Explicit Dates** page shown in the following example:

| Time | Explicit dates | Repeating activation |
|------------|---|----------------------|
| 2018-12-02 | | |
| 2018-12-03 | | |
| 2018-12-06 | Exclude date | |
| 2018-12-20 | Use next workday if selected date holiday | |
| 2018-12-24 | Use previous workday if selected date holiday | |

- 2 Proceed with [Step 2](#) of *Defining Explicit Dates for a Schedule*.

Defining Multiple Network Activations

You can repeat network activations multiple times.

Note: If activation times are defined for a network, the job-specific time frames will be adapted to fit into the network time frame.

➤ To define multiple network activations

- 1 In the [Define Scheduling window](#), open the **Repeating Activation** page shown in the following example:

2 Enter (or replace) either or both of the following:

- In the **Number of activations** field, enter the required number of activations.
- In the **every ... minutes** field, enter the time interval to be used for activation.

Or:

Enter (or replace) the following:

- In the input fields next to **Activate at**, enter single or multiple times to be used for network activation.

You can choose **Clear** to remove all entries from the **Repeating activation** page.

- 3 If required, select or enter a time limit for activation in the **Day Deadline**.
- 4 Choose **OK** to save your entries and close the window.

The rules that apply when defining multiple activations are described in the following section:

- [Activation End](#)

- Calculation of Time Frames for Multiple Activations

Activation End

Multiple activations are limited

- until the end of the schedule day,
- until the latest start,
- by the defined number of activations,

whichever comes first.

Calculation of Time Frames for Multiple Activations

The following applies if both **Number of Activations** (na) and **every ... minutes** (em) have a non-zero value:

- The latest start time of a time frame (tf_latest_start) is interpreted as the latest start time of the first multiple activation.
- For activation $1 \leq n \leq na$, the latest start time of the specific activation will be set to $tf_latest_start + (n - 1) * em$.
- The multiple activation end time (mae) will be calculated as $mae = schedule_date + tf_latest_start + (na * em)$

If the multiple activation end time (mae) is after the defined deadline of a time frame, it will be set to the deadline of the time frame.

If the multiple activation end time (mae) is after the end of the schedule day, it will be set to the end of the schedule day.

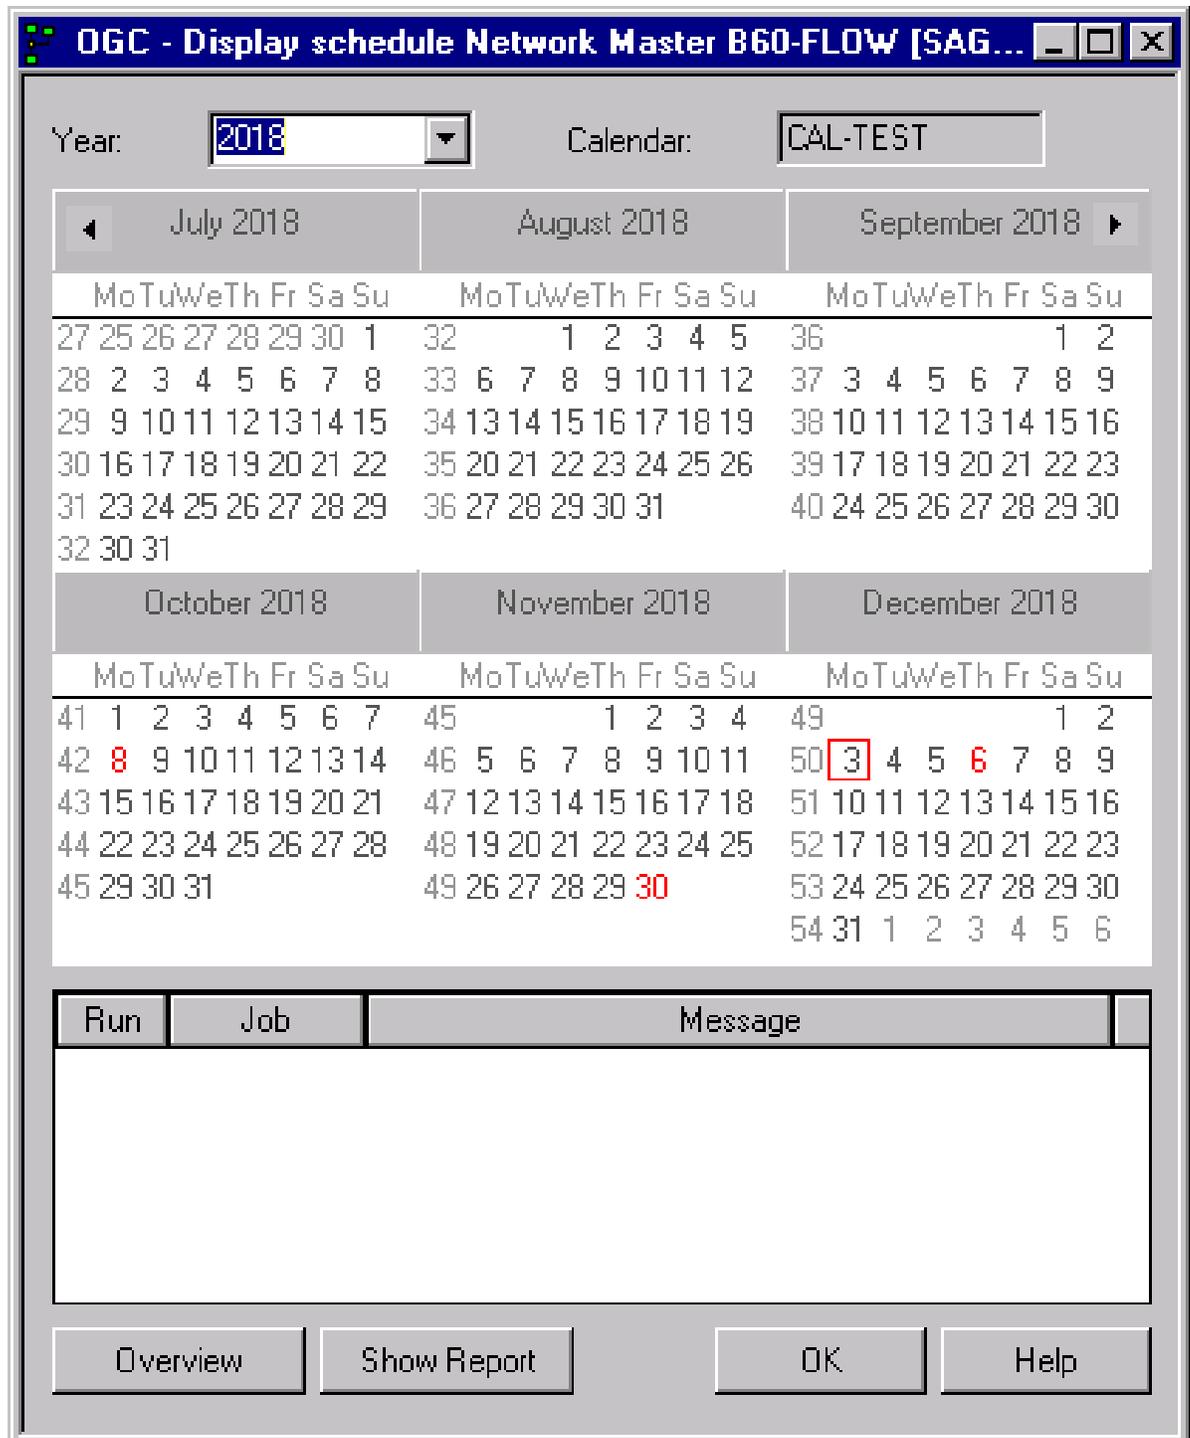

Note: A network is no longer treated as “already activated on the current day” if there was a multiple activation on the day before, which resulted in some runs that were executed after midnight. In this case, automatic activations (due to schedule) will not be blocked by the “activation on current day” check.

Viewing a Network Schedule Definition as a Calendar

➤ **To display the calendar view of a network schedule**

- 1 In the object workspace, select a **Network Master** instance and choose **Display Schedule** from the context menu.

A **Display Schedule** window similar to the example below opens:

- 2 Select the year you want to display.

Dates outlined in red indicate that a schedule is provided.

- 3 Select a date and choose **Overview**.

All activities scheduled for this date are displayed for online viewing in the lower area of the window.

- 4 Select a date and choose **Show Report**.

A list of available reports is displayed in a separate window.

Select the required report for printing purposes.

Note: For further information on reports, see the section [Reporting](#).

Producing a Network Start Summary

This section describes how to produce a network start summary for a single network. The report looks similar to the [example of a Network Start Summary](#) shown in the [Reporting](#) section.

If you want to produce a **Network Start Summary** for all network activations on a given day, see the corresponding report described in the section [Reporting](#).

» To produce a network start summary for the current network

- 1 In the [Display schedule window](#), select a valid date and choose **Overview**.

All activities scheduled for this date are displayed for online viewing in the lower area of the window.

- 2 Select a date and choose **Show Report**.

A list of available reports is displayed in a separate [Reporting window](#).

- 3 Select the required report, choose **Save as File** from the context menu and determine the file to be created from the report: see [Report Output Options](#).

For detailed information on generating reports, see the section [Reporting](#).

Displaying Next Network Starts - Next Activations

Scheduled starts are extracted from the network schedules and put into a pre-activation status. The extraction is usually performed at midnight, one day in advance.

Manual starts are explicitly invoked as manual activations by any user. If a special start time was not entered, the daily time frame is used. See [Activating a Job Network Manually](#) in the section [Network Maintenance](#).

This section covers the following topics:

- [Viewing and Maintaining Next Network Activations](#)
- [Columns: Next Activations](#)

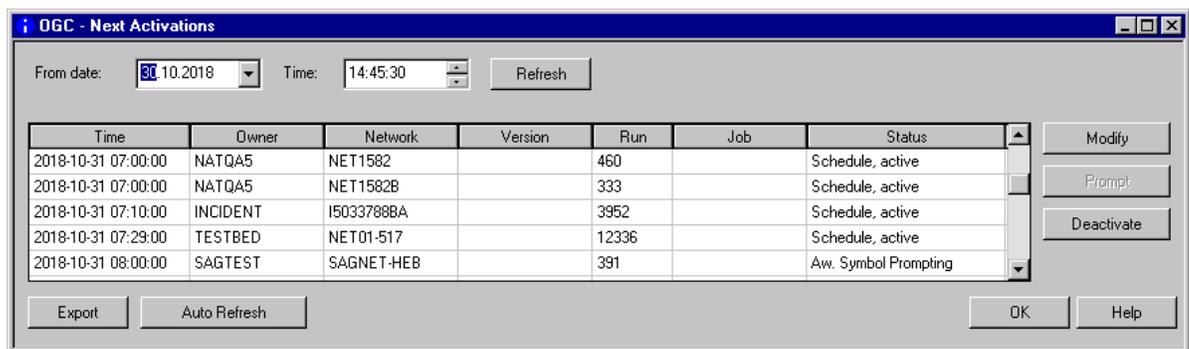

Viewing and Maintaining Next Network Activations

The context menu function **Next Activations** invokes the display of the future network activations. These activations are, in general, maintained by a schedule or a calendar but can also be invoked manually. You can view, modify or delete a planned activation.

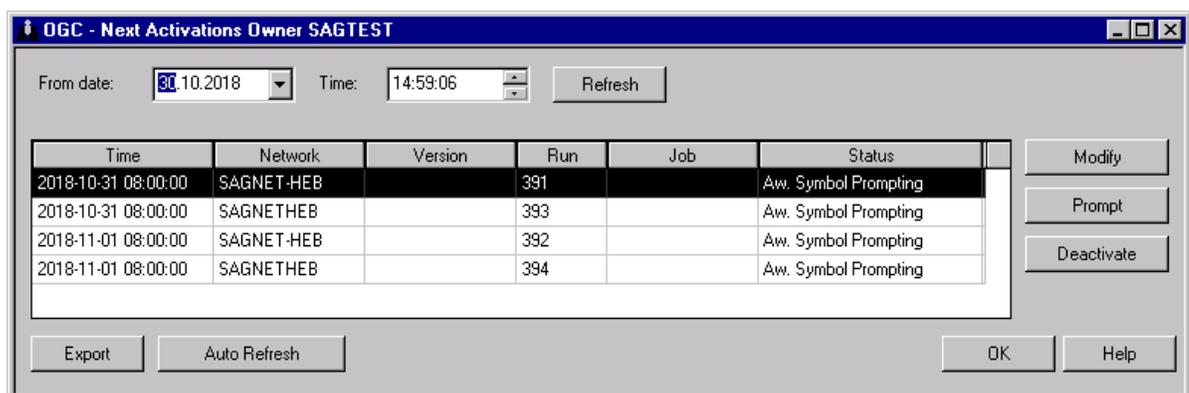

➤ To view and modify the next network activations

- 1 In the **object workspace**, select a **General** node, an **Owner** instance or a **Network Master** instance.
- 2 Open the context menu and choose **Next Activations**.

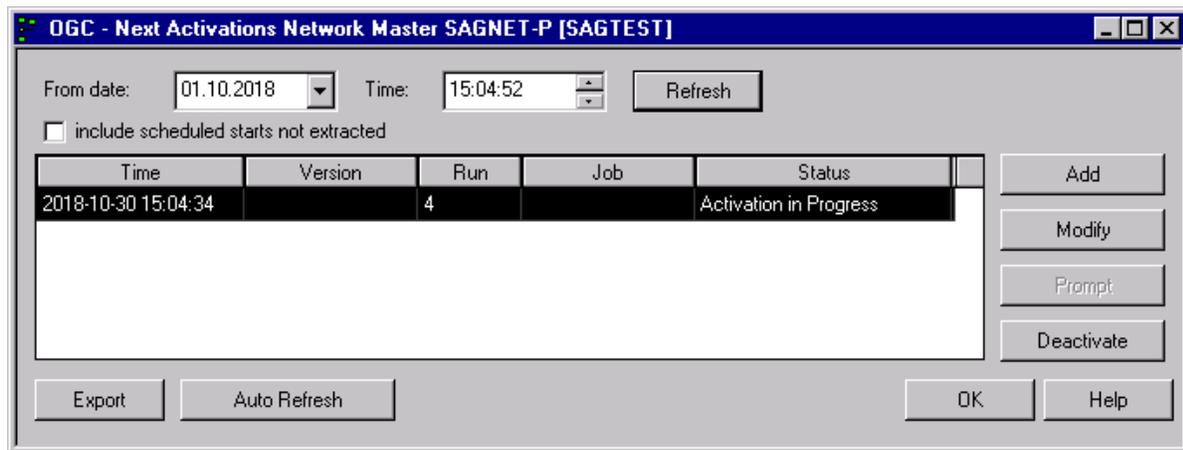

For a **General** node, the **Next Activations** window lists all network activations planned for all networks in your current Entire Operations environment as shown in the following example:

For an **Owner** instance, the **Next Activations** window lists all network activations planned for all networks that belong to the selected owner. Example:

For a **Network Master** instance, the **Next Activations** lists all activations planned for the selected network master. Example:

The **Next Activations** window displays a chronological list of all planned network or job starts, both scheduled and manual.

Note: The table view is filled dynamically with data if scrolled to the end of the table.

The columns contained in the window are described in [Columns: Next Activations](#).

3 You can refresh the list by choosing **Refresh** and **Auto Refresh** (see also [Refreshing Object Lists](#)).

4 You can cancel a future activation by selecting the respective row and choosing **Deactivate**.

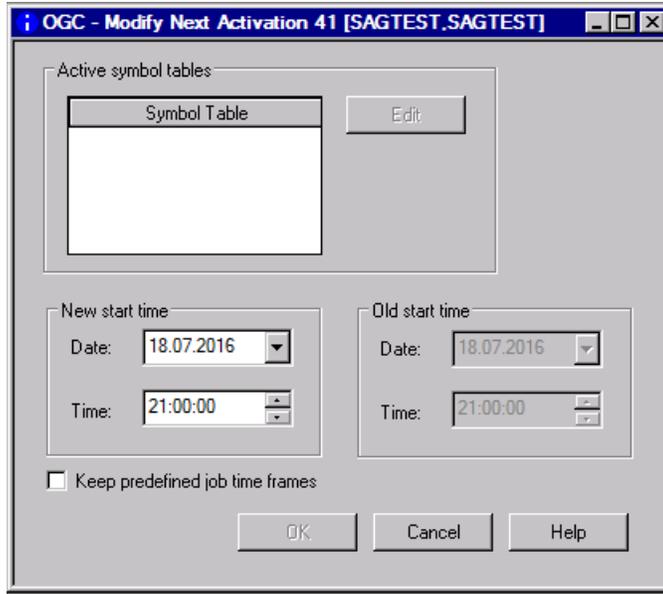

You can only cancel a job network to which a run number is assigned.

5 You can prompt symbols (if defined) by selecting the respective row and choosing **Prompt**.

This button is only active for activation with type Aw. Symbol Prompting and if a run number is assigned to the network.

6 You can edit a future activation by selecting the respective row and choosing **Modify**.

A window similar to the example below opens:

This window allows you to define a new start date and time for execution, edit a symbol table if used for this activation (see also [Displaying and Modifying a Master or Active Symbol Table](#)), and select the option to **keep predefined job time frames**.

- 7 If you want to export the current **Next Activation** settings, choose **Export**.

An **Export Objects** window opens. Proceed as described in *Exporting Objects* in the *Import/Export Functions* documentation.

➤ To add a next activation

Next activations can only be added for a network master because the objects have to be specified in advance of any activation.

- 1 In the **object workspace**, select a **Network Master** instance and choose **Next Activations** from the context menu.

The **Next Activations** window opens.

- 2 Choose **Add**.

The **Activation Network Master** window opens.

- 3 Define the time schedule for activation.
- 4 Choose **OK**.

The network is now marked and scheduled for its next activation and appears in the activations list.

➤ **To keep predefined job time frames**

- If you select the check box **Keep predefined Job Time Frames**, Jobs with master time frame definitions will not be adapted.

Or:

If you do not select the check box **Keep predefined Job Time Frames**, all job time frames will be adapted (default setting).

Columns: Next Activations

The columns contained in the **Next Activations** window depend on whether you execute the **Next Activations** function from the **General** node or an **Owner** instance (see also [Viewing and Maintaining Next Network Activations](#)). All columns that can be available are described in the following table:

| Column | Description |
|----------------|--|
| Owner | Owner of the network to be activated Above this column, you can make an owner preselection. If this field only contains an asterisk (*), all owners will be displayed. Your selection is stored in the user profile and is available when you invoke this function the next time. |
| Network | Network to be activated Above this column, you can make a network preselection. If this field only contains an asterisk (*), all networks for the current owner selection will be displayed. The network preselection is possible only if an owner was selected uniquely. Your selection is stored in the user profile and is available when you invoke this function the next time. |
| Run | Run number for this activation. |
| Version | Version of the network |
| Job | If the activation is for one job only, the job name appears in this column. |
| Date | Date of activation You can enter a start date and/or time in the fields above the Date and Start columns to display only those activations due to start after that time. |
| Start | Starting time of activation. |
| Type | Displays the current status of the activation. Possible status types are, for example: <ul style="list-style-type: none"> ■ Schedule Table, ■ on request, |

| Column | Description |
|--------|---|
| | <ul style="list-style-type: none"> ■ Schedule, active, ■ Aw. Symbol Prompting, ■ Symbol Entry in Progress. |

Displaying the Network Execution History

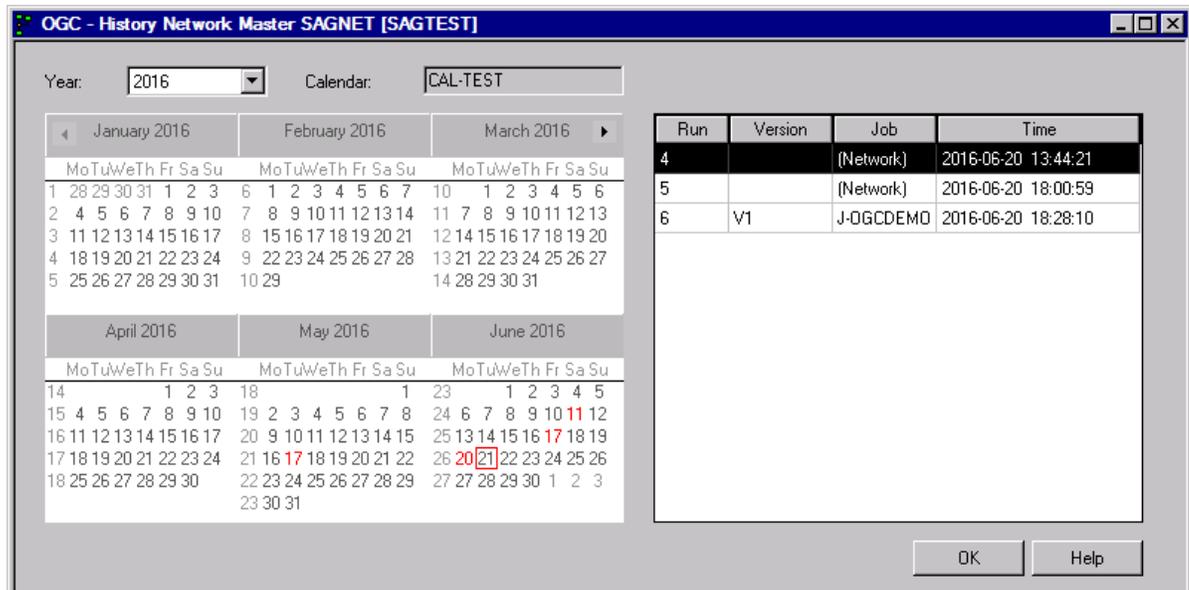

The execution history is a record of past schedules. It shows the days on which the network was scheduled for execution. The data in a **History** window cannot be modified.

There is history data on past network executions for the current and for the two preceding years (provided the network already existed at that time).

» To view the history of a network master

- 1 In the **object workspace**, select a **Network Master** instance and choose **History** from the context menu.

A **History Network Master** window similar to the example below opens:

A calendar is displayed where the dates on which the network ran are highlighted in red.

- 2 If available, select a year from the drop-down-list box next to **Year** to switch the display of the calendar to the selected year.
- 3 Click on the highlighted date for which you want to view the history data.

If history data exists for the selected network and date, execution information on all network starts is contained in the right-hand table columns of the window as shown in the example above. The columns are explained in [Columns: Network History](#).

If no history data exists, an appropriate message occurs. Log data is only retained for the number of days specified in the **Long-term log** field of the **Entire Operations Defaults** described in *Defaults for Time Ranges* in the *Administration* documentation.

This section covers the following topic:

- [Columns: Network History](#)

Columns: Network History

The columns of the [History Network Master](#) or [History Network Active](#) window are described in the following table:

| Column | Description |
|----------------|---|
| Run | Run number of the job network that executed. |
| Version | Network version (if available) of the network that executed. |
| Job | Job name if a single job was activated for execution, or (Network) if the entire network was activated. |
| Time | Date and time when the network executed. See also Date and Time Formats . |

Deleting a Scheduling Definition for a Single Network

➤ To delete a scheduling definition for a single network

- 1 In the [Define Scheduling window](#), open the tabbed page that contains the definition you want to delete.
- 2 On the **Time** or **Explicit Dates** page, select the table row that contains the definition you want to remove and choose **Delete**. On the **Repeating Activation** page, remove all entries.

Note: Removing the name of a schedule from the **Define Scheduling** window does not delete the corresponding schedule object. See also [Deleting a Schedule](#).

Or:

If you want to delete all definitions defined in the schedule, choose **Clear**.

- 3 Choose **Apply** or **OK** to confirm the deletion.

The schedule definition is deleted for the selected network and the window closes.

Warning:

If you choose **Clear**, the name in the **Schedule** field and all entries on the **Time**, **Explicit Dates** and **Repeating Activation** pages are removed from the schedule. The **Schedule effective from** option is unchecked (deactivated).

45

Scheduling a Job

- Defining Scheduling Parameters for a Job 580
- Maintaining Schedule Dependencies for a Job 584
- Sending a Late Message to One or More Users 589

Defining Scheduling Parameters for a Job

This feature allows you to define a schedule for a job master or an active job. You can define the time frame for the schedule, insert a message, assign account information and edit the schedule dependency information.

➤ **To define scheduling parameters for a job**

- 1 In the object workspace, open a **Job Master** instance.
- 2 In the **Maintenance Job Master** or **Maintenance Job Active** window, open the tabbed page **Scheduling Parameters**.

For a job master, the page looks similar to the following example:

| | | | | |
|-----------------------|-----------------------|------------------|--------------|----------------|
| Main | Resources | Input Conditions | EOJ Checking | JCL Definition |
| Scheduling Parameters | User Defined Log Data | Long Description | OS Specials | |

Estimated elapsed time: min. Average:

History elapsed time (min.):

| | | | | | | |
|--|--|--|--|--|--|--|
| | | | | | | |
| | | | | | | |
| | | | | | | |

Earliest start time: 08:00:00

Latest start time: 17:00:00 1 Workdays later

Deadline time: 20:00:00 2 Calendar days later

Schedule dependency: B H1 -1

For an active job, the corresponding page looks similar to the following example:

| Main | Allocated Resources | Resources | Input Conditions | EOJ Checking | | | | | | | | | | | | | | | | | | | | | |
|---|---|---------------------------------------|---|--------------|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|--|
| JCL Definition | Scheduling Parameters | | Long Description | OS Specials | | | | | | | | | | | | | | | | | | | | | |
| Estimated elapsed time: <input type="text"/> min. | | Average: <input type="text"/> | | | | | | | | | | | | | | | | | | | | | | | |
| History elapsed time (min.): | | | | | | | | | | | | | | | | | | | | | | | | | |
| <table border="1"> <tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr> <tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr> <tr><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td><td> </td></tr> </table> | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | | | | | | |
| | | | | | | | | | | | | | | | | | | | | | | | | | |
| Earliest start time: | <input type="text" value="19.12.2018"/> | <input type="text" value="00:00:00"/> | <input type="checkbox"/> Late Message | | | | | | | | | | | | | | | | | | | | | | |
| Latest start time: | <input type="text" value="19.12.2018"/> | <input type="text" value="23:59:59"/> | <input type="button" value="Account Info"/> | | | | | | | | | | | | | | | | | | | | | | |
| Deadline time: | <input type="text" value="19.12.2018"/> | <input type="text" value="23:59:59"/> | | | | | | | | | | | | | | | | | | | | | | | |
| Schedule dependency: | <input type="text" value="B H1 -1"/> | <input type="button" value="Modify"/> | | | | | | | | | | | | | | | | | | | | | | | |

- 3 Make your definitions. The fields contained in the window are explained in [Fields: Scheduling Parameters](#).
- 4 Choose **OK**.

This section covers the following topics:

- [Fields: Scheduling Parameters](#)

Fields: Scheduling Parameters

The fields of the [tabbed page Scheduling Parameters](#) are described in the following table.

| Field | Description |
|-------------------------------|--|
| Estimated Elapsed Time | <p>The expected total running time (in minutes) for the job.</p> <ul style="list-style-type: none"> ■ If not specified explicitly, this value is derived from the average running time of previous runs of the same job, displayed in the field directly below. ■ If this value is not equal to zero (0) for a permanent dummy job (job type Dummy Job) with a special type other than Execute as dummy (dummy due to a condition), this dummy job is executed for exactly the amount of time given here. This enables you to perform time simulations, etc. ■ Active scheduling parameters for a running dummy job: |

| Field | Description |
|------------------------------------|--|
| | <p>Modification of the estimated elapsed time causes the end time of the dummy job to be recalculated as sum of the start time and the new estimated elapsed time. If the new calculated end time is lower than the current time, the current time will be used instead.</p> <ul style="list-style-type: none"> ■ Temporary dummy jobs with the job type Dummy Job and special type Execute as dummy (dummy due to a condition) execute for the amount of time defined as estimated elapsed time for the job. ■ For temporary dummy jobs with other special types (for example, dummy due to a condition), the defined estimated elapsed time is ignored. Temporary dummy jobs always have the execution time zero. <p>Special value: For jobs of the job type Subnetwork, 999999 can be specified. In this case, all start times after that are set to the ending times in the subnetwork.</p> |
| Average | Average running time (in minutes) computed from the last 20 runs shown in the History Elapsed Time (min.) table. |
| History Elapsed Time (min.) | <p>Table containing the actual running times (in minutes) of the last 20 runs of the job.</p> <p>The running time of the last 20 runs with non-zero elapsed times is used to compute the average time (in the Average field) the job needs to finish.</p> <p>History elapsed times for multiple jobs (see also the Suffix Symbol field described in <i>Job Maintenance</i>):</p> <ul style="list-style-type: none"> ■ For a job master, the table contains the elapsed times of all multiple active jobs, which were last activated by this job master. ■ For an active job, the table contains the elapsed times of all multiple active jobs whose names match the name of this active job. |
| Earliest Start Time | <p>The job will not be started before this time.</p> <p>Use days later if the Earliest Start Time is more than one day later than the network start time.</p> <p>You can specify the number of workdays or calendar days to be used for later starts: see Calendar days later Workdays later below.</p> <p>See also <i>Processing of Time Frame Definitions</i>.</p> <p>For an active job, the Earliest Start fields contain the time calculated for the respective job run according to the definitions made in the corresponding job master. Both fields can be modified for the given job run only.</p> |
| Latest Start Time | <p>The job will not be started after this time.</p> <p>If this time precedes the Earliest Start Time and days later is empty, days later is set to 1 so this time follows the Earliest Start Time.</p> <p>You can specify the number of workdays or calendar days to be used for later starts: see Calendar days later Workdays later below.</p> |

| Field | Description |
|--|--|
| | <p>See also Processing of Time Frame Definitions.</p> <p>For an active job, the Latest Start fields contain the time calculated for the respective job run according to the definitions made in the corresponding job master. Both fields can be modified for the given job run only.</p> |
| Deadline Time | <p>Time by which the job must be finished.</p> <p>If the job cannot be finished before this time, it is not submitted.</p> <p>Dummy jobs with Estimated Elapsed Time not equal to zero (0) are finished at this time at the latest.</p> <p>You can specify the number of workdays or calendar days to be used for later starts: see Calendar days later Workdays later below.</p> <p>See also Processing of Time Frame Definitions.</p> <p>For an active job, the Deadline fields contain the time calculated for the respective job run according to the definitions made in the corresponding job master. Both fields can be modified for the given job run only.</p> |
| <p>Input fields for number of days and day type:</p> <p>Calendar days later Workdays later</p> | <p>(Applies to job masters only.)</p> <p>You can use the input fields next to Earliest Start Time, Latest Start Time and Deadline Time to define a time frame that exceeds 24 hours. Enter the number of days (maximum is 999) you want to postpone a start time or deadline.</p> <p>Use the drop-down list boxes to select the day type to be used for the specified start time or deadline: a calendar day or a workday as defined in the calendar linked to the schedule.</p> <p>See also Processing of Time Frame Definitions.</p> <p>Note: The Entire Operation default settings provide the option to define later start times in units of hours instead of integer days, for time ranges that are not a multiple of 24.</p> |
| Schedule Dependency | <p>A code shown in this read-only field indicates that this job has a schedule dependency.</p> <p>The field is empty if no schedule dependency is defined for the job.</p> <p>You can choose Modify to open a window where you can view, add or modify a schedule dependency.</p> <p>See also Maintaining Schedule Dependencies for a Job.</p> |
| Cyclic Interval | <p>This field is only available for cyclic jobs.</p> <p>Wait time (in minutes) between two executions of a cyclic job (special type Cyclic execution).</p> <p>Default: Monitor wait time.</p> |
| Late Message | See Sending a Late Message to One or More Users . |
| Account Info | See Viewing Job/Network Accounting Information in the section <i>Job Maintenance</i> . |

Maintaining Schedule Dependencies for a Job

You can define particular days of the week, month or year when a job (or all jobs of a network, see [Adding and Modifying a Time Frame Definition](#)) executes as a temporary dummy due to schedule condition (see also [Temporary Dummy Jobs](#)).

You can also define day dependencies for a job input condition. If defined, the job executes without performing an input condition check.

If a day dependency is not defined (default) at the job or network level, or for a job input condition, the job executes normally, that is, exactly as defined in the job master.

The date and time defined for job execution on the [Scheduling Parameters page](#) is then checked against the current schedule of the current network, or the current calendar. For jobs in a subnetwork, we recommend you to specify that the topmost calling network is checked instead of the current network by using [Check schedule of the topmost calling network](#) option.

Prerequisite for Concatenated Jobs

If you want to deactivate single or multiple jobs in a chain of dependent jobs, for all jobs in the chain, the option [End-of-Job Action](#) must be set to **No impact on the job result**. Otherwise, errors can occur during End-of-Job processing.

See also [Excluding a Job from Actual Execution](#).

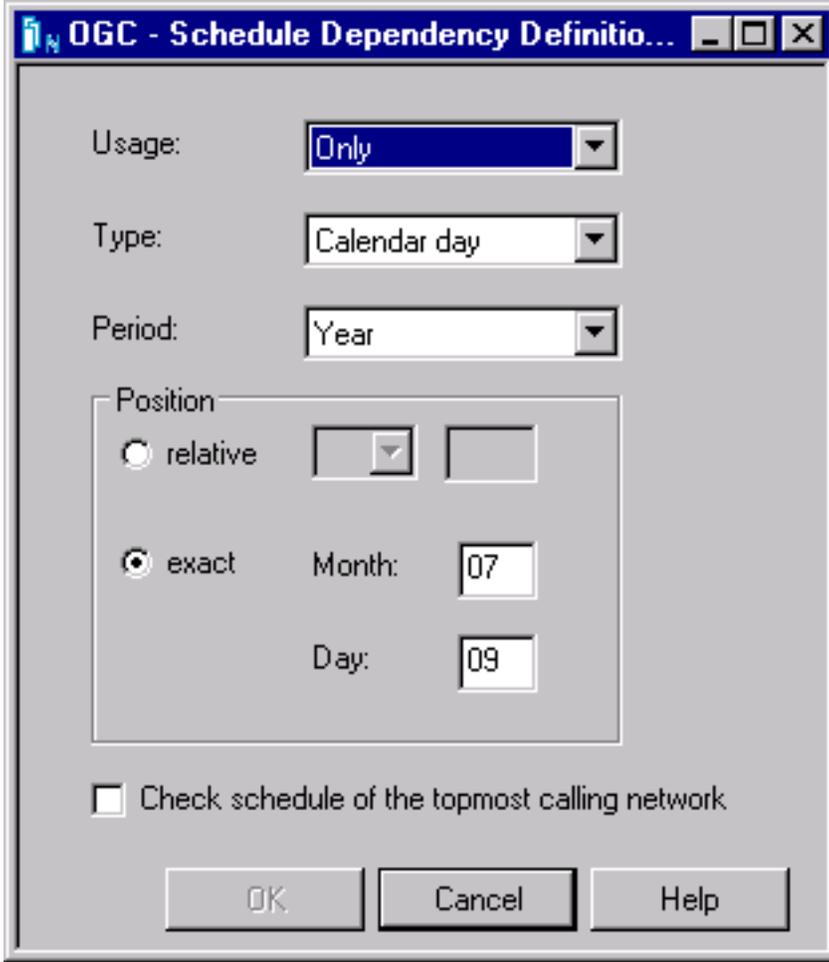

Note: The job execution date and time can be different (one or more days later) from the job activation date and time.

> To define schedule dependencies at the job level

- On the tabbed page [Scheduling Parameters](#) of the **Maintenance Job Master** window, choose **Modify** next to **Schedule dependency**.

A **Schedule Dependency Definition** window similar to the example below opens:

The screenshot shows a dialog box titled "OGC - Schedule Dependency Definition...". It contains the following fields and options:

- Usage:
- Type:
- Period:
- Position:
 - relative
 - exact Month:
Day:
- Check schedule of the topmost calling network

At the bottom are three buttons: OK, Cancel, and Help.

The input fields and options in the window are described in [Fields: Schedule Dependency Definition](#).

This section covers the following topics:

- [Defining Schedule Dependencies for an Input Condition](#)
- [Fields: Schedule Dependency Definition](#)
- [Examples of Schedule Dependency Definitions](#)

- [Deleting Schedule Dependency Entries](#)

Defining Schedule Dependencies for an Input Condition

You can define an input condition that is not used on all activation dates of a job network. This can be done for the following reasons:

- A predecessor job or network does not run on all schedule dates of the successor job or network.
- Some predecessor jobs are also schedule-dependent.

➤ To define schedule dependencies for an input condition

- 1 From the table on the [tabbed page Input Conditions](#), select an input condition and choose **Schedule Dep..**

A [Schedule Dependency Definition window](#) opens.

The fields contained in the window correspond to the fields of the **Schedule Dependency Definition for Job** window. They are explained in [Maintaining Schedule Dependencies for a Job](#).

- 2 Make your definitions.
- 3 Choose **OK**.

The schedule dependency is allocated to the input condition and the window closes.

The schedule dependency is now indicated in the **Sched.Dep.** column.

Fields: Schedule Dependency Definition

The input fields of the [Schedule Dependency Definition](#) window provided for a job, a job input condition and a network are described in the following table:

| Field | Description | |
|--|------------------------------|--|
| Check schedule of the topmost calling network | Possible check box settings: | |
| | <i>unchecked</i> | Checks the schedule of the current network (default). This setting is recommended for jobs in main networks. |
| | <i>checked</i> | Checks the schedule of the topmost network that calls the job. This setting is recommended for jobs in subnetworks. |
| Usage | Possible selection options: | |

| Field | Description | |
|---------------|-----------------------------|--|
| | Only | <p>For a job or condition:</p> <p>The job or condition is activated only if the execution date satisfies the criteria entered in the Type, Period and Position fields.</p> <hr/> <p>For a network:</p> <p>The object is valid only for schedule days matching the following definitions.</p> |
| | After holiday too | Like Only , but the first workday after an otherwise matching holiday is valid, too. |
| | Before holiday too | Like Only , but the last workday before an otherwise matching holiday is valid, too. |
| | Except | <p>For a job or condition:</p> <p>The job or condition is activated except when the execution date satisfies the criteria entered in the Type, Period and Position fields.</p> <hr/> <p>For a network:</p> <p>The object is valid for all schedule days except if they match the following definitions.</p> |
| Type | Possible selection options: | |
| | Is holiday | <p>Any holiday (no period and/or position required).</p> <p>The relative position to the holiday can be specified.</p> |
| | Is workday | <p>Any workday (no period and/or position required).</p> <p>The relative position to the workday can be specified.</p> |
| | Calendar day | <p>Calendar day within the defined period.</p> <p>A relative position refers to the real calendar period.</p> |
| | Workday | <p>Workday within the defined period.</p> <p>A relative position refers to the workdays in the period.</p> |
| | Schedule day | <p>Schedule day within the defined period.</p> <p>A relative position refers to the schedule days in the period.</p> |
| Period | Possible selection options: | |
| | Week | Current week. |
| | Month | Current month. |
| | Year | Current year, with relative or exact position. |

| Field | Description |
|-------|---|
| | <p>Position</p> <p>Schedule dependency position.</p> <p>The position within the defined period depending on the specified type.</p> <p>Relative position:</p> <ul style="list-style-type: none"> ■ Positive values (+) are relative to the period begin, negative values (-) are relative to the period end. For the types Is holiday and Is workday, this is the day difference. <p>Valid value ranges are:</p> <p>For a week: - 7 to - 1 and +1 to +7 For a month: - 31 to - 1 and +1 to +31 For a year: - 366 to - 1 and +1 to +366</p> <p>Note: You can specify up to three days for the period week. Example: 24 is Tuesday and Thursday.</p> <p>Exact position:</p> <ul style="list-style-type: none"> ■ Fixed month (1 - 12) and day (1 - 31) of the year. <p>Only applies if Calendar Day is selected for Type and Year for Period.</p> <p>See also Examples of Schedule Dependency Definitions.</p> |

Examples of Schedule Dependency Definitions

The following are example combinations for day calculation:

| Type | Period | Position or Month/Day | Calculated Day |
|--------------|--------|-----------------------|---|
| Calendar day | Week | +2 | Tuesday |
| | | - 1 | Sunday |
| | Month | +1 | 01 |
| | | - 1 | 28 ... 31 |
| | Year | +1 | January 01 |
| | | - 3 | December 29 |
| | | Month: 4, Day: 9 | April 09 (yearly, including leap years) |
| Workday | Month | - 1 | Last workday of the month |
| | | 234 | Second, third and fourth workday of the month |
| Is holiday | n/a | +1 | Day after a holiday |

Deleting Schedule Dependency Entries

➤ To delete a schedule dependency entry for a job

- 1 On the tabbed page **Scheduling Parameters**, choose **Modify** next to the entry in the **Schedule dependency** field.

A **Schedule Dependency Definition** window opens.

- 2 Clear the **Usage** field by selecting a blank option from the drop-down list box.

All entries are removed from the window.

- 3 Choose **OK**.

The **Schedule Dependency Definition** window closes and the **Schedule dependency** entry is removed from the **Scheduling Parameters** page.

Sending a Late Message to One or More Users

You can define one or more users (recipients) to receive job-related standard messages that are sent when a job could not be executed in the defined time range.

➤ To inform users that a job could not be executed

- 1 On the tabbed page **Scheduling Parameters**, choose **Late Message**.

A **Maintenance Message and Message Recipients window** opens.

- 2 Change, add or remove a message recipient as described under **Recipients** in Step 3 of *To view or change a notification message* in the section **Defining Notification Messages (Job Maintenance)**.

Note: You cannot change the text of job-related standard messages.

XIII

Calendar Maintenance

46

Calendar Maintenance

- General Rules and Restrictions 594
- Available Functions: Calendar 595
- Listing Calendars 596
- Displaying, Modifying or Adding a Calendar Definition 597
- Defining Workdays and Holidays 599
- Where Used - Listing Schedules Using a Calendar 600
- Deleting a Calendar Definition 601

Calendars can form the basis for schedules defined for jobs and job networks. An Entire Operations calendar distinguishes between workdays (working days) and holidays (non-working days) as defined by the user (weekends, national holidays, personal vacations).

If a schedule depends on a calendar, calendar-dependent definitions can be made in the schedule. If a schedule is not linked to a calendar, the schedule assumes that all days are workdays.

Calendars are identified by owner, name and year, and can belong to an owner or be used system-wide. You can specify a system calendar or a calendar belonging to your owner for a schedule table, but you can only modify calendars belonging to your owner. System calendars can be modified by authorized users only.

Any number of calendars can be defined to the system.

Calendars can be modified to change, include or delete holidays (system-wide calendars can only be modified by the system administrator). Modifications to calendars can affect the associated job network schedule(s).

General Rules and Restrictions

This section covers the following topics:

- [How Calendars Work](#)
- [Calendar Types](#)
- [Calendar Names](#)

How Calendars Work

Entire Operations calendars include workdays and holidays (non-workdays).

Entire Operations does not activate any networks on a day defined as a holiday.

For example, a job network is scheduled to run on every first day of a month and the schedule is based on a calendar in which Saturdays and Sundays are defined as non-workdays:

If the first day of a month is a Saturday or Sunday, Entire Operations does not start the network on these days, but either delays activation until the next workday following the holidays or brings activation forward to the last workday previous to the holidays, depending on the schedule definition.

Calendar Types

There are two types of calendars in Entire Operations:

- **System-wide calendars**

System calendars can be modified by authorized users only.

- **Owner-specific calendars**

When you define a calendar, it is automatically associated with your owner. You can modify only those calendars that belong to your owner.

You can specify a calendar belonging to your owner for a schedule, but you can also select a system calendar.

Calendar Names

A calendar can be valid for several years, so you are not forced to change the name of the calendar at the end of the year. Just define the calendar for the next year. For this reason, you should use calendar names independent of the year.

You must define a calendar separately for each year you want to use it. Networks cannot be started if a calendar is missing for the year for which it is needed. To be notified about such cases, select the Calendar undefined for year option in Global Messages for Events (see the *Administration* documentation). In November and December, the Entire Operations Monitor writes warning messages to the log if a calendar currently used is not defined for the next year.

Reserved Calendar Names

Calendar names must not begin with the prefix =EOR=.

This prefix is reserved for **special usage in symbol functions** (see the section *Symbol Table and Symbol Maintenance*).

Available Functions: Calendar

➤ **To list all functions available for a Calendar node**

- In the object workspace, select a **Calendar** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| List | F8 | See Listing Calendars . |
| New | CTRL+N | See Displaying, Modifying or Adding a Calendar Definition . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | See Filtering Objects . |
| Paste data | CTRL+V | See Pasting Objects . |
| Export | --- | See Exporting Objects in the Import/Export Functions documentation. |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all available functions for a Calendar instance

- In the object workspace, select a **Calendar** instance and open the context menu.

The following functions are available:

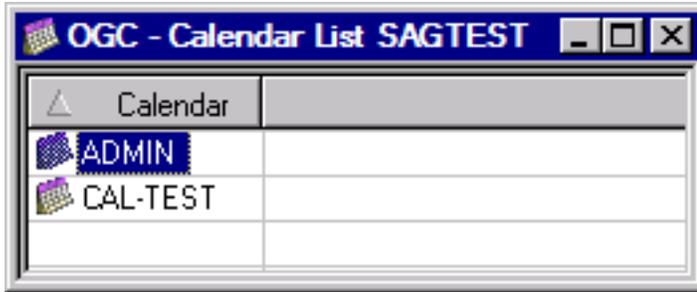

| Function | Shortcut | Description |
|----------------------------|----------|---|
| Open | CTRL+O | See Displaying, Modifying or Adding . |
| Display | CTRL+D | See Displaying, Modifying or Adding . |
| Where Used | --- | Displaying schedules using a calendar. See Where Used - Listing Schedules Using a Calendar . |
| Delete | DELETE | See Deleting a Calendar Definition . |
| Copy data | CTRL+C | See Copying Objects . |
| Export | --- | See Exporting Objects in the Import/Export Functions documentation. |
| Add to Workplan | --- | See Add to Workplan . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

Listing Calendars

➤ To list calendars

- 1 In the object workspace, select the **Calendar** node of the required owner
- 2 From the context menu, choose **List**, or press F8.

All calendars defined for the selected owner are listed in the **Calendar List** window as shown in the following example:

The list of calendars contains system-wide calendars and calendars belonging to the selected owner (here: SAGTEST).

A calendar is identified uniquely by its owner name and year.

This section covers the following topics:

Displaying, Modifying or Adding a Calendar Definition

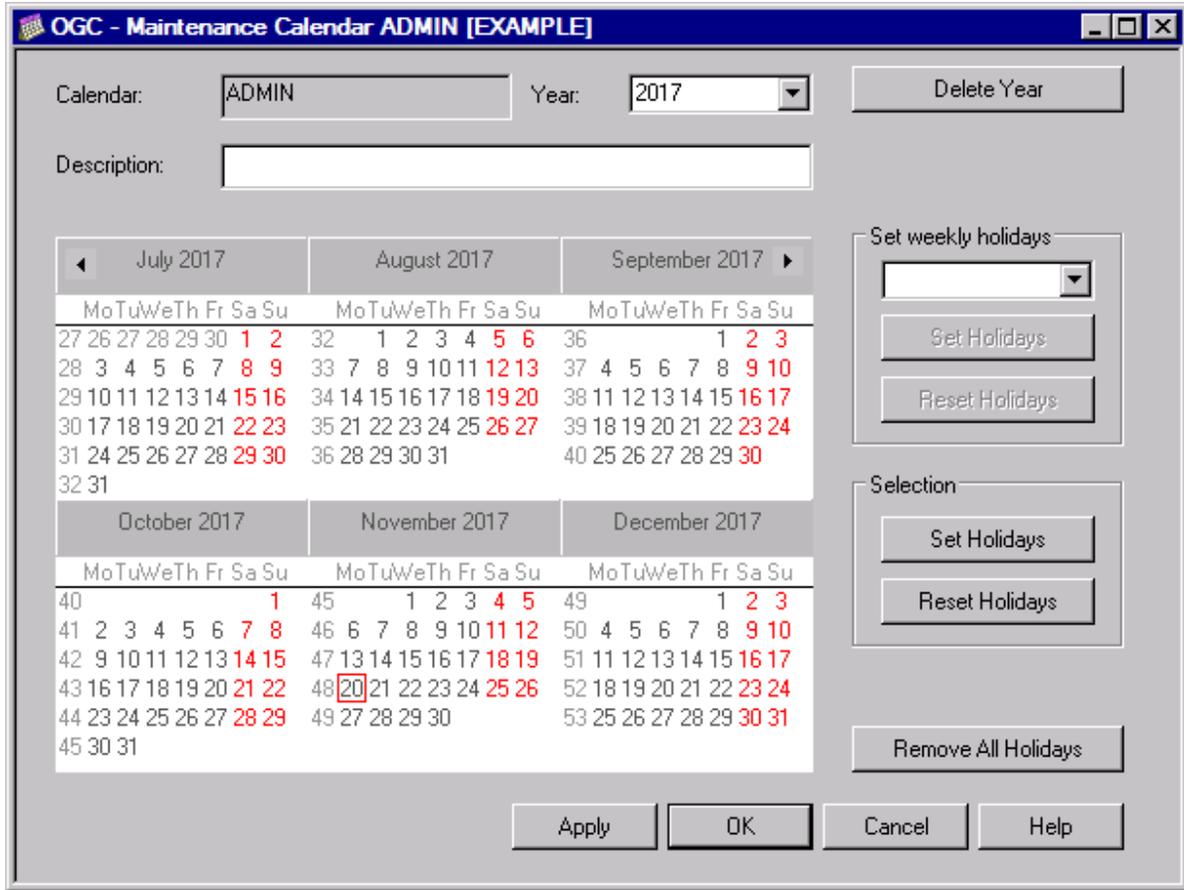

> To display, modify or add a calendar definition

- 1 From the **Calendar** node in the object workspace, select the calendar you want to view or modify and choose **Display** or **Open**, respectively, from the context menu. Alternatively, you can press **CRTL+D** or **CRTL+O**, respectively.

Or:

Select a **Calendar** node and choose **New** from the context menu, or press **CRTL+N**.

Depending on the function performed, a **Display Calendar**, **Maintenance Calendar** or **Create new Calendar** window opens:

If the calendar is for the current year, the window displays six months from the current month of the specified calendar year by default.

For other years, the first six months are displayed initially.

Click on the right arrow button  to scroll right in the calendar and view the next months, or click on the left arrow button  to scroll left and view the previous months.

The current date is indicated by a red square, holidays are highlighted in red.

The fields in the upper section of the window are explained in [Fields: Calendar Definition](#).

- 2 If defined for the calendar, you can select another year from the **Year** drop-down list box.

When modifying or adding a calendar, you add another year by replacing the current entry in the **Year** field.

- 3 When modifying or adding a calendar, define the required holidays as described in [Defining Workdays and Holidays](#).
- 4 Choose **OK** to save your calendar definition.

The calendar is saved and you can use it for scheduling network and jobs.

This section covers the following topics:

- [Fields: Calendar Definition](#)

Fields: Calendar Definition

The fields contained in the upper section of the **Display Calendar**, **Maintenance Calendar** and **Create new Calendar** window are described in the following table:

| Field | Description |
|--------------------|---|
| Calendar | Calendar name. |
| Year | Calendar year. The current year is entered by default. |
| Description | A short description of the calendar. |

Defining Workdays and Holidays

Defining a calendar consists of defining workdays and holidays (non-workdays). This is done in two steps:

1. Define weekly holidays. These are the non-workdays in every week, such as weekends.
2. Define special holidays or personal vacations.

Note: A network schedule can override workdays marked on a calendar, because a network runs on a day specified in a calendar, only if this day is also specified in the schedule.

➤ To define or remove weekly holidays

- 1 In the **Set weekly holidays** section of the [Maintenance Calendar](#) or **Create new Calendar** window, open the drop-down list box, select the weekday you want to define as a holiday and choose **Set Holidays**.

Or:

In the **Set weekly holidays** section of the [Maintenance Calendar](#) or **Create new Calendar** window, open the drop-down list window and select the defined holiday you want to change to a weekday and choose **Reset Holidays**.

Or:

Choose **Remove All Holidays**.

Caution: This function removes both all weekly and all special holidays for the year currently selected and shown in the **Maintenance Calendar** window.

- 2 Choose **OK** to save your calendar definition.

Weekdays defined as holidays are now highlighted in red.

➤ **To define or remove special holidays**

- 1 In the **Selection** section of the **Maintenance Calendar** or **Create new Calendar** window, click on single or multiple (SHIFT-click) dates and choose **Set Holidays**.

The selected dates are highlighted in red.

Or:

In the **Selection** section of the **Maintenance Calendar** or **Create new Calendar** window, click on single or multiple (SHIFT-click) highlighted (defined) dates and choose **Reset Holidays**.

Or:

Choose **Remove All Holidays**.

Caution: This function removes both all weekly and all special holidays for the year currently selected and shown in the **Maintenance Calendar** window.

- 2 Choose **OK** to save your calendar definition.

Weekdays defined as holidays are now highlighted in red.

Where Used - Listing Schedules Using a Calendar

➤ **To list schedules using a calendar**

- 1 In the object workspace, select the required calendar from the **Calendar** node and choose **Where used** from the context menu.

A **Where used** window similar to the example below opens:

| Owner | Schedule |
|---------|-----------|
| EXAMPLE | B60-FLOW |
| EXAMPLE | MAY-DATES |
| EXAMPLE | Q1-ADMIN |

The window indicates the name of the selected calendar (here: `EXAMPLECAL`) and its owner (here: `EXAMPLE`) and lists all schedules (and their owners) associated with the calendar.

- 2 You can modify a listed schedule by selecting the required table row and choosing **Open** from the context menu.

A [Maintenance Schedule window](#) opens where you can change or remove the name of the calendar entered for the schedule.

Deleting a Calendar Definition

➤ To delete a calendar definition

- 1 In the object workspace, select the calendar you want to delete from the **Calendar** node.
- 2 From the context menu, choose **Delete**.

Or:

Press `DELETE`.

A dialog opens where you have to confirm the deletion.

You cannot delete a calendar if it is specified for at least one schedule. If you wish to delete a calendar which is still used by a defined schedule, Entire Operations notifies you with an appropriate message. Use the **Where used** function to find out which schedule(s) are associated with the calendar (see [Where Used - Listing Schedules Using a Calendar](#)). In this case, you cannot delete the calendar until you have done either of the following:

- Specified another calendar for the relevant network schedule(s).

Or:

- Deleted the network for which the calendar is specified.

You can delete only the calendars you are permitted to delete.

XIV

Working with Mailboxes

47

Working with Mailboxes

- Concept of Single or Multiple Mailbox Users 606
- Listing and Maintaining Mailboxes 607
- Viewing Mailbox Messages 607
- Handling Messages and Requests 610

Mailboxes are used for sending messages to Entire Operations users. The messages are triggered by either system-detected or user-defined events.

If a message requires a reply, it is prompted in the [Show Messages and Requests window](#). You can then take appropriate steps and manually set the conditions necessary for the job to continue.

Several [message destination types](#) can be defined. Among them is the sending of [e-mails on z/OS and z/VSE, BS2000](#) and [UNIX and Windows](#) systems.

Optionally, you can use a global exit for message sending. This exit detects all messages that must be sent for various reasons by the Entire Operations Monitor. The exit can store the message content in files and forward the message to other applications, etc.

Related Topics:

- [Defining Notification Messages - Job Maintenance](#)
- [Mailbox Definition - Administration](#) documentation
- [Mailboxes, Message Sending - Concepts and Facilities](#) documentation (general information including example scenarios)

Concept of Single or Multiple Mailbox Users

A mailbox can be available to one or more users which are linked to the mailbox (see also the **Mailboxes** field described in *User Definition and Profile Settings* in the *Administration* documentation).

All users linked to a mailbox have access to the same range of messages and requests. If a message or request of this mailbox is handled by any of these users, the Entire Operations Monitor triggers all jobs waiting for actions and the message handled by the user disappears from the message list for all other users linked to the mailbox.

SYSDBA Mailbox

All generated messages and requests, for which no user is defined, are sent to the SYSDBA mailbox, which is accessible to the owner SYSDBA.

For an example illustration of single or multiple mailbox use, see *Example Scenario - Concept of Single and Multiple Mailbox Users* in the *Concepts and Facilities* documentation.

Listing and Maintaining Mailboxes

This section covers the following topics:

- [Listing Mailboxes](#)
- [Creating, Modifying and Deleting Mailboxes](#)
- [Clearing of Mailboxes](#)

Listing Mailboxes

You can list all mailboxes defined in your environment and view their contents depending on the access rights set in the **Mailbox Definitions** of your user profile (see *Administration Functions* in the *Administration* documentation).

➤ To list all mailboxes available in your environment

- Proceed as described in *Listing Mailboxes defined to Entire Operations* in the *Administration* documentation.

Creating, Modifying and Deleting Mailboxes

You can only create, change and delete a mailbox if you have appropriate access rights set in the **Mailbox Definitions** of your user profile (see *Administration Functions* in the *Administration* documentation).

For details on defining mailboxes, see *Mailbox Definition* in the *Administration* documentation.

Clearing of Mailboxes

Mailbox entries are cleared in accordance with the maximum length of time specified in the Entire Operations default settings for long-term logging. For further information, see the **Long-term log** option described in *Defaults for Time Ranges* in the *Administration* documentation.

Viewing Mailbox Messages

➤ To view the messages for a mailbox

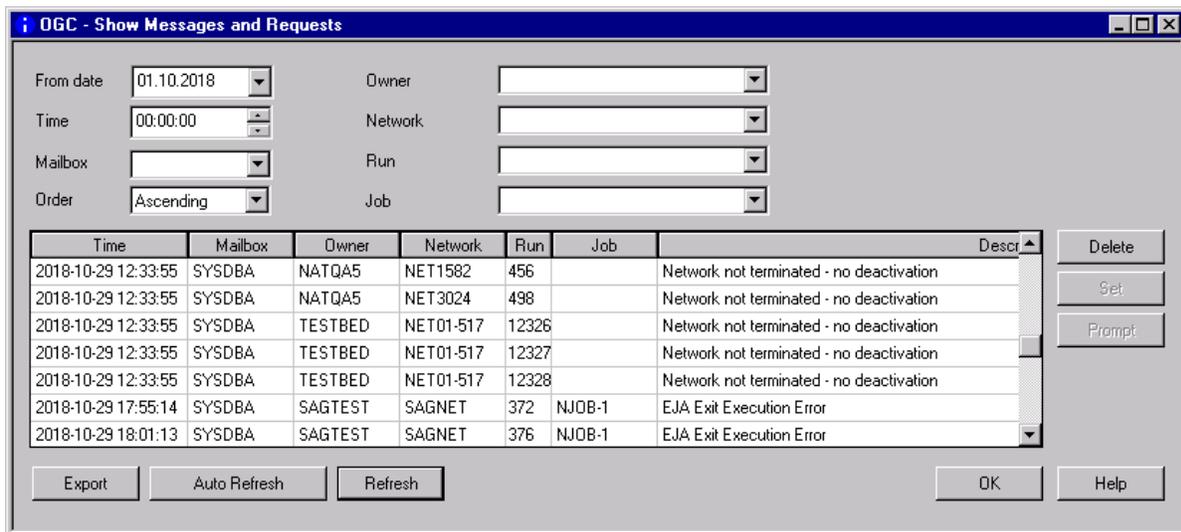

- In the object workspace, select a **Mailbox Definition** instance and choose **Show Messages** from the context menu.

Or:

In the object workspace, select the **General** metanode and choose **Show Messages** from the context menu.

Alternatively, you can use the direct command `MAIL` as described in the *Direct Commands* documentation.

A **Show Messages and Requests** window similar to the example below opens:

The table view is filled dynamically with data if scrolled to the end of the table.

All messages and requests of all mailboxes to which the current Entire Operations user (**Owner at Logon**) is linked are listed in the table depending on where you executed the **Show Messages** function.

You choose **Export** to export the current mailbox settings. For details, see *Exporting Current Settings* in the *Import/Export Functions* documentation.

You can choose **Auto Refresh** and **Refresh** to refresh the message list. For details, see [Refreshing Object Lists](#).

The window columns and input fields provided to change the display and filter the messages are described in [Fields and Columns: Messages and Requests](#).

The messages and requests listed in the window and the functions you can perform on them are described in [Handling Mailbox Messages and Requests](#).

This section covers the following topics:

- [Fields and Columns: Messages and Requests](#)

Fields and Columns: Messages and Requests

The fields and columns provided in the **Show Messages and Requests** window are described in the following table:

Note: Preselection settings of the **Show Messages and Requests** window can be saved within a session. For this purpose, check the **Save mailbox message list settings within a session** option in the user profile: see the **GUI General** page of the **Maintenance User** window described in *Defining GUI-Specific Attributes* in the *Administration* documentation.

| Column/Field | Description | |
|-----------------------|---|---|
| From Date/Time | Input fields: Specify the start date and time for displaying the messages. | |
| | Date and time when the message was sent. | |
| Mailbox | Mailbox to which the message was sent. | |
| | Drop-down list box: Select the mailbox for which to list the messages. If there is no specification, all messages of all mailboxes from the user are displayed. | |
| Order | Sort order of the message list. | |
| | Select either option from the drop-down list box: | |
| | Ascending | Ascending order. Earliest messages come first. |
| | Descending | Descending order. Latest messages come first. |
| Owner | Name of the owner. | |
| | Drop-down list box: Select the owner whose messages you want to list. | |
| Network | Name of the network. | |
| | Drop-down list box: Select the network for which to list the messages. | |
| Run | Number of the run. | |
| | Drop-down list box: Select the run number for which to show the messages. | |
| Job | Name of the job. | |
| | Drop-down list box: Select the run number for which to show the messages. | |
| Description | Message text. | |
| | For possible messages, see the message types described in <i>Handling Mailbox Messages and Requests</i> . | |

Handling Messages and Requests

You can perform message-specific actions on the messages and requests listed in the [Show Messages and Requests window](#), such as symbol prompting, setting a condition or removing a message.

The action (delete, set or prompt operations) you can perform on a selected message depends on the type of message you select from the message list and the permissions you are granted in your Entire Operations user profile. The types of messages that can be shown are listed in the following table. The numbers in the example messages denote the job run numbers.

Messages on which actions are performed are removed for all users linked to the respective mailbox.

➤ To perform an action on a message or request

- In the [Show Messages and Requests window](#), select the required message from the list and choose **Delete**, **Set** or **Prompt**, whichever is available for the type of message selected (otherwise, the functions are dimmed).

| Message Type | Possible Action | Example Message |
|--|--|---|
| <p>System Information</p> <p>This is internal processing information and error messages and global messages defined for events (see <i>Global Messages for Events</i> in the <i>Administration</i> documentation).</p> | <p>Delete</p> <p>You can remove a message of this type from the list.</p> <p>A dialog prompts you to confirm the deletion.</p> | <p>NETWORK DEMO-NET ACTIVATED ==> SAG / DEMO-NET / 195 / MESSAGE</p> <p>EJA Exit Execution Error ==> SAGTEST / SAGNET / 564 / JOB-1</p> |
| <p>User Notification</p> <p>This is a notification defined as an action for and End-of-Job event (see Defining Notification Messages).</p> | | <p>Remove job next month - no longer required ==> SAGTEST / SAGNET / 577 / NJOB-1</p> |
| <p>Confirmation Request</p> <p>Only available for jobs requesting a condition.</p> <p>A message of this type means that a scheduled network or job is waiting for a condition to be set.</p> | <p>Set</p> <p>You are prompted to set the selected condition to true. Choose YES (true) to confirm or NO (false) to reject the condition.</p> | <p>NETWORK-START-OK - 549 - RUN not found</p> <p>MAIL-ADMIN - 7 - RUN not found ==> SAG / SAGNET / 7 / DATA-PROCESSING-OK</p> |
| <p>Symbol Prompting</p> <p>Only available for networks or jobs requesting symbol prompting.</p> | <p>Prompt</p> <p>Proceed as described in Performing Symbol Prompting.</p> | <p>Symbol Prompting E60-FLOW Run 530 (OVER START TIME)</p> |

| Message Type | Possible Action | Example Message |
|--|-----------------|-----------------|
| <p>A message of this type means that a scheduled network or job is waiting for symbols to be entered or modified.</p> <p>See also Symbol Prompting during Network or Job Activation.</p> | | |

- [Performing Symbol Prompting](#)

Performing Symbol Prompting

 **Note:** Symbol prompting via mailbox is only used for automatic jobs started by schedule and cannot be used for jobs started interactively. Definition of the recipient mailbox for symbol prompting messages is described in [Specifying Recipients for Network Messages](#) in the section [Network Maintenance](#).

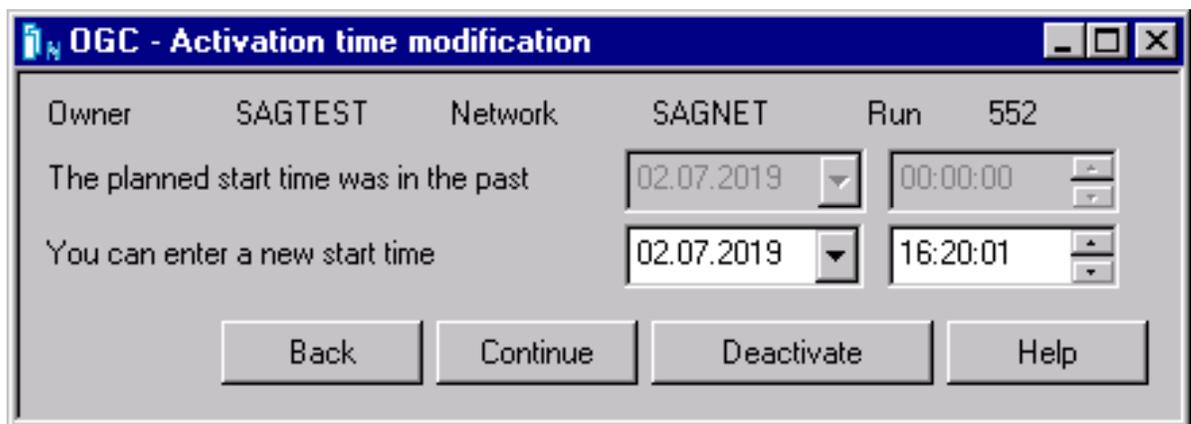

➤ To perform symbol prompting

- 1 From the [Show Messages and Requests window](#), select a message requesting symbol prompting.

A [Symbol Prompting window](#) opens where you can view, add, modify or deactivate the symbol(s) defined for the network indicated in the message.

Proceed as described in [Symbol Prompting during Network or Job Activation](#) in the section [Symbol Table and Symbol Maintenance](#).

- 2 A message requesting symbol prompting usually displays the time until the next network start (in hours). However, if the network has exceeded its start time, the message says OVER START TIME.

- 3 Enter a new start time and choose **Continue**

Any symbol changes are changed and the window closes.

The new start time is entered as the earliest start time in all active network jobs.

Back closes the **Symbol Prompting** window without any deactivate or activate action.

Or:

Choose **Back** to close the window without any deactivate or activate action.

Or:

Choose **Deactivate** to cancel the active run of the specified network.

A dialog prompts you to confirm the deactivation.

XV

Log Information

48

Log Information

- [Displaying Logged Information - Browse Log Function](#) 616
- [Monitoring Entire Operations Activities](#) 621

Entire Operations logs all important system events. You can view logs specific to an owner, network or job and specify selection criteria for the log report to be produced.

You can also use the monitoring function to observe all activities currently running in your Entire Operations environment.

The default system log displays information about activities in the system as a whole such as user actions, date and time of events and messages about events. If more information is available for any item on the system log, it is preceded by an asterisk (*). Log information at the job level can be any of the following:

- **JCL log**
Displays the JCL of a specific job run;
- **SYSOUT log**
Displays the SYSOUT of a specific job run;
- **System message log**
Displays all operating system messages about jobs. The system log displays the first of these messages. You can select a job from the system log to display all system messages for that job.

A selection window asks you to select the default log according to owner, network, job and run number.

Related Topic:

- [Defining Job-Specific Log Information](#) in the section *Job Maintenance*

Displaying Logged Information - Browse Log Function

➤ **To display log information**

- 1 For a single node item:

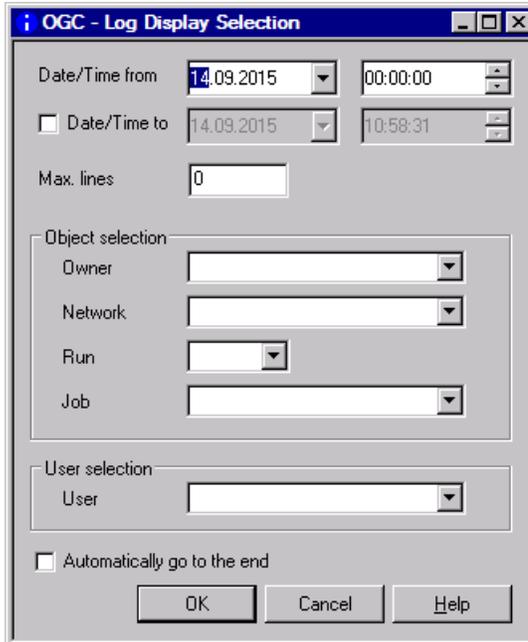

From the object workspace, select the object whose log you want to see and choose **Browse Log** (if applicable) from the context menu.

Or:

For a selected owner and network:

From the object workspace, select the **General** node and choose **Browse Log**.

A **Log Display Selection** window similar to the example below opens:

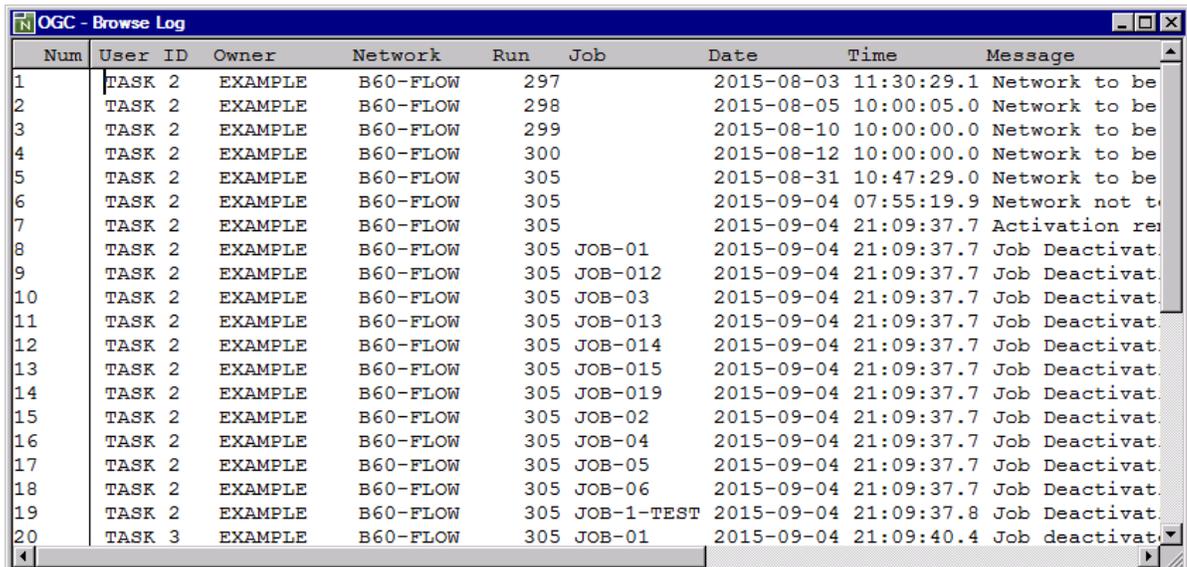

The dialog box 'OGC - Log Display Selection' contains the following fields and controls:

- Date/Time from: 14.09.2015, 00:00:00
- Date/Time to: 14.09.2015, 10:58:31
- Max. lines: 0
- Object selection:
 - Owner: [dropdown]
 - Network: [dropdown]
 - Run: [dropdown]
 - Job: [dropdown]
- User selection:
 - User: [dropdown]
- Automatically go to the end:
- Buttons: OK, Cancel, Help

- Specify the required selection criteria. The input fields are explained in [Fields: Log Display Selection](#).
- Choose **OK**.

The logging information is shown in a **Browse Log** window similar to the example below:

| Num | User ID | Owner | Network | Run | Job | Date | Time | Message |
|-----|---------|---------|----------|-----|------------|------------|------------|---------------|
| 1 | TASK 2 | EXAMPLE | B60-FLOW | 297 | | 2015-08-03 | 11:30:29.1 | Network to be |
| 2 | TASK 2 | EXAMPLE | B60-FLOW | 298 | | 2015-08-05 | 10:00:05.0 | Network to be |
| 3 | TASK 2 | EXAMPLE | B60-FLOW | 299 | | 2015-08-10 | 10:00:00.0 | Network to be |
| 4 | TASK 2 | EXAMPLE | B60-FLOW | 300 | | 2015-08-12 | 10:00:00.0 | Network to be |

| 20 | TASK 3 | EXAMPLE | B60-FLOW | 305 | JOB-01 | 2015-09-04 | 21:09:40.4 | Job deactivat |

For explanations of the columns, see [Columns: Browse Log](#). The functions of the context menu are described in [Available Functions: Browse Log](#).

- Fields: Log Display Selection

- [Columns: Browse Log](#)
- [Available Functions: Browse Log](#)
- [Extended Log](#)

Fields: Log Display Selection

The **Log Display Selection window** provides the following input fields:

| Field/Option | Description |
|-----------------------|--|
| Date/Time from | Start date and time for the log display. Default: Current date and 00:00:00 for time in the format HH:II:SS. |
| Date/Time to | End date and time for the log display. Default: Current date and time in the format HH:II:SS. |
| Max. Lines | Maximum number of lines to display in the log. 0 means: no limit (default). This setting can also be specified as a default value in the user profile: see the section <i>User Maintenance</i> in the <i>Administration</i> documentation. |
| Owner | Name of the owner whose log is to be displayed. Select an owner from the drop-down list box or leave the field blank to display the log for all owners. |
| Network | Name of the network whose log is to be displayed. Select a network from the drop-down list box or leave the field blank to display the log for all networks. |
| Run | Run number or a range of numbers to be displayed in the log. Can be used only if an owner and a network are specified. Select a run number from the drop-down list box or leave the field blank to display the log for all run numbers. Default: 1-9999 (all). |
| Job | Job whose log is to be displayed. Select a job from the drop-down list box or leave the field blank to display the log for all jobs. |
| User | User ID or Monitor task name (or ranges) for which the log is to be displayed. Enter (or select) a user ID or Monitor task name (for example, TASK 1) or use asterisk (*) to specify a range (for example, TASK*). To display the log for all users and tasks, either leave the field blank (default) or enter an asterisk only (*). |

| Field/Option | Description |
|--------------------------------|--|
| Automatically go to end | <p>If this option is selected, scrolls down to the end of the log report to see the most recent log entries.</p> <p>This setting can also be specified as a default value in the user profile: see the section <i>User Maintenance</i> in the <i>Administration</i> documentation.</p> |

Columns: Browse Log

The **Browse Log window** contains the following columns:

| Column | Description |
|----------------|--|
| Num | Log line number. |
| User ID | <p>User ID or Monitor task name.</p> <p>An ID or name preceded by an asterisk (*) indicates that extended log information is available for the job listed in this log line.</p> <p>For more information, see <i>Extended Log</i>.</p> |
| Owner | Owner name in Entire Operations. |
| Job | Entire Operations job name. |
| Network | Name of the job network. |
| Run | Job run number. |
| Date | Date of log entry. |
| Time | Time of log entry. |
| Message | <p>Message text.</p> <p>Depending on the default display option set (see <i>List Display Options</i> in the <i>Administration</i> documentation), the message text is prefixed with a message code (if one exists), for example: EOR2260 - Network activation performed.</p> |

Available Functions: Browse Log

The context menu of the **Browse Log window** provides the following functions:

| Function | Shortcut | Description |
|----------------------|----------|---|
| Copy | CTRL+C | Copies the currently selected text. In case some text from the selection is not received from a server, a warning is shown and the Copy function is not performed. |
| Select All | CTRL+A | Selects all text. |
| Reverse Order | CTRL+R | Shows text in the reverse order. |
| Find | CTRL+F | Finds the text fragment. |
| Find next | F3 | Finds the next text fragment. |

| Function | Shortcut | Description |
|-----------------------------|----------|---|
| Go To | CTRL+G | Moves the cursor to the specified line number. |
| Print | CTRL+P | Prints log data. |
| Refresh | F5 | Refreshes the log with "time to"=actual time |
| Refresh with new start time | F4 | Refreshes the log with "time from"=time from the selected row "time to"=actual time |
| Extended Log | CTRL+E | Displays job-specific extended log information if available for the log item. Extended log information is marked with an asterisk (*) in the User ID column. |

Extended Log

Job-specific extended logs are available if specified in the job master definition: see [Specifying Extended Log Information](#) in the section *Job Maintenance*.

An asterisk (*) in the **User ID** column of a log item indicates that an extended log is available for the job listed in this log line.

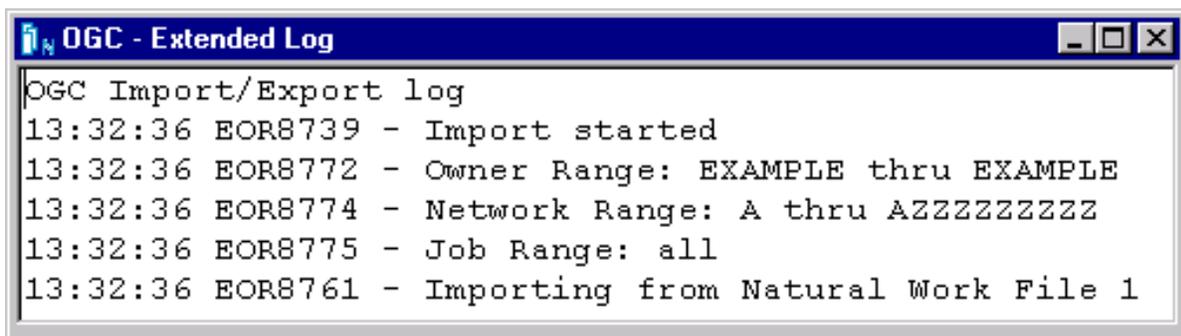

➤ To display an extended log

- In the **User ID** column of the **Browse Log window**, place the cursor in an item that begins with an asterisk (*) and choose **Extended Log** from the context menu, or press CTRL+E.

Or:

From an **Import/Export** window, choose **Display**.

An **Extended Log** window similar to the example below opens:

The example contains logs about an import or export operation.

Types of Extended Logs

The following types of extended logs are available:

■ JCL Log

If you [specified JCL logging](#) in the job master definition, the JCL of the job run selected from the **Browse Log** window is displayed in the editor (browse mode). The JCL log source is dependent upon the operating system, in which the job has run.

■ SYSOUT Log

If you specified the job [SYSOUT to be logged](#) after job termination in the job master definition, the SYSOUT of the job run selected from the **Browse Log** window is displayed in the editor (browse mode).

■ Operating System Messages

If you specified operating system [messages to be logged](#) according to the criteria defined in the job master definition, the messages of the job run selected from the **Browse Log** window are displayed in the editor (browse mode).

■ Active/Pregenerated JCL Modifications

If you specified to log the changes made to an active/pregenerated JCL by setting the corresponding option in the *Defaults: System/Log Files (Administration documentation)*, JCL changes are visible in detail for the job selected from **Browse Log** window.

■ Import/Export Log

You can choose **Display** from an **Import/Export** window to view an [extended log](#) file containing information on an import or export operation.

Monitoring Entire Operations Activities

Activity monitoring is used to permanently display Entire Operations events that currently occur in your Entire Operations environment.

The following applies to the monitoring feature:

- The activity monitoring facility receives its data from the Entire Operations log file.
- The activity monitoring facility only displays the most important messages. Error messages and other very important messages appear highlighted.
- The default setting displays events starting from the current time.
 - [Viewing Entire Operations Activities](#)

- [Columns: Activity Log](#)

Viewing Entire Operations Activities

➤ To start monitoring and display activities

- 1 In the object workspace, select the **General** metanode.
- 2 Open the context menu and choose **Activity Log**.

An **Activity Log** window similar to the example below opens:

| Owner | Network | Job | Run | Job ID | Time | Message |
|---------|----------|------------|-----|--------|----------|---------------------------------------|
| EXAMPLE | B60-FLOW | JOB-013 | 380 | | 18:28:29 | Activation in Progress - Job type JOB |
| EXAMPLE | B60-FLOW | JOB-014 | 380 | | 18:28:29 | Activation in Progress - Job type JOB |
| EXAMPLE | B60-FLOW | JOB-015 | 380 | | 18:28:29 | Activation in Progress - Job type DUM |
| EXAMPLE | B60-FLOW | JOB-019 | 380 | | 18:28:29 | Activation in Progress - Job type JOB |
| EXAMPLE | B60-FLOW | JOB-02 | 380 | | 18:28:29 | Activation in Progress - Job type JOB |
| EXAMPLE | B60-FLOW | JOB-03 | 380 | | 18:28:29 | Activation in Progress - Job type NAT |
| EXAMPLE | B60-FLOW | JOB-04 | 380 | | 18:28:29 | Activation in Progress - Job type JOB |
| EXAMPLE | B60-FLOW | JOB-05 | 380 | | 18:28:29 | Activation in Progress - Job type DUM |
| EXAMPLE | B60-FLOW | JOB-06 | 380 | | 18:28:29 | Activation in Progress - Job type JOB |
| EXAMPLE | B60-FLOW | JOB-1-TEST | 380 | | 18:28:29 | Activation in Progress - Job type JOB |
| EXAMPLE | B60-FLOW | JOB-03 | 380 | | 18:28:32 | NAT Module SYSEORU/B60-P01 not found |
| EXAMPLE | B60-FLOW | JOB-03 | 380 | | 18:28:32 | JCL Load Error occurred |

All current activities within Entire Operations are logged and displayed in this window. Error messages are highlighted in red.

The columns contained on the screen are described in [Columns: Activity Log](#).

- 3 You can use the **Auto Refresh** and **Refresh** options to update the display and modify the update interval. See also [Refreshing Object Lists](#).

You can use the **Auto scrolling** option to automatically scroll to the latest activity.

Columns: Activity Log

The columns in the **Activity Log window** are described in the following table:

| Column | Meaning |
|----------------|--|
| Owner | Owner of the active network. |
| Network | Name of the active network. |
| Job | Name of the active job. |
| Run | Run number as assigned to the active network by Entire Operations. |
| Job ID | Job identifier as assigned by the operating system or by the job entry subsystem. |
| Time | Last action or check time for the job. |
| Message | Last message issued for the job by Entire Operations. For a list of possible messages, see <i>Messages in Active Jobs Lists</i> in the <i>Messages and Codes</i> documentation. |

Symbol Tables

A symbol table is used to maintain common parameter definitions that apply to all jobs of a network. A symbol table contains a list of defined symbols with values that can be used for parameter substitution during JCL generation.

You can substitute symbols when activating a job network or a job, that is, when the active JCL is loaded to the active database. You can also substitute symbols when submitting a job.

Each network activation initiates its own active copy (**active symbol table**) of the linked symbol table(s). This allows you to schedule networks with different parameter sets, even a long time in advance. Any occurrence of a symbol name in the JCL or in a script is replaced by its current value.

You can maintain symbol tables by using either Entire Operations maintenance functions or user-written programs, user exits and application programming interfaces (APIs) supplied by Entire Operations. This allows modification of symbol tables and symbol values during job network processing.

Symbol tables are associated with owners. Each owner can have several symbol tables. You can only maintain the symbol tables that belong to your owner.

The symbol table to be referenced by a job and/or network must be specified in the job or network master definition or in the active queue for a single job run. Exceptions are **global symbol tables**.

This section covers the following topics:

- [Global Symbol Tables](#)
- [Active Symbol Tables](#)
- [Reserved Symbol Table Name](#)
- [Symbol Table Versions and Version Usage](#)

Global Symbol Tables

A master symbol table defined by the owner SYSDBA is considered a global symbol table because it can be referenced by multiple jobs and networks without explicit specifications in the job and network definitions. A global symbol table with the name A is supplied for the owner SYSDBA by default. It can be accessed and referenced by all owners.

All other owners can also define a global symbol table with the name A for their networks. Their global symbol table A then takes priority over the global symbol table A defined by SYSDBA. See also [Symbol Table Types and Symbol Search Order](#).

Active Symbol Tables

During job or network activation, an active copy of each symbol table used by a job or network is created by copying it to the active database. This is then called the active symbol table. Symbols to be replaced are taken from the active symbol table. This enables different values of the same symbols to be generated for different runs of the network or job.

To identify an active symbol table uniquely, both the network name and run number are required. For instructions on viewing active symbol tables, see [Displaying and Modifying a Master or Active Symbol Table](#).

For scheduled network activation, you can select the time to activate the symbol table in the network definition. This can be either of the following:

- Directly after the schedule extraction; this allows enough time for manual symbol replacement.
- During the network activation. In this case, however, manual symbol replacement is not possible.

Active symbols are maintained analogously to master symbols. Therefore, only the maintenance of master symbol tables and symbols is described in the section [Adding and Maintaining Symbol Tables](#).

Note: All modifications of active symbols apply to the current run only.

Reserved Symbol Table Name

The symbol table name with the prefix =EOR= is reserved for internal control purposes. This prefix must not be used for any user-defined table names.

Symbol Table Versions and Version Usage

You can maintain several versions of a master symbol table as described in [Versioning of Symbol Tables](#). Exceptions are **global symbol tables** for which versioning is not allowed.

If you have several symbol table versions, you can define a validity period for each version. See the section [Maintaining the Usage of Symbol Table Versions](#).

Symbols

A symbol is a variable definition that contains the format, prompting type, prompting text (optional) and the value(s) of the symbol.

Symbols can be defined by using Entire Operations maintenance functions, or they can be set and modified by any program, which invokes the Entire Operations symbol API [NOPUSY7N](#) (see the section *API Routines*) to set, reset, or modify a symbol.

For detailed information on defining symbols in JCL (including text objects) or Natural macro sources, see *Editing Master JCL and Natural Sources* and *Inserting Text Objects into the JCL* in the section *Job Maintenance*.

This section covers the following topics:

- [Global Symbols](#)
- [Predefined Symbols](#)
- [Symbols for Replacement](#)
- [Symbol Prompting](#)

Global Symbols

A master symbol contained in a global symbol table is considered a global symbol because it can be used by multiple jobs and networks without extra definitions for each job and/or network that references the symbol. See also [Global Symbol Tables](#).

Predefined Symbols

Predefined symbols provided by Entire Operations are described in the section [Predefined Symbols](#).

Symbols for Replacement

Symbols are usually replaced during the activation of a job network or job, that is, during the loading of the active JCL to the active database. In certain cases, symbol replacement can even be used in file names, messages texts, etc.

A symbol to be replaced is identified by an [escape character](#) defined in the Entire Operations default and network settings, or used as a prefix in JCL and Natural macro sources. You specify the symbols in JCL or macro sources as described in [Defining Escape Characters](#).

If a symbol is not found in the symbol table specified for a job or network, the symbol is searched for in the [global symbol table\(s\)](#). The first match is used to replace the symbol. A symbol is not replaced if it cannot be found in any table; an appropriate error message is then issued instead. See also [Symbol Table Types and Symbol Search Order](#).

For further information, see the separate chapter *Symbol Replacement*.

Symbol Prompting

You can define whether a symbol is prompted for symbol modification during or before job network activation.

- During a manual network or job activation, the prompting is performed immediately. See the section *Symbol Prompting during Network or Job Activation*.
- For scheduled (automatic) activations, prompting requests are sent to a mailbox linked to the network. The network activation does not continue until the prompting is performed by a user. See also *Specifying Recipients for Network Messages* in the section *Network Maintenance*.

Subnetworks and Recovery Jobs

Subnetworks and recovery jobs defined for a network require **predefined symbols** in order to pass information to the jobs of the network. These predefined symbols have names that begin with P-C-. For detailed information, see *Predefined Symbols for Subnetworks and Recovery Jobs*.

User Exits for User-Specific Symbol Maintenance Tasks

You can use user exit routines that perform user-specific symbol maintenance tasks and symbol replacement functions. For detailed information, refer to the following sections:

User Exits:

- *User Exits for Validation Checks of Symbol Values*
- *User Exits for Symbol Functions*

Global User Exits in the Administration documentation:

- *Global Symbol Modification Exit*
- *Global Symbol Not Found Exit*

Adding and Maintaining Symbol Tables

| | |
|--|-----|
| ▪ Available Functions: Symbol Table Master | 634 |
| ▪ Listing Symbol Table Masters | 635 |
| ▪ Versioning of Symbol Tables | 636 |
| ▪ Displaying a Symbol Table Master | 640 |
| ▪ Adding a Symbol Table Master | 641 |
| ▪ Modifying a Symbol Table Master | 644 |
| ▪ Maintaining the Usage of Symbol Table Versions | 646 |
| ▪ Saving Symbol Tables as Files | 649 |
| ▪ Using Active Symbol Tables | 650 |
| ▪ Deleting a Symbol Table Master | 653 |

Available Functions: Symbol Table Master

➤ To list all functions available for a Symbol Table Master node

- In the object workspace, select the **Symbol Table Master** metanode from an **Owner** instance and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| List | F8 | See <i>Listing Objects</i> . |
| New | CTRL+N | See <i>Adding a Symbol Table Master</i> . |
| Refresh | F5 | See <i>Refreshing Object Lists</i> . |
| Filter | F3 | See <i>Filtering Objects</i> . |
| Paste data | CTRL+V | See <i>Pasting Objects</i> . |
| Export | --- | See <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Set Drag And Drop Function | --- | See <i>Drag & Drop</i> . |

➤ To list all functions available for a symbol table master

- From the **Symbol Table Master** node, select an instance and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| Open | CTRL+O | See <i>Modifying a Symbol Table Master</i> . |
| Display | CTRL+D | See <i>Displaying a Symbol Table Master</i> . |
| Where used | --- | See <i>Listing Jobs and Networks that Use a Symbol Table Master</i> . |
| Delete | DELETE | See <i>Deleting a Symbol Table Master</i> . |
| Copy data | CTRL+C | See <i>Copying Objects</i> . |
| Version Usage | --- | See <i>Maintaining the Usage of Symbol Table Versions</i> . |
| Export | --- | See <i>Exporting Objects</i> in the <i>Import/Export Functions</i> documentation. |
| Add to Workplan | --- | See <i>Add to Workplan</i> . |
| Save as File | --- | See <i>Saving Symbol Tables as Files</i> . |
| Set Drag And Drop Function | --- | See <i>Drag & Drop</i> . |

Listing Symbol Table Masters

> To list all master symbol tables of an owner

- In the object workspace, select the **Symbol Table Master** node of an owner and choose **List** from the context menu, or press F8.

A **Symbol Table Master List** window similar to the example below opens:

The screenshot shows a window titled "OGC - Symbol Table Master List EXAMPLE". The window contains a table with the following data:

| Symbol Table | |
|-----------------|--|
| DEMO <v1> | |
| DEMO <v2> | |
| E20-ST | |
| E20-ST-VSE | |
| E40-ST | |
| E64-MPA | |
| E80-REPST1 | |
| E80-REPST2 | |
| E80-REPST3 | |
| EXAM-ST1 | |
| EXA-SYMBOL | |
| EX-ST-COMN | |
| EX-VSE-1 | |
| HEB-SYM | |
| MUT | |
| MUTMAIL | |
| SYMBOLT1 | |
| SYSMTAB-P | |
| SYTAB_M <vers1> | |
| SYTAB_M <vers2> | |
| UR-DEMO | |
| Z20-ST <v1> | |
| Z40-ST <v1> | |
| Z40-ST <v2> | |
| Z80-SYM1 | |

This window lists master symbol tables already defined to Entire Operations. You see only the symbol tables that belong to your owner (here: EXAMPLE). If no master symbol tables have been defined for your owner, the list is empty.

The functions available from the context menu are explained in [Available Functions: Symbol Table Master List](#).

This section covers the following:

- [Available Functions: Symbol Table Master List](#)

Available Functions: Symbol Table Master List

When you select a symbol table from the **Symbol Table Master List** window, you can open a context menu and perform the following functions:

| Function | Shortcut | Description |
|------------------------|----------|--|
| Open | CTRL+O | See Modifying a Symbol Table Master . |
| Display | CTRL+D | See Displaying a Symbol Table Master . |
| New | CTRL+N | See Adding a Symbol Table Master . |
| Refresh | F5 | See Refreshing Object Lists . |
| Where used | --- | See Listing Jobs and Networks that Use a Symbol Table Master . |
| Delete | DELETE | See Deleting a Symbol Table Master . |
| Copy data | CTRL+C | See Copying Objects - Copy Data Function . |
| Paste data | CTRL+V | See Pasting Objects . |
| Version Usage | --- | See Maintaining the Usage of Symbol Table Versions . |
| Export | --- | See Exporting Objects in the <i>Import/Export Functions</i> documentation. |
| Add to Workplan | --- | See Add to Workplan . |
| Save as File | --- | See Saving Symbol Tables as Files . |

Versioning of Symbol Tables

This section describes how to maintain and use different versions of symbol tables.

- [Version Names](#)
- [Version Names Exit](#)
- [Reserved Version Names for Symbol Tables](#)
- [Creating Symbol Table Versions by Copying Symbol Tables](#)
- [Copying Single Symbols](#)
- [Deleting Symbol Table Versions](#)
- [Deleting Symbol Table Versions or single Symbols via API](#)
- [Using Symbol Table Versions for Schedule Activation](#)
- [Definition of Symbol Table Versions](#)
- [Active Symbol Tables](#)
- [Symbol Prompting](#)
- [Search Order for Symbols](#)
- [Symbol Tables at System and Owner Level](#)
- [Logging](#)
- [Cross-References \(XREF\)](#)

- Reporting
- Import/Export
- Exit Functionality (Symbol Table)
- Maximum Number of Versions per Symbol Table

Version Names

The following applies when creating version names:

- The name can contain up to 10 alphanumeric characters and uppercase or lowercase letters.
- Space characters and the following special characters are not allowed:
?<>*,()_
- In general, do not use special characters and umlauts to avoid problems when porting an Entire Operations environment to another platform.
- Do not use a reserved version name (see the following section).

Version Names Exit

With the usage of a global version names exit you can force a user-specific version name syntax. For detailed information, see *Global Exit for Version Names* in the *Administration* documentation.

Reserved Version Names for Symbol Tables

blank value; in selections and in the log also: (unnamed)

Is used for an unnamed version.

This is the only network version that exists after migration from an earlier Entire Operations version that does not support network versioning.

In parameter listings (e.g., for reporting) you can use also a hyphen (-).

(current)

Will be replaced by the version that is set in the activated time schedule. (current) can be used in version references.

(nv)

Will be replaced by the network version of the active network. If only an unnamed network version exists, then this symbol table will be referred to this.

If a symbol table version with the same name is not existent in the network version, then an error message will be sent and the request aborted.

(svn)

The symbol table version will be replaced thru the active network. (svn) can be used in referenced versions of a slaved network.

Example of use:

- Job definition

(svj)

The symbol table version will be replaced thru the active job. (svj) can be used in referenced versions of a slaved job.

Examples of use:

- Requested prerequisite dependent on the symbol value,
- Requested prerequisite dependent on multiple-value symbols,
- End-of-Job action: set symbol.

Creating Symbol Table Versions by Copying Symbol Tables

You can copy symbol tables to add a new version for an existing symbol table. This is a common way to build new symbol table versions.

Copying Single Symbols

Symbols in any version can copied out of the originating symbol table.

Deleting Symbol Table Versions

- If multiple versions of a symbol table exist, then one must select one to be deleted.
- A symbol table version cannot be deleted if listed in an activated time schedule as a standard version. A defined date in the past is not relevant.

Deleting Symbol Table Versions or single Symbols via API

By using the API [NOPUSY7N](#) you can delete single symbol table versions and symbols.

Using Symbol Table Versions for Schedule Activation

To maintain version usage in symbol table administration, use the functions described in [Maintaining the Usage of Symbol Table Versions](#).

Definition of Symbol Table Versions

Symbol table versions can be defined in the following:

- Network versions definition,
- Job definition.

Active Symbol Tables

- The activation of symbol tables is a component of network and job activations.
- A symbol table can only be activated in a clearly identified version. The identification of the requested symbol table version is part of the activation process.
- Active symbol tables lose their version nomenclature (`current`) or (`nv`). They are detached during activation.
- Active symbol tables can only have the version nomenclature (`none`) or a defined version name.
- If a requested symbol table version is missing, or the version cannot be defined, then the activation process will be aborted with an error message.

Symbol Prompting

Before symbol prompting (during manual activation and before executing the symbol prompting exit in the Monitor), the symbol table versions to be used will be clearly determined. See also [Symbol Prompting during Network or Job Activation](#).

If at least one symbol table version cannot be identified, the activation process will be aborted with an error message.

Search Order for Symbols

The order in which symbols are searched for in the symbol tables defined in your environment depends on the hierarchy levels at which the symbol tables defined in your environment can be accessed: see [Symbol Table Types and Symbol Search Order](#).

Symbol Tables at System and Owner Level

Global symbol tables are not version-controlled.

The symbol tables are:

```
SYSDBA / A  
owner / A
```

Logging

Logging of symbol actions include the version of the table where the symbol was loaded from.

The generated comments in the Entire Operations JCL header contain the symbol table version of all used symbols.

Cross-References (XREF)

Symbol table versions will be considered.

Reporting

Symbol table versions will be considered.

Import/Export

Symbol table versions will be considered.

Exit Functionality (Symbol Table)

Entire Operations provides user exits and APIs that are related to symbols and support network versioning, for example, API [NOPUSY7N](#).

Maximum Number of Versions per Symbol Table

The maximum number of symbol table versions can be limited system wide as described in *Defaults for Network Options* in the *Administration* documentation.

Displaying a Symbol Table Master

➤ To display a symbol table master

- 1 In the object workspace, select a **Symbol Table Master** instance.
- 2 Choose **Display** from the context menu, or press CTRL+D.

A **Display Symbol Table Master** window similar to the [Maintenance Symbol Table Master](#) window opens.

The window contains a table with a list of all symbols defined for the symbol table master.

The fields and table columns contained in the window are explained in *Fields and Columns: Symbol Table Master*.

- 3 If you want to view additional information on a listed symbol, select the required symbol from the table and choose **Display**.

A **Display Symbol Master** window similar to the **Maintenance Symbol Master** window opens.

- 4 You can view all symbol definitions on the tabbed pages of the window. The fields on the pages are described in *Fields: Master and Active Symbols*.

Adding a Symbol Table Master

You can add a symbol table master by either copying an existing table (see the **Copy data/Paste data** functions of a symbol table instance/master node) or creating a new symbol table with the **New** function. This requires that you define at least one symbol master along with the table.

This section provides instructions for using the **New** function.

➤ To add a symbol table master

- 1 In the object workspace, select the **Symbol Table Master** metanode.
- 2 From the context menu choose **New**, or press CTRL+N.

A **Create new Symbol Table Master** window opens.

The fields and columns contained in the window correspond to the field and columns in the **Maintenance Symbol Table Master** window. They are explained in *Fields and Columns: Symbol Table Master*.

- 3 Enter a name for the symbol table and symbol table version and choose **Add**.

A **Create new Symbol Master** window opens.

The fields and tabbed pages contained in the window correspond to the fields and tabbed pages in the **Maintenance Symbol Master** window. They are explained in *Fields: Master and Active Symbols*.

- 4 If required, enter a different symbol table name and version and make your definitions on the tabbed pages **Main**, **Multiple Symbol Values** and **Value Check**.
- 5 Choose **OK** when you are finished.

The symbol table master is created and now ready to use in the active network.

This section covers the following topics:

■ [Fields: Master and Active Symbols](#)

Fields: Master and Active Symbols

The fields on the tabbed pages **Main**, **Multiple Symbol Values** and **Value Check** (symbol masters only) of a **Symbol Master** or **Symbol Active** window are explained in the following table.

The fields are either write-protected or available for input depending on whether you view or modify the symbols. The table indicates when a field does not apply to active symbols.

| Main Page: | | |
|---------------|--|--|
| Symbol | Name of the symbol. | |
| Format | Format of the symbol (variable). Possible values: | |
| | A | Alphanumeric (including special characters). |
| | D | Date in the format YYYYMMDD (see also Date and Time Formats). |
| | H | Alphanumeric; hidden. <ul style="list-style-type: none"> ■ The symbol value will not be visible in the Value field. ■ In lists and logs, the symbol value will be displayed as *** hidden ***. |
| | L | Alphanumeric; lower case. |
| | N | Numeric. See Value for the numeric field format. |
| | U | Alphanumeric; upper case. |
| Value | Value of the symbol to be substituted. To enter a fixed length or an empty string, include the value in quotes. Use two apostrophes to get a quote within a string. Example: 'Fixed Length ' Note: <ol style="list-style-type: none"> 1. If a value is longer than 40 characters, continue on the second Value line. The maximum value is 120 characters. Be careful with insertions and deletions. The lines are concatenated to one symbol value. 2. The maximum length for a numeric value is N10.4 (10 digits before the decimal point and 4 digits after the decimal point). A decimal point can appear at any position. 3. A date must use the format YYYYMMDD. 4. The value of a hidden symbol (format H) can be entered, but it will be invisible. | |

| | | |
|--|---|--|
| | See also Defining Multiple Symbol Values . | |
| Prompting (list box) | Specifies whether the user is to be prompted for this symbol during manual activation of the job network. See also Symbol Prompting during Network or Job Activation . | |
| | Possible selection options: | |
| | A | Prompt for symbol during each activation. |
| | E | Prompt only if no value is specified in the table. |
| | N | Never prompt for symbol. |
| Prompting (check box) | Write back modified active symbol to the master table as well. Note: The symbol is also written back if a respective global setting is available. See also <i>Entire Operations Defaults</i> in the section <i>System Administrator Services</i> of the <i>Entire Operations Administration Documentation</i> . | |
| Prompt Text | Optional text to be displayed when symbol prompting is performed, to help the user specify the correct value. See also Symbol Prompting during Network or Job Activation . | |
| Multiple Symbol Values Page: | | |
| Values 1 to 150 | Assign multiple values to a symbol. These can be used in subsequent replacements of the same symbol. See also Defining Multiple Symbol Values . You can enter up to 150 values here. The maximum value length is 120. These values are used for subsequent substitutions. | |
| Value Check Page: | | |
| Not applicable to active symbols. Used to define a number range for numeric symbol values to be checked for valid input. See also Specifying a Range Check for Numeric Symbol Values . | | |
| None | Select this button (default) if you neither use Range check nor User exit . | |
| Range check | Select this button if you want to define and/or activate a range of numbers to be checked during input of numeric symbol values. | |
| Value from | Start number (Value from) and end number (Value from) of the range to be checked. | |
| Value to | Valid input values are positive integer numbers in the range from 1 to 9999999999 (format N10). | |
| User exit | Select this button if you want to specify and/or activate a user exit. | |
| Library | Name of the library that contains the user exit. Note: You cannot select the libraries SYSLIB and SYSLIBS. They are reserved for internal use. | |

| | |
|------------------|---|
| User Exit | <p>Name of the user exit.</p> <p>If the name entered in Library is valid, you can select a user exit from the drop-down list box.</p> <p>If the specified exit does not (yet) exist, you will be warned with an appropriate message.</p> |
|------------------|---|

Modifying a Symbol Table Master

Modifying a master symbol table or an active symbol table consists of adding, modifying or deleting symbols and their current values.

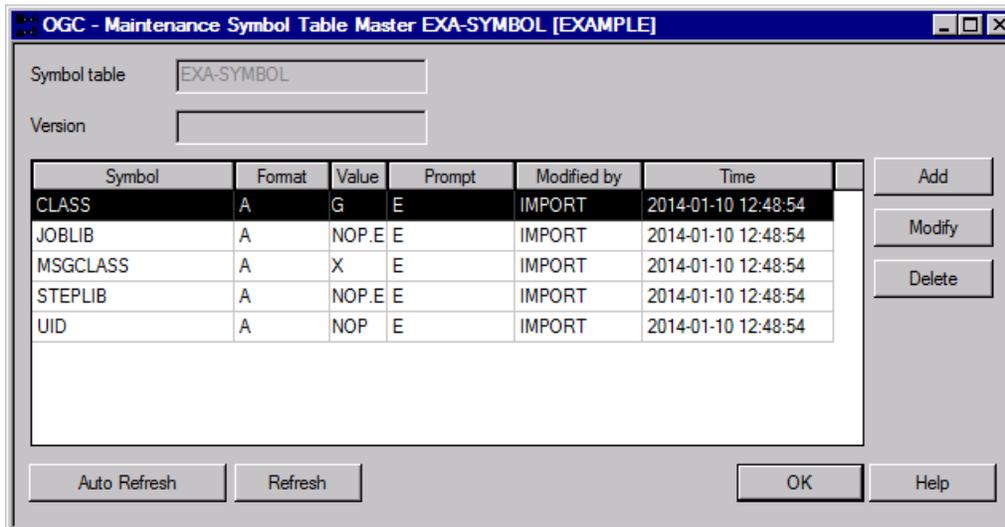

➤ To modify a symbol table master

- 1 In the object workspace, select a **Symbol Table Master** instance.
- 2 Invoke the context menu and choose the **Open** function.

Or:

Press CTRL+O.

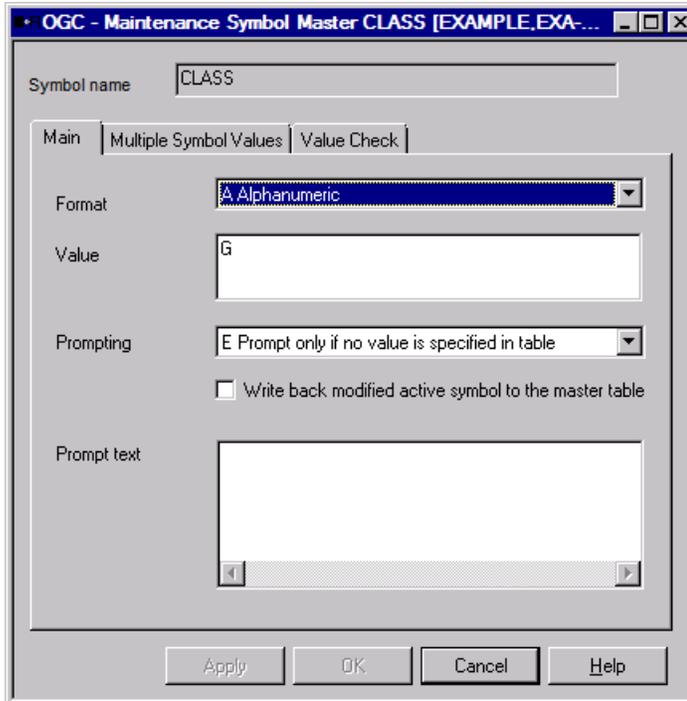

A **Maintenance Symbol Table Master** window similar to the example below opens:

You can modify a selected symbol (here: CLASS) by choosing **Modify**, add a new symbol by choosing **Add**, or delete a selected symbol by choosing **Delete**.

The fields and columns contained in the window are explained in [Fields and Columns: Symbol Table Master](#).

- 3 If you choose **Delete**, a window prompts you to delete the selected symbol.
- 4 If you choose **Modify** or **Add**, a **Maintenance Symbol Master** window similar to the example below opens:

- 5 Make the required definitions in the fields of the tabbed pages **Main**, **Multiple Symbol Values** and **Value Check**. They are explained in [Fields: Master and Active Symbols](#).
- 6 Choose **OK** when you are finished.

The symbol table master is changed and now ready to use in the active network.

This section covers the following topics:

- [Fields and Columns: Symbol Table Master](#)

Fields and Columns: Symbol Table Master

The fields and columns in the **Create new Symbol Table Master**, **Display Symbol Table Master** or **Maintenance Symbol Table Master** window are explained in the following table:

| Field/Column | Description | |
|--------------------|--|---|
| Symbol | Name of the symbol used as a variable. | |
| Format | Format of the variable. Possible values: | |
| | A | Alphanumeric (including special characters). |
| | D | Date. |
| | L | Alphanumeric; conversion to lower-case letters. |
| | N | Numeric. |
| | U | Alphanumeric; conversion to upper-case letters. |
| Prompt | Prompting. The user is prompted for this symbol during manual activation of the job network. Possible values: | |
| | A | Prompted for symbol during each activation. |
| | E | Prompted only if no value is specified in table. |
| | N | Never prompted for symbol. |
| Value | Current value of the variable, i.e., the string or number substituted in dynamically generated JCL. Possible entries: | |
| | empty column | The value of the symbol is an empty string. |
| | *** <i>n</i> multiple values *** | One or more values (<i>n</i>) are defined for the variable. Select the Multiple Symbol Values tab to view or change the values. |
| | | |
| Modified by | User who last modified the symbol. | |
| Time | Date and time when a user last modified the symbol. | |

Maintaining the Usage of Symbol Table Versions

You can determine a period (from/to date range) during which a particular symbol table version is used as the current symbol table for all scheduled job activations.

The **Version Usage** function is used to define the maintenance of date ranges, in which symbol table versions are to be used for scheduled activations.

Note: You cannot use the **Version Usage** function to add a symbol table version. You can define a symbol table version when you create or copy a symbol table master.

This section covers the following topics:

- [Listing, Defining and Deleting Version Usage](#)
- [Fields and Columns: Version Usage Definition](#)

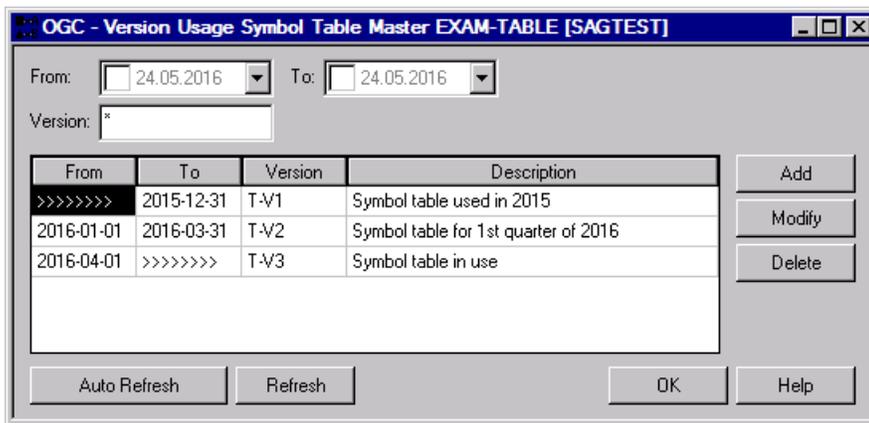

Listing, Defining and Deleting Version Usage

This section provides instructions for listing, defining and deleting version usage definitions for symbol table versions.

» **To list version usage definitions**

- 1 In the object workspace, select a symbol table master.
- 2 Open the context menu and choose **Version Usage**.

A **Version Usage Symbol Table Master** window similar to the example below opens:

The window lists the version usage defined for the selected symbol table master version (the table is empty if no definition exists).

If you enter an asterisk (*) in the **Version** field, all version usages defined for all versions of the symbol table master are listed in the window as shown in the example above. The fields and columns are explained in [Fields and Columns: Version Usage Definition](#).

The following functions are available:

| Function | Description |
|---------------|---|
| Add | See To add or modify a version usage definition . |
| Modify | Modifies the usage definition selected in the table row. See To add or modify a version usage definition . |
| Delete | Deletes the usage definition selected in the table row. A window prompts you to confirm the deletion with Yes or cancel the action with No . |

| Function | Description |
|----------------------|---|
| Auto Refresh/Refresh | See Refreshing Object Lists . |

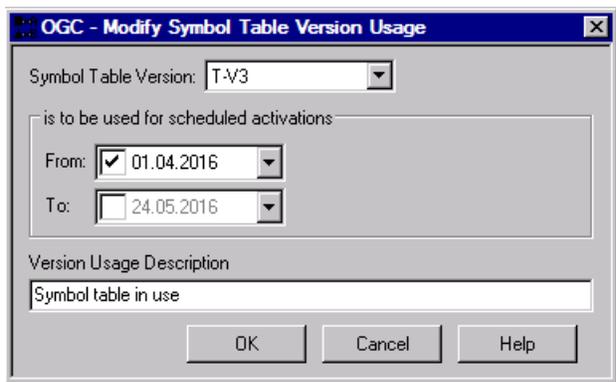

➤ To add or modify a version usage definition

- 1 In the **Version Usage Symbol Table Master window**, choose **Add** to create a new definition.

Or:

In the **Version Usage Symbol Table Master window**, select the table row that contains the definition you want to modify, and choose **Modify**.

The input fields that appear in the window are shown in the following example:

- 2 Enter the required values or select a value from the drop-down list boxes. Activate or deactivate a **From** or **To** field by selecting the check box next to it. Deactivated fields are ignored and not processed. For additional information, see [Fields and Columns: Version Usage Definition](#).
- 3 Choose **OK** when you are finished.

Fields and Columns: Version Usage Definition

| Field/Column | Description |
|--|---|
| From (column or input field) | <p>Start date of a default usage period of a network version.</p> <p>>>>>>>> denotes that no start date has been defined.</p> <p>Possible value for an input field:</p> <p>A start date or no value (check box of field not selected) for no start date.</p> <p>You can open the drop-down list box to select a date from a calendar.</p> <p>Default: start date is not defined.</p> |

| Field/Column | Description |
|--------------------------------------|---|
| | Note: Date ranges must not overlap. |
| To (column or input field) | <p>End date of a default usage period of a network version.</p> <p>>>>>>>> denotes that no end date has been defined; the usage is unlimited (infinite).</p> <p>Possible value for an input field:</p> <p>An end date or no date (check box of field not selected) for an unlimited (infinite) time.</p> <p>You can open the drop-down list box to select a date from a calendar.</p> <p>Note: Date ranges must not overlap.</p> <p>Default: end date is not defined.</p> |
| Version (column) | Symbol table version for which the usage is defined. |
| Description (column) | Description of the version usage. |
| Symbol Table Version | <p>Input field for the symbol table version to be used as the current version during the period specified in the From/To fields.</p> <p>Enter the required version or select a version from the drop-down list box.</p> |
| Version Usage Description | <p>Input field for a description of the version usage.</p> <p>Maximum input: 70 characters.</p> |

Saving Symbol Tables as Files

➤ To save a master symbol table as a file

- 1 In the object workspace, select a **Symbol Table Master** instance and choose **Save as File** from the context menu.
- 2 Specify the file format and type as described in [Report Output Options](#) and choose **OK**.

An output file similar to the example below is created:

Master Symbol Table

Owner: SAGTEST Symbol Table: EXAM-TABLE

| Symbol | MV | Symbol Value | Modified by | Time |
|------------|----|------------------|-------------|---------------------|
| CLASS | 1 | 22.2 | NATQA5 | 2016-05-12 14:18:10 |
| CLASS | 2 | 10.2 | NATQA5 | 2016-05-12 14:18:10 |
| CLASS | 3 | 7 | NATQA5 | 2016-05-12 14:18:10 |
| JOBLIB | | NOP.EXAMPLE.LOAD | IMPORT | 2014-01-10 12:48:54 |
| MSGCLASS | | X | IMPORT | 2014-01-10 12:48:54 |
| STEPLIB | | NOP.EXAMPLE.LOAD | IMPORT | 2014-01-10 12:48:54 |
| TESTSYMBOL | | *** empty *** | NATQA5 | 2016-05-04 18:51:16 |

This output displays the selected symbol table master and all related information.

› To save an active symbol table as a file

- 1 In a **Symbol Prompting** window, select **Save active symbol table as file** and choose **Continue**.
- 2 Specify the file format and type as described in *Report Output Options* and choose **OK**.

An output file similar to the example below is created:

Active Symbol Table

Owner: SAGTEST Network: SAG-PROMPT Run: 26 Symbol Table: EXAM-TABLET-V3

| Symbol | MV | Symbol Value | Modified by | Time |
|------------|----|------------------|-------------|---------------------|
| CLASS | | K | IMPORT | 2014-01-10 12:48:54 |
| JOBLIB | | NOP.EXAMPLE.LOAD | IMPORT | 2014-01-10 12:48:54 |
| MSGCLASS | | X | IMPORT | 2014-01-10 12:48:54 |
| STEPLIB | | NOP.EXAMPLE.LOAD | IMPORT | 2014-01-10 12:48:54 |
| TESTSYMBOL | | a | NATQA | 2016-05-12 15:28:03 |

This output displays the active symbol table and all related information.

Using Active Symbol Tables

This section covers the following topics:

- Available Functions: Symbol Table Active
- Modifying a Symbol Table Active

- [Listing Active Jobs Using a Symbol Table Active](#)

Available Functions: Symbol Table Active

➤ To list all functions available for a symbol table active node

- In the object workspace, select a **Symbol Table Active** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| List | F8 | See Listing Objects . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | See Filtering Objects . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all functions available for a symbol table active

- In the object workspace, select an instance of a **Symbol Table Active** node and open the context menu.

The following functions are available:

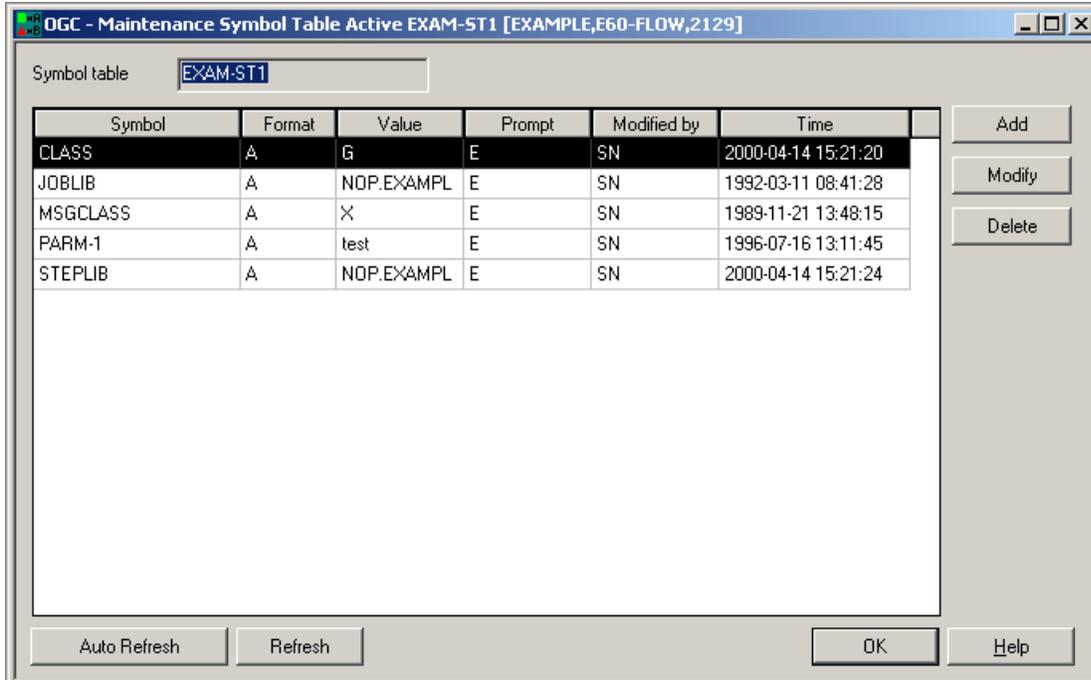

| Function | Shortcut | Description |
|-----------------|----------|---|
| Open | CTRL+O | See Modifying a Symbol Table Active . |
| Display | CTRL+D | See Displaying Objects . |
| Active Usage | --- | See Listing Active Jobs Using a Symbol Table Active . |
| Add to Workplan | --- | See Add to Workplan . |
| Save as File | --- | See Saving Symbol Tables as Files . |

Modifying a Symbol Table Active

➤ To modify an active symbol table

- 1 In the object workspace, select a **Symbol Table Active** instance.
- 2 Open the context menu and choose **Open**, or press CTRL+O.

A **Maintenance Symbol Table Active** window similar to the example below opens:

Here, you can add, modify or delete a symbol of the symbol table without affecting the master symbol table definition.

The fields, columns and functions available in the window correspond to the fields, columns and functions of the **Maintenance Symbol Table Master** window. They are explained in the following sections:

- *Fields and Columns: Symbol Table Master,*
- *Adding a Symbol Table Master,*
- *Modifying a Symbol Table Master,* and
- *Deleting a Symbol Table Master.*

3 Make your definitions and choose **OK** when you are finished.

Listing Active Jobs Using a Symbol Table Active

This function is used to display all active jobs using an active symbol table.

➤ To list all active jobs using an active symbol table

- 1 In the object workspace, select a **Symbol Table Active** instance.
- 2 Open the context menu and choose **Active Usage**.

An **Active Usage Symbol Table Active** window similar to the example below opens:

| Network | Job | Type | Run | SymTab Version |
|---------|------------|------------|-----|----------------|
| SAGNET | DEMO-JOBK | Job Active | 403 | T-V3 |
| SAGNET | DEMO-JOB2 | Job Active | 403 | T-V1 |
| SAGNET | JCLJOB-FTP | Job Active | 403 | |
| SAGNET | JCLJOB-MAC | Job Active | 403 | |
| SAGNET | JCL2 | Job Active | 403 | |
| SAGNET | JCL3 | Job Active | 403 | |
| SAGNET | JOB-NEW | Job Active | 403 | |
| SAGNET | NAT | Job Active | 403 | |
| SAGNET | PREREQ-JCL | Job Active | 403 | |
| SAGNET | SRV1 | Job Active | 403 | |
| SAGNET | TEST-JOB | Job Active | 403 | T-V1 |

The window lists all active jobs used by the active symbol table. The columns contained in the window correspond to the columns in the [Where used Symbol Table Master](#). They are explained in [Columns: Symbol Table Usage](#)

Deleting a Symbol Table Master

Restrictions:

- You cannot delete a master symbol table that is still used by one or more jobs. In this case, the error message EOR1859 - Symbol Table ... used in Definitions occurs. You can only delete the symbol table if you either specify another symbol table for these jobs or delete them. Proceed as described in [Listing Jobs and Networks that Use a Symbol Table Master](#) to find the jobs that use the symbol table.
- You cannot delete a master symbol table with a symbol table version that is still defined in the version usage of the symbol table. In this case, the error message EOR2691 - Version ... - current usage found occurs. You then need to delete the usage defined for the version as described in [Maintaining the Usage of Symbol Table Versions](#).

➤ **To delete a symbol table master**

- 1 In the object workspace, select a **Symbol Table Master** instance.
- 2 Choose **Delete** from the context menu, or press `DELETE`.

A confirmation window opens.

- 3 Choose **Yes** to confirm the deletion or **No** to cancel the action.

51 Finding Symbol Tables Associated with Jobs and Networks

-
- Listing Usable Symbol Tables 656
 - Listing Jobs and Networks that Use a Symbol Table Master 657

You can list all symbol tables available for use in a job or a network, and list all symbol tables already used by a job or a network.

Listing Usable Symbol Tables

You can list all symbol tables that can be used by a job or a network.

➤ **To list symbol tables available for a job or network**

- 1 In the object workspace, select a job or a network instance.
- 2 Open the context menu and choose **Usable Symbol Tables**.

A **Usable Symbol Tables** window similar to the example of an active job below opens:

| Type ^ | Owner | Symbol Table | Version | Network | Version | Run |
|----------------|---------|--------------|---------|----------|---------|-----|
| Job Active | EXAMPLE | EXAM-ST1 | | E60-FLOW | | 70 |
| Job Master | EXAMPLE | EXAM-ST1 | | | | |
| System default | SYSDBA | A | | | | |

This window lists all symbol tables which can be used by the current object (network, job master, job active). The example above lists the symbol tables that can be used by the active job J07.

The columns in the window are explained in [Columns: Usable Symbol Tables](#).

The symbol tables are listed in descending hierarchical order, that is, the topmost symbol table is used first during symbol replacement.

For information on all types of symbol tables available and the search order that applies when replacing symbols, see [Symbol Table Types and Symbol Search Order](#).

This section covers the following topics:

- [Columns: Usable Symbol Tables](#)

Columns: Usable Symbol Tables

The columns contained in the [Usable Symbol Tables window](#) are described in the following table:

| Column | Description |
|---------------------|--|
| Type | Type of the symbol table: see Symbol Table Types and Symbol Search Order . |
| Owner | Owner of the symbol table. |
| Symbol Table | Name of the symbol table. |
| Version | Version of the symbol table. |
| Network | For active job networks only. Active network which uses the symbol table. |
| Version | For active job networks only Version of the active network which uses the symbol table. |
| Run | For active job networks only. Run number of the active job network. |

Listing Jobs and Networks that Use a Symbol Table Master

You can list all jobs and networks that use a symbol table master. This is required, for example, if you cannot delete a symbol table because it still uses one or more jobs. You then need to find these jobs and change their symbol table settings or delete the jobs.

Note: This function only shows the references of a network or job to a master symbol table if it has been explicitly defined. You can use the cross-reference function [Symbol Table Usage](#) (see [Generating Cross-Reference Reports Online](#)) to get a list of all references to a master symbol table including the references contained in input conditions and End-of-Job actions.

➤ To list of jobs and networks that use a symbol table master

- In the object workspace, select a **Symbol Table Master** instance and select **Where used** from the context menu.

A **Where used Symbol Table Master** window similar to the example below opens:

| Network | Job | Type | Run | SymTab Version |
|-------------|------------|------------|-----|----------------|
| SAG-PROMPT | STANDARD | Job Master | | (svn) |
| SAG-PROMPT | STANDARD2 | Job Master | | (svn) |
| SAGNET | DEMO-JOB | Job Master | | (current) |
| SAGNET | DEMO-JOB2 | Job Master | | T-V1 |
| SAGNET | JCLJOB-FTP | Job Master | | |
| SAGNET | JCLJOB-MAC | Job Master | | |
| SAGNET | JCL2 | Job Master | | |
| SAGNET | JCL3 | Job Master | | |
| SAGNET | JOB-NEW | Job Master | | |
| SAGNET | NAT | Job Master | | |
| SAGNET | PREREQ-JCL | Job Master | | |
| SAGNET | SRV1 | Job Master | | |
| SAGNET | TEST-JOB | Job Master | | T-V1 |
| SAGNET <V1> | JOB-01 | Job Master | | |
| SAGNET <V3> | DEMO-JOB | Job Master | | (current) |
| SAGNET <V3> | DEMO-JOB2 | Job Master | | T-V1 |
| SAGNET <V3> | JCLJOB-FTP | Job Master | | |
| SAGNET <V3> | JCLJOB-MAC | Job Master | | |
| SAGNET <V3> | JCL2 | Job Master | | |
| SAGNET <V3> | JCL3 | Job Master | | |

The window lists all networks and jobs that use the selected symbol table master (here: EXAM-TABLE) of the specified owner (here: SAGTEST).

All symbol table versions defined for the selected symbol table are listed.

The columns in the window are explained in *Fields and Columns: Symbol Table Usage*.

➤ **To open a list of jobs and networks that use an active symbol table**

- In the object workspace, select a **Symbol Table Active** instance and choose **Active Usage** from the context menu.

An **Active Usage Symbol Table Active window** which corresponds to the **Where used Symbol Table Master** window opens. The fields and columns are explained in *Fields and Columns: Symbol Table Usage*.

This section covers the following topics:

- [Columns: Symbol Table Usage](#)

Columns: Symbol Table Usage

The columns contained in the [Where used Symbol Table Master](#) or [Active Usage Symbol Table Active window](#) are explained in the following table:

| Column | Description |
|-----------------------|---|
| Network | Name and version of the job network. |
| Job | Name of the job that uses the symbol table. A dash (-) or a blank indicates that the symbol table is specified in the network definition. |
| Type | Indicates whether a job master or job active, or a network master/version or network active uses the symbol table. For possible column entries, see the Symbol Table Type table column described in Symbol Table Types and Symbol Search Order . |
| Run | If the symbol table is used by an active job, this field displays the job's run number. |
| SymTab Version | Named version (if defined) or reserved name of the symbol table. For possible column entries, see Reserved Version Names for Symbol Tables . |

52

Defining Symbols and Symbol Values

| | |
|--|-----|
| ▪ Available Functions: Symbol Master | 662 |
| ▪ Listing Symbol Masters | 663 |
| ▪ Viewing a Symbol Master Definition | 663 |
| ▪ Modifying a Symbol Master | 664 |
| ▪ Adding a Symbol Master | 665 |
| ▪ Maintaining a Symbol Active | 665 |
| ▪ Defining Multiple Symbol Values | 669 |
| ▪ Specifying a Range Check for Numeric Symbol Values | 671 |
| ▪ Reserved Symbols | 672 |
| ▪ Predefined Symbols | 677 |
| ▪ Symbols in Node Definitions | 683 |
| ▪ Validating Symbol Values with a User Exit | 684 |
| ▪ Global Symbol Modification Exit | 685 |
| ▪ Symbol Setting triggered by the SYSOUT of a Job | 685 |
| ▪ Deleting a Symbol from a Symbol Table | 686 |

Available Functions: Symbol Master

➤ To list all functions available for a Symbol Master node

- In the object workspace, select a **Symbol Master** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| List | F8 | See Listing Symbol Masters . |
| New | CTRL+N | See Adding a Symbol Master . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | See Filtering Objects . |
| Paste data | CTRL-V | See Pasting Objects . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all functions available for a symbol master

- From the **Symbol Master** node, select an instance and open the context menu.

The following functions are available:

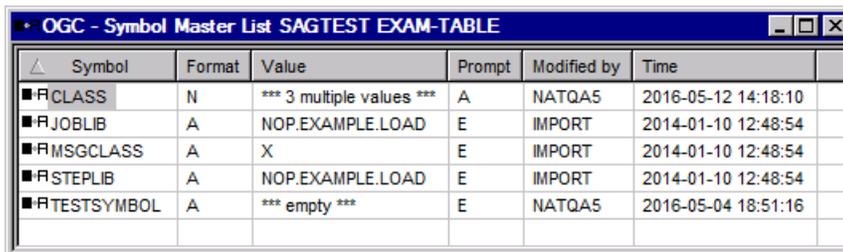

| Function | Shortcut | Description |
|----------------------------|----------|---|
| Open | CTRL+O | See Modifying a Symbol Master . |
| Display | CTRL+D | See Viewing a Symbol Master . |
| Delete | DELETE | See Deleting a Symbol from a Symbol Table . |
| Copy data | CTRL+C | See Copying Objects . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

Listing Symbol Masters

> To list symbol masters

- In the object workspace, select a **Symbol Master** node and choose **List** from the context menu, or press F8.

A **Symbol Master List** window similar to the example below opens:

| Symbol | Format | Value | Prompt | Modified by | Time |
|---------------|--------|---------------------------|--------|-------------|---------------------|
| ■ FCLASS | N | *** 3 multiple values *** | A | NATQA5 | 2016-05-12 14:18:10 |
| ■ FJOB LIB | A | NOP.EXAMPLE.LOAD | E | IMPORT | 2014-01-10 12:48:54 |
| ■ FMSGCLASS | A | X | E | IMPORT | 2014-01-10 12:48:54 |
| ■ FSTEPLIB | A | NOP.EXAMPLE.LOAD | E | IMPORT | 2014-01-10 12:48:54 |
| ■ FTESTSYMBOL | A | *** empty *** | E | NATQA5 | 2016-05-04 18:51:16 |

The table contained in the window lists all symbol masters defined for the selected symbol table master (here: EXAM-TABLE).

The columns in the window are explained in [Fields and Columns: Symbol Table Master](#).

Viewing a Symbol Master Definition

> To view a symbol master definition

- 1 In the object workspace, select a **Symbol Master** instance.
- 2 Open the context menu and choose **Display**, or press CTRL+D.

A **Display Symbol Master** window opens with the current symbol definition.

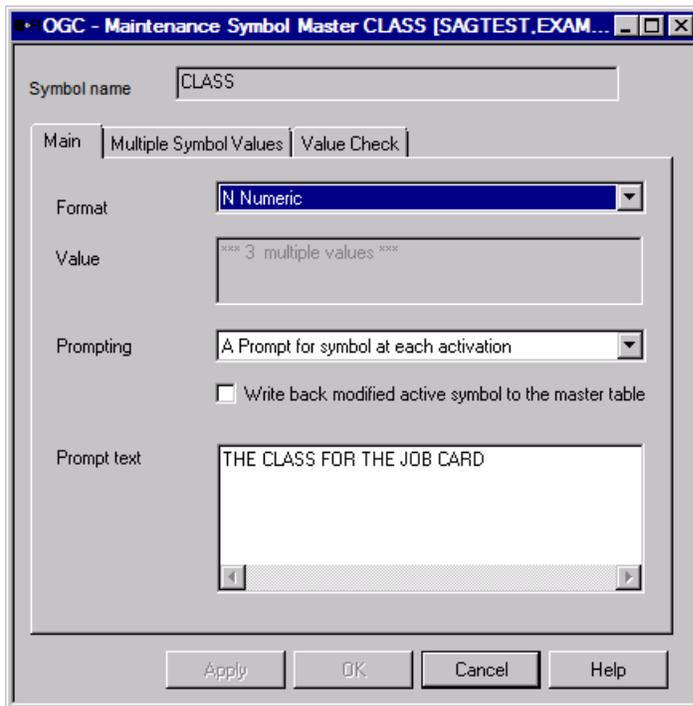

The read-only fields on the tabbed pages **Main**, **Multiple Symbol Values** and **Value Check** correspond to the fields and pages in the [Maintenance Symbol Master window](#). They are explained in [Fields: Master and Active Symbols](#).

Modifying a Symbol Master

> To modify a symbol master

- 1 In the object workspace, select a **Symbol Master** instance.
- 2 Open the context menu and choose the **Open** function, or press CTRL+O.

A **Maintenance Symbol Master** window similar to the example below opens:

- 3 Make your changes. The fields on the tabbed pages **Main**, **Multiple Symbol Values** and **Value Check** are explained in [Fields: Master and Active Symbols](#).
- 4 Choose **OK** when you are finished.

The symbol master is modified, stored and now ready to use in the active network.

Adding a Symbol Master

Note: If this is the first symbol of a new symbol table, the table itself will be created implicitly by this action.

➤ To add a symbol master to a symbol table

- 1 In the object workspace, select the **Symbol Master** node.
- 2 From the context menu, choose **New**, or press CTRL+N.

A **Create new Symbol Master** window opens.

The input fields on the tabbed pages **Main**, **Multiple Symbol Values** and **Value Check** correspond to the fields and pages in the [Maintenance Symbol Master window](#). They are explained in [Fields: Master and Active Symbols](#).

- 3 Enter a name for the symbol and make the required definitions.
- 4 Choose **OK** when you are finished.

The symbol master is created and now ready to use in the active network.

Maintaining a Symbol Active

This section covers the following topics:

- [Available Functions: Symbol Active](#)
- [Viewing a Symbol Active](#)
- [Adding a Symbol Active](#)
- [Modifying a Symbol Active](#)

Available Functions: Symbol Active

➤ To list all functions available for a Symbol Active node

- In the object workspace, select a **Symbol Active** node and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| List | F8 | See Listing Objects . |
| New | CTRL+N | See Adding a Symbol Active . |
| Refresh | F5 | See Refreshing Object Lists . |
| Filter | F3 | See Filtering Objects . |
| Paste data | CTRL+V | See Pasting Objects . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

➤ To list all functions available for a single symbol active

- Select a **Symbol Active** instance and open the context menu.

The following functions are available:

| Function | Shortcut | Description |
|----------------------------|----------|---|
| Open | CTRL+O | See Modifying a Symbol Active . |
| Display | CTRL+D | See Viewing a Symbol Active . |
| Delete | DELETE | See Deleting a Symbol from a Symbol Table . |
| Copy data | CTRL+C | See Copying Objects . |
| Set Drag And Drop Function | --- | See Drag & Drop . |

Viewing a Symbol Active

➤ To view a symbol active

- In the object workspace, select a **Symbol Active** instance and choose **Display** from the context menu, or press CTRL+D.

A **Display Symbol Active** window similar to the **Maintenance Symbol Active** window opens.

You can view all symbol definitions on the tabbed pages **Main** and **Multiple Symbol Values**.

The fields and columns contained on the pages correspond to the field and columns of the **Maintenance Symbol Active** window. They are explained in [Fields: Master and Active Symbols](#).

Adding a Symbol Active

➤ To add a symbol active

- 1 In the object workspace, select a **Symbol Active** node.
- 2 Open the context menu and choose **New**, or press CTRL+N.

A **Create new Symbol Active** window opens.

The fields on the tabbed pages **Main** and **Multiple Symbol Values** of the window correspond to the fields of the **Maintenance Symbol Active window**. They are explained in *Fields: Master and Active Symbols*.

Fill in the fields as required.

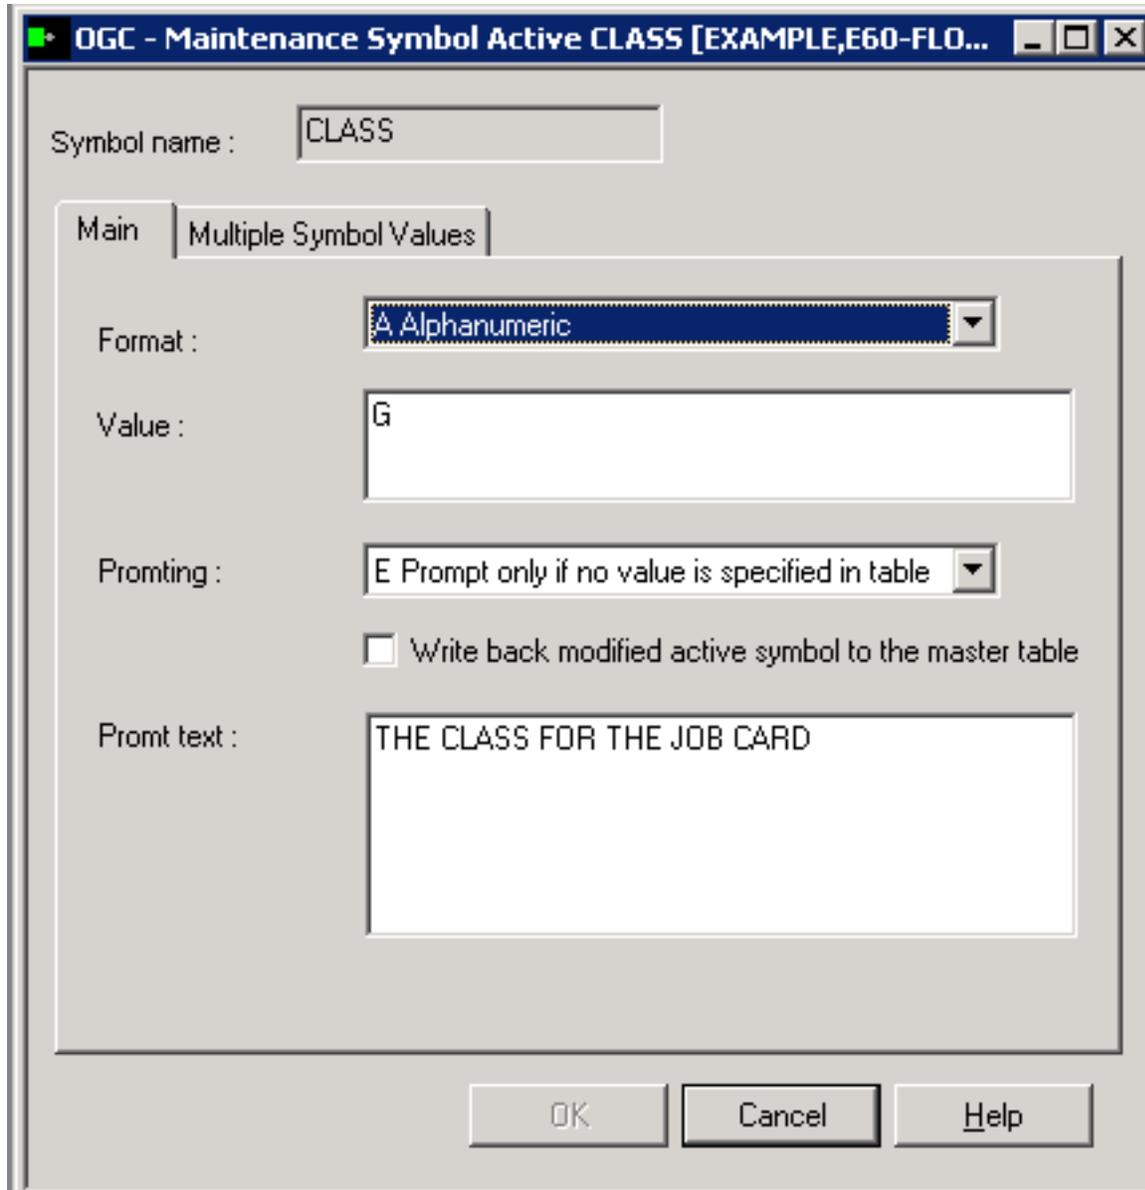

- 3 When you are finished, choose **OK**.

Modifying a Symbol Active

➤ To modify a symbol active

- 1 In the object workspace, select a **Symbol Active** instance and choose **Open** from the context menu, or press CTRL+O.

A **Maintenance Symbol Active** window similar to the example below opens:

- 2 Make your modifications. The fields on the tabbed pages **Main** and **Multiple Symbol Values** are explained in *Fields: Master and Active Symbols*.
- 3 When you are finished, choose **OK**.

The symbol active is modified and saved.

Defining Multiple Symbol Values

You can give a symbol several values which can be used in subsequent substitutions of the same symbol. These values can be used for the multiple parallel activation of a job. The number of parallel jobs is the same as the number of multiple values defined here. The maximum number of multiple values is 150.

➤ **To view and define multiple symbol values**

- 1 In a **Symbol Master** or **Symbol Active** window, open the tabbed page **Multiple Symbol Values**.

A **Multiple Symbol Values** page similar to the example below opens:

- [Symbol Replacement](#)

Symbol Replacement

You can use the [symbol function !MV or ?MV](#) (see *Functions for Symbol Replacement*) to get single occurrences of multiple-value symbols for replacement.

Specifying a Range Check for Numeric Symbol Values

You can guarantee that a numeric symbol value is within a specified number range.

➤ To specify a range check for numeric symbol values

- 1 Open the **Value Check** page of a **Symbol Master** window.
- 2 Select the **Range check** button (default is **None** for no check) and enter a start number in the **Value from** field and an end number in the **Value to** field as shown in the following example of a **Value Check** page:

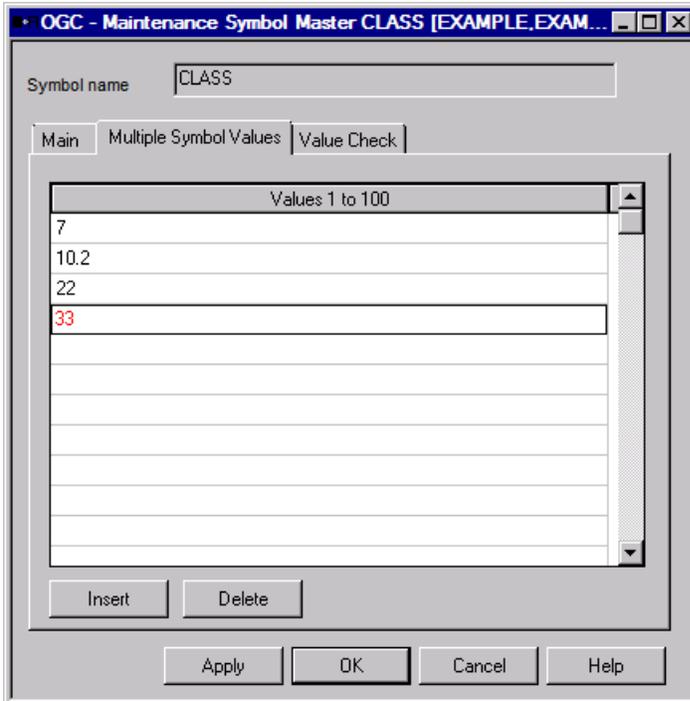

The screenshot shows a dialog box titled "OGC - Maintenance Symbol Master CLASS [EXAMPLE.EXAM...]" with a "Value Check" tab selected. The "Symbol name" field contains "CLASS". Under the "Value Check" tab, there are three radio button options: "None", "Range check", and "User exit". The "Range check" option is selected. To the right of the "Range check" option are two input fields: "Value from" containing "1" and "Value to" containing "30". Below these are fields for "Library" and "User exit", each with a dropdown arrow. An "Edit" button is located below the "User exit" field. At the bottom of the dialog box are four buttons: "Apply", "OK", "Cancel", and "Help".

For valid input values and further information on range checks, see [Value Check](#) in the section [Fields: Master and Active Symbols](#).

- 3 Choose **OK** to save your entries.

You can deactivate the check by selecting the **None** button.

- 4 If you open the **Multiple Symbol Values** page and add a new value that is not within the specified range (here: 1 to 30) the new (incorrect) value (here: 33) appears in red:

Reserved Symbols

Reserved symbols perform user-specified tasks. They can be changed as required if symbol table maintenance is allowed for the user (see **Symbol Tables** in *Network Maintenance Functions* in the *Administration* documentation).

Reserved symbols can be added, modified and deleted in symbol tables like all other symbols.

This section covers the following topics:

- [Reserved Symbols for Command Line Parameters](#)
- [Reserved Symbols for Mainframe Platforms](#)
- [Reserved Symbols for FTP Jobs](#)
- [Reserved Symbols for Profile Scripts \(UNIX\)](#)

- Reserved Symbol for Epilog Scripts (UNIX and Windows)

Reserved Symbols for Command Line Parameters

| Symbol | Format | Description |
|---------------------|--------|--|
| CMDLINE- <i>job</i> | A80 | <p>Command line parameter(s) for the following job types and/or JCL locations:</p> <ul style="list-style-type: none"> Started tasks (job type STC) on z/OS, UNIX shell scripts (job type JOB, Windows BAT files (job type JOB) and PowerShell scripts (job type WPS), Windows services (job type SRV), and Programs which are to be executed directly under UNIX or Windows (JCL location EXE). |

Passing Command Line Parameters

If you want to pass command line parameters for a job, use the reserved symbol `CMDLINE-job` in the job's symbol table, where *job* is the job name.

Several parameters, separated by blanks, can be contained in this symbol.

Example:

| | |
|---------------------------------|---------------------|
| Job name: | JOB1 |
| Member name in JCL definition: | STC001 |
| Content of symbol CMDLINE-JOB1: | PARAM1=Y , PARAM2=N |

The start command generated and issued by the Entire Operations Monitor is:

```
S STC001 , PARAM1=Y , PARAM2=N
```

Command Line Passing to Shell Scripts in Entire Operations

- If a job is to be activated, Entire Operations checks whether a `CMDLINE-job` symbol exists.

If such a symbol exists, its content is appended to the invocation of the `job.B` script.

- Nested (recursive) symbol replacement:

The `CMDLINE-job` symbol can contain nested symbols.

These can be prefixed by the **activation escape character** for activation time replacement, or by the **submission escape character** for submission time replacement.

- The `job.sh` resp. `job.bat` script (the user's script, with some Entire Operations header files), is not invoked directly, but out of the wrapping script `job.nnnnnnnn.frame.sh` resp. `job.nnnnnnnn.frame.bat`.

nnnnnnnn denotes an 8-digit repeat count. For the first job submission, this is 00000000.

- The *job.nnnnnnnn.frame.sh* resp. *job.nnnnnnnn.frame.bat* script is generated by Entire Operations at submission time. On UNIX, this is always a Bourne shell script (starting with the shebang `#!/bin/sh`), regardless of the shell of the user's script.
- UNIX: Command line parameters must be passed in Bourne shell syntax. This means quoting and masking of special characters according to Bourne shell rules. Note that the Bourne shell script quotes from the parameters quoted in the invoked shell script.
- Use *c:\work\test.txt* to pass a windows file name, for example, *c:\work\test.txt*.
- The maximum total length of all parameters is 2000 bytes (including separating blanks) after symbol replacement.
- The maximum length of a single parameter is 240 bytes.

Reserved Symbols for Mainframe Platforms

| Symbol | Format | Description |
|--------------------|--------|--|
| SYSOUT-NODE-GLOBAL | N5 | (Only in table SYSDBA/A.) If this SYSOUT exists and contains a valid Entire System Server node number and if there is no other applicable SYSOUT node definition available, SYSOUT file copies for Entire Output Management are created on this node. |
| JCL-NODE | N5 | If this symbol is found during job activation, this node is used as a JCL node for the active job. |
| SUBMIT-NODE | N5 | If this symbol is found during job activation, this node is used as a job start node for the active job. |
| SYSOUT-NODE | N5 | If this symbol is found during job activation, this node is used as a SYSOUT node for the active job. This symbol supersedes SYSOUT-NODE-GLOBAL. |

The symbols `JCL-NODE`, `SUBMIT-NODE` and `SYSOUT-NODE` are searched for in the symbols tables as described in [Symbol Table Types and Symbol Search Order](#).

Reserved Symbols for FTP Jobs

There are some symbols which have a special meaning for jobs of the type **FTP**.

Wildcards mean that all symbols starting with the mentioned prefix are reserved.

| Symbol | Description |
|-----------|------------------------------|
| FTP-JOBC* | FTP JCL. |
| FTP-SITE* | FTP site commands. |
| FTP-PARM* | FTP command line parameters. |

Reserved Symbols for Profile Scripts (UNIX)

This section describes the reserved symbols used when generating UNIX frame scripts (*job.current.frame.sh*) that source profile scripts as described in [UNIX: Usage of Profile Scripts](#) in the section *Job Maintenance*.

The reserved symbols are defined with **Format A**.

| Symbol | Description |
|-------------|--|
| ETC-PROFILE | Determines the profile scripts to be sourced. Possible symbol values are: |
| | Y Source the profile scripts contained in <i>/etc/profile</i> and <i>/etc/profile.local</i> , if available. |
| | N Do not source any of the profile scripts contained in <i>/etc/profile</i> and <i>/etc/profile.local</i> . This setting has the same effect as if the ETC-PROFILE was not defined at all. The symbol is then not found in the symbol table hierarchy. If you do not want to source profile scripts, make sure that ETC-PROFILE set to Y is not defined at a higher level in the symbol table hierarchy (for example, SYSDBA/A). In this case, you must explicitly set ETC-PROFILE to N at a lower hierarchy level. See also Symbol Table Types and Symbol Search Order . N is the default when no value is specified for ETC-PROFILE. |
| ENV | <i>script-name</i> Source the user-defined profile script defined for this symbol. Example: \$HOME/.profile |

Reserved Symbol for Epilog Scripts (UNIX and Windows)

This section describes the reserved symbol used for executing epilog scripts for UNIX or Windows jobs.

| Symbol | Format | Description |
|-----------------------------------|--------|--|
| NOP-EPILOG- <i>execution_node</i> | A120 | Fully-qualified name of an epilog script file. Example: NOP-EPILOG-517 Path to the shell file: /home/sag/jcl/epilog.node517.sh |

Symbol Table Search for Epilog Scripts

Entire Operations searches for NOP-EPILOG-*execution_node* in the symbol table hierarchy each time a job is submitted on a UNIX or Windows execution node.

The epilog script is not executed if NOP-EPILOG-*execution_node* cannot be found in any symbol table or if the value supplied with the reserved symbol is empty, contains a dash (-) or is set to NO.

If the reserved symbol is contained in the topmost symbol table (SYSDBA/A), the respective epilog scripts is executed for all UNIX and Windows jobs, except for those that reference a reserved symbol contained in a lower-ranking symbol table.

Using Epilog Scripts

The shell script defined with NOP-EPILOG-*execution_node* must have executable rights.

The epilog script is invoked by the defined JCL frame script and starts to execute when the main script terminates.

If an epilog script is defined but cannot be found, the exit code of the job is set to 102 so that the whole job ends in error.

The epilog script does not accept any parameters. The epilog script can obtain information from environment variables set in the JCL frame script by using reserved symbols (see [Reserved Symbols for UNIX and Windows Environment Variables](#)).

Symbol replacement is not performed for the epilog script. The epilog script is directly executed by the frame script, without intermediate storage in Entire Operations.

A Windows epilog script must not end with an `exit` statement. Set an exit code as follows:

```
set errorlevel=exit_code
```

If the exit code defined in the epilog script is higher than the exit code of the frame script, the exit code of the main script is set to the exit code of the epilog script.

Predefined Symbols

Predefined symbols perform special-purpose tasks for example, within JCL files or scripts. They are defined by Entire Operations and cannot be modified.

All symbol names starting with an asterisk (*) or P - are reserved for predefined read-only symbols. These prefixes must not be used for user-defined symbols.

Predefined symbols must not be defined in symbol tables.

- [Table of Predefined Symbols](#)
- [Predefined Symbols for Multiple and Parallel Activations](#)
- [Predefined Symbols for Subnetworks and Recovery Jobs](#)

Table of Predefined Symbols

The following symbols are read-only. They can be used without defining them in a symbol table.

For further explanations of date and time formats, see also [Date and Time Formats](#).

| Symbol | Format | Description |
|--------|--------|---|
| *DATD | A8 | Date in the format DD.MM.YY. |
| *DATE | A8 | Date in the format DD/MM/YY. |
| *DATG | A15 | Date in the format DD $monthname$ YYYY (Gregorian date). |
| *DATI | A8 | Date in the format YY/MM/DD. |
| *DATJ | A5 | Date in the format YYDDD (Julian). |
| *DATN | N8 | Date in the format YYYYMMDD. |
| *DATU | A8 | Date in the format MM/DD/YY. |
| *DAT4J | A7 | Date in the format YYYYDDD (Julian). |
| *TIME | A10 | Time of day in the format HH:II:SS.T. |
| *TIME8 | A8 | Time of day in the format HH:II:SS. |
| *TIMN | N7 | Time of day in the format HHMMSS. See also the symbol function !TIMN . This function allows the usage of constant time values. |
| *TIMN6 | N6 | Time of day in the format HHMMSS. |
| *TIMA6 | A6 | Time of day in the format HHMMSS. |

| Symbol | Format | Description | |
|------------------|--------|---|-----------------------------------|
| *TIMA7 | A7 | Time of day in the format HHMMSS. | |
| P-ACT-USER | A8 | <p>For manual activations: user ID of the user who activated the network or job.</p> <p>For subnetwork activations: activation user ID of the calling (parent) job.</p> <p>For scheduled activations: default user ID of the Entire Operations Monitor.</p> | |
| P-ACT-ORIGIN | A1 | Contains a letter that indicates the activation origin: | |
| | | A | Activated by API. |
| | | E | Activated by EOJ action. |
| | | M | Activated manually. |
| | | R | Recovery. |
| | | S | Activated by schedule extraction. |
| U | A1 | Activated by API, as a subnetwork. | |
| | | | |
| P-DATE | A8 | Execution date in the format YYYYMMDD. The date of the previous day is transmitted if the end time of the previous production day has not yet been reached. | |
| P-ESC-ACT | A1 | <p>Activation escape character (see Symbol Escape Characters), as defined for the current object (for example, a job).</p> <p>Note:</p> <ol style="list-style-type: none"> The value of P-ESC-ACT is not changed by the #EOR-ESC-ACT meta statement if defined in JCL (see Definitions in JCL and Macro Sources). P-ESC-ACT can also be used as a predefined variable in meta statements defined in macro JCL. | |
| P-ESC-SUB | A1 | <p>Submission escape character (see Symbol Escape Characters), as defined for the current object (for example, a job).</p> <p>Note:</p> <ol style="list-style-type: none"> The value of P-ESC-SUB is not changed by the #EOR-ESC-SUB meta statement if defined in JCL (see Definitions in JCL and Macro Sources). P-ESC-SUB can also be used as a predefined variable in meta statements defined in macro JCL. | |
| P-EXECUTION-NODE | N5 | Execution node. | |

| Symbol | Format | Description |
|--------------|--------|--|
| P-JCL-FILE | A250 | <p>JCL file.</p> <p>If not applicable, an empty string is returned. P-JCL-FILE is always resolved to a fully qualified file name.</p> <p>Recursive resolution of symbols is performed.</p> <p>If the JCL node is a Windows node, backslashes (\) in the file name can be returned by slashes.</p> <p>For further usage in Windows BAT and Powershell JCL, the string +F+&P-JCL-FILE is to be used (with & as escape character).</p> <p>Windows example, assuming the ampersand (&) is the escape character:</p> <pre>P-JCL-FILE = e:/sag/nop/jcl/job1.bat type +F+&P-JCL-FILE</pre> <p>is resolved to</p> <pre>e:\sag\nop\jcl\job1.bat</pre> |
| P-JCL-MEMBER | | <p>JCL member.</p> <p>If not applicable, an empty string is returned.</p> |
| P-JCL-NODE | N5 | JCL node. |
| P-JOB | A10 | Job. |
| P-JOB-ID | A10 | Job ID (job number, BS2000 TSN, process ID). |
| P-JI | A10 | Job ID (job number, BS2000 TSN, process ID). |
| P-JOBCOUNT | A8 | <p>Job type SAP only:</p> <p>Job count in the SAP system.</p> <p>Note: The field is available after job termination.</p> |
| P-MUL | A8 | User who made last change (in lower case). |
| P-MUU | A8 | User who made last change (in upper case). |
| P-NADIR | A250 | <p>Directory for temporary files for this network (UNIX and Windows only).</p> <p>Note:</p> <ol style="list-style-type: none"> 1. On Windows nodes, the directory name contains backslashes (\). For the usage on mainframe (EBCDIC) environments, these backslashes will be returned encoded |

| Symbol | Format | Description |
|----------------------------------|--------|--|
| | | <p>in trigraphs (see the relevant section in <i>Submission of Jobs by Entire Operations</i>).</p> <p>2. The content of P-NADIR can be subject to change in different Entire Operations versions.</p> |
| P-NETWORK | A10 | Network. |
| P-NETWORK-VERSION | A10 | Network version. |
| P-NODE | N5 | Execution node. |
| P-OWNER | A10 | Owner of the network. |
| P-REPEAT or P-REPEAT-COUNT | N10 | Repeat count. Contains the number of the current repetition of the job (if the job was resubmitted, etc.). |
| P-RUN | N5 | Run number of the network. |
| P-RUN5 | N5 | Run number of the network, always with 5 digits (with leading zeros). For example: The run number 7 will be returned as 00007. This symbol is also available in the macro JCL. |
| P-SGL | A50 | UNIX group or Windows domain (in lower case) of the job. |
| P-SGU | A50 | UNIX group or Windows domain (as defined) of the job. |
| P-SUL | A50 | Job start user ID (in lower case). |
| P-SUU | A50 | Job start user ID (in upper case). |
| P-SUBMIT-ID | A50 | Job start user ID (as defined). |
| P-SUBMIT-GRP | A50 | UNIX group or Windows domain (as defined) of the job. |
| P-SYSF1 | A10 | Concatenated DBID (database ID) and FNR (file number) of Entire Operations System File 1. Example: Entire Operations System File 1 has the LFILE setting LFILE=(216,9,17). P-SYSF1 will be set to 0000900017. |
| P-SYSOUT | A250 | Name of the SYSOUT file. This variable and its effective (usable) size depends on the operating system in which the job is executed: BS2000 |

Available any time after the activation.

| Symbol | Format | Description | |
|------------------|--------|-----------------------|---|
| | | | The effective size is 54. |
| | | z/OS and z/VSE | Not available. The value is set to three consecutive periods (. . .). |
| | | UNIX | Available any time after the activation. |
| | | Windows | Available any time after the activation. The file name is returned in UNIX syntax. |
| P-SYMTAB | A10 | Symbol table. | |
| P-SYMBOL-TABLE | A10 | Symbol table. | |
| P-SYMTAB-VERSION | A10 | Symbol table version. | |

Predefined Symbols for Multiple and Parallel Activations

| Symbol | Format | Description |
|-----------------------|--------|--|
| P-SUFFIX or P-X | A10 | Job name suffix if multiple and parallel job activation is in use. You can find detailed information about multiple and parallel job activation in the section Job Maintenance . P-X is an abbreviation for P-SUFFIX. |
| PMPA | A5 | Content of the suffix symbol of a multiple-value symbol . This symbol can be used in a master JCL node, an execution node and a SYSOUT node definition, prefixed with the activation escape character . For an execution node, you can also use the submission escape character as a prefix. This allows the execution of multiple parallel jobs on different nodes. The multiple-value symbol must be an array of valid node numbers or mnemonic node short names. See also P-MPA . |

| Symbol | Format | Description |
|--------|--------|---|
| P-MPA | A50 | <p>Full current value of the symbol containing the job name suffix if multiple jobs are activated in parallel.</p> <p>To redefine this field, code:</p> <pre>\$ 1 P-MPA (A50) \$ 1 REDEFINE P-MPA ... #GET-SYMBOL P-MPA</pre> <p>See also PMPA.</p> |
| P-MPI | N3 | Numeric index of the multiple-value symbol used for a multiple parallel activation. |

Predefined Symbols for Subnetworks and Recovery Jobs

The table below lists and describes the symbols a subnetwork or recovery job requires to communicate with its invoking network or the calling job, respectively.

These symbols have the value of a blank, unless they are used in a subnetwork or a recovery job.

| Symbol | Format | Description | Rec. Subnet Job |
|---------------------|--------|---|-----------------|
| P-C-OWNER | A10 | Owner of the calling job or invoking network. | X X |
| P-C-NETWORK | A10 | Network of the calling job or invoked subnetwork. | X X |
| P-C-NETWORK-VERSION | A10 | Network version of the calling job or invoked subnetwork. | X X |
| P-C-RUN | N5 | Run number of the calling job or invoking network. | X X |
| P-C-RUN5 | N5 | <p>5-digit run number (with leading zeros) of the calling job or invoking network. For example:</p> <p>Run number 7 will be returned as 00007.</p> <p>This symbol is also available in the macro JCL.</p> | X X |
| P-C-JOB | A10 | Name of the calling job. | X X |
| P-C-SUFFIX | A10 | Suffix value of the job which invoked the subnetwork where the symbol is used. | X X |
| P-C-JCL-NODE | N5 | JCL node of the calling job. | X n/a |
| P-C-EXEC-NODE | N5 | Execution node of the calling job. | X n/a |
| P-C-SYMTAB | A10 | Symbol table of the calling job or invoking network. | X X |

| Symbol | Format | Description | Rec. | Subnet Job |
|--------------------|--------|--|------|------------|
| P-C-SYMTAB-VERSION | A10 | Symbol table version of the calling job or invoking network. | X | X |
| P-C-MPA | A50 | The full current value of the symbol, containing the suffix of the job which invoked the subnetwork if multiple and parallel job activation is in use in the calling network. To redefine this field, code: <pre> § 1 P-C-MPA (A50) § 1 REDEFINE P-C-MPA ... #GET-SYMBOL P-C-MPA </pre> | X | n/a |
| P-C-SUU | A20 | Submit user ID of the calling job. It is possible to define this symbol as submit user ID in the jobs of the subnetwork, preceded by the activation escape character. (The subnetwork jobs must have a symbol table definition.) | X | n/a |
| P-C-SUG | A20 | Submit group of the calling job. It is possible to define this symbol as submit group in the jobs of the subnetwork, preceded by the activation escape character. (The subnetwork jobs must have a symbol table definition.) | X | n/a |

Symbols in Node Definitions

In general, you can define all nodes used in network and job definitions as symbols. Extra rules and restrictions for particular nodes are described in the following section.

You can define a node as a symbol of up to 4 characters that is preceded by the **activation escape character**, for example, \$NODE. Make sure that the **Use symbol as** option is selected in the respective node definition.

You can also use the predefined symbol **PMPA** preceded by the **activation escape character**, for example, \$PMPA. See also *Predefined Symbols* in the section *Symbol Table and Symbol Maintenance*.

This section describes restrictions and special considerations that apply when using a symbol for a node:

- [Using Symbols in Message Sending Nodes](#)

Using Symbols in Message Sending Nodes

Symbol use for message sending nodes is currently only possible on the Entire Operations CUI client.

Caution: Using symbols for message nodes on Entire Operations GUI client can produce severe errors.

When using the activation escape character as a symbol prefix, the symbol is evaluated immediately and the message is sent at job activation time.

Validating Symbol Values with a User Exit

You can define a user exit to check the validity (plausibility) of symbol values during symbol modification or prompting.

For detailed information on writing a user exit, see [User Exits for Validation Checks of Symbol Values](#) in the section *User Exits*.

> To check symbol values with a user exit

- 1 Open the **Value Check** page of a **Symbol Master** window.
- 2 Select the **User exit** button (default is **None** for no check) and enter the name of a library and a user exit in the fields **Library** and **User exit**, respectively. The input fields are described in [Fields: Master and Active Symbols](#).

Choose **Edit** if you want to modify the source of the user exit. Remember that you need to recatalog (STOW command) the source after modification.

- 3 Choose **OK** to save your entries.
- 4 Select the **None** button if you can deactivate the user exit.

Global Symbol Modification Exit

For the active symbol modification, a global symbol modification exit (described in the *Administration* documentation) can be defined too. This global exit is only used if there is no specific exit defined on the network level. The global exit is called with the same parameter list as the exit on the network level.

Symbol Setting triggered by the SYSOUT of a Job

(Not applicable on mainframes)

It is possible to set symbols during a job's End-of-Job checking, triggered by a meta command in the job's SYSOUT. The meta command is EOR-SYMBOL.

With this meta command it is possible to set an Entire Operations symbol during the End-of-Job checking of a job.

The meta command is available for jobs running on UNIX or Windows.

The symbol will be set into the active job's active or master symbol table. If the active job has no active symbol table, the job result is set to `not ok`.

Syntax:

```
EOR-SYMBOL SA symbol=value
```

Sets an active symbol.

```
EOR-SYMBOL SM symbol=value
```

Sets a master symbol.

The meta command can be generated, for example, with an echo command:

```
echo "EOR-SYMBOL SA SYMBOL1=$HOSTNAME "
```

With `HOSTNAME=pcsn` this produces the SYSOUT line:

```
EOR-SYMBOL SA SYMBOL1=pcsn
```

During End-of-Job checking, the symbol `SYMBOL1` in the job's active symbol table will be set to `pcsn`.

The echo command can be generated dynamically by using symbol replacement. Therefore, this kind of symbol setting is very flexible.

Example:

```
echo "EOR-SYMBOL SA PID.&*TIMN=$$"
```

creates the SYSOUT line:

```
EOR-SYMBOL SA PID.1131185=4837
```

Deleting a Symbol from a Symbol Table

The options provided to delete a symbol master or symbol active from a symbol table are described in the following section.

➤ To delete a symbol master

- 1 In the object workspace, select a **Symbol Master** instance.

Choose **Delete** from the context menu, or press `DELETE`.

Or:

In a **Maintenance Symbol Table Master window**, select the symbol you want to delete and choose **Delete**.

A confirmation window opens.

- 2 Choose **Yes** to confirm the deletion or **No** to cancel the action.

Note: You can delete individual symbols from a symbol table even if the table is specified for one or more MAC-type jobs. If the symbol table is specified for any job, the deleted symbol cannot be substituted when the JCL is dynamically generated. The Monitor records this event by writing a message to the log.

➤ To delete a symbol active

- 1 In the object workspace, select a **Symbol Active** instance.

Choose **Delete** from the context menu, or press `DELETE`.

Or:

In a **Maintenance Symbol Table Active window**, select the symbol you want to delete and choose **Delete**.

A confirmation window opens.

- 2 Choose **Yes** to confirm the deletion or **No** to cancel the action.

53

Symbol Replacement

- Symbol Escape Characters 690
- Symbol Prompting during Network or Job Activation 693
- Specifying User Exits for Symbol Modification 695
- Rules and Restrictions for Symbol Replacement 698

Symbols are replaced during network or job activation or during job submission:

- Symbols starting with the **activation escape character** are resolved during JCL loading, as part of the job activation.
- Symbols starting with the **submission escape character** are resolved during job submission.

Note: If a symbol replacement error occurs at submission time, the event JNR Job not run - JCL error will be set to occurred. If the event JNR is not defined, it will be added to the active job.

Note for BS2000:

BS2000 SYSJV references (for example, &(\$SYSJV.TSN) are no longer treated as Entire Operations symbols, regardless of whether they are prefixed with an ampersand (&) denoting an activation escape or submission escape character.

Symbol Escape Characters

In JCL and Natural macro sources, the symbols to be substituted must be preceded by an escape character.

You can use different escape characters to determine whether symbol replacement is performed during JCL generation or job submission.

The following escape characters can be used in parallel in your Entire Operations environment:

- **Activation Escape Character**

Symbols preceded by the activation escape character are replaced at activation of a network or job.

If a JCL file contains the activation escape character, a symbol replacement is performed:

- During JCL editing (temporary, using the master symbol table).
- During JCL loading (permanently, using the active symbol table).

- **Submission Escape Character**

Symbols preceded by the submission escape character (also called submit escape character) are replaced during submission of a job. They can be used to pass symbol values that cannot be specified earlier when the job is activated.

Both activation escape and submission escape characters can be defined as system-wide defaults in the Entire Operations default settings (see *Defaults for Network Options* in the *Administration* documentation). However, different escape characters can be used for each job if necessary.

You can also specify escape characters in your JCL or macro source. See also [Defining Escape Characters](#).

Caution: If you change escape character definitions for existing JCL, symbols to be replaced can no longer be detected. In this case, consider defining escape characters in your JCL or macro source.

This section covers the following topics:

- [Recommended Escape Characters](#)
- [Defining Escape Characters](#)

Recommended Escape Characters

We recommend that you use the following escape character:

| Operating System | Escape Characters |
|------------------|--|
| z/OS | § (section sign) and \$ (dollar sign). |
| z/VSE | § (section sign) and # (number sign). |
| BS2000 | ^ (circumflex accent) and ` (grave accent). Do not use \$ (dollar sign), § (section sign) and @ (commerical at sign) because they have a special meaning in BS2000. |
| UNIX, Windows | No recommendation, except for UNIX: Do not use \$ (dollar sign) because it has a special meaning in UNIX. |

Caution: We strongly recommend that you do not define escape characters already used by other (operating system specific) JCL features, for example, parameters for DO procedures and SUBDTA characters in BS2000.

Defining Escape Characters

This section describes the options provided to define your default activation and submission escape characters.

■ Default Settings

The **Network Options** page of the **Entire Operations Defaults** function (see the *Administration* documentation) is used to define the default for all networks in your Entire Operations environment.

On the **Operating System Specials** page, you can also define the default escape characters for each operating system.

■ Network Definition

Defines the default escape characters to be used by all jobs of a network.

■ Job Definition

Defines the default escape characters to be used by an individual job.

■ Definitions in JCL and Macro Sources

In JCL and Natural macro sources, the symbols to be substituted must be preceded by an escape character.

You can define default escape characters in Entire Operations JCL or macro sources by coding one or both of the following meta statements as the first source line(s):

```
#EOR-ESC-ACT = activation-character  
#EOR-ESC-SUB = submit-character
```

For example:

```
#EOR-ESC-ACT = $  
#EOR-ESC-SUB = ^
```

The `#EOR-ESC-ACT = activation-character` meta statement is evaluated when the JCL containing this statement is loaded. *activation-character* replaces the current activation escape character in the current file. This replacement has an effect on symbol replacement only, not a meta statement defined in a macro (Natural statement). The `#EOR-ESC-ACT` meta statement is removed from the active JCL after loading.

The `#EOR-ESC-SUB = submission-character` meta statement is evaluated during job submission. *submission-character* replaces the current submission escape character in the current file. This replacement has an effect on symbol replacement only, not a meta statement defined in a macro (Natural statement). The `#EOR-ESC-SUB` meta statement is kept in the active JCL after loading.

Both meta statements are logged when they are evaluated during JCL loading or job submission.

If you add a meta statement to a Natural macro source, you have to recatalog the source with the `MACRO` command.

Note about Trigraphs:

Trigraph encoding uses question marks (?) as escape characters in the JCL definition. You can avoid decoding conflicts by **switching trigraph encoding off and on** in the JCL as described in *Trigraph Encoding for JCL Submission on UNIX and Windows*.

Symbol Prompting during Network or Job Activation

Entire Operations provides a standard method for symbol prompting. Standard symbol prompting is not used in NET-type (subnetworks) jobs. On a full-sized screen, all necessary symbols are displayed and can be modified by simply typing over them.

If any of the activated jobs are MAC-type jobs (**dynamic JCL generation**) or JOB-type jobs whose JCL contains symbols for variable values, these symbols are replaced by their current values during the manual activation, except those that are defined to be replaced at submission time.

In a job network definition and in the subsidiary jobs, several symbol tables can be defined. During a network or job activation, all symbol tables are prompted sequentially, which contain at least one symbol to be prompted.

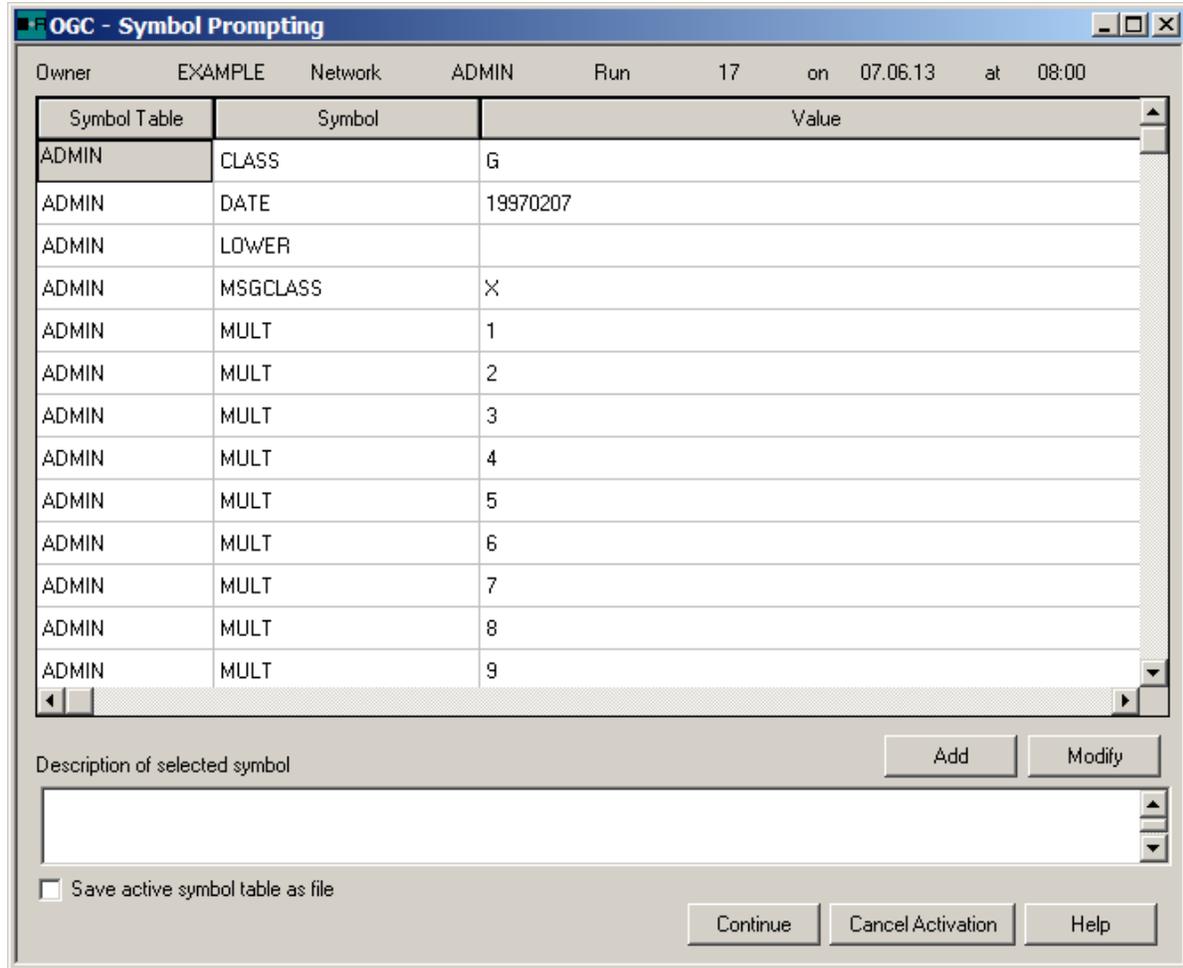

Note: Up to 100 different symbol tables can be prompted during a network activation.

If the activation is manual and if the JCL of a job contains symbols that are defined to be prompted, you are prompted for the values to be used in this activation. You can add new symbols and modify existing symbols of the active symbol table used during the network activation. Additionally, you can save the current symbols as a file.

➤ To modify and confirm symbols and save the active symbol table as a file

- 1 Activate a network with at least one symbol defined for prompting.

A **Symbol Prompting** window similar to the example below opens:

The window lists all the symbols requiring prompting in the symbol table and their values. The symbol values are taken from the corresponding master symbol table.

You can add new symbols, modify existing symbol values or leave them unchanged. The new values remain in the symbol table until the symbol table is modified specifically or until the next prompting after manual activation of a job network that uses the symbol table.

Note: If a validation check is defined for the symbol, you can only enter a valid symbol value. Incorrect values are rejected and a user-defined error message is issued.

- 2 Choose **Continue** when you are finished.

If **Save active symbol table as file** is selected in order to save the active symbol table as a file and **Symbol printing after prompting** is selected in your user profile (see the *Administration* documentation), a window opens for the file specification: see [To save an active symbol table](#) in the section *Saving Symbol Table Information as a File*.

Choose **OK** when you are finished.

Specifying User Exits for Symbol Modification

You can specify a customized user exit routine that defines your own validation checks and help information for symbol prompting. This can be used to modify active symbols depending on the values of other symbols, or of anything else.

You can then adapt a symbol table during each job run with or without using a window that prompts you for input. If you do not use a prompting window, the symbol table is adapted automatically in the background.

For details on defining user exit routines, see [User Exits for Validation Checks of Symbol Values](#) in the section *User Exits*.

➤ To specify a user exit for symbol modification

- 1 In a **Network Master** window, open the tabbed page **Symbol Prompting**:

The screenshot shows a configuration window with a tabbed interface. The tabs are: Scheduling, Long Description, Message and Message Recipients, Main, Default Values for the Jobs, OS Specials, Symbol Prompting (selected), and Granting Definition. The main content area is titled "Symbol prompting for this network will be done by" and contains the following fields and options:

- Natural library: A text box containing "SYSEORU" and an "Edit" button.
- User exit: A dropdown menu showing "GET-SYMB".
- Symbol modification during prompting
- Symbol modification in background

- 2 Specify the type of symbol prompting by defining the Natural library and the respective user exit routine. The fields are explained in [Fields: Symbol Prompting User Exit](#).
- 3 Choose **OK** when you are finished.

This section covers the following topics:

- [Fields: Symbol Prompting User Exit](#)

- [Example of an Active Symbol Table List](#)

Fields: Symbol Prompting User Exit

The input fields of the [Symbol Prompting page](#) are described in the following table:

| Field | Description | |
|----------------------------|---|--|
| Natural Library | Name of the Natural library where the symbol prompting user exit resides. | |
| User Exit | Name of the symbol prompting user exit. | |
| Symbol Modification | Symbol modification option(s). Possible check box settings: | |
| | during prompting <i>(checked)</i> | A prompt window opens (default). You are asked to modify or confirm symbols defined for prompting for the active symbol table. See also Example of an Active Symbol Table List . |
| | in Background <i>(checked)</i> | No prompt window opens. The symbol modification is managed by the user exit routine which runs in the background. |
| | <i>(both boxes checked)</i> | Performs both modification options: A prompt window opens first and then symbol modification is managed by the specified user exit. This allows you to set other symbols which are dependent on prompting. |

Example of an Active Symbol Table List

The following is an example of an output file generated for an active symbol table using Entire Operations GUI Client:

Active Symbol Table

Owner: SAGTEST Network: SAG-PROMPT Run: 26 Symbol Table: EXAM-TABLET-V3

| Symbol | MV | Symbol Value | Modified by | Time |
|------------|----|------------------|-------------|---------------------|
| CLASS | | K | IMPORT | 2014-01-10 12:48:54 |
| JOBLIB | | NOP.EXAMPLE.LOAD | IMPORT | 2014-01-10 12:48:54 |
| MSGCLASS | | X | IMPORT | 2014-01-10 12:48:54 |
| STEPLIB | | NOP.EXAMPLE.LOAD | IMPORT | 2014-01-10 12:48:54 |
| TESTSYMBOL | | a | NATQA | 2016-05-12 15:28:03 |

The file lists the current status of the symbols defined for the symbol table `EXAM-TABLET-V3` which is prompted when the network `SAG-PROMPT` is activated.

Rules and Restrictions for Symbol Replacement

Notes:

1. A symbol replacement is always attempted if at least one of the activation or submission escape characters currently in effect is found in a source line (see the section [Symbol Escape Characters](#)). It is not necessary for a symbol table to be defined on the job or network level. Symbols can also be replaced via [global symbol tables](#). [Predefined symbols](#) can be replaced without having to define a symbol table.
2. If an escape character is detected and no symbol table is defined, the error message `no symbol table defined` is issued.

This section covers the following topics:

Symbol Table Types and Symbol Search Order

The types of symbol tables available and the search order used to find and replace symbols in symbol tables are described in the following section.

Entire Operations first searches for a symbol in the active user-specific symbol table. After this, it searches in the master user-defined symbol table, in the network default symbol table, and finally in the system-wide symbol table. If it searches for the symbol in a subnetwork, the symbol tables of the calling job of type NET as well as the symbol tables of the superior job networks are searched (in ascending order) if necessary.

| Symbol Table Type | Description | Search Order |
|-------------------------|---|--------------|
| JA (Job active) | Active symbol table referenced by the active job. | 1 |
| NA (Network, active) | Active symbol table referenced by the network. | 2 |
| CA (Calling job) | Active symbol table referenced by the calling job. This only applies if the active job is within a subnetwork . Depending on the subnetwork nesting level, several symbol tables of calling jobs can be searched. The search operation can repeat recursively ascending. | 3 |
| CN (Calling network) | Active symbol table referenced by the calling network. Depending on the subnetwork nesting level, several symbol tables of calling networks can be searched. The search operation can repeat recursively ascending. | 4 |
| JM (Job master) | Symbol table referenced by the job master. | 5 |
| NV (Network version) | Symbol table referenced in the network version. | 6 |
| OD (Owner default) | Master symbol table <i>owner/A</i> . <i>owner</i> is the current owner of the active job. The symbol table <i>owner/A</i> is searched even if there is no symbol table definition on the job level and/or network level. | 7 |
| SD (System default) | Master symbol table SYSDBA/A. The symbol table SYSDBA/A is searched even if there is no symbol table definition on the job level and/or network level. | 8 |

Note: If you invoke the link to the symbol table(s) in the object network, job master or active job, you will get a list of all usable **symbol tables** for this object in the above hierarchical order.

Actions Triggered for Missing Symbols

The following actions are triggered as soon as a symbol cannot be found in any symbol table:

A message is written to the log

A message is written to the system log file (see [Log Information](#)), for example:

```
Symbol XYZ not found
... Symbol Table EXAMPLE/SYMTAB1
```

The logged symbol table (here: SYMTAB1) is the first symbol table searched upward in the symbol table hierarchy. Example: If no symbol table has been defined at the job level, the symbol table defined for the network is logged.

A global message is sent

A `symbol not found` message containing the name of the searched symbol table is sent if the Global Message Sending Exit (see the *Administration* documentation) is enabled in your environment.

A global message is saved in the event store

An appropriate message including the name of the searched symbol table is saved in the event store if the **Symbol not found** and **Event Store** options of the **Global Messages and Exits** function (see the *Administration* documentation) are enabled in your environment.

The problem is handled by a global user exit

A user exit takes action for the missing symbol to resolve the problem and continue processing if the Global Symbol Not Found Exit (see the *Administration* documentation) is defined and enabled in your environment.

Current processes are aborted

Current operations (for example, JCL loading) are terminated if a problem with missing symbols cannot be resolved.

Nested Replacement

Within nested replacements, the following rules apply:

- On the top level, only the “original” escape character is checked and replaced.
- If the activation escape is used on a nested level, only activation escapes are replaced on deeper levels. This is necessary to prevent too early replacements of submission escapes.
- If the submission escape is used on a nested level, submission and activation escapes are replaced on deeper levels.

Recursive Symbol Replacement

Symbols can be used within other symbols.

Example:

| Symbol | Value |
|---------|-----------------------|
| PREFIX | EOR |
| STEPLIB | \$PREFIX.EXAMPLE.LOAD |

\$STEPLIB is replaced by EOR.EXAMPLE.LOAD.

Note: If a point marks the end of a symbol, it is deleted on replacement. With recursive replacement, the deletion takes place replacement by replacement. Thus, a sufficient number of points must be coded. If a point is to remain at the end of the symbol, two points must be coded.

Symbol Replacement in JCL

For symbol replacement in JCL (Job Control Language) submitted on mainframe operating systems (z/OS, z/VSE and BS2000), the following particularities apply:

| | |
|--|---|
| Column 72 contains one blank and the columns 73 to 80 contain digits. | The columns 71 to 80 of the line are saved before the first replacement, and they are written back after the last replacement. |
| Column 72 contains a hyphen (-) and the columns 73 to 80 contain blanks. | The columns 71 to 80 of the line are saved before the first replacement, and they are written back after the last replacement. |
| Column 71 contains a comma (,) and the columns 72 to 80 contain blanks. | The columns 71 to 80 of the line are saved before the first replacement, and they are written back after the last replacement. |
| Intermediate results | Intermediate results can even be longer than 71 characters. They are only overwritten by possibly saved strings at the end of the replacement as a whole. |

Import/Export Restrictions

Avoid the equal sign (=) within a symbol value. This causes problems during the import or export of symbol tables.

Escape Character

Symbols to be replaced are detected by a preceding escape character anywhere in the JCL. See [Symbol Escape Characters](#) for details.

Example: Recursive Symbol Replacement

```
/* IN $JJ. SOFTWARE AG
```

changes to the following when J = 20 and JJ = \$J.01:

```
/* IN 2001 SOFTWARE AG
```

The advantage of this method is that symbol replacement is performed within the fixed positions.

Indicator for End of a Symbol Name

Symbol names end with one of the following delimiter characters:

blank (), comma (,), semicolon (;),
period (.), apostrophe ('), commercial at (@),
percent sign (%), logical not (¬), ampersand (&),
parenthesis ((or)), or equal sign (=).

Example: \$SYMBOL-1 ; .

A single period (.) after a symbol is removed during replacement. But two consecutive periods (. .) are converted to one period (.). This is important for the dynamic creation of file names.

Symbol Replacement Algorithm

The following algorithm is used for symbol replacement:

1. Search for the symbol farthest to the left.

If none (or no more) available -> end.

2. Replacement

In case of error -> end.

3. Write updated line.

Continue at (1).

This makes recursive symbol replacement (symbols within symbols) possible.

Fixed Positions within a JCL Line

Note: This chapter applies to JCL submitted on mainframes only.

Multiple symbol replacement can cause a shift within a line. However, in the following cases, parts of the line are kept in a fixed position:

1. Symbols do not follow one another directly.
2. The columns 72 to 80 always remain fixed. If column 70 contains a blank and column 71 a comma, then these will also remain fixed.
3. If a symbol is followed by at least two blank spaces, the rest of the line is kept in its original position, unless the symbol value would overlap with it. For example:

```
/FILE ABC.$VAR          COMMENT
```

changes to the following when VAR = REPLACE:

```
/FILE ABC.REPLACE      COMMENT
```

4. If a symbol is followed directly by continuous text, then by at least two blank spaces, then by an exclamation mark (!) and continuous text: the symbol is replaced as in (2) and the exclamation mark (!) is replaced by blank spaces. For example:

```
/FILE ABC.$VAR..XYZ    !COMMENT
```

changes to the following when VAR = REPLACE:

```
/FILE ABC.REPLACE..XYZ  COMMENT
```

Symbol Replacement with Multiple Symbol Values

If you want to replace a symbol with multiple values when a job is activated numerous times concurrently, you must use `P-SUFFIX` to identify the variable to be replaced. This is the variable you entered in the **Suffix Symbol** field in the **Job Master Definition** window (see the field description in the section *Job Maintenance*).

For information on defining multiple symbol values, see the symbol functions `!MV or ?MV and !MM or ?MM` described in the section *Functions for Symbol Replacement*.

Note: If **Suffix Symbol** contains no values, then the multiple job is activated as a temporary dummy job.

You can obtain a specific occurrence of a multiple-value symbol by using the **symbol function** `!MV or ?MV` delivered with Entire Operations.

Symbol Replacement in Subnetworks

To be able to enter symbols in subnetworks as well, you can attach a symbol table to the main network; this table contains all symbols to be queried in the jobs of the subnetwork(s). At the same time, the symbol tables can be linked to the corresponding jobs of the subnetwork(s) by means of symbols whose values are not to be retrieved. After symbol entry, this creates active symbol tables attached to the main network.

On the job level, Entire Operations tries to load the symbols from the level(s) above if a symbol with the corresponding symbol table is not found, for example from the active symbol table of the main network. Entire Operations does not create active symbol tables on subnetwork job levels as the run numbers are not yet known at the time of the main network's activation and as symbol prompting is activated first.

54

Functions for Symbol Replacement

- Results Returned by a Symbol Function 706
- Function !D or ?D - Date Calculation and Date Formatting 707
- Function !E or ?E - Date from Date Calculation 713
- Functions !MV or ?MV and !MM or ?MM - Access to Multiple-Value Symbols 714
- Function !TIMN or ?TIMN - Constant Time Values 716

A symbol function is used to set a symbol value depending on the parameters provided for the function.

A symbol function is identified by either an exclamation mark (!) or a question mark (?) that is used as a start value. You can choose either character depending on the current code page used in your Natural environment. The exclamation mark (!) can conflict with code page conversion.

You can also perform your own symbol functions with a user exit routine. For details, see [User Exits for Symbol Functions](#) in the section *User Exits*.

The predefined symbol functions provided are explained in this section.

Related Topic:

- [User Exits for Symbol Functions](#)

Results Returned by a Symbol Function

Results of symbol functions are written back to the active job's symbol table after the first evaluation. The following invocations of the same symbol function with the same parameters do not invoke the symbol function again, but just return the function value.

Symbol functions with activation escape character are written to the active symbol table without escape character.

Symbol functions with [submission escape character](#) are written to the active symbol table with the submission escape character.

Notes:

1. The same symbol or symbol function can be used with both the activation escape character and the submission escape character. Both are handled separately and occupy different active symbol table entries. This is especially important if you use any time-dependent symbols or symbol functions.
2. Results of symbol functions are not kept in active symbol tables to enforce recalculation of symbol function values, for example, after the change of a multiple-value symbol.

Function !D or ?D - Date Calculation and Date Formatting

(This symbol function replaces the obsolete symbol function !W or ?W.)

This symbol function calculates date values and formats them.

This section covers the following topics:

- [Syntax](#)
- [Examples](#)
- [Return Format](#)
- [Parameters](#)
- [Edit Masks for Date Functions](#)
- [Reference Objects](#)
- [Output Date Formats](#)

Syntax

```
§!D|?D<type|period|offset[offset-unit][,edit-mask][,calendar]>
```

(for all **types** except T)

or

```
§!D|?D<T[,edit-mask]>
```

or

```
§!D|?D<yyyymmdd,edit-mask>
```

Examples

```
§!D<AC-1>
```

Get the date before the current date (yesterday). The date is returned in the default format YYYYMMDD.

`§?D<CW+1,DDMMYY>`

Get the first day (Monday) of the current week, in the format DDMMYY.

`§!D<T,YYMMDD>`

Get the current date in the format YYMMDD.

`§!D<20070629,05>`

Get the date 2007-06-29 in the format 05 (DD.MM.YY). See [Output Date Formats](#).

`§!D<A1+1,MM>`

Get the previous month in the format MM (month only).

`§!D<A1+1,YYYYMMDD>`

Get the first day of the previous month.

`§!D<A1-1,YYYYMMDD>`

Get the last day of the previous month.

Return Format

See [Output Date Formats](#).

Parameters

The parameters are written one after the other without spaces.

| Parameter/Syntax Element | Value | Description |
|--------------------------|-------|--|
| <i>type</i> | T | Today's date. For this type, the parameters <i>period</i> , <i>offset</i> and <i>offset-unit</i> are not required or evaluated. |
| | A | All days (365 resp. 366 days a year). |
| | C | Calendar days (days defined as workdays in the calendar). |
| | S | Schedule days. |
| <i>period</i> | | Not evaluated for the type T. |
| | C | From current day. |
| | W | Week. |
| | M | Month. |

| Parameter/Syntax Element | Value | Description |
|--------------------------|--------|---|
| | 1 to 9 | One month back...nine months back. |
| | Q | Quarter. |
| | Y | Year. |
| <i>offset</i> | | Positive or negative number with prefix. |
| <i>offset-unit</i> | | Unit for the offset (optional); only evaluated for the type A . |
| | D | Days (default). |
| | W | Weeks. |
| | M | Months. |
| | Q | Quarters. |
| | Y | Years. |
| <i>edit-mask</i> | | See Edit Masks for Date Functions . |
| <i>calendar</i> | | See Calendar in <i>Reference Objects</i> . |
| <i>yyyymmdd</i> | | Date in the format YYYYMMDD. |

For further explanations of date and time formats, see also [Date and Time Formats](#).

Edit Masks for Date Functions

The edit mask can be entered either directly or with a format sign. The format sign can be used to shorten the function call.

| Format Sign | Format | Example |
|-------------|------------|------------|
| F1, 1 | DD | 29 |
| F2, 2 | DDMM | 2910 |
| F3, 3 | DDMMYY | 291008 |
| F4, 4 | DDMMYYYY | 29102008 |
| F5, 5 | DD.MM.YY | 29.10.08 |
| F6, 6 | DD.MM.YYYY | 29.10.2008 |
| F7, 7 | DD/MM/YY | 29/10/08 |
| F8, 8 | DD/MM/YYYY | 29/10/2008 |
| F9, 9 | DD-MM-YY | 29-10-08 |
| F10, 10 | DD-MM-YYYY | 29-10-2008 |
| F11, 11 | MM | 10 |
| F12, 12 | MMDD | 1029 |
| F13, 13 | MMYY | 1008 |
| F14, 14 | MM.YY | 10.08 |
| F15, 15 | MMYYYY | 102008 |

| Format Sign | Format | Example |
|-------------|------------|---|
| F16, 16 | MM.YYYY | 10.2008 |
| F17, 17 | NN | We (Weekday; language-dependent.) |
| F18, 18 | O | 4 (Number of the weekday.) |
| F19, 19 | WW | 44 (Number of the week.) |
| F20, 20 | YY | 08 |
| F21, 21 | YYJJJ | 08245 |
| F22, 22 | YYMM | 0810 |
| F23, 23 | YYMMDD | 081029 |
| F24, 24 | YYYY | 2008 |
| F25, 25 | YYYYJJJ | 2008245 |
| F26, 26 | YYYYMM | 200810 |
| F27, 27 | YYYYMMDD | 20081029 |
| F28, 28 | YYYY.MM.DD | 2008.10.29 |
| F29, 29 | YYYY/MM/DD | 2008/10/29 |
| F30, 30 | YYYY-MM-DD | 2008-10-29 |
| F31, 31 | YY.MM.DD | 08.10.29 |
| F32, 32 | YY/MM/DD | 08/10/29 |
| F33, 33 | YY-MM-DD | 08-10-29 |
| F34, 34 | QQ | WE (Weekday; language-dependent; in upper case.) |

For further explanations of date and time formats, see also [Date and Time Formats](#).

Reference Objects

| Parameter/Syntax Element | Description |
|--------------------------|--|
| Owner | Owner of the network from which the function was called. |
| Calendar | If a calendar was specified explicitly, this is used for calendar calculations. This calendar must exist under the current owner. If it is not found there, it is searched for under the owner SYSDBA. Otherwise, the calendar of the current schedule is used. If no calendar has been defined, all days are treated as workdays. Subnetwork considerations |

| Parameter/Syntax Element | Description |
|--------------------------|---|
| | <ul style="list-style-type: none"> ■ If the symbol function is invoked from within a subnetwork, the schedule or calendar of the top level (main calling network) is used for schedule or calendar calculation. ■ Schedules or calendars defined in the subnetwork are ignored in such calculations. ■ It is not necessary to define schedules or calendars in a network used only as a subnetwork, because they are not relevant. |

If this parameter is missing or if an unknown format has been used, the date is returned in the format YYYYMMDD (see also [Date and Time Formats](#)).

Output Date Formats

The output date formats described here can be used in the symbol functions !D or ?D and !W or ?W.

The default date output format is YYYYMMDD (see also [Date and Time Formats](#)).

| Format | Numeric Equivalent | Example |
|--------------------------|--------------------|------------|
| DD | 01 | 29 |
| DDMM | 02 | 2910 |
| DDMMYY | 03 | 291008 |
| DDMMYYYY | 04 | 29102008 |
| DD.MM.YY DD#MM#YY | 05 | 29.10.08 |
| DD.MM.YYYY DD#MM#YYYY | 06 | 29.10.2008 |
| DD/MM/YY | 07 | 29/10/08 |
| DD/MM/YYYY | 08 | 29/10/2008 |
| DD-MM-YY | 09 | 29-10-08 |
| DD-MM-YYYY | 10 | 29-10-2008 |
| JJJ | 38 | 245 |
| JJJYY | 39 | 24508 |
| JJJYYYY | 40 | 2452008 |
| MM | 11 | 10 |
| MMDD | 12 | 1029 |
| MMDDYY | 35 | 102908 |
| MMYY | 13 | 1008 |

| Format | Numeric Equivalent | Example |
|--------------------|--------------------|---|
| MM.YY MM#YY | 14 | 10.08 |
| MMYYYY | 15 | 102008 |
| MM.YYYY MM#YYYY | 16 | 10.2008 |
| MM/DD/YY | 36 | 10/29/08 |
| MM-DD-YY | 37 | 10-29-08 |
| NN | 17 | Sa (First 2 characters of name of weekday. This value depends on the current language setting of the Natural session.) |
| O | 18 | 6 (Number of weekday. This value depends on the Natural profile parameter DTFORM of the Natural session. Refer to the Natural <i>Parameter Reference</i> documentation.) |
| QQ | 34 | SA (Like format NN, but in upper case.) |
| WW | 19 | 44 (Number of week.) |
| WWYY | 41 | 4408 (Week and year.) |
| WWYYYY | 42 | 442008 (Week and year.) |
| YY | 20 | 08 |
| YYJJJ | 21 | 08245 |
| YYMM | 22 | 0810 |
| YYMMDD | 23 | 081029 |
| YYWW | 43 | 0844 (Year and week.) |
| YYYY | 24 | 2008 |
| YYYYJJJ | 25 | 2008245 |
| YYYYMM | 26 | 200810 (Year and month.) |

| Format | Numeric Equivalent | Example |
|--------------------------|--------------------|----------------------------|
| | | |
| YYYYMMDD | 27 | 20081029 |
| YYYYWW | 44 | 200844 (Year and week.) |
| YYYY.MM.DD YYYY#MM#DD | 28 | 2008.10.29 |
| YYYY/MM/DD | 29 | 2008/10/29 |
| YYYY-MM-DD | 30 | 2008-10-29 |
| YY.MM YY#MM | 45 | 08.10 |
| YY.MM.DD YY#MM#DD | 31 | 08.10.29 |
| YY/MM/DD | 32 | 08/10/29 |
| YY-MM-DD | 33 | 08-10-29 |

For further explanations of date and time formats, see also [Date and Time Formats](#).

Function !E or ?E - Date from Date Calculation

This symbol function is used to add or subtract a number of days from a given date in the format YYYYMMDD (see also [Date and Time Formats](#)).

This section covers the following topics:

- [Syntax](#)
- [Examples](#)
- [Return Format](#)

- [Parameters](#)

Syntax

```
$!E|?E<date,offset[,edit-mask]>
```

Examples

```
$!E<20081029,+28>
```

```
$!E<20081029,-7,F10>
```

Return Format

Date in the format YYYYMMDD (see also [Date and Time Formats](#)).

Parameters

The parameters are separated by a comma.

| Parameter/Syntax Element | Description |
|--------------------------|--|
| <i>date</i> | Date in the format YYYYMMDD. See also Date and Time Formats . |
| <i>offset</i> | Positive or negative number with a plus (+) or minus (-) sign. Unit: days. |
| <i>edit-mask</i> | See Edit Masks for Date Functions . |

Functions !MV or ?MV and !MM or ?MM - Access to Multiple-Value Symbols

These symbol functions allow you to use multiple symbol values.

You can get the maximum index of a multiple-value symbol.

This section covers the following topics:

- [Symbol Function !MV or ?MV](#)

- [Symbol Function !MM or ?MM](#)

Symbol Function !MV or ?MV

This symbol function allows you to use one single value of a multiple-value symbol.

Syntax

```
$!MV | ?MV<symbol, index>
```

Examples

```
$!MV<ARRAY, 1>
```

```
$?MV<ARRAY, $INDEX>
```

Return Format

Integer value.

Parameters

The parameters are separated by a comma.

| Parameter/Syntax Element | Description |
|--------------------------|------------------------------------|
| <i>symbol</i> | Name of the multiple-value symbol. |
| <i>index</i> | Index of the symbol value. |

Errors

In the following cases, Symbol not found appears:

- Multiple-value symbol not found,
- Index missing,
- Index not numeric, and
- Index too high.

Reference Objects

| Parameter/Syntax Element | Description |
|--------------------------|--|
| Symbol table | The symbol table of the active job is always used. |

Symbol Function !MM or ?MM

This symbol function allows you to get the maximum index of a multiple-value symbol.

This function accesses single occurrences of a multiple-value symbol.

Syntax

```
$!MM | ?MM<symbol>
```

Example

```
$!MM<ARRAY>
```

Return Format

Symbol value.

Parameters

This function has only one parameter.

| Parameter/Syntax Element | Description |
|--------------------------|------------------------------------|
| <i>symbol</i> | Name of the multiple-value symbol. |

Errors

In the following case, `Symbol not found` appears:

- Multiple-value symbol not found.

Reference Objects

| Parameter/Syntax Element | Description |
|--------------------------|--|
| Symbol table | The symbol table of the active job is always used. |

Function !TIMN or ?TIMN - Constant Time Values

This symbol function allows you to use constant time values in multiple timestamp replacements.

This section covers the following topics:

- [Syntax](#)
- [Examples](#)
- [Return Format](#)
- [Parameters](#)

- Reference Objects

Syntax

```
$!TIMN|?TIMN<parm>
```

Examples

```
$!TIMN<A>
```

```
$?TIMN<B>
```

Return Format

A time stamp in the format of the Natural system variable *TIMN:

Format: A7,

Content: HHIISST where T = tenths of seconds.

Parameters

| Syntax Element/Parameter | Description |
|--------------------------|---|
| <i>parm</i> | <p>The parameter (for example, A or B) must be specified for syntactical reasons only and has not meaning otherwise.</p> <p>Note: All invocations with the same parameter create the same time value (if the same active symbol table is used). The result of each combination of symbol function and parameter(s) is kept in the active symbol table for subsequent replacements.</p> <p>Example:</p> <pre>/* line 1 - \$TIMN<A> /* line 2 - \$TIMN /* line 3 - \$TIMN<A></pre> <p>The example above can be replaced as follows:</p> |

| Syntax Element/Parameter | Description |
|-----------------------------|--|
| | /** line 1 - 1601331 /** line 2 - 1601332 /** line 3 - 1601331 |

Reference Objects

None.

This section describes the **Reporting** function which is used to generate reports that help overview your network environment to define objects, monitor the system and plan workloads.

Related Topic:

- See also the cross-reference reports described in the section [Cross-References](#).

Report Types

The report types available you can select from the **Reporting dialog** are described in the following table. Reports that require special user privileges are indicated in the table.

| Report Type | Description |
|---|---|
| Log - reports (see below) | <p>The LOG - reports provide job or network processing information for a given date/time range, extracted from the Entire Operations log. The following applies to all job logs:</p> <p>Only those networks are displayed for which the user has read access. The user has read access if:</p> <ul style="list-style-type: none"> ■ the user has profile type A (Administrator); ■ the owner SYSDBA is currently assigned to the user; ■ the network owner can be found on the user's owner list; ■ access to the network has been explicitly granted to the user (see Granting Definition: Authorizing Other Users or Owners to Access a Network in the section <i>Network Maintenance</i>). |
| Log - Terminated Jobs | <p>Lists all jobs that ended normally (OK).</p> <p>See also Example of Log - Terminated Jobs.</p> |
| Log - Abended Jobs | <p>Lists all jobs that ended abnormally (not OK).</p> <p>See also Example of Log - Abended Jobs.</p> |
| Log - Jobs not started | <p>Lists all jobs that were not started.</p> <p>A job cannot start, for example, if its latest start time exceeded, or if it is waiting for an input condition or a resource.</p> <p>See also Example of Log - Jobs not started.</p> |
| Log - Jobs with permanent errors | <p>Lists all jobs that fail to run because of permanent errors.</p> <p>See also Example of Log - Jobs with permanent errors.</p> |

| Report Type | Description |
|---------------------------------------|---|
| Log - Networks not activated | <p>Lists all networks that could not be activated, because an extraction or activation error occurred.</p> <p>See also Example of Log - Networks not activated.</p> |
| Accounting Information | <p>Information on job accounting data (for example, job elapsed times and CPU times) of previous network and job executions.</p> <p>See also Example of Accounting Information.</p> |
| Network Description (short) | <p>Displays information on networks and jobs as defined on the master database, including scheduling information, prerequisites and End-of-Job checking and actions.</p> <p>See also Example of Network Description (short).</p> |
| Network Description (detailed) | <p>Displays the same information as the Network Description (short), but includes all prose descriptions defined at the network, job or event level using the Editor facility.</p> <p>See also Example of Network Description (detailed).</p> |
| Schedule of Jobs | <p>Displays a jobs schedule for a specific date range.</p> <p>See also Example of Schedule of Jobs.</p> |
| Network Start Summary | <p>Status report of all network starts for a given day, regardless of whether they:</p> <ul style="list-style-type: none"> ■ are waiting for prerequisite resources; ■ have already been executed; ■ are currently being executed; ■ have already been completed. <p>See also Example of Network Start Summary.</p> |
| Network Schedule Overview | <p>Overview of scheduled and/or not yet executed, system-wide network activations.</p> <p>See also Example of Network Start Summary.</p> |
| Activation Overview | <p>Overview of network activations.</p> <p>See also Example of Activation Overview.</p> |
| Compare Symbol Tables | <p>(Special user authorization required.)</p> <p>Displays the results of the comparison of one or more symbol tables.</p> <p>See also Example of Compare Symbol Tables.</p> |
| Compare Networks | <p>(Special user authorization required.)</p> <p>Displays the results of the comparison of one or more networks.</p> |

| Report Type | Description |
|---|---|
| | <p>The report shows whether jobs defined in one network exist also in another network. Additionally the attributes of the networks and of all jobs having the same name are compared.</p> <p>See also Example of Compare Networks.</p> |
| Node Overview | <p>(Special user authorization required.)</p> <p>Overview of available nodes.</p> <p>See also Example of Node Overview.</p> |
| Network/Job Usage | <p>(Special user authorization required.)</p> <p>Lists networks and related subnetworks (jobs of the type NET) as well as jobs activated by an End-of-Job action or a recovery job.</p> <p>See also Example of Network/Job Usage.</p> |
| Network Start Overview (Bar Chart) | <p>Displays the network start time and the end time of a previous network execution as a bar chart.</p> <p>See also Network Start Overview (Bar Chart).</p> |
| Network and Job Start Overview (Bar Chart) | <p>Displays the network and job start as a bar chart.</p> <p>See also Example of Network and Job Start Overview (Bar Chart).</p> |
| Network Schedule Overview (Bar Chart) | <p>Displays the schedule selection of a network as a bar chart.</p> <p>See also Example of Network Schedule Overview (Bar Chart).</p> |
| Monitor Tasks and Functions Overview | <p>Displays data collected from performed Monitor tasks and called Monitor functions in a task time table.</p> <p>See also Example of Monitor Tasks and Functions Overview.</p> <p>Note: The Monitor Accounting option (see the <i>Administration documentation</i>) must be enabled to collect the data.</p> |
| Monitor Tasks and Exits Overview | <p>Displays data collected from performed Monitor tasks and called Monitor exits in a task time table.</p> <p>See also Example of Monitor Tasks and Exits Overview.</p> <p>Note: The Monitor Accounting option (see the <i>Administration documentation</i>) must be enabled to collect the data.</p> |

Viewing the Report Status List

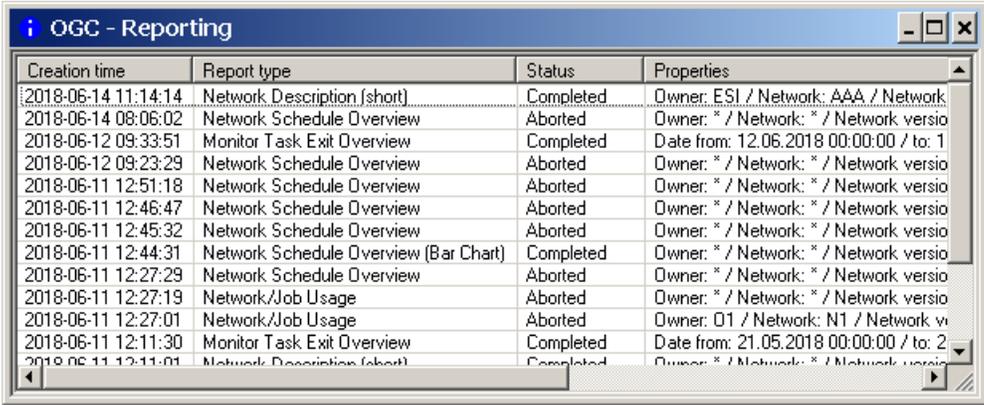

➤ To view all reports submitted for processing

- 1 In the object workspace, select the **General** node and choose **Reporting** from the context menu.

Or:

In the **Command** box, type `REPORTS` (see *Direct Commands*) and press `ENTER`.

A **Reporting** window similar to the example below opens:

| Creation time | Report type | Status | Properties |
|---------------------|---------------------------------------|-----------|--|
| 2018-06-14 11:14:14 | Network Description (short) | Completed | Owner: ESI / Network: AAA / Network |
| 2018-06-14 08:06:02 | Network Schedule Overview | Aborted | Owner: * / Network: * / Network versio |
| 2018-06-12 09:33:51 | Monitor Task Exit Overview | Completed | Date from: 12.06.2018 00:00:00 / to: 1 |
| 2018-06-12 09:23:29 | Network Schedule Overview | Aborted | Owner: * / Network: * / Network versio |
| 2018-06-11 12:51:18 | Network Schedule Overview | Aborted | Owner: * / Network: * / Network versio |
| 2018-06-11 12:46:47 | Network Schedule Overview | Aborted | Owner: * / Network: * / Network versio |
| 2018-06-11 12:45:32 | Network Schedule Overview | Aborted | Owner: * / Network: * / Network versio |
| 2018-06-11 12:44:31 | Network Schedule Overview (Bar Chart) | Completed | Owner: * / Network: * / Network versio |
| 2018-06-11 12:27:29 | Network Schedule Overview | Aborted | Owner: * / Network: * / Network versio |
| 2018-06-11 12:27:19 | Network/Job Usage | Aborted | Owner: * / Network: * / Network versio |
| 2018-06-11 12:27:01 | Network/Job Usage | Aborted | Owner: O1 / Network: N1 / Network w |
| 2018-06-11 12:11:30 | Monitor Task Exit Overview | Completed | Date from: 21.05.2018 00:00:00 / to: 2 |
| 2018-06-11 12:11:01 | Network Description (short) | Completed | Owner: * / Network: * / Network versio |

A list of scheduled and ready reports appears.

(If no reports exist, the table in the **Reporting** window is empty.)

The reports listed in the table are used to manage and view all reports requested by the current user. Report generation is invoked within Entire Operations GUI Client whereas the reports themselves are generated asynchronously in the background via the Entire Operations Monitor.

The report list contains the following columns:

| | |
|----------------------|--|
| Creation time | Date and time when a report generation was initiated arranged in descending order (latest date first). |
| Report type | Report type requested. |
| Status | Indicates the progress in generating the report: |
| | |

| | | |
|-------------------|--|--|
| | Queued | Report is queued for processing. A report is queued, for example, if it must wait until the Entire Operations Monitor has finished another task before it can handle the report generation (asynchronous processing). This allows you to continue working while the report is processed in the background. |
| | Running | Report is being generated. |
| | Completed | Report has been generated successfully. |
| | Aborted | Report has been aborted. A probable reason for abortion is: <ul style="list-style-type: none"> ■ No report data found for processing ■ An inactive Entire Operations Monitor ■ A system error |
| Properties | Properties settings used to generate the report. | |

Press F5 or choose **Refresh** or **Auto Refresh** (specifies an automatic refresh interval) from the context menu to refresh the processing status in the **Status** column.

- From the table in the **Reporting** window, you can select the report you want to generate by choosing **Save as File** from the context menu to determine the file to be created from the report: see [Report Output Options](#).

Generating or Regenerating Online Reports

This section provides instructions for generating or regenerating a report in online mode with the **Reporting** function.

Report data is evaluated for the current day by default. If you want to change the evaluation date, use the [Determination Date](#) function.

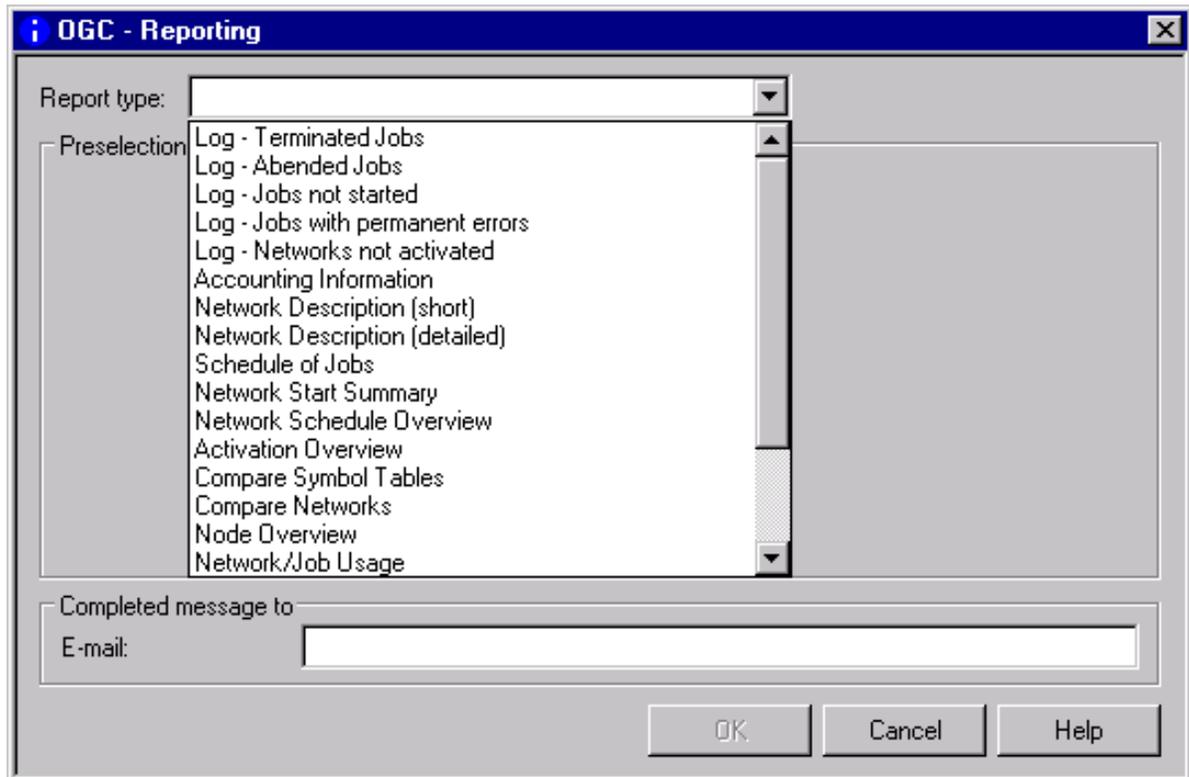

Note: The selection options provided to generate a report allow extremely flexible reporting. On the other hand, it allows you to formulate requests that will cause very many Adabas calls. For this reason, it is possible to disallow asterisk/wildcard report selection for non-administrator users: see [Range Specification and Usage Restrictions](#).

➤ To generate a report

- 1 From the table in the [Reporting window](#), select **Add** from the context menu.

A **Reporting** dialog similar to the following opens:

- 2 From the drop-down list box next to **Report type**, select the required [report type](#).

Depending on the report type selected, additional input fields appear in the **Preselection** section of the **Reporting** dialog. They are explained in [Fields and Columns: Reports](#).

- 3 In the **Preselection** section, enter the required selection criteria and output options.

In the **Completed message to E-mail** field, enter an e-mail address if you want to send a notification when the report generation has finished.

- 4 Choose **OK** when you are finished.

The report is added to the table in the [Reporting window](#) and queued for processing.

If you choose **Cancel**, the selected report type and selection criteria are retained in the **Reporting** dialog until you open it again and choose **OK**.

- 5 When the report has been processed successfully, the **Status** in the **Reporting** window changes to **Completed**.

You can then save the report as described in [Report Output Options](#).

➤ To regenerate a report

- 1 From the table in the [Reporting window](#), select a generated report and choose **Regenerate** from the context menu.

A [Reporting dialog](#) opens with the properties settings of the previous report generation.

If required, change the current settings by replacing the values in the **Preselection** section and the **Completed message to Email** field of the dialog. The fields are explained in [Fields and Columns: Reports](#).

- 2 Choose **OK**.

The report is added to the table and queued for processing.

The same applies as stated for generating a report.

Viewing Report Properties and Deleting a Report

➤ To display the properties of a report

- Select the required report from the table in the [Reporting window](#) and choose **Properties** from the context menu.

A [Reporting dialog](#) similar to the example below appears where the properties (report type, owner, network and e-mail) are displayed:

The screenshot shows a dialog box titled "OGC - Reporting". It features a "Report type" dropdown menu currently set to "Network Schedule Overview". Under the "Preselection" section, there are three dropdown menus: "Owner" (EXAMPLE), "Network" (B60-FLOW), and "Network version". To the right of these are four radio button options: "Extractions + Schedule, sorted by network, time" (selected), "Extractions only, sorted by network, time", "Extractions only, sorted by time", and "Extractions + Schedule, sorted by time, network". Below the radio buttons are two date dropdowns: "Date from" (09.06.2015) and "Date thru" (09.06.2015). At the bottom, there is a text field for "Completed message to Email" and two buttons: "OK" and "Help".

➤ **To delete single or multiple reports**

- From the table in the **Reporting window**, select one or more generated reports and choose **Delete** from the context menu or press DELETE.

The selected reports are removed from the table.

Fields and Columns: Reporting

The input fields for specifying selection criteria and output options for the report to be produced are explained in the following table. The input fields correspond to the columns contained in the report output file.

Depending on the report type (to be) produced, the following fields and columns are available:

| Field/Column | Description |
|----------------------------|--|
| Owner | Name of an owner or a range of names . |
| Network | Name of a network or a range of names . |
| Network version | Name of a network version or a range of names . |
| Job | (Applies to Log - reports and Job Schedule only.) Name of a job or a range of names . If no job name is defined, the corresponding output column in the report file contains a dash (-). |
| Date/Time from/thru | Start date/time and end date/time of the reporting period. Valid number range: 1 to 31. Default: current date and time range 00:00 until 23:59. For Monitor Tasks and Functions Overview and Example of Monitor Tasks and Exits Overview the default time range is 00:00 until the current time. For Network Schedule Overview reports, the start and end dates can be in the past. In this case, only those network activations are logged, which have not yet been executed. These can be caused by symbol prompting, which has not been completed, or by an Entire Operations Monitor, that has not been active over an extended period of time. |
| Run from/thru | Start and end run numbers for a range of active job networks. Can be used only if owner and network have been selected. Default range: 1 - 9999 (all) |

| Field/Column | Description | | | | | | | | | | | | |
|--|---|------------------|--|--------------------|---|-----------------|--|------------|--|------------|------------------------------------|------------------|--------------------------|
| Completed message to Email | E-mail address of the user who receives an e-mail notification when the report generation completed successfully (Subject: EOR: OGC Report ended ok) or when the report generation was aborted (Subject: EOR: OGC Report ended not ok). | | | | | | | | | | | | |
| Save As File | See <i>Report Output Options</i> . | | | | | | | | | | | | |
| Type | (Applies to Activation Overview only.) Type of network activation. Valid selection options: <table border="1" data-bbox="456 604 1385 1144"> <tr> <td>All types</td> <td>All types of activations.</td> </tr> <tr> <td>Manual</td> <td>Activated manually.</td> </tr> <tr> <td>Recovery</td> <td>Activated by End-of-Job recovery processing.</td> </tr> <tr> <td>API</td> <td>Activated by the activation API. NOPUAC5N (see the section <i>API Routines</i>).</td> </tr> <tr> <td>EOJ</td> <td>Activated by an End-of-Job action.</td> </tr> <tr> <td>Scheduled</td> <td>Activated by a schedule.</td> </tr> </table> | All types | All types of activations. | Manual | Activated manually. | Recovery | Activated by End-of-Job recovery processing. | API | Activated by the activation API. NOPUAC5N (see the section <i>API Routines</i>). | EOJ | Activated by an End-of-Job action. | Scheduled | Activated by a schedule. |
| All types | All types of activations. | | | | | | | | | | | | |
| Manual | Activated manually. | | | | | | | | | | | | |
| Recovery | Activated by End-of-Job recovery processing. | | | | | | | | | | | | |
| API | Activated by the activation API. NOPUAC5N (see the section <i>API Routines</i>). | | | | | | | | | | | | |
| EOJ | Activated by an End-of-Job action. | | | | | | | | | | | | |
| Scheduled | Activated by a schedule. | | | | | | | | | | | | |
| Compare Networks/Symbol Tables reports only: | | | | | | | | | | | | | |
| Show | Determines the amount of information to be shown for the compared networks. Valid selection options: <table border="1" data-bbox="456 1291 1385 1501"> <tr> <td>ALL</td> <td>Shows all matching and differing objects and attributes.</td> </tr> <tr> <td>Differences</td> <td>Shows only the differing objects with the differing attributes (default).</td> </tr> </table> | ALL | Shows all matching and differing objects and attributes. | Differences | Shows only the differing objects with the differing attributes (default). | | | | | | | | |
| ALL | Shows all matching and differing objects and attributes. | | | | | | | | | | | | |
| Differences | Shows only the differing objects with the differing attributes (default). | | | | | | | | | | | | |
| Accounting Information/Schedule of Jobs reports only: | | | | | | | | | | | | | |
| Step | (Applies to z/OS only.) Job step. Step data is only collected if the Collect z/OS step accounting data option is enabled in the Entire Operations default settings: see <i>Defaults for Operating System Specials</i> in the <i>Administration</i> documentation. | | | | | | | | | | | | |
| JobID | Job identifier as assigned by the operating system. | | | | | | | | | | | | |
| Start | Start date/time of the job. | | | | | | | | | | | | |

| Field/Column | Description |
|---|---|
| Stop | End date/time of job. |
| Elapsed min or Elapsed Time | Estimated run time (in minutes) of the job. BS2000: Since the BS2000 LOGOFF message does not contain seconds, the elapsed time cannot be calculated exactly. |
| CPU Time sec | Estimated CPU time (in seconds) of the job. UNIX: CPU time information is written to the SYSOUT of UNIX jobs. For this purpose, the shell <code>times</code> command is used. The output is enclosed in the messages EOR0303 and EOR0304. Example: <pre>%% EOR0303 - times - Begin 0m0.121s 0m0.025s 0m0.043s 0m0.066s %% EOR0304 - times - End</pre> Notes: <ul style="list-style-type: none">■ With Entire System Server for UNIX Version 2.1.2 PL 4 and above, this output is used to determine the CPU time consumption of UNIX jobs. The CPU time is included in the Entire Operations accounting data.■ For Sun Solaris: The <code>times</code> command output is useful only if the script frame (*.BF) is executed under the Korn shell. Therefore, the *.BF scripts on Sun Solaris are started under the Korn shell. |
| <i>date to date are</i> | Line below the report table indicating the average CPU consumption. Average values of all elapsed and CPU times for all jobs in the network. |
| Network/Job Usage reports only: | |
| Used Job | Networks and jobs used by single or multiple jobs. |
| Using Job | Networks and jobs using a job as a subnetwork (job type NET), an End-of-Job (EOJ) action or a recovery job. |
| Usage | Indicates the job use: Subnet, EOJ Activation or Recovery. |
| Activation Mode | Activation mode defined for the subnetwork. See also Time of Activation of a Subnetwork in the <i>System Overview</i> . |
| Node Overview reports only: | |

| Field/Column | Description | | | | | | |
|-------------------------------------|---|-----|---|----|---|---|--|
| Server Name | For mainframe nodes: a descriptive name. For UNIX and Windows nodes: the name of the EntireX Broker service. | | | | | | |
| Node Range | Range of node numbers from 1 to 99900. | | | | | | |
| Short | Short name of a node. | | | | | | |
| AM | Access mode used: <table border="1"> <tr> <td>N</td> <td>Mainframe nodes accessed through Entire Net-Work.</td> </tr> <tr> <td>B</td> <td>UNIX and Windows nodes accessed through EntireX Broker.</td> </tr> <tr> <td>L</td> <td>Applies to UNIX and Windows only. Local node, invoked directly on the machine where Entire Operations is running.</td> </tr> </table> | N | Mainframe nodes accessed through Entire Net-Work. | B | UNIX and Windows nodes accessed through EntireX Broker. | L | Applies to UNIX and Windows only. Local node, invoked directly on the machine where Entire Operations is running. |
| N | Mainframe nodes accessed through Entire Net-Work. | | | | | | |
| B | UNIX and Windows nodes accessed through EntireX Broker. | | | | | | |
| L | Applies to UNIX and Windows only. Local node, invoked directly on the machine where Entire Operations is running. | | | | | | |
| Op. Sys. | Operating system under which the node is running as received from the last SYSTEM-INFO call to Entire System Server or UNIX/Windows system information. | | | | | | |
| Wait a. Error | Wait time after error. Time in minutes to wait until next node access after a temporary error. | | | | | | |
| VSE SysId | SYSID defined for a z/VSE node is added to the JCL of jobs submitted on this node. | | | | | | |
| SSU | Submit Security User Type. If empty, the system-wide default is in effect for this node. | | | | | | |
| Time Diff. | Time difference between local time and GMT in hours if node is in a different time zone. | | | | | | |
| Valid | Indicates whether a node is available: <table border="1"> <tr> <td>yes</td> <td>Node can be used.</td> </tr> <tr> <td>no</td> <td>Node has been disabled.</td> </tr> </table> | yes | Node can be used. | no | Node has been disabled. | | |
| yes | Node can be used. | | | | | | |
| no | Node has been disabled. | | | | | | |
| NPR Version | Current Entire System Server version of the node. | | | | | | |
| OS Release | Information about the operating system (where available). | | | | | | |
| Bar Chart reports only: | | | | | | | |
| Run | Run number of the job. | | | | | | |
| Activation Time | Date/time when the job is activated. | | | | | | |
| Start time | Date/time when the job started. | | | | | | |
| Stop Time | Date/time when the job stopped. | | | | | | |
| Elapsed Time | Elapsed time (between job start time and job stop). | | | | | | |
| Minimum/Maximum Elapsed Time | Minimum or maximum elapsed time per job run. | | | | | | |
| CPU Time | CPU time in milliseconds (ms). | | | | | | |
| Stop Job | Last executed job. | | | | | | |

| Field/Column | Description |
|--------------|--|
| Stop Message | Message of the last executed job. |
| Run OK? | Is true if the networks finished without errors. |

Range Specification and Usage Restrictions

If indicated in the table above, you can use an asterisk (*) or a smaller/greater than (< or >) wildcard character to determine a start or an end value (see also *Valid Name Specifications in Direct Commands*) or open a selection list of names.

The use of asterisk/wildcard report selection can be disallowed for non-administrator users (see *User Definitions and Profile Settings* in the *Administration* documentation).

By default, users of type A (system administrator) and O (operator) are allowed to use asterisk/wildcard selection; users of type G (general user) are not. It is not possible to disallow it for users of type A.

Determination Date for Report Data

Report data is evaluated for the current day by default. This evaluation date needs to be considered, in particular, when you maintain different versions of networks and symbol tables with either fix versions or versions dynamically loaded on this date.

The determination date can also affect named filters that use the selection criterion (current): see [Filtering Objects](#) and [Changes to the Determination Date](#).

You can specify the date for which a report (or a named filter with (current)) evaluates the data to be generated.

» To set the determination date

- 1 Select the **General** node.
- 2 Open the context menu and select **Determination Date**.

A **Determination Date** window similar to the example below opens:

- 3 Open the drop-down list box and select the required date from a calendar.

Or:

Type the required date in the input box.

- 4 Choose **OK** to save the date.

Report Output Options

The **Save as File** dialog specifies the format for the report and the location where the report is written.

| Field | Explanation |
|---------------------------------------|---|
| File type | <p>The format used for report generation:</p> <ul style="list-style-type: none"> ■ HTML: a file in HTML (Hypertext Markup Language) format. ■ HTML5: a file in HTML5 format is required to display bar charts reports. ■ This only works if the Windows Open with function calls an HTML5-enabled browser by default. ■ CSV: a comma-separated value file for Excel. ■ XML: a file in XML (Extensible Markup Language) format without style sheet for HTML. ■ XML with style sheet for HTML: a file in XML format with a style sheet for HTML. <p>If this option is selected, a processing instruction with a reference to an external style sheet is added to the generated XML file to transform the XML file into HTML.</p> |
| File name | <p>The name to be used for the report file.</p> <p>If no path is specified in the File name field, the file will be saved at:</p> <p>%LOCALAPPDATA%\Software AG\Natural\</p> |
| Open with external application | <p>If this option is checked (default setting), the default Windows application associated with the specific file extension opens.</p> |

The settings in the **Save as File** dialog are stored between sessions in a client-specific XML profile and are used as the default value for the next **Save as File** operation on a report of the same report type.

Using Reports with Bar Charts

The report types **Network Start Overview (Bar Chart)**, **Network and Job Start Overview (Bar Chart)** and **Network Schedule Overview (Bar Chart)** generate the usual report columns but additionally provide an interactive diagram with a bar chart for better data visualization.

Bar charts of the report types visualize report column data as an interactive diagram. Bar charts are useful for overviewing the job flow and finding out the peak and off-peak times to balance the workload (CPU load) among the different networks.

Network Start Overview (Bar Chart) from 2018-10-01 thru 2018-11-26

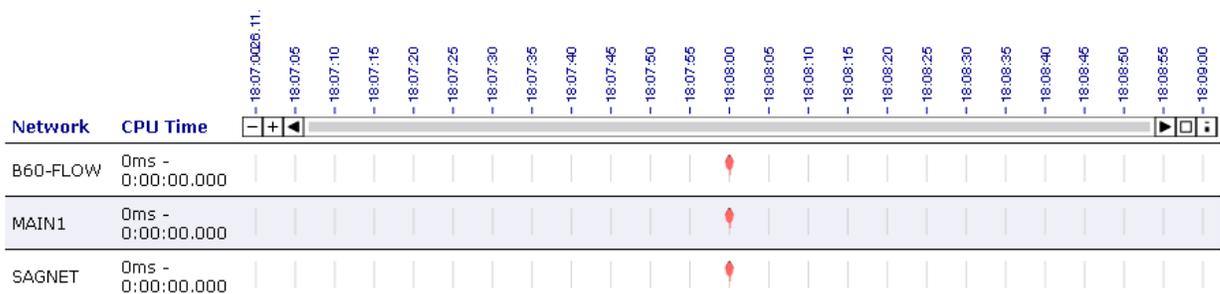

Generation Date: 2018-11-26 - 18:10:00.6

Diagram columns: Owner Network Run

Start Time Stop Time

Stop Job Stop Message CPU Time Run OK?

Diagram

Bar charts reports are not static but have interactive elements which are described in the following section:

- [Filter Area](#)

■ Diagram Part

Filter Area

Diagram columns: ▼ Owner Network Run
 Start Time Stop Time
 Stop Job Stop Message CPU Time Run OK?
 Diagram

You can collapse the filter area by clicking on the arrow:

Diagram columns: ▶

Depending on the diagram columns you select, different columns of the report are shown:

Generation Date: 06.06.2014 - 09:39:00.7
Diagram columns: ▼ Owner Network Run
 Start Time Stop Time
 Stop Job Stop Message CPU Time Run OK?
 Diagram

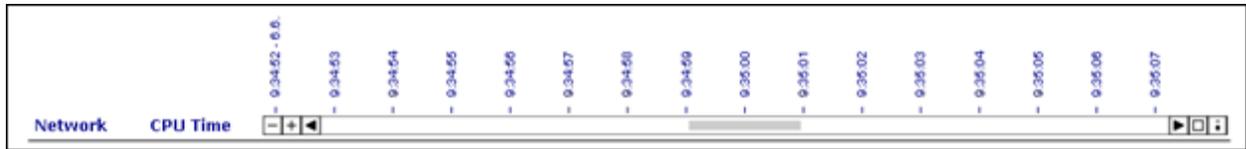

| Owner | Network | Run | Run OK? |
|----------|------------|------|---------|
| INCIDENT | I5026810A | 983 | OK |
| INCIDENT | I5033788A1 | 8282 | OK |
| INCIDENT | I5033788A1 | 8283 | OK |

Diagram Part

If you select part of the time table as shown below,

| Owner | Network | Run | Run OK? |
|----------|-----------|-----|---------|
| INCIDENT | I5026810A | 983 | OK |

the diagram is zoomed in so you can view more details:

| Symbol | Explanation |
|--------|---|
| | Zooms the diagram out (-) or in (+). |
| | Scrolls left or right in the diagram. |
| | Shows the complete diagram. |
| | Shows further information/explanations. |

If you move the mouse over the marker, you can view further information such as start and/or end times:

Start Time: 06.06.2014 - 09:35:00.0

If you move the mouse over a bar, you can view additional information about the given network:

```

Owner:      INCIDENT
Network:    I5033788A1
Run:        8283
Start Time: 06.06.2014 - 09:35:00.0
Stop Time:  06.06.2014 - 09:35:00.0
Elapsed Time:      0ms - 0:00:00.000
CPU Time:         0ms - 0:00:00.000
  
```

Using Reports with Monitor Task Time Tables

The report types [Monitor Tasks and Functions Overview](#) and [Monitor Tasks and Exits Overview](#) provide an interactive diagram with a bar chart and features to filter information as described in the following section.

- [Filter Area](#)

■ Diagram Part

Filter Area

Filter Tasks:

Task 1 Task 2 Task 3

Filter Exits:

(internal) NAT

You can unmark or mark the items to deselect or select the items to be shown in the diagram.

You can choose **Clear All** or **Select All** to deselect or select all items marked in the **Tasks**, **Exits** and/or **Functions** rows.

Diagram Part

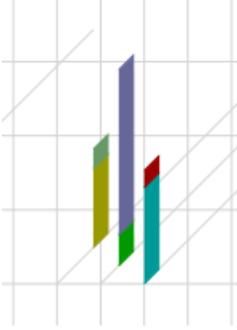

If you select part of the time table as shown below,

the diagram

is zoomed in so you can view more details:

| Symbol | Explanation |
|--------|---------------------------------------|
| | Zooms the diagram out (-) or in (+). |
| | Scrolls left or right in the diagram. |
| | Shows the complete diagram. |

If you move the mouse over the top of a bar graph in the diagram, you can view additional information such as the execution time, average execution time and the number of calls, for example:

| | |
|-----------------------|-------------------------|
| Date - Time: | 29.06.2018 - 08:47:00.0 |
| Task: | 1 |
| Job execution: | 41 s # 289 Ø 0.14 s |
| JCL loading: | 234 s # 151 Ø 1.55 s |

User Restrictions for Reports

Administrator users (and reports run in batch) may report on any network in any owner. Non-administrator users, however, will only receive information on networks to which they have read access. A user is considered to have read access if:

1. The user is linked to owner SYSDBA.
2. The user is linked to the network owner.
3. Access to the network has been explicitly granted to the user.

User authorization for performing report functions are granted in the default user profile as described in *Reporting Functions* in the *Administration* documentation.

Retention Period for Reports from Entire Operations GUI Client

Data generated for a report from Entire Operations GUI Client is retained for the number of days specified for active jobs in the **Retention Periods** of the Entire Operations default settings (see *Defaults for Time Ranges* in the *Administration* documentation).

Older reports listed in the **Reporting** window of Entire Operations GUI Client are automatically removed after this period or during the next database cleanup (see also the *Administration* documentation).

Examples of Reports

This section contains examples of all types of reports you can generate with the **Reporting** function:

- Example of Log - Terminated Jobs
- Example of Log - Abended Jobs
- Example of Log - Jobs not started
- Example of Log - Jobs with permanent errors
- Example of Log – Networks not activated
- Example of Accounting Information
- Example of Network Description (short)
- Example of Network Description (detailed)
- Example of Schedule of Jobs
- Example of Network Start Summary
- Example of Network Schedule Overview
- Example of Activation Overview
- Example of Compare Symbol Tables
- Example of Compare Networks
- Example of Node Overview
- Example of Network/Job Usage
- Example of Network Start Overview (Bar Chart)
- Example of Network and Job Start Overview (Bar Chart)
- Example of Network Schedule Overview (Bar Chart)
- Example of Monitor Tasks and Exits Overview

- [Example of Monitor Tasks and Functions Overview](#)

Example of Log - Terminated Jobs

The following is an example of the report type **Log - Terminated Jobs**:

Log - Terminated Jobs

Generation Date: 2018-10-31 - 12:20:56

| Owner | Network | Job | Run | Date | Time | Message |
|-------|--------------|-------|-----|------------|----------|-----------------------------|
| DEMO | DEMO1 <eins> | JOB1 | 29 | 2018-10-31 | 12:18:00 | JCL Check ok |
| DEMO | DEMO1 <eins> | JOB1 | 29 | 2018-10-31 | 12:18:00 | JCL Check ok |

| DEMO | DEMO2 | JOB1Y | 13 | 2018-10-31 | 12:18:00 | Ended ok |

The columns contained in the report are described in [Fields and Columns: Reports](#).

Example of Log - Abended Jobs

The following is an example of the report type **Log - Abended Jobs**:

Log - Abended Jobs

Generation Date: 2018-10-31 - 13:26:29

| Owner | Network | Job | Run | Date | Time | Message |
|-------|--------------|------|-----|------------|----------|---|
| DEMO | DEMO1 <eins> | JOB6 | 28 | 2018-10-31 | 12:18:00 | Ended not ok |
| DEMO | DEMO1 <eins> | JOB6 | 28 | 2018-10-31 | 12:18:00 | Ended not ok - STEP01 C0009 (> default C0008) |

The columns contained in the report are described in [Fields and Columns: Reports](#).

Example of Log - Jobs not started

The following is an example of the report type **Log - Jobs not started**:

Log - Jobs not started

Generation Date: 2018-10-31 - 13:31:38

| Owner | Network | Job | Run | Date | Time | Message |
|-------|--------------|------|-----|------------|----------|---|
| DEMO | DEMO1 <eins> | JOB1 | 28 | 2018-10-31 | 12:18:00 | +BDE-KKL - 0 - ABS not found |
| DEMO | DEMO1 <eins> | JOB1 | 28 | 2018-10-31 | 12:18:00 | ... referenced Run: -1 |
| DEMO | DEMO1 <eins> | JOB2 | 28 | 2018-10-31 | 12:18:00 | JCL Load - ESY5995 File not in catalog. |
| DEMO | DEMO1 <eins> | JOB2 | 28 | 2018-10-31 | 12:18:00 | ... TST.NOP542.JOBS/FTPNOPCF |
| DEMO | DEMO1 <eins> | JOB2 | 28 | 2018-10-31 | 12:18:00 | JCL Load Error occurred |

The columns contained in the report are described in [Fields and Columns: Reports](#).

Example of Log - Jobs with permanent errors

The following is an example of the report type **Log - Jobs with permanent errors**:

Log - Jobs with permanent errors

Generation Date: 2018-10-31 - 13:39:17

| Owner | Network | Job | Run | Date | Time | Message |
|-------|--------------|------|-----|------------|----------|---|
| DEMO | DEMO1 <eins> | JOB2 | 28 | 2018-10-31 | 12:18:00 | JCL Load - ESY5995 File not in catalog. |
| DEMO | DEMO1 <eins> | JOB2 | 28 | 2018-10-31 | 12:18:00 | ... TST.NOP542.JOBS/FTPNOPCF |
| DEMO | DEMO1 <eins> | JOB2 | 28 | 2018-10-31 | 12:18:00 | JCL Load Error occurred |
| DEMO | DEMO1 <eins> | JOB2 | 28 | 2018-10-31 | 12:18:00 | JCL Load - ESY5995 File not in catalog. |
| DEMO | DEMO1 <eins> | JOB5 | 28 | 2018-10-31 | 12:18:00 | JCL Load - ESY5995 File not in catalog. |

The columns contained in the report are described in [Fields and Columns: Reports](#).

Example of Log – Networks not activated

The following is an example of a **Log – Networks not activated** report:

Log - Networks not activated

Generation Date: 2018-10-31 - 13:56:44

| Owner | Network | Job | Run | Date | Time | Message |
|---------|----------|-----|-----|------------|----------|--|
| EXAMPLE | B60-FLOW | - | 478 | 2018-10-30 | 14:34:00 | Calendar EXAMPLE/EXAMPLECAL undefined for 2018 |
| EXAMPLE | B60-FLOW | - | 480 | 2018-10-30 | 14:51:00 | Calendar EXAMPLE/EXAMPLECAL undefined for 2018 |
| EXAMPLE | B60-FLOW | - | 481 | 2018-10-30 | 14:52:00 | Calendar EXAMPLE/EXAMPLECAL undefined for 2018 |

The columns contained in the report are described in [Fields and Columns: Reports](#).

Example of Accounting Information

The following is an example of the report type **Accounting Information**:

Accounting Information

Generation Date: 2019-02-07 - 16:20:43

Owner: EXAMPLE Network: E01-CONTI

| Job | Run | Step | JobId | Start | Stop | Elapsed min | CPU Time sec | |
|--------------------------------------|-----|------|--------|---------------------|---------------------|-------------|--------------|------|

- TES-SYNC

See also the section [Using Reports with Monitor Task Time Tables](#) for information on how to handle task time tables.

Generating Batch Reports

You can use the batch command client of Entire Systems Management to generate a report in batch mode: see [Commands for the Batch Command Client](#) in the section *Using Entire Operations in Batch Mode*.

XVIII

Cross-References

56 Cross-References

- Types of Cross-Reference Reports 758
- Generating Cross-Reference Reports Online 759
- Fields and Columns: Cross-References 768
- Examples of Cross-Reference Reports 773
- Generating Cross-Reference Reports in Batch 776

The **Cross-References** function is used to cross-check the use of individual Entire Operations objects and produce a report from the data found.

This section describes how to generate cross-reference reports in online and batch mode.

Related Topic:

- For general information on using reports, see [Generating or Regenerating Online Reports](#) in the section [Reporting](#).

Types of Cross-Reference Reports

The types of cross-references you can select from the **Cross-References window** are described in the following table.

| Report Type | Description |
|--------------------------------|--|
| Exit Usage | Lists user exits defined in your environment. See also Example of User Exit Usage . |
| Symbol Table Usage | Lists symbol tables used in networks and jobs. Note: The cross-reference for symbol tables includes the symbol table usage for input conditions and for End-of-Job symbol settings. See also Example of Symbol Table Usage . |
| Symbol and Symbol Value Search | Lists symbols that match a specified value. See also Example of Symbol and Symbol Value Search . |
| JCL Usage | Lists JCL files used in networks and jobs. See also Example of JCL Usage . |
| Node Usage | Lists JCL nodes and execution nodes used in networks. See also Example of Node Usage . |
| Resource Usage | Lists resources used by active jobs. See also Example of Resource Usage . |
| List Undefined Objects | Lists objects that are referenced by other objects which are not defined in your environment. The missing definition of these objects might lead to errors during network activation. Note: JCL is not inspected for undefined symbols. See also Example of List Undefined Objects . |

Generating Cross-Reference Reports Online

This section describes how to generate cross-reference reports online.

Report data is evaluated for the current day by default. If you want to change the evaluation date, use the **Determination Date** function described in the section *Reporting*.

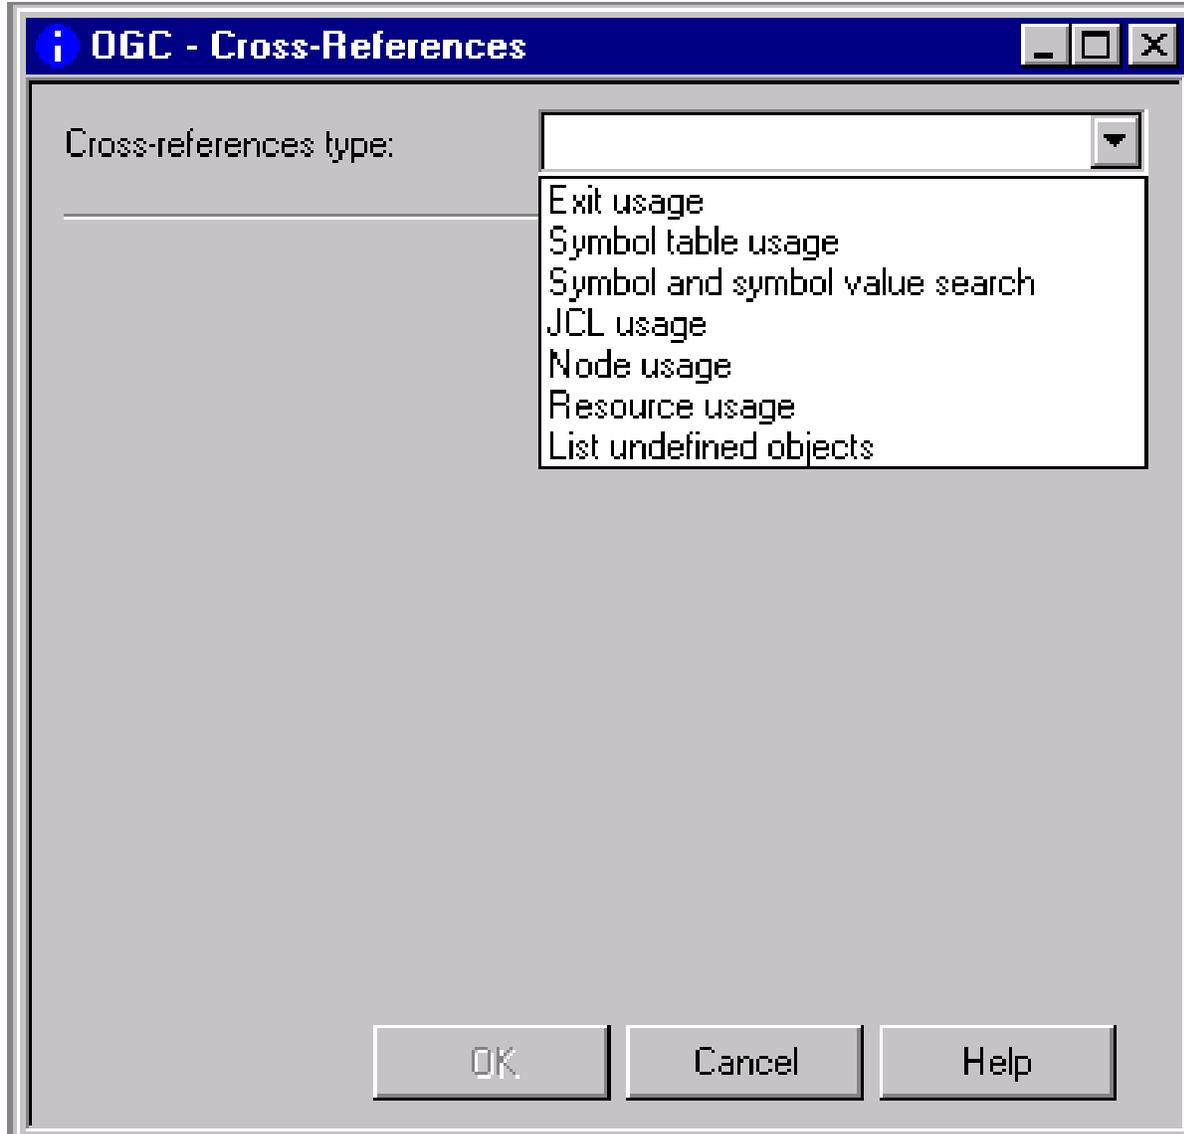

➤ To generate a cross-reference report

- 1 In the object workspace, select the **General** node and choose **Cross-References** from the context menu.

Or:

In the **Command** input field, type `XREF` (see *Direct Commands*) and press ENTER.

A **Cross-References** window opens where you can select a cross-reference type from the drop-down list box:

- 2 Select the **type of cross-reference** for which you want to generate a report.

Depending on the report type selected, proceed as described in the relevant step for

[Exit Usage](#)

[Symbol Table Usage](#)

[Symbol and Symbol Value Search](#)

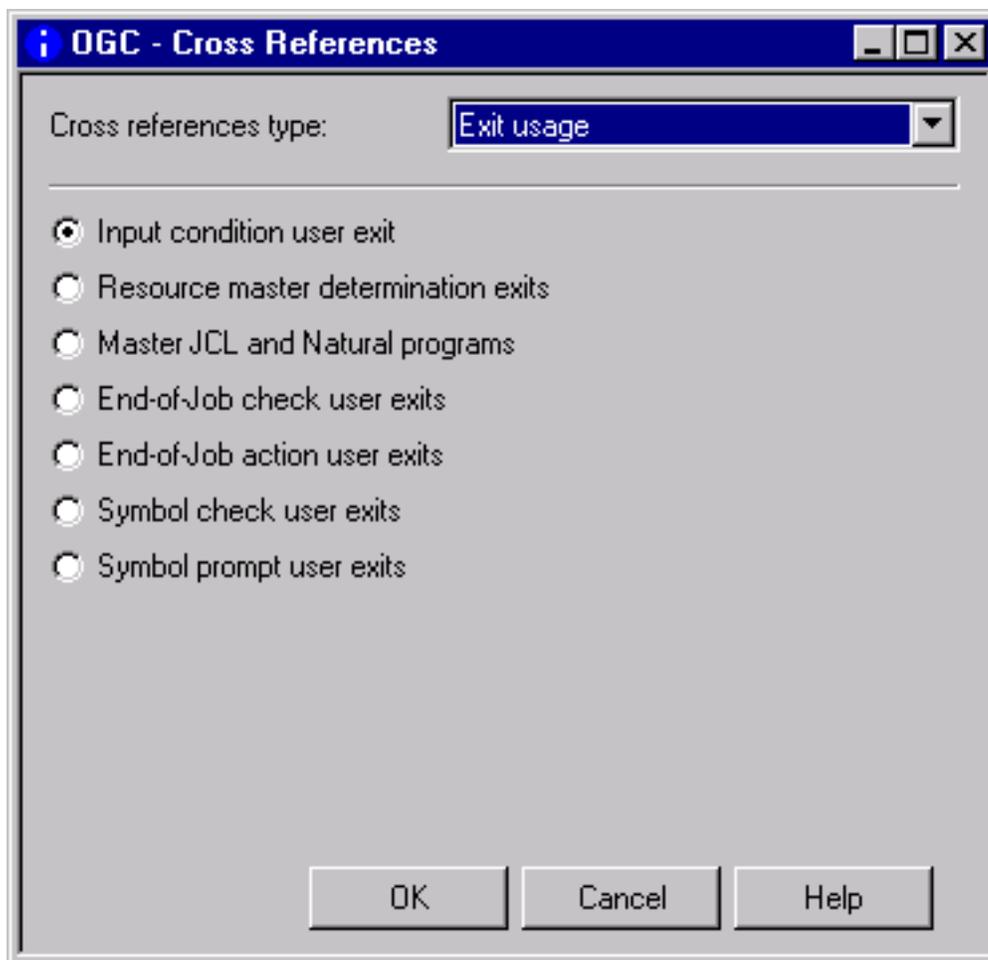

[JCL Usage](#)

[Node Usage](#)

[Resource Usage](#)

[List Undefined Objects](#)

- 3 **Exit Usage:** If you select **Exit usage** from the **Cross-References window**, a selection list of user exit types similar to the example below appears:

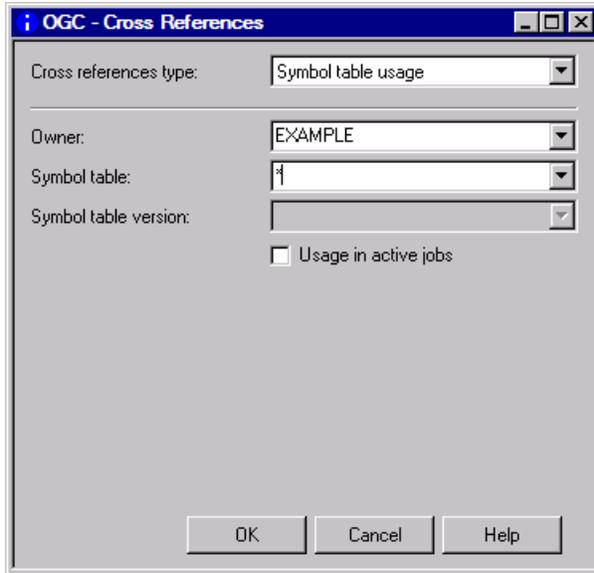

Select the required type and choose **OK**.

In the **Save as File** dialog that opens, specify the output file to be produced for the report as described in [Report Output Options](#) (section *Reporting*), and choose **OK**.

A report with a list of used user exits is generated into the output file as shown in [Example of User Exit Usage](#).

- 4 **Symbol Table Usage:** If you select **Symbol table usage** from the [Cross-References window](#), input fields appear as shown in the following example:

Specify the selection criteria required for the report to be produced. For valid input values, see [Fields and Columns: Cross-References](#). When you are finished, choose **OK**.

In the **Save as File** dialog that opens, specify the output file to be produced for the report as described in [Report Output Options](#) (section *Reporting*), and choose **OK**.

A report with a list of used symbol tables is generated into the output file as shown in [Example of Symbol Table Usage](#).

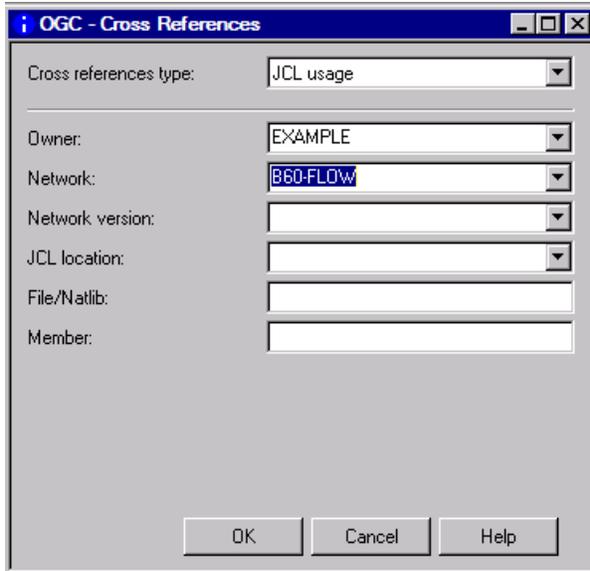

- 5 **Symbol and Symbol Value Search:** If you select **Symbol and symbol value search** from the [Cross-References window](#), input fields appear as shown in the following example:

Specify the selection criteria required for the report to be produced. For valid input values, see [Fields and Columns: Cross-References](#). When you are finished, choose **OK**.

In the **Save as File** dialog that opens, specify the output file to be produced for the report as described in [Report Output Options](#) (section *Reporting*), and choose **OK**.

A report with a list of used symbols is generated into the output file as shown in [Example of Symbol and Symbol Value Search](#).

- 6 **JCL Usage:** If you select **JCL usage** from the [Cross-References window](#), input fields appear as shown in the following example:

Specify the selection criteria required for the report to be produced. For valid input values, see [Fields and Columns: Cross-References](#). When you are finished, choose **OK**.

In the **Save as File** dialog that opens, specify the output file to be produced for the report as described in [Report Output Options](#) (section *Reporting*), and choose **OK**.

A report with a list of used JCL is generated into the output file as shown in [Example of JCL Usage](#).

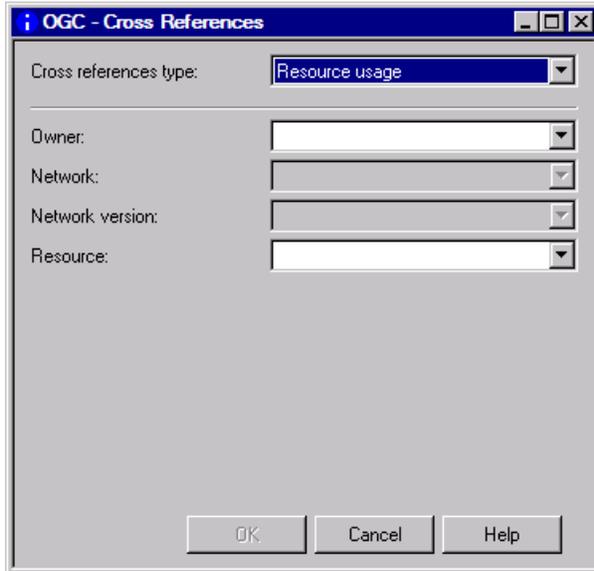

- 7 **Node Usage:** If you select **Node usage** from the [Cross-References window](#), input fields appear as shown in the following example:

Specify the selection criteria required for the report to be produced. For valid input values, see [Fields and Columns: Cross-References](#). When you are finished, choose **OK**.

In the **Save as File** dialog that opens, specify the output file to be produced for the report as described in [Report Output Options](#) (section *Reporting*), and choose **OK**.

A report with a list of used nodes is generated into the output file as shown in [Example of Node Usage](#).

- 8 **Resource Usage:** If you select **Resource usage** from the [Cross-References window](#), input fields appear as shown in the following example:

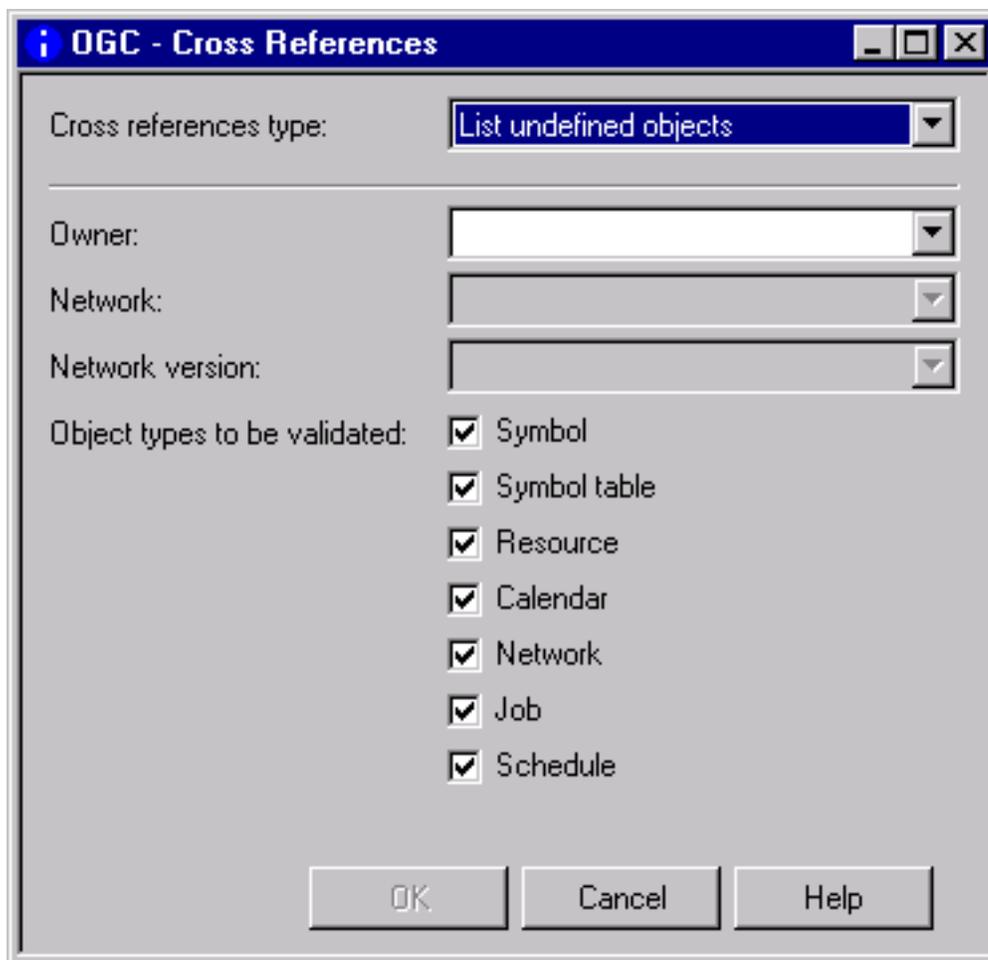

Specify the selection criteria required for the report to be produced. For valid input values, see [Fields and Columns: Cross-References](#). When you are finished, choose **OK**.

In the **Save as File** dialog that opens, specify the output file to be produced for the report as described in [Report Output Options](#) (section *Reporting*), and choose **OK**.

A report with a list of used resources is generated into the output file as shown in [Example of Resource Usage](#).

- 9 **List Undefined Objects:** If you select **List undefined objects** from the [Cross-References window](#), input fields appear as shown in the following example:

Specify the selection criteria required for the report to be produced. For valid input values, see [Fields and Columns: Cross-References](#).

Unmark the object type(s) you do not require. All object types for which you can search are selected by default.

When you are finished, choose **OK**.

In the **Save as File** dialog that opens, specify the output file to be produced for the report as described in [Report Output Options](#) (section *Reporting*), and choose **OK**.

A report with a list of used undefined objects is generated into the output file as shown in [Example of List Undefined Objects](#).

Fields and Columns: Cross-References

The input fields for specifying selection criteria and output options for the cross-reference report to be produced are explained in the following table. The input fields correspond to the columns contained in the report output file.

Depending on the report type (to be) produced, the following fields and columns are available:

| Field/Column | Explanation |
|---------------------------------|---|
| Owner | <p>Name of an owner or a range of names.</p> <p>Specify a valid name or range (see Specifying Filter Criteria) or open a selection window with a list of names.</p> <p>Enter an asterisk (*) to select all names.</p> |
| Network | <p>Name of a network or a range of names.</p> <p>Specify a valid name or range (see Specifying Filter Criteria) or open a selection window with a list of names.</p> <p>Enter an asterisk (*) to select all names.</p> |
| Network version | <p>Name of a network version or a range of names.</p> <p>Specify a valid name or range (see Specifying Filter Criteria) or open a selection window with a list of names.</p> <p>Leave the field blank to select a blank name.</p> <p>Enter an asterisk (*) to select all names.</p> |
| Symbol table | <p>Name of a symbol table or a range of names.</p> <p>Specify a valid name or range (see Specifying Filter Criteria) or open a selection window with a list of names.</p> <p>Enter an asterisk (*) to select all names.</p> |
| Symbol table version | Version of the specified symbol table. |
| Resource | <p>Name of a resource or a range of names.</p> <p>This can reflect real resources or can describe a fictitious resource.</p> <p>Specify a valid name or range (see Specifying Filter Criteria) or open a selection window with a list of names.</p> <p>Enter an asterisk (*) to select all names.</p> |
| Exit Usage reports only: | |
| Job | Name of the job using the user exit. |

| Field/Column | Explanation | |
|---|---|--|
| Exit Library | Name of the library that contains the user exit. | |
| User Exit | Name of the user exit. | |
| Enabled | Indicates whether the user exit is enabled (Yes) or disabled (No) depending on the type of user exit selected. | |
| Background | This column is only shown for symbol prompt exits. It indicates whether symbol prompting runs in the background: | |
| | Y | Symbol prompting runs in the background. |
| | N | A window prompts the user for input. |
| | B | Performs both opens a prompt window and then runs prompting in the background. |
| | See also Specifying User Exits for Symbol Modification . | |
| (User exit selection buttons) | Type of user exit(s) to be selected: Input condition exits Resource master determination exits Master JCL and Natural programs End-of-Job (EOJ) check exits End-of-Job (EOJ) action exits Symbol check exits Symbol prompt exits | |
| Symbol Table Usage reports only: | | |
| Usage in active jobs | Jobs to be searched. | |
| | Possible check-box settings: | |
| | <i>unchecked</i> | Selects job masters only (default). |
| | <i>checked</i> | Selects both job masters and active jobs. |
| JCL Usage reports only: | | |
| JCL location | A supported JCL location. All possible locations are described in List of JCL Locations in the section <i>Job Maintenance</i> . Leave the field blank to select all locations. | |
| File/Natlib | Name of a file or Natural library or a range of names. Specify a valid name or range (see Specifying Filter Criteria). Your range specification can contain more than one leading or trailing asterisk (*). | |

| Field/Column | Explanation | |
|---|--|---|
| Member | Name of a member or a range of names. Specify a valid name or range (see Specifying Filter Criteria) or open a selection window with a list of names. | |
| Node Usage reports only: | | |
| JCL node | Name of a JCL node. Select a name from the drop-down list box or leave the field blank to select all names. | |
| Execution node | Name of an execution node or a range of names. Select a name from the drop-down list box or leave the field blank to select all names. | |
| Operating system class | Operating system under which the JCL or execution node is used. Select an operating system from the drop-down list box or leave the field blank to select all names. | |
| Usage in jobs | Jobs to be selected. | |
| | Possible check-box settings: | |
| | master | Selects job masters only (default). |
| | active | Selects active jobs only. |
| Symbol Search by Value reports only: | | |
| Symbol | Symbol for which to search. Enter an asterisk (*) to select all symbols. | |
| Usage in: Master/Active | Symbols in which to search. Select Master (default) and/or Active to search in master symbols, active symbols, or in both. | |
| Mult. value index: From/To | Index range for symbols to which multiple values are assigned. From: Minimum index value in the range from 1 through 100 To: Maximum index value in the range from 1 through 100 or * for all multiple values available Default range: 1 to * | |
| At position | Position within the symbol value to be searched. | |
| | Possible check-box settings: | |
| | anywhere | Anywhere within the symbol value (default) |
| | <i>nn</i> | At the exact position: <i>nn</i> is any value in the range from 1 through 80 |

| Field/Column | Explanation | |
|--|---|---|
| | at beginning | At the beginning of the symbol value |
| | at end | At the end of the symbol value |
| Scan for | Scan value. Searches in a symbol value for a string of up to 80 characters | |
| Case sensitive | Mark this check box to perform a case-sensitive search. | |
| Undefined Objects reports only: | | |
| <p>This report inspects specified objects (symbol, symbol, table, resource, calendar, network, job and/or schedule) to determine which objects are referenced but not defined in your environment.</p> <p>Note: We recommend that you view this report in Entire Operations GUI Client which provides a graphical structure that helps interpret the output more easily.</p> <p>The columns in the GUI report are arranged in hierarchical order of object types from left (superior objects) to right. The corresponding items in the CUI report are arranged in a reverse order (subordinate object first).</p> | | |
| Object References | Owner | Owner of the network that references the undefined object. |
| | Network | Network and network version (if defined) that references the undefined object. For possible version entries , see Version Defined/Determined . |
| | Object: Type Name Component | Type and name of the object the references the undefined object. If relevant, the component of the referenced object is listed, for example, the input condition of a job. |
| Undefined Object | Owner | Owner of the undefined object. If this column is empty or if it contains (same), the owner name is identical to Owner in the Object References section. |
| | Parent: Type Name | Type and name of the object that references the undefined object. If the Name column is empty or if it contains (same), the object name is identical to Name in the Object References section. |
| | Version Defined | Version defined for the referenced Parent . Possible version entries are: (current) Current object version. (nv) Network version. (svn) Symbol table version of the network. (svj) Symbol table version of the job. |

| Field/Column | | Explanation |
|-------------------------------------|---|---|
| | Version Determined | <p>A report is generated for the current date by default. If you schedule the report to run on a different date, the object version valid on this date is listed in this column.</p> <p>See also determination date in the section <i>General Functions and Metanode General</i>.</p> |
| | Object: Type Name | Type and name of the undefined object. |
| | Version Defined Version Determined | <p>Version defined for the undefined object.</p> <p>If a determination date is set for the cross-reference report (see also <i>General Functions and Metanode General</i>), the version defined for the undefined object on the given specified is listed in Version Determined. (void) denotes that a version is defined for the object but was not be found on the specified determination date.</p> |
| Resource Usage reports only: | | |
| Type | Type of resource. | |
| | Possible values: | |
| | U | Not reusable, quantitative. |
| | R | Reusable, quantitative. |
| | N | Not quantitative (absolute). |
| Quantity - Initial | <p>Initial quantity.</p> <p>Total amount of the resource defined to the system.</p> | |
| Quantity - Used | <p>Used quantity.</p> <p>Amount of resource currently used by running job.</p> | |
| Used by Owner | The active job, used by owner. | |
| Used by Network | The active job, used by network. | |
| Run | Run job. | |
| Job | Active job. | |
| Begin | Date and time of the allocation. | |

Examples of Cross-Reference Reports

This section contains examples of all types of reports you can generate with the **Cross-References** function:

- [Example of User Exit Usage](#)
- [Example of Symbol Table Usage](#)
- [Example of Symbol and Symbol Value Search](#)
- [Example of JCL Usage](#)
- [Example of Node Usage](#)
- [Example of Resource Usage](#)
- [Example of List Undefined Objects](#)

Example of User Exit Usage

The following is an example of a cross-reference report for **Exit Usage**:

Input condition user exit

Generation Date: 2020-01-22 - 15:35:18

| Owner | Network | Job | Exit Library | User Exit |
|----------|----------|-----------|--------------|-----------|
| EXAMPLE | E50-USRT | E50-J1-IC | SYSEORU | URD-UIC |
| INCIDENT | I5045008 | I50450081 | EOR-T531 | I5045008 |
| NATQA5 | A | WILLI1 | NOPNET | AAEVIT1 |

All user exits of the specified type (here: input condition) and the jobs that reference these exists are listed in the report.

The columns contained in the report are described in [Fields and Columns: Cross-References](#).

Example of Symbol Table Usage

The following is an example of a cross-reference report for **Symbol Table Usage**:

Symbol table usage

Determination Date: 2020-01-23

Generation Date: 2020-01-23 - 08:52:15

Symbol Table Owner: EXAMPLE Symbol Table: EXA-TABLE

| Owner | Network | Run | Job |
|---------|----------|-----|----------|
| EXAMPLE | EXA-NET1 | | EXA-JOB3 |
| EXAMPLE | EXA-NET3 | | EXA-JOB3 |

Symbol Table Owner: EXAMPLE Symbol Table: EXAM-ST 1

| Owner | Network | Run | Job |
|---------|----------|-----|---------|
| EXAMPLE | B60-FLOW | | JOB-JCL |
| EXAMPLE | E51-MAIL | | |

All networks and jobs that use the specified symbol table are listed in the report.

The columns contained in the report are described in [Fields and Columns: Cross-References](#).

Example of Symbol and Symbol Value Search

The following is an example of a cross-reference report for **Symbol and Symbol Value Search**:

Symbol and symbol value search

Determination Date: 2020-01-23

Generation Date: 2020-01-23 - 09:01:20

| Owner | Symbol Table | Symbol | MV | Format | Network | Run | Symbol Value |
|---------|--------------|----------|----|--------|---------|-----|------------------|
| EXAMPLE | DEMO <v1> | FILE-1 | | A | | | EOR.DEMO.SRCE |
| EXAMPLE | DEMO <v2> | FILE-1 | | A | | | EOR.DEMO.SRCE |
| EXAMPLE | DEMO <v2> | X | | A | | | 99 |
| EXAMPLE | E20-ST | CLASS | | A | | | G |
| EXAMPLE | E20-ST | JOBLIB | | A | | | NOP.EXAMPLE.LOAD |
| EXAMPLE | E20-ST | MSGCLASS | | A | | | X |
| EXAMPLE | E20-ST | STEPLIB | | A | | | NOP.EXAMPLE.LOAD |

All symbols defined in the specified symbol table are listed in the report.

The columns contained in the report are described in [Fields and Columns: Cross-References](#).

Example of JCL Usage

The following is an example of a cross-reference report for **JCL Usage**:

JCL usage

Generation Date: 2020-01-23 - 09:06:23

Owner: EXAMPLE

| Network | Job | Job Type | Node | JCL Location | File/Member |
|----------|---------|----------|------|--------------|-----------------|
| B60-FLOW | JOB-JCL | JOB | 148 | MAC | SYSEORU E60-M02 |
| B60-FLOW | JOB-01 | NAT | 148 | NAT | SYSEORU ALL1338 |
| B60-FLOW | JOB-012 | JOB | 31 | MAC | SYSEORU B60-M01 |
| B60-FLOW | JOB-013 | JOB | 31 | MAC | SYSEORU B60-M01 |
| B60-FLOW | JOB-014 | JOB | 31 | MAC | SYSEORU B60-M01 |
| B60-FLOW | JOB-019 | JOB | 31 | MAC | SYSEORU B60-M01 |
| B60-FLOW | JOB-02 | JOB | 31 | MAC | SYSEORU B60-M02 |

All JCL files and referencing jobs are listed for the specified selection.

The columns contained in the report are described in [Fields and Columns: Cross-References](#).

Example of Node Usage

The following is an example of a cross-reference report for **Node Usage**:

Node usage

Generation Date: 2020-01-23 - 17:34:25

| Owner | Network | Run | Job | Job Type | JCL Node | Execution Node |
|---------|----------|-----|---------|----------|----------|----------------|
| EXAMPLE | B60-FLOW | | JOB-JCL | JOB | 148 | 148 |
| EXAMPLE | B60-FLOW | | JOB-01 | NAT | 148 | 31 |
| EXAMPLE | B60-FLOW | | JOB-012 | JOB | 31 | 31 |
| EXAMPLE | B60-FLOW | | JOB-013 | JOB | 31 | 31 |
| EXAMPLE | B60-FLOW | | JOB-014 | JOB | 31 | 31 |
| EXAMPLE | B60-FLOW | | JOB-015 | DUM | 31 | 31 |
| EXAMPLE | B60-FLOW | | JOB-019 | JOB | 31 | 31 |
| EXAMPLE | B60-FLOW | | JOB-02 | JOB | 31 | 31 |

All nodes and referencing jobs are listed for the specified selection.

The columns contained in the report are described in [Fields and Columns: Cross-References](#).

Example of Resource Usage

The following is an example of a cross-reference report for **Resource Usage**:

Resource usage

Generation Date: 2020-01-23 - 17:43:52

| Resource | Type | Quantity | | Owner | Network | Used by | | |
|--------------|------|----------|------|---------|----------|---------|---------|-------------------------|
| | | Initial | Used | | | Run | Job | Begin |
| HUGO | U | 2.00 | 1.00 | SAGTEST | B60-FLOW | 11416 | JOB-015 | 2019-12-04 - 15:58:19.9 |
| HUGO | U | 2.00 | 1.00 | SAGTEST | B60-FLOW | 11418 | JOB-015 | 2019-12-04 - 15:58:20.2 |
| TESTRESOURCE | R | 50.00 | 5.00 | SAGTEST | B60-FLOW | 11416 | JOB-015 | 2019-12-04 - 15:58:19.9 |
| TESTRESOURCE | R | 50.00 | 5.00 | SAGTEST | B60-FLOW | 11418 | JOB-015 | 2019-12-04 - 15:58:20.2 |

All resources and referencing active jobs are listed for the specified selection.

The columns contained in the report are described in [Fields and Columns: Cross-References](#).

Example of List Undefined Objects

The following is an example of a cross-reference report for **List Undefined Objects**:

List undefined objects

Determination Date: 2020-01-14

Generation Date: 2020-01-14 - 16:01:00

| Object References | | | | | Undefined Object | | | | | | | |
|-------------------|----------|---------|--------|-----------|------------------|---------|-----------------|------------|---------------------|-----------|-----------------|------------|
| Owner | Network | Object | | | Owner | Parent | Object | | | Object | | |
| | | Type | Name | Component | Type | Name | Version Defined | Determined | Type | Name | Version Defined | Determined |
| EXAMPLE | B60-FLOW | Network | Master | | EXAMPLE | | | | Symbol Table Master | SYMB-TEST | | |
| EXAMPLE | B60-FLOW | Job | Master | JOB-01 | Input Condition | EXAMPLE | | | Network Master | SAGTEST | | |

All objects that are referenced but not defined in your environment are listed in the report. In the example above, the following objects of the owner EXAMPLE are missing:

- The symbol table SYMB-TEST is not defined but referenced by the network B60-FLOW.
- The network SAGTEST is not defined but referenced in the input condition COND-SW of the job JOB-01 in the network B60-FLOW.

The columns contained in the report are described in [Fields and Columns: Cross-References](#).

Generating Cross-Reference Reports in Batch

You can use the batch command client of Entire Systems Management to generate a report in batch mode: see [Commands for the Batch Command Client](#) in the section *Using Entire Operations in Batch Mode*.

XIX

API Routines

This section describes the Application Programming Interface (API) routines provided by Entire Operations for batch and online processing.

[Purpose and Use of Entire Operations APIs](#)

[Available Entire Operations APIs](#)

57

Purpose and Use of Entire Operations APIs

| | |
|---|-----|
| ▪ Features Provided by Entire Operations APIs | 780 |
| ▪ Locating and Implementing an API | 780 |
| ▪ API Usage Rules and Restrictions | 781 |
| ▪ Testing Available API Routines | 782 |
| ▪ API-specific Parameter Definitions | 783 |

Features Provided by Entire Operations APIs

An API can be used for accessing Entire Operations data and/or performing Entire Operations functions from any Natural application.

An API provides the following features:

- Dynamic connection to the Entire Operations data file;
- Access to conditions;
- Access to symbols;
- Writing to the Entire Operations log.

An API can be used for a number of purposes within and outside Entire Operations. Among them are:

- Dynamic modification of symbol tables during the execution of a job network;
- Modification of conditions from Natural programs;
- Exchanging information between Entire Operations and any other online or batch application;
- Setting input conditions for job networks from online applications;
- Inquiring the status of job networks from applications;
- Setting Entire Operations symbols from external tables;
- Inquiring Entire Operations symbols for use in external applications.

Locating and Implementing an API

An Entire Operations API (Application Programming Interface) routine is supplied as a Natural subprogram in the Natural SYSEOR system library.

The naming convention for an API subprogram is usually as follows:

`NOPUxxx y`

where `NOPU` means Entire Operations User API Routine, `xxx` is the program name (sometimes containing a version number) and `y` is the program type (N - subprogram, P - program).

➤ To make use of an API

- Call the API subprogram from a Natural program that executes a `CALLNAT` statement using the following syntax:

```
CALLNAT 'NOPUxxxN' parameters
```

where *parameters* represents the individual API parameters that can be passed to the API subprogram. See also [API-specific Parameter Definitions](#).

The CALLNAT statement is described in detail in the *Natural Statements* documentation.

API Usage Rules and Restrictions

The following general rules apply when using an API:

- We recommend that you do not rename API routines because they are also used internally by Entire Operations.
- The routines delivered with the previous Entire Operations version are still supported (except for special notice, and only if they are delivered again with the current SYSEOR library). Convert their calls to the newer version when you modify the calling programs. Change all relevant CALLNAT statements and adapt the API parameter list. The complete range of functions and functionality is only available with the latest API version.
- Entire Operations internal data structures are subject to change between versions. The usage of an outdated API may cause data inconsistencies, unexpected Monitor failures or abnormal termination of Entire Operations.
- With newer API versions, new fields might have been added. You may leave these fields blank or zero if their description says “reserved for future use”. These fields are intended to become meaningful with a future Entire Operations version.
- No END TRANSACTION statement will be executed inside of Entire Operations APIs.
- If you invoke APIs from within an Entire Operations user exit, you must not code any END TRANSACTION statement within the exit. Refer to the user exit coding rules.
- If you invoke APIs from anywhere else than an Entire Operations user exit, you must code an END TRANSACTION statement in an appropriate location after the CALLNAT statement to close Entire Operations transaction logic.
- You can change the parameter names, but not the parameter format, number and order.

API Access Restrictions

If Natural Security is installed, you can restrict Natural RPC access to particular APIs. For more information, see the **Service Protection** option of an RPC server profile described in the section *Allowing/Disallowing Services* in the *Natural Security* documentation.

Testing Available API Routines

You can execute the Natural NOPUT1-P program to find out how API routines react to real data. It shows how to code the calls of the supplied routines, and how to check the return codes.

The source and the cataloged object of NOPUT1-P are supplied in the SYSEOR system library.

When you execute the program NOPUT1-P, you can select and test the required API routine from a screen similar to the example below:

```

Entire Operations - API Routines

Please Select:
Network / Job Status      ST      NOPUST3N
Conditions                CO      NOPUCN3N
Resource Master          RM      NOPURS1N
Resource Usage           RU      NOPURE2N
Symbols                  SY      NOPUSY7N
Calendars/Schedules     CS      NOPUCS1N
Activation               AC      NOPUAC5N
Milestone                MI      NOPUMI1N
Subnetwork               SN      NOPUSN2N
Job Import               JI      NOPUJI4N
Version Info             VE      NOPUVI2N
Symbol Prompt Texts     SP      NOPUSP3N
Job Schedule             SC      NOPUJS2N
Log Monitor Activity     LM      NOPMLA1N
Active Job Statistics    AS      NOPUAS1N
Message Text             MT      NOPUMT3N
====>  _  (blank or . or PF3 ==> End)
    
```

API-specific Parameter Definitions

The parameters that can be passed to an API subprogram with the `CALLNAT` statement are described for each API in the section [Available Entire Operations APIs](#).

The data types listed in the individual parameter description of an API represent the Natural data format and length, for example, `A1` for an alphanumeric variable with a one-byte length. For details, see *User-Defined Variables* in the *Natural Programming Guide*.

By default, parameters are passed to an API subprogram *by reference*, that is, the data is transferred via address parameters, the parameter values themselves are not moved. The parameter descriptions indicate parameters that are defined with `BY VALUE`, `BY VALUE RESULT` and/or `OPTIONAL`.

OPTIONAL

For a parameter defined with `OPTIONAL`, a value can, but need not be supplied.

Since the parameter sequence is fixed, usually a value must be passed from the calling program to each parameter. However, a parameter defined with `OPTIONAL`, can be skipped by substituting it with `1X` in the `CALLNAT` statement as indicated in [Example of Using `NOPUST3N`](#).

BY VALUE

A parameter defined with `BY VALUE` is passed to the API subprogram by value; that is, the actual parameter value (instead of its address) is passed. Consequently, the field in the subprogram need not have the same format/length as the parameter passed in the `CALLNAT` statement.

BY VALUE RESULT

A parameter defined with `BY VALUE RESULT` is passed by value in both directions; that is, the actual parameter value is passed from the calling program to the API subprogram and, on return to the calling program, the actual parameter value is passed from the subprogram back to the calling program.

For further information, refer to *Defining Parameter Data* in the *DEFINE DATA* section of the *Natural Statements* documentation.

58

Available Entire Operations API Routines

| | |
|---|-----|
| ▪ EORUCB1N: Check Use of BS2000 User IDs | 786 |
| ▪ NOPFB2-N: Generate SYSOUT File Names for BS2000 | 786 |
| ▪ NOPMLA1N: Start and Stop the Monitor Activity Log | 789 |
| ▪ NOPU--1N: Read Network Available to a Specific User | 790 |
| ▪ NOPU--2N: Return all Usable Symbol Tables for a Network | 791 |
| ▪ NOPU--3N: Get Correlation ID for an Activated Network | 792 |
| ▪ NOPU--4N: Store New Event in Entire Operations System File | 792 |
| ▪ NOPUAC5N: Activate Job Networks or Jobs | 793 |
| ▪ NOPUAS1N: Retrieve Numbers of Active Jobs in Defined Status Ranges | 797 |
| ▪ NOPUCN3N: Access Entire Operations Conditions | 798 |
| ▪ NOPUCS1N: Access Calendars and Schedules | 799 |
| ▪ NOPUJ4N: Import Operating System Jobs into the Active Queue | 803 |
| ▪ NOPUJS2N: Job Schedule Inquiry and Modification | 804 |
| ▪ NOPULW9N: Write Messages to System Automation Tools Log | 806 |
| ▪ NOPUMI1N: Set/Reset Text Milestones in Master and Active Jobs | 807 |
| ▪ NOPUMT3N: Expand Message Texts | 809 |
| ▪ NOPUNI1N: Invalidate Entire System Server Node Table Entries | 810 |
| ▪ NOPUNX1N: Entire System Server Calls to Access UNIX and Windows Files | 811 |
| ▪ NOPURE2N: Handle Resource Allocations | 821 |
| ▪ NOPURS1N: Access Entire Operations Resource Masters | 824 |
| ▪ NOPUSN2N: Inquire Calling Job or Called Network for Subnetworks | 826 |
| ▪ NOPUSP3N: Display Long Texts for Symbol Prompting | 828 |
| ▪ NOPUST3N: Inquire Network and Job Status, Symbol Table | 829 |
| ▪ NOPUSY7N: Access Entire Operations Symbols | 833 |
| ▪ NOPUVI2N: Obtain Entire Operations Version Information | 838 |
| ▪ NOPUXD1N: Maintain End-of-Job User Exits for a Network | 839 |
| ▪ NOPUXI0N: Add Input Condition to an Activated Job | 841 |

EORUCB1N: Check Use of BS2000 User IDs

You can use the exit EORUCB1N contained in the library SYSEORU for a user-defined check if Natural users are allowed to use BS2000 user IDs.

Meaning of the input and output fields:

Parameter Description

| Parameter | Format/Length | Use |
|-----------------|---------------|---|
| P-RC | N4 | out Return code (not evaluated, should be 0). |
| P-RT | A70 | out Return text (not evaluated). |
| P-USER | A8 | in *USER in Natural. |
| P-BS2000-USERID | A8 | in BS2000 user ID. |
| P-ACCOUNT | A8 | in BS2000 account number. |
| P-SUBMIT-PSWD | A8 | in BS2000 submit password. |

In the following you find the example of the exit EORUCB1N delivered with Entire Operations which you can adapt according to your needs. The exit always returns P-RC=0 (authorized).

Example

```
* NOPFB2-N
END
```

NOPFB2-N: Generate SYSOUT File Names for BS2000

The exit NOPFB2-N may be copied into the library SYSEOR to enable the user-defined generation of SYSOUT file names in BS2000. Only one instance of this exit exists in the system and it is executed only if it is present. Otherwise, standard name generation is used.

This exit is called with the parameter list [NOPXPL-A](#), so the first line of the exit must be:

DEFINE DATA PARAMETER USING NOPXPL-A

This section covers the following topics:

- [Parameter Description](#)
- [Rules for Exit Coding](#)
- [Use with Work File Deletion](#)
- [Example](#)

Parameter Description

Meaning of the parameters in [NOPXPL-A](#):

| Parameter | Format/Length | Use | | |
|-------------------|---------------|-----|---|--|
| P-CALL-PLACE | A3 | in | Constant FSB (file name SYSOUT BS2000). | |
| P-RC | N4 | out | Return code: | |
| | | | 0 | Function OK (name generation OK). |
| | | | 1 | A name could not be generated. The default name routine of Entire Operations is to be called. |
| | | | 2 | A name could not be generated. The action (activation) is to be cancelled. |
| | | | If the activation is cancelled by means of the name routine, a corresponding log entry will be written. | |
| P-RT | A66 | out | Return code (not evaluated). | |
| P-OWNER | A10 | in | Network owner. | |
| P-NETWORK | A10 | in | Job network. | |
| P-JOB | A10 | in | Job. | |
| P-RUN | P13 | in | Run number. | |
| P-ACTIVATION-TIME | T | in | Activation time of the network. | |
| P-EXECUTION-NODE | N3 | in | Entire System Server execution node. | |
| P-EXECUTION-OPSYS | A8 | in | Operating system of Entire System Server node. | |
| P-SYMBOL-TABLE | A10 | in | Name of the defined symbol table. | |
| P-FSB-OBJECT-TYPE | A5 | in | File type: | |
| | | | S0-C | Current SYSOUT file. |
| | | | S0-P | Previous SYSOUT file. |
| | | | S0-P1 | Previous SYSOUT file without user ID. |

| Parameter | Format/Length | Use | |
|---------------|---------------|-----|------------------------------------|
| | | | S0-A All SYSOUT files of a job. |
| P-FSB-USERID | A8 | in | BS2000 user ID. |
| P-FSB-CATID | A4 | in | BS2000 Cat ID. |
| P-FSB-SUFFIX | A2 | in | BS2000 suffix. |
| P-SYSOUT-FILE | A54 | out | Generated file name. |

Rules for Exit Coding

- File names must be created which are unique system-wide. Otherwise, the proper running of Entire Operations is no longer possible.
- File names which are unique system-wide can be produced by using the fields P-OWNER, P-NETWORK, P-RUN, P-JOB and P-FSB-SUFFIX simultaneously.
- You must be able to process all object types defined above.
- Except for the object type S0-P1, a fully-qualified file name must be created which includes the BS2000 user ID.
- A wildcard file entry valid for all SYSOUT files of an active job must be created for the type S0-A. This type is used for deleting files.
- The field P-FSB-SUFFIX is transferred and must be used to differentiate SYSOUT files when jobs are repeated. The caller ensures that the suffix for the currently active job is unique. For the object type S0-C, this field is blank.

Note: If no file name is returned, then standard name generation is used.

Use with Work File Deletion

Even in case of work file deletion (in connection with deactivation or cleanup) this exit is called, if it exists at all. The following will apply in this context:

- At any rate, an attempt is made to also delete work files, which correspond to the default name conventions of Entire Operations, independent of the existence of the exit.
- It is presumed that the exit will generate the run number with exactly 5 digits, which are enclosed by dots:
 - aaa.00000.bbb (example: aaa.01234.bbb)

For the Entire Operations file search, this pattern is replaced by a wildcard:

- aaa.00000.bbb --> aaa.*.bbb
- If the name syntax of the exit is modified, files cannot be found any longer, the names of which have been generated before the modification. It is not recommended to exchange the exit, while active jobs are running in the operating system.

Example

```

* NOPFB2-N
* EXAMPLE EXIT FOR SYSOUT FILE NAME
*
* MODIFICATIONS:
* 29.10.08 (139240) SYSOUT FILE NAME EXIT                               SN210
* -----
DEFINE DATA PARAMETER USING NOPXPL-A
END-DEFINE
* -----
COMPRESS P-OWNER P-NETWORK P-RUN P-JOB
  INTO P-SYSOUT-FILE LEAVING NO SPACE
IF P-FSB-OBJECT-TYPE NE 'SO-P1'
* -- ALL OBJECT TYPES EXCEPT SO-P1 M U S T HAVE A BS2000 USERID --
  COMPRESS '$' P-FSB-USERID '.' P-SYSOUT-FILE
    INTO P-SYSOUT-FILE LEAVING NO SPACE
END-IF
IF P-FSB-OBJECT-TYPE EQ 'SO-A'
* -- ALL SYSOUT FILES FOR A JOB --
  COMPRESS P-SYSOUT-FILE '*'
    INTO P-SYSOUT-FILE LEAVING NO SPACE
ELSE
  COMPRESS P-SYSOUT-FILE '.S' P-FSB-SUFFIX
    INTO P-SYSOUT-FILE LEAVING NO SPACE
END-IF
RESET P-RC          /* OK
END

```

NOPMLA1N: Start and Stop the Monitor Activity Log

You can start and stop the monitor activity log using the following calls from your Natural application.

```

CALLNAT 'NOPMLA1N'
P-FUNCTION

```

Parameter Description

| Parameter | Format/Length | Use |
|------------|---------------|--------------------------------------|
| P-FUNCTION | A1 | in Function code: |
| | | Y Starting the monitor activity log. |
| | | N Stopping the monitor activity log. |

The call of this API has the same effect as setting the field **Log Monitor Activity** in the **Monitor Defaults** (see the *Administration* documentation).

This enables you to automatically start and stop the monitor activity log at particular times or on account of specific conditions.

NOPU--1N: Read Network Available to a Specific User

You can get a list of networks owned or granted to a user using the following call from your Natural application.

```
CALLNAT 'NOPU--1N'
P-USER
P-SELECTION
P-RC
P-RESULT-GRANTED-NETWORKS (*)
```

The parameters have the following meaning:

| Parameter | Format/Length | Use |
|---------------------------|---------------|---|
| P-USER | A8 | in User name. |
| P-SELECTION | A10 | in Selection Criteria. |
| | | Select by P-SELECTION (combination of values possible): |
| | | 0 Networks of owner. |
| | | G Owner granted networks. |
| | | A Active networks only. Note: Only usable together with 0,G or U. |
| | | U User granted networks. |
| P-RC | N3 | 1 User not defined. |
| | | 99 Natural runtime error. |
| P-RESULT-GRANTED-NETWORKS | | |

| Parameter | Format/Length | Use | |
|---|---------------|-----|-------------------------------|
| Note: This is a dynamic structure consisting of: | | | |
| P-OWNER | A10 | out | Owner of network. |
| P-NETWORK | A10 | out | Network name. |
| P-NETWORK-VERSION | A10 | out | At least "" or "(current)". |
| P-DESCRIPTION | A50 | out | Short description of network. |

NOPU--2N: Return all Usable Symbol Tables for a Network

You can get a list of usable symbol tables for a given Network using the following call from your Natural application.

```
CALLNAT 'NOPU--2N'
  P-OWNER
  P-NETWORK
  P-NETWORK-VERSION
  P-RC
  P-RESULT-SYMBOL-TABLES (*)
```

The parameters have the following meaning:

| Parameter | Format/Length | Use | |
|---|---------------|-----|--------------------------------|
| P-OWNER | A10 | in | Owner name. |
| P-NETWORK | A10 | in | Network name. |
| P-NETWORK-VERSION | A10 | in | Network version. |
| P-RC | N3 | 1 | Error when determining tables. |
| | | 99 | Natural runtime error. |
| P-RESULT-SYMBOL-TABLES | | | |
| Note: This is a dynamic structure consisting of: | | | |
| P-SYMBOL-TABLE_TYPE | A2 | out | Symbol table type. |
| P-SYMBOL-TABLE_OWNER | A10 | out | Symbol table owner. |
| P-SYMBOL-TABLE | A10 | out | Table name. |
| P-SYMBOL-TABLE-VERSION | A10 | out | Symbol table version. |

NOPU--3N: Get Correlation ID for an Activated Network

You can retrieve the correlation ID for a specific Network using the following call from your Natural application.

```
CALLNAT 'NOPU--3N'
  P-OWNER
  P-NETWORK
  P-RUN-NUMBER
  P-RC
  P-CORRELATION-SUBSYS
  P-CORRELATION-ID
  P-CORRELATION-TYPE
```

The parameters have the following meaning:

| Parameter | Format/Length | Use | |
|----------------------|---------------|-----|-----------------------------------|
| P-OWNER | A10 | in | Owner name. |
| P-NETWORK | A10 | in | Network name. |
| P-RUN-NUMBER | I4 | in | Run number. |
| P-RC | N3 | 1 | Activated network does not exist. |
| | | 99 | Natural runtime error. |
| P-CORRELATION-SUBSYS | A32 | out | Correlation subsystem. |
| P-CORRELATION-ID | A36 | out | Correlation ID. |
| P-CORRELATION-TYPE | A32 | out | Correlation type. |

NOPU--4N: Store New Event in Entire Operations System File

You can store an event record for a given network run using the following call from your Natural application.

```
CALLNAT 'NOPU--4N'
  P-EVENT-TYPE
  P-EVENT-VERSION
  P-EVENT-DATA (*)
  P-OWNER
  P-NETWORK
  P-NETWORK-RUN
  P-RC
  P-ERROR-NR
```

The parameters have the following meaning:

| Parameter | Format/Length | Use | | |
|---------------------|---------------|-----|--|-----------------------------|
| P - EVENT - TYPE | A32 | in | | |
| P - EVENT - VERSION | A5 | in | | |
| P - EVENT - DATA | A80/1:19 | | | |
| P - OWNER | A10 | in | Owner of network. | |
| P - NETWORK | A10 | in | Network. | |
| P - NETWORK - RUN | I4 | in | Run number. | |
| P - RC | N4 | out | 1 | Network run does not exist. |
| | | | 99 | Natural runtime error. |
| P - ERROR - NR | N7 | out | Only filled with the contents of the Natural system variable *ERROR - NR in case of a runtime error. | |

NOPUAC5N: Activate Job Networks or Jobs

You can activate job networks or jobs from your Natural application. The network of job definitions must exist in Entire Operations. Use:

```
CALLNAT 'NOPUAC5N'
      FUNCTION RC OWNER NETWORK NETWORK-VERSION JOB SYMTAB SYMTAB-VERSION START-TIME ↵
RUN
```

This section covers the following topics:

- [Parameter Description](#)
- [Activation with Symbol Modification](#)
- [Repetition of an Active Network](#)

Parameter Description

| Parameter | Format/Length | Use | |
|-----------|---------------|-----|--|
| FUNCTION | A1 | in | Function code: |
| | | A | Activate , no hold for symbols. |
| | | 1 | Like A, but time frame as defined in schedule is used. |
| | | C | Change start time. |
| | | D | RUN > 0: Deactivate network, RUN = -1: Delete master-network. |
| | | H | Activate , but hold task until released. |

| Parameter | Format/Length | Use |
|-----------|------------------------------|--|
| | | <p>I Set run number initial value.</p> <p>The next network run will use the next run number available after the number entered.</p> <p>The run number must be between 0 and the highest run number permitted.</p> |
| | | <p>J Modify the earliest start time, latest start time and deadline time of an active job. The three time stamps are shifted with the same offset.</p> |
| | | <p>K Modify the earliest start time of an active job only. The latest start time and deadline time will not be modified.</p> |
| | | <p>R Release activation.</p> |
| | | <p>2 Like R, but time frame as defined in schedule is used.</p> |
| | | <p>S Repetition of an active job.</p> |
| | | <p>T Repetition of an active network.</p> |
| | | <p>X Network or job existence test only.</p> |
| RC | N4 BY VALUE RESULT | <p>out Return code:</p> <p>0 OK.</p> <p>1 Owner, network, job not found.</p> <p>2 Activation entry not found.</p> <p>3 Network not active.</p> <p>4 Job cannot be restarted. For the function S (repetition), this return code is issued if there is a SYSOUT copy in progress.</p> <p>5 Run number has already been used.</p> <p>6 Run number not in valid range.</p> <p>7 No free run number.</p> <p>8 Active objects existing.</p> <p>9 Current version cannot be determined.</p> <p>10 Version default usage found. This return may be issued at a deletion attempt.</p> <p>101 Invalid function code.</p> <p>102 Parameters missing.</p> <p>111 Symbol table name contained reserved prefix =EOR=.</p> |

| Parameter | Format/Length | Use |
|-----------------|---------------------------------|---|
| | | <p>120 Owner must not be used. Applies to the reserved owner WASTEBIN, for example.</p> <p>121 Owner does not exist.</p> <p>122 Network version is required.</p> <p>901 OK; subnetwork symbol prompting.</p> |
| DBENV | A10 BY VALUE OPTIONAL | in Database environment (reserved for future use). |
| OWNER | A10 BY VALUE | in Owner of the job network. If a job is placed in hold status by means of the function H, this will be written to the log. |
| NETWORK | A10 BY VALUE | in The job network. |
| NETWORK-VERSION | A10 BY VALUE OPTIONAL | in Version name of the job network or (current) (see <i>Reserved Version Names for Networks</i>). |
| JOB | A10 | in Job. If empty, whole network is activated, deactivated or tested. |
| SYMTAB | A10 BY VALUE OPTIONAL | in The symbol table. |
| SYMTAB-VERSION | A10 BY VALUE OPTIONAL | in Symbol table version. |
| START-TIME | T | <p>in If zero (0), the network is activated immediately. Otherwise, the network is activated at the designated time. The field must contain both date and time.</p> <p>out Start time actually set.</p> |
| RUN | I4 BY VALUE RESULT | <p>in Run number used by Entire Operations.</p> <p>Functions A and H:</p> <ul style="list-style-type: none"> ■ When activating a single job, an existing run number can be entered. This should only be used for post activations of an active network. <p>Functions C, D, R and S:</p> <ul style="list-style-type: none"> ■ Must be an existing run number of the job network. |

| Parameter | Format/Length | Use |
|-----------|---------------|--|
| | | Function X: ■ If 0, the network master is tested. Otherwise, an active network with this run number is tested. |
| | | out Functions A and H: ■ If 0, the next free run number is assigned. ■ If not 0, this number is used; if this number is still active, the next free number in ascending order is used. |

 **Note:** You can use this function from outside Entire Operations, as well as from user exits within Entire Operations. This function is comparable to the manual activation of networks or jobs in the Entire Operations online system.

Activation with Symbol Modification

➤ To activate a job or network and pass specific symbol values to this activation, proceed as follows

- 1 Activate the network and keep it in hold, with function H.
- 2 Use the returned run number to set symbols in the active symbol table(s) for this run. You must call the routine **NOPUSY7N** (see the relevant section).
- 3 After setting the symbol(s), release this activation with the R function.

 **Note:** Active symbols, which are set here, will not be overwritten by a subsequent complete symbol table activation.

Repetition of an Active Network

The field P-JOB may remain empty.

- If P-JOB is empty, all executed jobs of the active network will be repeated.
- If P-JOB contains a valid job name, the active network will be repeated, but the given job will be repeated as “dummy due to repetition”.

The repetition also works correctly for jobs of type NET (subnetwork): subnetworks are also repeated, with their original run number.

The conditions NET-BEGIN, NET-END and NET-END-NOTOK will be reset before the repetition.

This API function enables you to repeat whole active networks, including subnetworks. Active conditions which are already set or reset will be backed out.

-  **Caution:** You should exercise caution if the API NOPUAC5N function T is invoked for a network, in which jobs are currently executing. These will not be repeated. We recommend that you use this API function only for active networks, in which no job is currently executing.

NOPUAS1N: Retrieve Numbers of Active Jobs in Defined Status Ranges

This section covers the following topics:

- [Function Call](#)

Function Call

You can retrieve the numbers of active jobs in defined status ranges by using the following call:

```
CALLNAT 'NOPUAS1N'
        NOPUAS-VERSION NOPUAS-PARMS
```

In the calling program, define the parameter list for this API as follows:

```
DEFINE DATA
...
LOCAL USING NOPUAS1L
```

Meaning of the parameters:

| Parameter | Format/Length | Use | | |
|--------------------------------------|---------------|-----|--|------------------------|
| NOPUAS-VERSION | N2 | in | Interface version (currently this is 01 constantly). | |
| NOPUAS-PARMS | A250 | mod | Parameter data area. | |
| Redefinition of NOPUAS-PARMS: | | | | |
| P-FUNCTION | A1 | in | Function code: | |
| | | | S | Get statistics. |
| P-RC | N3 | out | Return code: | |
| | | | 0 | OK. |
| | | | 101 | Invalid function code. |
| | | | 102 | Parameter(s) missing. |
| P-NUMBER-WAITING | I4 | out | Number of jobs waiting. | |
| P-NUMBER-HOLD | I4 | out | Number of jobs in hold. | |
| P-NUMBER-INPUT-QUEUE | I4 | out | Number of jobs in the input queue. | |
| P-NUMBER-EXECUTING | I4 | out | Number of jobs executing. | |
| P-NUMBER-PERM-ERROR | I4 | out | Number of jobs in permanent error status. | |

NOUCN3N: Access Entire Operations Conditions

You can handle conditions using the following statement in your Natural application:

```
CALLNAT 'NOUCN3N'
  P-FUNCTION P-RC P-OWNER P-NETWORK P-CONDITION P-RUN-FROM P-RUN-TO
  P-TIME-FROM P-TIME-TO P-CONFIRM P-JCL-CHECK
```

This section covers the following topics:

- [Parameter Description](#)
- [Description of Function Codes](#)

Parameter Description

| Parameter | Format/Length | Use | |
|-------------|-----------------------|--|--|
| P-FUNCTION | A1 | in | Function code: |
| | | R | Reset a condition. |
| | | S | Set a condition. |
| | | T | Test a condition. |
| | | See also Description of Function Codes . | |
| P-RC | N3 | out | Return code: |
| | | 0 | Function OK. |
| | | 1 | Condition not found. |
| | | 2 | Time or run required for reset. |
| | | 3 | Invalid run number range. |
| | | 101 | Invalid function code. |
| | | 102 | Condition name missing. |
| | | 104 | Network name missing. |
| 121 | Owner does not exist. | | |
| P-OWNER | A10 | in | Owner of the job network/condition. |
| P-NETWORK | A10 | in | Job network. |
| P-CONDITION | A20 | in | Condition name. |
| P-RUN-FROM | I4 | | Corresponding run number. |
| | | in | Absolute condition: -1 |
| | | out | Function T and field empty: Last run number found is returned. |
| P-RUN-TO | I4 | in | Run number to (end of interval). If zero, only P-RUN-FROM will be handled. |
| P-TIME-FROM | T | in | Starting time of condition. |

| Parameter | Format/Length | Use |
|-------------|---------------|--|
| | | out Function T and field empty: Time belonging to run number is returned. |
| P-TIME-TO | T | in End time of condition. |
| P-CONFIRM | A1 | in Confirm deletions: Y (yes), N (no). |
| P-JCL-CHECK | A1 | in If this field contains C, the condition is treated like one which is used during a JCL check. |

Description of Function Codes

Meaning of the function codes:

| Code | Description |
|------|---|
| R | Reset a condition. The date or the run number must be specified. If a run number is specified, the date is not considered. If a date is specified, the deletion of several conditions with the same date, but different run numbers might occur. |
| S | Set a condition. The date and/or run number are optional. |
| T | Test a condition. If a run number is specified, the time frame is not considered. If no time frame and no run number are specified, each condition with the specified name matches. If no run number is specified, the last run number for the time frame up to the current time is returned. If no time frame was given, the time belonging to this run number is returned in P-TIME-FROM. |

NOPUCS1N: Access Calendars and Schedules

This section covers the following topics:

- [Accessing Dates within Calendars or Schedules](#)

▪ [Example for Using NOPUCS1N](#)

Accessing Dates within Calendars or Schedules

You can access dates within calendars or schedules using the following statement in your Natural application:

```
CALLNAT 'NOPUCS1N'
      P-FUNCTION P-RC P-OBJECT-TYPE P-OWNER P-OBJECT P-DATE-A8
```

Meaning of the parameters:

| Parameter | Format/Length | Use | |
|------------|--|-----|--|
| P-FUNCTION | A1 | in | Function code: |
| | | A | Delete a calendar or schedule. |
| | | B | Add calendar. |
| | | C | Determine the calendar used. |
| | | D | Determine the schedule used. |
| | | N | Determine the next set date, from a start date. |
| | | P | Determine the previous set date, from a start date. |
| | | R | Reset a date. Date will be removed from calendar or schedule. |
| | | S | Set a date. Date will be added to calendar or schedule. |
| | | T | Test a date. If date exists within calendar or schedule: RC contains 0, otherwise 1. |
| | | 1 | Set all dates in the whole table (calendar or schedule). |
| 2 | Reset all dates in the whole table (calendar or schedule). | | |
| P-RC | N3 | out | Return code: |
| | | 0 | Function OK, or date is set. Note: For calendars, this means workday. |
| | | 1 | Date is not set. Note: For calendars, this means holiday. |
| | | 2 | Object not found. |
| | | 3 | Object used in definitions. |
| | | 4 | Object already existing. |

| Parameter | Format/Length | Use | | | | | | | | | | | | | | |
|---------------|---|---|-----|---|-----|--|-----|--------------------------------|-----|----------------------|-----|---------------|-----|-------------------------------|-----|-----------------------|
| | | <table border="1"> <tr><td>101</td><td>Invalid function code.</td></tr> <tr><td>102</td><td>Parameter(s) missing.</td></tr> <tr><td>103</td><td>Invalid parameter combination.</td></tr> <tr><td>104</td><td>Invalid object type.</td></tr> <tr><td>105</td><td>Invalid date.</td></tr> <tr><td>106</td><td>Table of explicit dates full.</td></tr> <tr><td>121</td><td>Owner does not exist.</td></tr> </table> | 101 | Invalid function code. | 102 | Parameter(s) missing. | 103 | Invalid parameter combination. | 104 | Invalid object type. | 105 | Invalid date. | 106 | Table of explicit dates full. | 121 | Owner does not exist. |
| 101 | Invalid function code. | | | | | | | | | | | | | | | |
| 102 | Parameter(s) missing. | | | | | | | | | | | | | | | |
| 103 | Invalid parameter combination. | | | | | | | | | | | | | | | |
| 104 | Invalid object type. | | | | | | | | | | | | | | | |
| 105 | Invalid date. | | | | | | | | | | | | | | | |
| 106 | Table of explicit dates full. | | | | | | | | | | | | | | | |
| 121 | Owner does not exist. | | | | | | | | | | | | | | | |
| P-OBJECT-TYPE | A1 | <table border="1"> <tr><td>in</td><td>Object type:</td></tr> <tr><td></td><td>N Network.</td></tr> <tr><td></td><td>C Calendar.</td></tr> <tr><td></td><td>H Schedule history.</td></tr> <tr><td></td><td>S Schedule.</td></tr> </table> | in | Object type: | | N Network. | | C Calendar. | | H Schedule history. | | S Schedule. | | | | |
| in | Object type: | | | | | | | | | | | | | | | |
| | N Network. | | | | | | | | | | | | | | | |
| | C Calendar. | | | | | | | | | | | | | | | |
| | H Schedule history. | | | | | | | | | | | | | | | |
| | S Schedule. | | | | | | | | | | | | | | | |
| P-OWNER | A10 | <table border="1"> <tr><td>in</td><td>Owner of object.</td></tr> <tr><td>out</td><td>Functions C and D: owner of determined object.</td></tr> </table> | in | Owner of object. | out | Functions C and D: owner of determined object. | | | | | | | | | | |
| in | Owner of object. | | | | | | | | | | | | | | | |
| out | Functions C and D: owner of determined object. | | | | | | | | | | | | | | | |
| P-OBJECT | A10 | <table border="1"> <tr><td>in</td><td>Name of object: owner name resp. schedule name If P-FUNCTION is N, P, or T, and if a calendar is expected as object: ■ You may use the reserved calendar name =EOR=WORK7. This pseudo-calendar is valid for any year and has all days defined as workdays. ■ The value of P-OWNER is meaningless in this case.</td></tr> <tr><td>out</td><td>Function codes C and D: name of determined object.</td></tr> </table> | in | Name of object: owner name resp. schedule name If P-FUNCTION is N, P, or T, and if a calendar is expected as object: ■ You may use the reserved calendar name =EOR=WORK7. This pseudo-calendar is valid for any year and has all days defined as workdays. ■ The value of P-OWNER is meaningless in this case. | out | Function codes C and D: name of determined object. | | | | | | | | | | |
| in | Name of object: owner name resp. schedule name If P-FUNCTION is N, P, or T, and if a calendar is expected as object: ■ You may use the reserved calendar name =EOR=WORK7. This pseudo-calendar is valid for any year and has all days defined as workdays. ■ The value of P-OWNER is meaningless in this case. | | | | | | | | | | | | | | | |
| out | Function codes C and D: name of determined object. | | | | | | | | | | | | | | | |
| P-DATE-A8 | A8 | <table border="1"> <tr><td>in</td><td>Date in format: YYYYMMDD. ALL in this field means all years. This value applies for deletions.</td></tr> <tr><td>out</td><td>Function codes N and P: the date found.</td></tr> </table> | in | Date in format: YYYYMMDD. ALL in this field means all years. This value applies for deletions. | out | Function codes N and P: the date found. | | | | | | | | | | |
| in | Date in format: YYYYMMDD. ALL in this field means all years. This value applies for deletions. | | | | | | | | | | | | | | | |
| out | Function codes N and P: the date found. | | | | | | | | | | | | | | | |

**Notes:**

1. Only function T (test a date) is allowed for object type H (schedule history)
2. Schedule history is usually available for the current year and previous two years.
3. Schedule dates can be set for the current year and the next year.
4. In calendars, a set date means workday, and a non-set date means holiday. The functions N and P work for a range of years. Limitations:
For schedules, only the current and the previous year are available.
5. Calendars must be defined for all years in which a search is to be performed.

6. Function A deletes calendar/schedule master when P-OBJECT-TYPE='C' or P-OBJECT-TYPE='S' respectively. In case calendar/schedule is for the current year, and if is referenced in schedule/network the P-RC value 3 (Object used in definitions) is returned. Calendars for past years will be deleted without reference check.
7. When a calendar is deleted (P-FUNCTION='A' and P-OBJECT-TYPE='C'), the value of P-DATE-A8 shall be either in form YYYY or YYYYMMDD or constant ALL. Value ALL means: the calendar will be deleted for all defined years.

Example for Using NOPUCS1N

The program calculates the first Monday of each month in 2008 and subsequently enters the network REQUEST/NET001 for the calculated days in the schedule.

```

* DETECT FIRST MONDAY IN MONTHS
*
DEFINE DATA
LOCAL
1 #YYYYMMDD (A8)
1 REDEFINE #YYYYMMDD
  2 #YYYY (N4)
  2 #MM (N2)
  2 #DD (N2)
1 #D1 (D)
1 #WD (A1)
1 #OWNER (A10) INIT <'REQUEST'> /* Owner
1 #OBJECT (A10) INIT <'NET001'> /* Network
1 #RC3 (N3)
END-DEFINE
*
#YYYY := 2010 /* Year
F1. FOR #MM = 01 TO 12
  RESET #DD
  R1. REPEAT
    ADD 1 TO #DD
    MOVE EDITED #YYYYMMDD TO #D1 (EM=YYYYMMDD)
    MOVE EDITED #D1 (EM=0) TO #WD
    WRITE #D1 (EM=YYYYMMDD) #WD
    UNTIL #WD = '1' /* R1.
  END-REPEAT /* R1.
  WRITE #D1 (EM=YYYYMMDD' 'N(10))
*
* CALL NOP SCHEDULE API TO SET THESE DAYS
*
CALLNAT 'NOPUCS1N'
'S' #RC3 'S' #OWNER #OBJECT #YYYYMMDD
WRITE #YYYYMMDD #RC3
END-FOR /* F1.
END TRANSACTION
END

```

NOPUJI4N: Import Operating System Jobs into the Active Queue

You can activate a job in Entire Operations together with an existing operating system job number. This is possible if the job was submitted by any application and set to HOLD status.

Use the following statement:

```
CALLNAT 'NOPUJI4N'
  P-FUNCTION P-RC P-OWNER P-NETWORK P-JOB P-RUN P-EXECUTION-NODE P-SYSOUT-NODE
  P-SYSOUT-FILE P-BS2000-MONJV P-JOB-ID P-OS-JOB-NAME
```

Parameter Description

| Parameter | Format/Length | Use | | |
|----------------------|---------------|-----|---|---|
| P - FUNCTION | A1 | in | Function code: | |
| | | | I | Import job, without prerequisite check. |
| | | | J | Import job, with prerequisite check. The new active job is created with input and output condition definitions. |
| P - RC | N3 | out | Return code: | |
| | | | 0 | Function OK. |
| | | | 101 | Invalid function code. |
| | | | 102 | Parameter(s) missing. |
| | | | 103 | P - JOB - ID value invalid |
| | | | 121 | Owner does not exist. |
| P - OWNER | A10 | in | Optional ¹ . | |
| P - NETWORK | A10 | in | Optional ¹ . | |
| P - JOB | A10 | in | Optional ¹ . | |
| P - RUN | I4 | in | Optional ¹ . If P - RUN is set to zero (0), Entire Operations assigns a new run number; otherwise, the job is activated under the run number given. Job masters for imports with run number must be defined with the special type R to prevent automatic activation. | |
| P - EXECUTION - NODE | I4 | in | Required. Execution node. | |

| Parameter | Format/Length | Use |
|----------------|---------------|---|
| P-SYSOUT-NODE | I4 | in Optional. Necessary only if P-SYSOUT-FILE is specified, and if P-SYSOUT-NODE is different from P-EXECUTION-NODE. |
| P-SYSOUT-FILE | A250 | in Required for BS2000, UNIX and Windows. File which contains the SYSOUT. |
| P-BS2000-MONJV | A250 | in Optional. BS2000 monitor job variable. Specify this parameter only for BS2000, and only if the job was started in conjunction with a monitor job variable. |
| P-JOB-ID | A10 | in Required. The job ID can be passed left-justified in this field, regardless of whether it is numeric or alphanumeric. |
| P-OS-JOB-NAME | A8 | in Optional; from operating system. |

¹ The parameters P-OWNER, P-NETWORK, P-JOB and P-RUN are optional. If any of these are empty, IMPORT is used instead as owner, network and/or job name. Entire Operations will try to find a job definition for these values. If a definition is found, the new active job entry is supplied from it.

NOPUJS2N: Job Schedule Inquiry and Modification

You can inquire and modify a job schedule by using the following statement in your Natural application:

```
CALLNAT 'NOPUJS2N'
  P-FUNCTION P-RC P-DBENV P-OWNER P-NETWORK P-NETWORK-VERSION
  P-RUN P-JOB P-AVERAGE-TIME P-EARLIEST-START
  P-LATEST-START P-DEADLINE
```

Parameter Description

| Parameter | Format/Length | Use | |
|------------|---------------|-----|--|
| P-FUNCTION | A1 | in | Function code: |
| | | N | Inquire job schedule for the next job (in alphabetical order). At the end of the list, RC = 1 is returned. |
| | | R | Inquire job schedule. |
| | | S | Change job schedule. |

| Parameter | Format/Length | Use | | |
|-----------------------|------------------------|--------|---|---|
| P - RC | N3 | out | Return code: | |
| | | | 0 | Function OK. |
| | | | 1 | Owner, network, run number or job not found. |
| | | | 101 | Invalid function code. |
| | | | 102 | Parameter missing. |
| | | | 103 | Earliest start time invalid. |
| | | | 104 | Latest start time invalid. |
| | | | 105 | End time invalid. |
| | | | 106 | Latest start must be greater than earliest start. |
| | | | 107 | End time must be greater than latest start. |
| | | | 108 | Job has already been started. |
| | | | 109 | Earliest start must be greater than current time. |
| 110 | Job is in hold status. | | | |
| 121 | Owner does not exist. | | | |
| P - DBENV | A10 OPTIONAL | in | Database environment (reserved for future use). | |
| P - OWNER | A10 | in | Owner of the network. | |
| P - NETWORK | A10 | in | Job network. | |
| P - NETWORK - VERSION | A10 | in | Network version. | |
| P - RUN | I4 | in | Run number. | |
| | | | 0 | Data of the network master is inquired or modified. |
| | | | Other value | Data of the specified active network run is inquired or modified. |
| P - JOB | A10 | in | Job. | |
| P - AVERAGE - TIME | I4 | in/out | Expected runtime tenths of a second. | |
| P - EARLIEST - START | A14 | in/out | Earliest possible start time. Format: YYYYMMDDHHIISS | |
| P - LATEST - START | A14 | in/out | Latest possible start time. Format: YYYYMMDDHHIISS | |
| P - DEADLINE | A14 | in/out | Deadline. Format: YYYYMMDDHHIISS | |

NOPULW9N: Write Messages to System Automation Tools Log

You can write messages to the System Automation Tools log file. The messages will be written with the product identifier of Entire Operations so that they will appear in the Entire Operations log display.

Use the following statement:

```
CALLNAT 'NOPULW9N'
  P-TASK-ID P-MESSAGE-CODE P-MESSAGE P-DBENV P-OWNER P-NETWORK P-NETWORK-VERSION
  P-RUN P-JOB P-JOB-ID P-LOG-TARGET P-USE-NAT-MSG-CACHE
```

Parameter Description

| Parameter | Format/Length | Use |
|-------------------|---------------------------------|---|
| P-TASK-ID | A8 BY VALUE | in User ID of person initiating the Entire Operations log messages. This can remain blank, in which case it is supplied with the content of the Natural *USER system variable. Entire Operations-internal use: name of the current Monitor task. |
| P-MESSAGE-CODE | N4 BY VALUE | in Internal message code (not displayed); used for later message selection. Use message codes in the range 8000 - 8999 to avoid conflicts with internal messages. |
| P-MESSAGE | A70/1:V BY VALUE | in The message text line(s). Note: This parameter is a dynamic array. One or several text lines may be passed. |
| P-DBENV | A10 BY VALUE OPTIONAL | in Database environment (reserved for future use). |
| P-OWNER | A10 BY VALUE OPTIONAL | in Owner; used for later message selection; can remain blank. |
| P-NETWORK | A10 BY VALUE OPTIONAL | in Network; used for later message selection; can remain blank. |
| P-NETWORK-VERSION | A10 BY VALUE OPTIONAL | in Network version; used for later message selection; can remain blank. |

| Parameter | Format/Length | Use | |
|-----------------------------|---------------------------------|---|---|
| P - RUN | I4 BY VALUE OPTIONAL | in Run number assigned to the message; can remain blank. | |
| P - JOB | A10 BY VALUE OPTIONAL | in Job; used for later message selection; can remain blank. | |
| P - JOB - ID | A10 BY VALUE OPTIONAL | in Operating system job identifier; can remain blank. Numeric values must be right-justified with leading zeros, for example: 0000004711. | |
| P - LOG - TARGET | A3 | in Defines where to write the log message: | |
| | | NOP | Writes to Entire Operations log (default). |
| | | SO | Writes to the SYSOUT of the current monitor task or of the batch job. |
| | | ALL | Writes to both the Entire Operations log and the SYSOUT. |
| P - USE - NAT - MSG - CACHE | L OPTIONAL | in Use the Natural internal message cache. If this routine is called from outside the Entire Operations Monitor, this parameter must be skipped or set to FALSE, because the Natural message cache is not initialized in this case. If this routine is called from within the Entire Operations Monitor, you may set this parameter to TRUE. In case of any problems with this setting, skip the parameter or use FALSE. | |

The time stamp and the originating Natural user ID are inserted automatically.

This routine is also invoked internally by the other user API routines.

NOPUMI1N: Set/Reset Text Milestones in Master and Active Jobs

You can inquire on or modify milestone definitions in master and active jobs (see also [Milestone types](#) in the section *Job Maintenance*) by using the following statement in your Natural application:

Available Entire Operations API Routines

```
CALLNAT 'NOPUMI1N'
  P-FUNCTION P-MILESTONE-TYPE P-DBENV P-OWNER P-NETWORK P-NETWORK-VERSION
  P-RUN P-JOB P-RC
```

The parameters have the following meaning:

| Parameter | Format/Length | Use | |
|-------------------|--|-----|--|
| P-FUNCTION | A1 | in | Function code: |
| | | S | Set milestone. |
| | | R | Reset (delete) milestone. |
| | | T | Test milestone. |
| P-MILESTONE-TYPE | A1 | in | Milestone type: |
| | | B | Milestone set at network begin. |
| | | E | Milestone set at network end. |
| | | I | Milestone set for any job (any network position except begin and end). |
| A | All milestone types (not for function code S). | | |
| P-DBENV | A10 OPTIONAL | in | Database environment (reserved for future use). |
| P-OWNER | A10 | in | Owner of the network. |
| P-NETWORK | A10 | in | Name of the job network. |
| P-NETWORK-VERSION | A10 | in | Version of the job network. |
| | OPTIONAL | | |
| P-RUN | I4 | in | Run number of the job network. |
| | BY VALUE OPTIONAL | | |
| P-JOB | A10 | in | Name of the job. |
| P-RC | I4 BY VALUE RESULT | out | Return code: |
| | | 0 | Function OK. Or: Milestone was set. |
| | | 1 | Owner, network, version, run and/or job not found. |
| | | 2 | Milestone was not set. |
| | | 9 | Current version cannot be determined. |
| | | 101 | Invalid function code. |
| | | 102 | Parameter missing |
| 103 | Invalid milestone type. | | |

| Parameter | Format/Length | Use |
|-----------|---------------|-------------------------------------|
| | | 121 Owner does not exist. |
| | | 122 Network version is required. |

NOPUMT3N: Expand Message Texts

Entire Operations stores its message texts in the Log file in a language-independent, compressed format.

To read the proper message text, you must use the following routine:

```
CALLNAT 'NOPUMT3N'
      P-APPLIC-ID P-MESSAGE P-USE_NAT_MSG_CACHE P-LANGUAGE P-PREFIX-HANDLING
```

Note: Expansion is only necessary if the message text begins with a semicolon (;).

Parameter Description

| Parameter | Format/Length | Use | |
|---------------------|---------------|---|---|
| P-APPLIC-ID | A8 | in Name of the application from which the message is to be taken. | |
| P-MESSAGE | A70 | in The message text. Input: compressed. Output: readable text. | |
| P-USE-NAT-MSG-CACHE | L | in Use the Natural internal message cache. If this routine is called from outside the Entire Operations Monitor, this parameter must be set to FALSE, because the Natural message cache is not initialized. If this routine is called from within the Entire Operations Monitor, you may set this parameter to TRUE. In case of any problems with this setting, use FALSE. | |
| P-LANGUAGE | I1 | in Language code for the message. | |
| | | Values: | |
| | | 0 | Use current setting of the Natural *LANGUAGE system variable. |
| | | 1 | English |
| | | 2 | German |
| | | other | English |
| P-PREFIX-HANDLING | A1 | in A (or blank) | Do not remove message prefix. |
| | | , | |

| Parameter | Format/Length | Use |
|-----------|---------------|--|
| | | B If prefix AAA9999 - , return from position 9. Example: AAAA999 - text --> - text |
| | | C If prefix AAA9999 - , return from position 11. Example: AAAA999 - text --> text |
| | | D If prefix is missing in SYSERR, insert a prefix. The resulting message will be EOR1234 - Just an example. Example: The message in internal format is ;EOR;1234, and the SYSERR message text is Just an example. The resulting message will be EOR1234 - Just an example. |

NOPUNI1N: Invalidate Entire System Server Node Table Entries

You can use this API to invalidate session node table entries.

This API must be invoked before exiting a user exit if logons to Entire System Server nodes were made. The invalidation forces new Entire System Server logons to the nodes after termination of the calling user exit.

Use the following statement:

```
CALLNAT 'NOPUNI1N'
      P-FUNCTION P-NODE(*) P-RC
```

Parameter Description

| Parameter | Format/Length | Use |
|------------|---------------|--|
| P-FUNCTION | A1 | in Function code: |
| | | I Invalidate nodes. |
| P-NODE | I4/1:V | in Node number(s) of nodes to be invalidated. The array may have an arbitrary size. |
| P-RC | I4 | out Return code: |

| Parameter | Format/Length | Use |
|-----------|---------------|-------------------------------|
| | | 0 Function OK. |
| | | 101 Invalid function code. |

NOPUNX1N: Entire System Server Calls to Access UNIX and Windows Files

You can use this API to access UNIX and Windows files out of Natural programs.

For FILE / READ or FILE / WRITE, and if the **buffer type** B, C or D is used:

```
CALLNAT 'NOPUNX1N' NOPUNX1A data-buffer
```

For all other calls:

```
CALLNAT 'NOPUNX1N' NOPUNX1A
```

For calls to NOPUNX1N, use the parameter data area NOPUNX1A described in the following section.

- [Parameter Description](#)
- [Runtime Environment](#)
- [Programming Hints](#)
- [Opening and Closing a File](#)
- [Error Checking](#)
- [Reading a File](#)
- [Searching for specific Data Sets in a File](#)
- [Writing a File](#)
- [Reading and Writing a File Using a Large Buffer](#)
- [Deleting a File](#)
- [Copying a File](#)
- [Scrolling or Renaming a File](#)
- [Verifying the Existence of a File](#)
- [Creating a List of Files of a Directory](#)

Parameter Description

The parameters in the parameter data area NOPUNX1A have the following meaning:

| Parameter | Format/Length | Use |
|---|---------------|--|
| OBJECT | A16 | in Possible values: USER FILE JOB SERVER |
| FUNCTION | A8 | in Possible values for USER: |
| | | LOGON Logon to a node. |
| | | LOGOFF Logoff from a node. |
| | | Possible values for FILE: |
| | | APPEND Append to an existing file. |
| | | COPY Copy file. |
| | | CLOSE Close file. |
| | | DELETE Delete file. |
| | | DELDIR Delete file directory. |
| | | DIR List files. |
| | | DTA List files sorted by modification time in descending order. |
| | | DTD List files sorted by modification time in descending order. |
| | | GETATTR Get file attributes. |
| | | LINECNT Count lines in a file. |
| | | MOVE Move file or rename. |
| | | READ Read file. |
| | | SCAN Search for strings in a file. |
| | | WRITE Write file. |
| | | Possible values for JOB: |
| | | CANCEL Cancel job. |
| COMMAND Execute command. | | |
| GETEXIT Get exit code of a terminated job. | | |
| Possible values for SERVER: | | |
| CL-TL-G Get command log level and trace level. | | |

| Parameter | Format/Length | Use | | |
|--------------------------|---------------|--------------------------------|---|---------------------------|
| RETURN-CODE | N8 | out | If 0, then the function was OK. If a different value was returned, then check the data content of RETURN-TEXT. | |
| RETURN-TEXT | A80 | out | Explanation of RETURN-CODE. | |
| NODE | N5 | in | Node, as defined in Entire Operations. | |
| NODE-NAME | A16 | in | Node name. <ul style="list-style-type: none"> ■ Can be passed as an alternative to NODE. ■ Will be analyzed if NODE=0. | |
| NODE-ACCESS-MODE | A1 | can only be changed by the API | <i>empty</i> | Has not yet been checked. |
| | | | N | Node is not local. |
| | | | Y | Node is local. |
| | | | This field is set by API at USER / LOGON. It should not be changed by the application. | |
| USERID | A20 | in | User ID for logon. | |
| GROUP | A20 | in | Optional: | |
| | | | UNIX | Group for logon. |
| | | | Windows | Domain for logon. |
| PASSWORD | A16 | in | Password for logon. We recommended that you clear this field after a successful USER / LOGON. | |
| SID | N10 | can only be changed by the API | Session ID from Entire System Server. This field is set by the API at USER / LOGON. It should not be changed by the application until USER / LOGOFF. | |
| UID | A10 | can only be changed by the API | Internal user ID of the operating system. This field is set by the API at USER / LOGON. It should not be changed by the application until USER / LOGOFF. | |
| REDEF-1 | A10 | - | Redefinition area. | |
| SERVER-COMMAND-LOG-LEVEL | N5 | out | Output of SERVER / CL-TL-G. | |
| SERVER-TRACE-LEVEL | N5 | out | Output of SERVER / CL-TL-G. | |
| HTML-CODE-HANDLING | A1 | in/out | For FILE functions. | |
| CODEPAGE-ID | N5 | in | For the FILE functions WRITE and APPEND. | |
| OPSYS-CLASS | A1 | in/out | Operating system class of NODE. Possible values: | |

| Parameter | Format/Length | Use | | |
|-------------------------|---------------|------------------------|---|--|
| | | | B | BS2000 |
| | | | M | z/OS |
| | | | V | z/VSE |
| | | | X | UNIX |
| | | | W | Windows |
| USE - PAM | A1 | in | For USER / LOGON. | |
| INHERIT - ACCESS - TIME | A1 | in | For FILE functions. | |
| BUFFER - FORMAT | A1 | in | For the FILE functions READ, WRITE and APPEND. | |
| | | | Possible values: | |
| | | | T | Text, single record. |
| | | | 3 | Text, multiple records, 3-byte fields. |
| | | | L | Text, multiple records, variable-length fields. |
| | A | Base64-encoded format. | | |
| UNUSED - 1 | A10 | - | Unused. | |
| ESC - TRIGRAPH | A1 | in | Trigraph usage: | |
| | | | empty or N | No trigraph converted. |
| | | | Y | Use question mark (?) as trigraph escape character. |
| | | | other | Use this character as trigraph escape character. |
| | | | For information on trigraph encoding , see the relevant section in <i>Submission of Jobs by Entire Operations</i> . | |
| TRACE - LEVEL | N1 | in | 0 | No trace. |
| | | | > 0 | Trace activated. |
| TRACE - TARGET | A1 | in | Destination where trace will be stored. | |
| | | | S | SYSOUT. |
| | | | L | Entire Operations log. |
| | | | B | Both: SYSOUT and Entire Operations Log (only relevant if TRACE - LEVEL > 0). |
| BUFFER - TYPE | A1 | in | Mainly used for the FILE functions READ, WRITE and APPEND. | |
| | | | Possible values: | |

| Parameter | Format/Length | Use | | |
|------------------|---------------|--------------------------------|--|--|
| | | | A (or blank) | XS-FIRWA-BUFFER-TYPE size 600. |
| | | | B | XS-FIRWB-BUFFER-TYPE size 9700. |
| | | | C | XS-FIRWC-BUFFER-TYPE size 99000. |
| | | | D | XS-FIRWD-BUFFER-TYPE size 59000. |
| | | | For the buffer types B, C and D: The buffer is to be passed as a separate parameter in the <code>CALLNAT 'NOPUNX1N'</code> statement (mentioned earlier). | |
| OBJECT-AREA | A1200 | - | Object-specific fields. Object: FILE (redefinition of OBJECT-AREA). | |
| F-FILE | A250 | in | File name. The file name has to be in a qualified expression. That means in a complete path starting at the root of the file system. The file name may contain environment variables. | |
| F-HANDLE | N10 | can only be changed by the API | File handle. Is allocated by Entire System Server at the first access of a file. Is active until FILE / CLOSE. | |
| F-LINE | N10 | in/out | In | Line number where reading begins. (0 or 1: start reading at the beginning of the file) |
| | | | Out | (Last) read line number. |
| F-NUMBER-RECORDS | N10 | out | Number of read data sets. | |
| F-SEARCH-TEXT | A100 | in | Only FILE / SCAN: Text to be searched for in the file. | |
| F-RECORD-BUFFER | A600 | in/out | Whole record buffer (redefinition of F-RECORD BUFFER). Used for BUFFER-TYPE='A' only. | |
| F-RECORD-250 | A250 | in/out | FILE / READ, FILE / WRITE: Effective record. Used for BUFFER-TYPE='A' only. | |

Runtime Environment

- The API can be run under Entire Operations on mainframes, UNIX or Windows.
- With this API you can access only UNIX and Windows nodes.
- In the selected Natural environment you must define the steplib SYSEOR and the steplib used by SYSEOR.
- The system files (System File 1, System Automation Tools Log File) used by Entire Operations must be defined by LFILE assignments.

Programming Hints

Preface

In general the call OBJECT / FUNCTION (e.g. USER / LOGON), starts NOPUNXIN with the requested object and function.

Windows File Names

Windows file names can also be specified with a slash instead of a backslash.

Example:

```
c:/work/file1.txt
```

is equivalent to

```
c:\work\datei1.txt
```

Session

All file operations are functional only during a valid session.

The session is started with USER / LOGON, and ends with USER / LOGOFF.

During a session the SESSION-ID, UID and GID are not to be changed.

Course of Session

```
USER / LOGON  
FILE / ...  
FILE / ...  
...  
USER / LOGOFF
```

Opening and Closing a File

- Files must not be explicitly opened. This will be done automatically with the first call of `FILE / READ` or `FILE / WRITE`.
- After a read or write session, the file must be closed with the function `FILE / CLOSE`.

Error Checking

After each call of `NOPUNX1N`, the error code is to be checked in `NOPUNX1A.RETURN-CODE`. In `NOPUNX1A.RETURN-TEXT` you can access the information.

Reading a File

With the function `FILE / READ`, a file is read in sequential mode.

In `NOPUNX1A.F-LINE` you can name a line number to start.

If `NOPUNX1A.F-LINE` contains the value 0 (zero) or 1, the read sequence starts at the beginning of the file.

Scheme

```

USER / LOGON

R1. repeat
  FILE / READ
  if (NOPUNX1A.RETURN-CODE ne 0)
    escape bottom (R1.)
  end-if
  ... handle record
end-repeat      /* R1.

FILE / CLOSE

USER / LOGOFF

```

Searching for specific Data Sets in a File

With the function `FILE / SCAN`, it is possible to search for a specific string in a file. The search string must be present in `NOPUNX1A.F-SEARCH-TEXT`.

Scheme

```
USER / LOGON

R1. repeat
  FILE / SCAN
  if (NOPUNX1A.RETURN-CODE ne 0)
    escape bottom (R1.)
  end-if
  ... handle record
  add 1 to NOPUNX1A.F-LINE
*      -- line start for follow-up scan
end-repeat      /* R1.

FILE / CLOSE

USER / LOGOFF
```

Writing a File

With the function FILE / WRITE, a file is written in sequential mode.

Scheme

```
USER / LOGON

R1. repeat
  ... allocate record in NOPUNX1A.F-RECORD-250
FILE / WRITE
  if (...)
    escape bottom (R1.)
  end-if
end-repeat      /* R1.

FILE / CLOSE

USER / LOGOFF
```

Reading and Writing a File Using a Large Buffer

The following is an example of using a large data buffer to read or write files.

1. Define a large data buffer:

```
1 #BUFFER-99000 (A99000)
```

Choose one of the following buffer types:

```
NOPUNX1A.BUFFER-TYPE := 'B'           /* 9900 bytes
NOPUNX1A.BUFFER-TYPE := 'C'           /* 99000 bytes
NOPUNX1A.BUFFER-TYPE := 'D'          /* 59000 bytes
```

2. Call the API:

```
CALLNAT 'NOPUNX1N' NOPUNX1A #BUFFER-99000
```

The parameter definition of NOPUNX1N is:

```
DEFINE DATA
PARAMETER USING NOPUNX1A
PARAMETER
1 P-BUFFER-99000 (A99000)
  BY VALUE RESULT OPTIONAL
...
END-DEFINE
```

Note: #BUFFER-99000 can contain a maximum of 9900, 99000 or 59000 bytes depending on the size specified with NOPUNX1A.BUFFER-TYPE. The data written to the buffer can have less bytes but must not exceed the specified buffer size.

Deleting a File

With the function FILE / DELETE, you can delete one or several files. If F-FILE contains a wildcard (*), all files will be deleted that match the wildcard.

Copying a File

With the function FILE / COPY, the target file is passed on to F-RECORD-250.

Scrolling or Renaming a File

With the function FILE / MOVE, the target file is passed on to F-RECORD-250.

Verifying the Existence of a File

To verify the existence of a file, you can use the function `FILE / DIR` with a defined file name. If a 0 (zero) is returned to `NOPUNX1A.RETURN-CODE`, the file exists.

Creating a List of Files of a Directory

With the function `FILE / DIR`, you can create a list of files of a directory. With the wildcard expression contained in `NOPUNX1A.F-FILE` you can keep the list small.

Example

| | |
|-------------------------|--|
| <code>/tmp/*</code> | All files in the directory <code>/tmp</code> . |
| <code>/tmp/*.txt</code> | All files in the directory <code>/tmp</code> that end with <code>.txt</code> . |

The file names are stored in `F-RECORD-BUFFER`. The file names are separated by a semicolon (;) as indicated for `SHOW-DIR-BUFFER` in the following example.

If the buffer is not large enough for the file names, then the value 19 (more objects) is passed on to `NOPUNX1A.RETURN-CODE`.

Scheme

```

USER / LOGON

... allocate file name (with wildcard) in NOPUNX1A.F-FILE

R1. repeat
FILE / DIR
  decide on first value of NOPUNX1A.RETURN-CODE
    value 0, 19      /* 0: ok, 19: more objects
      perform SHOW-DIR-BUFFER
    none value
      ignore
  end-decide
  if NOPUNX1A.RETURN-CODE ne 19
    escape bottom (R1.)
  end-if
  add 1 to NOPUNX1A.F-LINE
end-repeat      /* R1.

FILE / CLOSE

USER / LOGOFF

* -----
DEFINE SUBROUTINE SHOW-DIR-BUFFER
* -----
* -- Function FILE / DIR:

```

```

* -- The record buffer contains a file list, with delimiter ';'
* -- This routine separates the single file names out of the buffer.
* -- #DIR-FILE and #DIR-REST should be declared as (A600)
*
SDB1. REPEAT
    EXAMINE  NOPUNX1A.F-RECORD-BUFFER FOR ';' REPLACE FIRST WITH ':'
SEPARATE NOPUNX1A.F-RECORD-BUFFER INTO #DIR-FILE #DIR-REST
    WITH DELIMITER ':'
* -- now #DIR-FILE contains a single file name, without qualifiers

    IF #DIR-REST = ' '
        ESCAPE BOTTOM (SDB1.)

    END-IF
    NOPUNX1A.F-RECORD-BUFFER := #DIR-REST
END-REPEAT /* SDB1.
END-SUBROUTINE

```

NOPURE2N: Handle Resource Allocations

You can handle resource allocations and deallocations with the following statement:

```

CALLNAT 'NOPURE2N'
    P-FUNCTION P-RC P-DBENV P-OWNER P-NETWORK P-NETWORK-VERSION P-RUN
    P-JOB P-RESOURCE P-QUANTITY P-DEALLOCATION P-JOB-EXECUTED

```

Parameter Description

| Parameter | Format/Length | Use | |
|------------|---------------|-----|--|
| P-FUNCTION | A1 | in | Function code: |
| | | A | Allocate resource. |
| | | R | Release one or several resources. <ul style="list-style-type: none"> ■ If job and resource name given: release only one allocated resource of one job. ■ If job given, but no resource: release all allocated resources of one job. ■ If run number, but no job and no resource given: release all allocated resources of one network run. ■ If no run number and no job and no resource given: Release all allocated resources of all network runs. |

| Parameter | Format/Length | Use |
|-----------|---------------|--|
| | | <p>N</p> <p>Network release.</p> <p>Release resources with deallocation = N as well.</p> <p>For other parameters, see R.</p> |
| | | <p>F</p> <p>Forced release.</p> <p>Release resources with deallocation = N or K as well.</p> <p>For other parameters, see R.</p> |

| P-DBENV | A10 OPTIONAL | <p>in</p> <p>Database environment (reserved for future use).</p> | | | | | | | | | | | | | | | | | | | | | | | | | | | | |

| Parameter | Format/Length | Use |
|-------------------|---------------|--|
| P-OWNER | A10 | in Owner. Wildcard allowed. Function A: obligatory, no wildcard allowed. |
| P-NETWORK | A10 | in Network. Wildcard allowed. Function A: obligatory, no wildcard allowed. |
| P-NETWORK-VERSION | A10 | in Network version. |
| P-RUN | I4 | in Run. A value of zero means all runs of a network. Function A: obligatory, no wildcard allowed. |
| P-JOB | A10 | in Job. If empty, the whole network is meant. Wildcard allowed. Function A: obligatory, no wildcard allowed. Note: If this API is used to free a resource and if the allocation was made by another job, this field must remain empty. |
| P-RESOURCE | A20 | in Name of the resource. If empty, all prerequisite resource definitions of a job are meant. Function A: obligatory, no wildcard allowed. |
| P-QUANTITY | N7.2 | in Quantity to be allocated. Function A only. |
| P-DEALLOCATION | A1 | in How to deallocate this allocation (for function A only). |
| | | J after job termination |
| | | N after network termination |
| | | K keep until explicit release |
| | | For a detailed description of deallocation modes, see Resource Deallocation Modes in the section <i>Job Maintenance</i> . |
| P-JOB-EXECUTED | L | in Not reusable resources are decreased only if the job was really executed. |

NOPURS1N: Access Entire Operations Resource Masters

This section covers the following topics:

- [Handling Entire Operations Resource Masters](#)

- [Description of Function Codes](#)

Handling Entire Operations Resource Masters

You can handle resource masters with the following statement:

```
CALLNAT 'NOPURSIN'
      P-FUNCTION P-RC P-NODE P-RESOURCE P-TYPE P-INIT-QTY P-USED-QTY
```

Meaning of the parameters:

| Parameter | Format/Length | Use | | |
|--------------|---------------|--------|--|---------------------------------------|
| P - FUNCTION | A1 | in | Function code: | |
| | | | A | Add a resource. |
| | | | D | Delete a resource. |
| | | | M | Modify a resource. |
| | | | T | Test a resource. |
| | | | See also Description of Function Codes . | |
| P - RC | N3 | out | Return code: | |
| | | | 0 | Function OK; resource found. |
| | | | 1 | Resource not found. |
| | | | 2 | Resource already exists. |
| | | | 3 | Inconsistent values. |
| | | | 4 | Initial quantity may not be modified. |
| | | | 101 | Invalid function code. |
| | | | 102 | Resource name missing. |
| P - NODE | N3 | in | Not used; use constant with value=0. | |
| P - RESOURCE | A20 | in | Name of the resource. | |
| P - TYPE | A1 | in | Type of resource | |
| | | | (only for FUNCTION = 'A') | |
| | | | N | Not quantitative. |
| | | | R | Quantitative, reusable. |
| | | U | Quantitative, not reusable. | |
| P - INIT-QTY | P7.2 | in/out | Total quantity. | |
| P - USED-QTY | P7.2 | in/out | Currently used quantity. | |

Description of Function Codes

Meaning of the function codes:

| Code | Description |
|------|--|
| A | Adds a new resource definition. You must give values for P-TYPE, P-INIT-QTY and P-QTY. |
| D | Deletes a resource definition. |
| M | Used to modify the values P-INIT-QTY. |
| T | Returns the current values of P-INIT-QTY and P-QTY. |

Notes:

1. Before using M for modifications, you should use T to read the present values (unless you want to enter an absolute value).
2. The currently used amount of a resource can no longer be modified directly. You must perform a resource allocation or deallocation with the API [NOPURE1N](#) to modify the currently used resource amount.

NOPUSN2N: Inquire Calling Job or Called Network for Subnetworks

You can use this API to:

- Find the current subnetwork for a job of type NET (subnetwork);
- Find the current job calling a subnetwork.

Use the following statement:

```
CALLNAT 'NOPUSN2N'
      P-FUNCTION P-RC P-DBENV *P-OWNER P-NETWORK P-NETWORK-VERSION
      P-RUN P-JOB
```

The parameters P-OWNER, P-NETWORK, P-RUN and P-JOB are input and output parameters. They are overwritten with the values found by the API. Therefore the caller must supply these fields with new entries before each new call.

Parameter Description

| Parameter | Format/Length | Use | | |
|-----------------------|----------------------|-----|---|---|
| P - FUNCTION | A1 | in | Function code: | |
| | | | C | Find calling job (available for active subnetworks only). |
| | | | S | Find subnetwork. |
| | | | T | Find the topmost calling job (available for active subnetworks only). This function recursively goes back in the subnetwork hierarchy, until the caller job is no longer part of a subnetwork. |
| P - RC | N3 | out | Return code: | |
| | | | 0 | Function OK. |
| | | | 1 | Input object not found. |
| | | | 2 | Wrong job type. |
| | | | 3 | No calling job. |
| | | | 4 | No symbol(s) with caller information. |
| | | | 101 | Invalid function code. |
| | | | 102 | Parameter missing. |
| | | | 121 | Owner does not exist. |
| 141 | Symbol access error. | | | |
| P - DBENV | A10 OPTIONAL | mod | Database environment (reserved for future use). | |
| P - OWNER | A10 | mod | Owner of the network. | |
| P - NETWORK | A10 | mod | Network. | |
| P - NETWORK - VERSION | A10 | mod | Network version. | |
| P - RUN | I4 | mod | Run number. If the function S is used for a job master, this parameter must be zero. | |
| P - JOB | A10 | mod | Job. | |

NOPUSP3N: Display Long Texts for Symbol Prompting

You can display the symbol prompting long text for a specified symbol by using the following statement in your Natural application:

```
CALLNAT 'NOPUSP3N'
      P-FUNCTION P-DBENV P-OWNER P-NETWORK P-RUN P-SYMTAB P-SYMTAB-VERSION
      P-SYMBOL P-PROMPT-TYPE P-RC P-PROMPT-TEXT (*)
```

Parameter Description

| Parameter | Format/Length | Use | | |
|------------------|----------------------------|--------|--|---|
| P-FUNCTION | A1 | in | Function code: | |
| | | | G | Get prompting attributes (for master and active). |
| | | | S | Set prompting attributes (for master and active). |
| P-DBENV | A10 OPTIONAL | in | Database environment (reserved for future use). | |
| P-OWNER | A10 | in | Owner of the symbol table. | |
| P-NETWORK | A10 | in | Job network (for active symbols). | |
| P-RUN | I4 | in | Job run number (for active symbols). | |
| P-SYMTAB | A10 | in | Symbol table. | |
| P-SYMTAB-VERSION | A10 | in | Symbol table version. | |
| P-SYMBOL | A40 | in | Name of the prompted symbol. | |
| P-PROMPT-TYPE | A1 | in/out | Input parameter for the function code S, and output parameter for the function code G. | |
| | | | Possible values: | |
| | | | A | Prompt for a symbol at each activation. |
| | | | E | Prompt only if no value is specified in the symbol table. |
| N | Never prompt for a symbol. | | | |
| P-RC | N3 | out | Return code: | |
| | | | 0 | Function ok. |
| | | | 1 | Symbol not found. |
| | | | 99 | Invalid parameter value. |

| Parameter | Format/Length | Use |
|---------------|---------------|---|
| | | 111 Symbol table name begins with reserved prefix =EOR=. |
| P-PROMPT-TEXT | A70/1:V | out Symbol prompting long text. Caller should provide an array of at least 5 text lines. |

NOPUST3N: Inquire Network and Job Status, Symbol Table

You can inquire the current status of an active job network or of a single active job by using the following statement in your Natural application:

```
CALLNAT 'NOPUST3N'
      P-FUNCTION P-RC P-DBENV P-OWNER P-NETWORK P-NETWORK-VERSION P-JOB P-RUN
      P-SYMTAB P-SYMTAB-VERSION P-JOB-ID P-STATUS-TIME
```

This section covers the following topics:

- [Parameter Description](#)
- [Inquire Status of Whole Active Network](#)
- [Inquire Status of all Jobs of an Active Network Individually](#)
- [Inquire Symbol Table Used](#)
- [Example of Using NOPUST3N](#)

Parameter Description

| Parameter | Format/Length | Use |
|------------|---------------|--|
| P-FUNCTION | A1 | in Function code: |
| | | A Get next active run number (in numerical order) beginning with a starting run number. If the starting run number is equal to the run number limit, the range from 1 to the starting run number minus 1 is checked. |
| | | R Get last activated run number (in chronological order). |
| | | S Inquire status. |
| | | N Inquire status of next job (alphabetically). |
| | | W Status of next job waiting for anything, or of next job in status permanent error. |

| Parameter | Format/Length | Use |
|--|---------------|---|
| | | Y Get name of symbol table either from network master or from job definition. |
| P-RC | N3 | out Return code: |
| | | 0 Function OK. |
| | | 1 Network/job not found, or run number does not exist |
| | | 20 Waiting for symbol prompting |
| | | 21 Waiting for job/network activation |
| | | 25 Waiting for prerequisite |
| | | 26 Job(s) are in hold |
| | | 27 Waiting for next action or start time |
| | | 28 Waiting for input condition |
| | | 29 Waiting for resource |
| | | 30 Waiting for operating system node |
| | | 31 Waiting for JCL to be loaded |
| | | 32 Network activation error |
| | | 33 Job activation error |
| | | 34 Symbol replacement error |
| | | 35 Schedule extraction or network activation error |
| | | 36 Job is being submitted |
| | | 37 Job submission error |
| | | 38 Job is executing |
| | | 39 Job execution error |
| | | 41 Network/job is executing |
| | | 42 Performing End-of-Job checking |
| | | 43 End-of-Job checking error |
| | | 44 Performing End-of-Job actions |
| | | 45 End-of-Job actions error |
| | | 65 All jobs ended successfully |
| | | 66 Job(s) ended not successfully |
| 69 Permanent error(s) | | |
| 93 Waiting for network to be deactivated | | |
| 101 Invalid function code | | |
| 102 Parameters missing | | |
| 121 Owner does not exist | | |
| 999 Status not defined | | |

| Parameter | Format/Length | Use |
|--------------------|---------------------|--|
| P-DBENV | A10 OPTIONAL | in Database environment (reserved for future use). |
| P-OWNER | A10 | in Owner of network. |
| P-NETWORK | A10 | in Job network. |
| P-NETWORK -VERSION | A10 | in Version of job network. |
| P-JOB | A10 | in Job. If left blank, inquiry is for whole network. |
| | | out The job for which the return code is returned. |
| P-RUN | I4 | in Function code: |
| | | A Starting run number (can be 0). |
| | | S Run number to be checked. |
| | | out Function code: |
| | | A Next active run number (in numerical order). |
| | | R Last run number of the network in chronological order. |
| P-SYMTAB | A10 | out Name of the defined symbol table. Function R: Name of the defined symbol table on the network level. Function Y: Name of the defined symbol table on the network level (empty P - JOB), or the job level (given P - JOB). Empty, if a symbol table is not defined on the requested level. |
| P-SYMTAB-VERSION | A10 | out Version of the symbol table. The parameter only applies if P - SYMTAB contains a name. |
| P-JOB-ID | A10 | out ID of the job (for single jobs only, and only if the job was already submitted). |
| P-STATUS-TIME | A14 | out Timestamp when the current status of the job was set. Format: YYYYMMDDHHIISS. |

Inquire Status of Whole Active Network

Use function S. Leave the P-JOB parameter blank.

Inquire Status of all Jobs of an Active Network Individually

Use function N. Delete the P-JOB parameter. Then invoke this API in a REPEAT loop until you get RC = 1 (network end).

Each call returns the status of a job. The name is contained in P-JOB. Do not change the content of P-JOB, because it is used as starting value for the next call.

Inquire Symbol Table Used

The symbol table used is always returned for active networks and jobs.

For network masters and jobs, you can use the function Y.

Notes:

- The status inquiry functions independently of Monitor activity, because it uses database entries.
- For a whole network inquiry (with function S), the statuses of the individual jobs are linked with logical AND. In the worst case, if at least one job has failed, the status `failed` is returned for the whole network.
- An active network is considered to have `terminated OK` only if all its active jobs have `terminated OK`.
- The status inquiry is only possible as long as the network or job involved has not been deactivated.
- To obtain all active run numbers of a network, proceed as follows:
 1. Use function A.
 2. Begin with starting run number 0.
 3. Call the API.
 4. Terminate when RC is not equal to 0, or when the number returned for the active run is less than the number of the previous run.
 5. Keep result as next starting run number and continue with Step 3 (Call the API).

Example of Using NOPUST3N

```

...
1 #RC (N3)
1 #OWNER (A10)
1 #NETWORK (A10)
1 #NETWORK-VERSION (A10)
1 #JOB (A10)
1 #RUN (I4)
1 #SYMTAB (A10)
1 #SYMTAB-VERSION (A10)
1 #JOB-ID (A10)
1 #STATUS-TIME (A14)
...

```

```

CALLNAT 'NOPUST3N'
'S' /* get status
  #RC 1X #OWNER #NETWORK #NETWORK-VERSION #JOB #RUN
  #SYMTAB #SYMTAB-VERSION #JOB-ID #STATUS-TIME

```

In the above example, 1X is the placeholder for the [OPTIONAL](#) parameter P-DBENV.

NOPUSY7N: Access Entire Operations Symbols

You can handle symbols in symbol tables using the following statement:

```

CALLNAT 'NOPUSY7N'
  FUNCTION RC DBENV OWNER NETWORK NETWORK-VERSION RUN JOB SYMTAB SYMTAB-VERSION ↵
SYMBOL FORMAT
  VALUE USER TIME
  1X 1X
  VALUE-INDEX

```

Where:

1X 1X are placeholders for [OPTIONAL](#) parameters required for internal purpose only.

This section covers the following topics:

- [Description of Parameters](#)
- [Description of Function Codes](#)
- [Sequential Reading in a Symbol Table](#)
- [Example of Sequential Symbol Table Reading](#)

Related Topic:

- [Symbol Table and Symbol Maintenance](#)

Description of Parameters

| Parameter | Format/Length | Use | |
|--|--|-----|---|
| FUNCTION | A1 | in | Function code: |
| | | D | Delete one multiple value. |
| | | M | Add one multiple value. |
| | | N | Test next symbol. |
| | | P | Test next symbol to be prompted. |
| | | R | Reset a symbol. |
| | | S | Set (add or modify) a symbol. |
| | | T | Test existence of a symbol and inquire its value. |
| | | 1 | Test existence of a symbol and inquire its value, with recursive resolution. |
| | | 4 | Applies to active symbol tables only. Test next symbol and inquire its value, with recursive resolution. |
| See also Description of Function Codes . | | | |
| RC | N3 | out | Return code: |
| | | 0 | Function OK; symbol found. |
| | | 1 | Symbol not found. |
| | | 2 | Invalid numeric value. |
| | | 3 | Invalid format. |
| | | 4 | Format modification attempted. |
| | | 5 | Multiple table full. |
| | | 6 | Value missing. |
| | | 7 | Attempted to write a predefined (read-only) symbol. Refer to Predefined Symbols Ranges . |
| | | 10 | Invalid value by user exit. |
| | | 11 | User exit not found. |
| | | 12 | Access to user exit not allowed (Natural Security). |
| | | 20 | OK; is a multiple value. |
| | | 30 | OK; the master symbol was also modified. |
| | | 101 | Invalid function code. |
| | | 102 | Parameter missing. |
| 111 | Symbol table name starts with reserved prefix =EOR=. | | |

| Parameter | Format/Length | Use |
|-----------------|---------------------|---|
| | | 121 Owner does not exist. |
| | | 131 Invalid symbol table name. |
| | | 132 Invalid symbol table version name. |
| | | 777 Internal parameter error. Refer to the Entire Operations log for more information. |
| DBENV | A10 OPTIONAL | in Database environment (reserved for future use). |
| OWNER | A10 | in Owner of the symbol table. |
| NETWORK | A10 | in Network (for active symbol table only). |
| NETWORK-VERSION | A10 | in Network version. |
| RUN | P13 | in Run (for active symbol table only). |
| JOB | A10 | in Job. |
| SYMTAB | A10 | in Symbol table. |
| SYMTAB-VERSION | A10 | in Symbol table version. |
| SYMBOL | A40 | in Symbol. |
| | | out For function codes N and P. |
| FORMAT | A1 | in Symbol format. For the function 1 for master symbol tables, this parameter has a special meaning: FORMAT may contain the escape character to be used for the recursive resolution. The format values (below) and a question mark (?) must not be used as escape character. |
| | | out For function codes N, P and T. |
| | | blank or A Alphanumeric. No case conversion. |
| | | D Date in the format: YYYYMMDD |
| | | H Alphanumeric. Hidden. |
| | | L Alphanumeric. Conversion to lower case. |
| | | N Numeric. |
| | | U Alphanumeric. Conversion to upper case. |
| VALUE | A250 | in Symbol value. |
| | | out For function codes N, P and T. |
| VALUE - INDEX | I4 | in Index for multiple-value symbols. Set VALUE - INDEX to an appropriate value. After the call, this value is adapted to the index of the next multiple-value symbol read. |

| Parameter | Format/Length | Use |
|-----------|---------------|---|
| | | If the value set for VALUE - INDEX is higher than the highest index of the given symbol, the next symbol is read. |
| | | out For function code 4 only. |
| USER | A8 | out User who made the last modification. |
| TIME | T | out Time of the last modification. |

Description of Function Codes

Meaning of the function codes:

| Code | Description |
|------|--|
| D | Delete one multiple value. Resets one value in a multiple-value symbol. If this is the last symbol value, the whole symbol is removed from the table. |
| M | Add one multiple value. Sets one more value in a multiple-value symbol. Even if the quantity of the multiple values is 1, the single value remains a multiple value. It will not be converted into a standard value. |
| N | Test next symbol. Tries to find the next symbol (in alphabetic order) from the specified symbol. The given name is overwritten by the name found. The other fields are returned as in function T. To find the first symbol of a symbol table, the symbol name can be omitted. If the end of the symbol table is reached, code 1 is returned. See also <i>Sequential Reading in a Symbol Table</i> . |
| P | Test next symbol to be prompted. Finds the next symbol in alphabetical order to be prompted for the current network/job run. Otherwise works like function code N. |
| R | Reset a symbol. The symbol is removed from the symbol table. |
| S | Set a symbol. If the symbol does not exist in the symbol table, it is inserted; if it already exists, it is overwritten. |
| T | Test a symbol. If the symbol is not found, code 1 is returned. If the symbol exists, its format and value are returned. The fields USER and TIME contain the user and time stamp of the last modification. |

| Code | Description |
|------|---|
| 1 | <p>Test a symbol.</p> <p>If the symbol is not found, code 1 is returned. If the symbol exists, its format and value are returned. If the symbol value contains symbols, they will be resolved recursively. The fields USER and TIME contain the user and time stamp of the last modification.</p> |
| 4 | <p>Applies to active symbol tables only.</p> <p>Test next symbol and inquire its value, with recursive resolution.</p> <p>This function requires you to specify the following:</p> <ul style="list-style-type: none"> ■ A network and run number (in addition to owner). ■ The VALUE - INDEX parameter. <p>See also Sequential Reading in a Symbol Table.</p> |

Notes:

1. To access a master symbol table, the fields [NETWORK](#) and [RUN](#) must be empty. To access an active symbol table, the fields [NETWORK](#) and [RUN](#) must be supplied by the caller.
2. If a [validation check user exit](#) (see the section *User Exits*) is defined for the symbol, it is invoked from this API routine, too. Make sure that the user exit is accessible in the calling environment. The library containing the user exit must be defined as a steplib for the executing environment of these APIs. A symbol value is rejected if the exit returns not OK (RC=10) or if the exit is missing (RC=11).
3. All actions will be logged.
4. The API is can also read the values of [predefined symbols](#) (described in *Symbol Table and Symbol Maintenance*).
5. Symbol created by this API will get the symbol prompting setting N (never). See also [Symbol Prompting during Network or Job Activation](#) in the section *Symbol Table and Symbol Maintenance*.

Sequential Reading in a Symbol Table

➤ To read symbols sequentially from a master or an active symbol table

- 1 Set the function to N.
- 2 If you want to start reading at the start of the table, reset [SYMBOL](#) first; otherwise put a start name into [SYMBOL](#).
- 3 Call the user exit in a [REPEAT](#) loop; leave it if RC is not 0 and not 20.
- 4 Leave [SYMBOL](#) unchanged as the start value for the next call.
- 5 Reset [VALUE](#) before the next call if RC=0.

6 Do not reset VALUE if RC=20.

➤ **To read symbols sequentially from an active symbol table**

- 1 Set the function to 4.
- 2 If you want to start reading at the start of the table, reset SYMBOL first; otherwise put a start name into SYMBOL.
- 3 Leave SYMBOL and VALUE-INDEX unchanged as the start values for the next call.
- 4 Reset VALUE before the next call if RC=0.
- 5 Do not reset VALUE-INDEX if RC=20.

Example of Sequential Symbol Table Reading

```
MOVE 'N' TO FUNCTION
RESET SYMBOL-NAME
R1. REPEAT
    CALLNAT 'NOPUSY7N' RC ...

    DECIDE ON FIRST VALUE OF RC
    VALUE 0, 20 IGNORE
    VALUE 1 ESCAPE BOTTOM (R1.)
    NONE VALUE
        /* Error handling
    END-DECIDE
        /* process symbol here
    IF RC NE 20
        RESET VALUE
    END-IF
END-REPEAT
```

NOPUVI2N: Obtain Entire Operations Version Information

You can use this API to find out the version of Entire Operations. Use the following statement:

```
CALLNAT 'NOPUVI2N'
    P-FUNCTION P-VERSION P-VERSION-DATE P-UPDATE-DATE
```

Parameter Description

| Parameter | Format/Length | Use | |
|----------------|------------------------|-----|---|
| P-FUNCTION | A1 | in | Function code: V Version information. |
| P-VERSION | A20 BY VALUE RESULT | out | Version, in the format <i>vv.rr.ss.pppp</i> : see Format for Product Versions . |
| P-VERSION-DATE | A8 | out | Date of version. Format: YYYYMMDD. |
| P-UPDATE-DATE | A8 | out | Date of last updates. Format: YYYYMMDD. |

Format for Product Versions

A product version in the format *vv.rr.ss.pppp* denotes the following:

| | |
|-------------|----------------|
| <i>vv</i> | Major version. |
| <i>rr</i> | Minor version. |
| <i>ss</i> | Service pack. |
| <i>pppp</i> | Fix. |

Leading zeros are omitted, for example: 5.5.1.1.

Note: For further information on product versions, see *Version* in the *Glossary* of the *Natural* documentation.

NOPUXD1N: Maintain End-of-Job User Exits for a Network

You can maintain End-of-Job (EJA) definitions of a specific activated network using the following call from your Natural application.

```
CALLNAT 'NOPUXD1N' UXD-PARAMETER-AREA
```

The parameters have the following meaning:

| Parameter | Format/Length | Use |
|---------------------------|---------------|---|
| UXD - FUNCTION | A1 | A Add. |
| | | M Modify. |
| | | D Delete. |
| UXD - RC | N4 | Return code: |
| | | 0 Function OK. |
| | | 1 Input object not found. |
| | | 2 Wrong job type. |
| | | 3 Not a calling job. |
| | | 4 Call place not supported. |
| | | 5 Invalid exit mode. |
| | | 6 Run number not in range. |
| | | 7 Exit is already defined. |
| | | Note: For UXD - FUNCTION A only. |
| | | 101 Invalid function code. |
| | | 102 Parameter(s) missing. |
| 121 Owner does not exist. | | |
| UXD - DBENV | A10 | Reserved for future use. |
| UXD - OWNER | A10 | Reserved for future use. |
| UXD - NETWORK | A10 | Reserved for future use. |
| UXD - RUN | I4 | Reserved for future use. |
| UXD - JOB | A10 | Reserved for future use. |
| UXD - EVENT - TYPE | A3 | JOK Job OK. |
| | | JNO Job not OK. |
| | | UEX No influence. |
| UXD - EVENT - NAME | A30 | in Selected event. If empty, a new additional job-ok or job-not-ok event will be added. |
| | | out Event name used. |
| UXD - EXIT - CALL - PLACE | A3 | EJA End-of-Job action. |
| UXD - EXIT - LIBRARY | A8 | Reserved for future use. |
| UXD - USEREXIT | A8 | Reserved for future use. |
| UXD - EXIT - MODE | A1 | blank Synchronous execution. |
| | | A Asynchronous execution. |

NOPUXION: Add Input Condition to an Activated Job

You can add an input condition to an activated job using the following call from your Natural application.

```
CALLNAT 'NOPUXION'
  P-OWNER
  P-NETWORK
  P-JOB
  P-RUN-NUMBER
  P-RC
  P-CONDITION
  P-NATURAL-LIBRARY
  P-NATURAL-SUBPROGRAM
```

The parameters have the following meaning:

| Parameter | Format/Length | Use |
|----------------------|---------------|---|
| P-OWNER | A10 | in Owner name. |
| P-NETWORK | A10 | in Network name. |
| P-JOB | A10 | in Job name. |
| P-RUN-NUMBER | I4 | in Run number. |
| P-RC | N3 | 1 Activated job does not exist. |
| | | 2 Maximum number of existing conditions. |
| | | 3 Global condition only allowed for owner SYSDBA. |
| | | 4 Invalid parameters for condition passed. |
| | | 5 Condition already exists. |
| | | 99 Natural runtime error. |
| P-CONDITION | A20 | in Name of the new condition. |
| P-NATURAL-LIBRARY | A8 | in Name of exit library. |
| P-NATURAL-SUBPROGRAM | A8 | in Name of exit subprogram. |

User exits (user routines) must be coded as Natural subprograms and are automatically invoked by the Entire Operations Monitor according to where they are defined.

Entire Operation user exits require information specified in the Natural parameter data area NOPXPL-A.

When implementing Entire Operation user exits, you use the Entire Operations editor (see also [Editing Master JCL and Natural Sources](#) in the section *Job Maintenance*) and must obey the [User Exit Coding Restrictions](#).

What User Exits Can Do

User exits can be used to check job results and influence job flow by their return codes. Apart from running checks, however, the use of Entire System Server and Adabas technology allows user exits to perform various actions such as

- Database updates;
- File access and handling;
- Access to operating system functions;
- Validation checks.

User exits for the Monitor can perform any Adabas or Entire System Server function, but must not perform any type of screen I/O.

Entire Operations checks the existence of a user exit while it is being defined, as well as at invocation time. Entire Operations treats the non-existence of a user exit as an error. When such an error occurs at invocation time or during job processing, the job network execution is interrupted.

User exits can affect the Entire Operations job flow by sending a return code or other information back to the caller after execution, depending on the type and result of the routine.

Notes:

1. User exits are invoked by the Entire Operations Monitor, which performs them as subroutines. Do not forget that intensive use of user exits can influence other work to be performed by the Monitor.
2. For user exit coding, the [user exit coding restrictions](#) must be adhered to.

The following section describes the different types of user exit in more detail.

Global User Exits

Global user exits can be used in your whole Entire Operations environment. For more information, see the following sections in *Global User Exits* in the *Administration* documentation:

- *Global Exit for Version Names*
- *Global JCL Activation Exit*
- *Global Symbol Modification Exit*
- *Global Symbol Not Found Exit*
- *Global Message Sending Exit*

Front-end User Exits

Front-end user exits are coded as Natural subprograms and are invoked by the Entire Operations front end for specific processing.

They can use any user-defined map with the following restrictions:

- The map (Natural object type M) must be accessible from the SYSEOR system library. The easiest way is to copy the required maps into the SYSEOR system library.
- Note that Entire Operations can be executed with the following Natural language codes: 1 = English; 2 = German. So it could be useful to supply two maps and to refer to them with the ampersand & as a placeholder representing the current language code. For more information on this technique, see the section *Multilingual User Interfaces* in the *Natural Programming Guide*.

You can define the following front-end user exit:

- Symbol prompting for a network or job activation. For more information, see [Symbol Prompting during Network or Job Activation](#) in the section [Symbol Table and Symbol Maintenance](#).

Common User Exit Parameter Data Area NOPXPL-A

All user exits under Entire Operations must use the common parameter data area NOPXPL-A, which is available in both object and source format in the SYSEOR library.

For this reason, the initial coding of a user exit must always resemble:

This section covers the following topics:

- [User Exit Types, P-CALL-PLACE](#)
- [Parameters Used for Different Call Places](#)
- [Additional Independent \(AIV\) Variables](#)
- [Predefined Symbols](#)
- [Common Considerations for User Exits](#)
- [Decimal Character \(DC\) Setting](#)
- [User Exit Coding Restrictions](#)

User Exit Types, P-CALL-PLACE

The field [P-CALL-PLACE](#) in the parameter list shows for which purpose the user exit was called:

| P-CALL-PLACE | Description |
|---------------------|--|
| EJA | End-of-Job Action See also Defining Action User Exits in the section <i>Defining and Managing End-of-Job (EOJ) Checking and Actions</i> . |

where:

n/a = Parameter can contain invalid values, do not modify.

in = Parameter contains input values.

out = Parameter contains output values.

mod = Parameter modifications are saved.

Notes:

¹ in; BS2000 only

² in; contains P-SUFFIX in first 10 bytes

³ in; only for active symbols

⁶ in; contains P-JOB-ID (A5) in first 5 bytes

⁷ in; here: timestamp of previous exit call

⁹ This field is obsolete. Use P-JOB-ID instead. The size of P-JOB-NUMBER is too small for some operating systems. For compatibility reasons, the field will be filled on return, if the job number is in the range of 1 to 99999.

¹⁰ Node numbers from 1 thru 999 are provided here. For node numbers greater than 999, P-EXECUTION-NODE is zero. Node numbers of any size are provided in the AIV variable +P-EXEC-NODE-I4 (I4).

¹¹ For longer file names, you must use the AIV variable +P-SYSOUT-FILE-250 (A250).

¹³ This field is only maintained for compatibility reasons. Parameter modifications using the internal A40 format/length can truncate values thus causing data loss.

¹⁴ This field is only maintained for compatibility reasons. Parameter modifications using the internal A80 format/length can truncate values thus causing data loss.

¹⁵ For the fields P-RC and P-RT with P-CALL-PLACE set to IC0: see [Input Condition with User Exit](#) in the section *Job Maintenance*.

Additional Independent (AIV) Variables

In addition to the parameter list NOPXPL-A, some parameters are provided as independent (AIV) variables.

| Field Name | Format | Call Place | | | | | | | | | | | | |
|--------------------|--------|------------|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|-----|
| | | EJA | EJC | FSB | ICO | MAC | NAT | NVN | RMD | SFX | SNF | SVN | SYC | SYF |
| +P-NETWORK-VERSION | A10 | in | in | in | in | in | in | in | in | in | in | in | n/a | in |
| +P-SYMTAB-VERSION | A10 | in | in | in | in | in | in | n/a | in | in | in | n/a | n/a | in |
| +P-EXEC-NODE-I4 | I4 | in | in | in | in | in | in | n/a | in | in | in | n/a | in | in |
| +P-SYSOUT-FILE-250 | A250 | in | in | n/a |
| +P-JI-JOB-TYPE | A3 | in | in | n/a |
| +P-JI-DUMMY-FLAG | A1 | in | in | n/a |

Field Descriptions

| | | |
|--------------------|---|------------------|
| +P-NETWORK-VERSION | Version of the network. | |
| +P-SYMTAB-VERSION | Version of the symbol table. | |
| +P-EXEC-NODE-I4 | This field provides node numbers of any size (1 thru 99900). It is provided for each node number. You must use it instead of P-EXECUTION-NODE, if the node number is greater than 999. | |
| +P-SYSOUT-FILE-250 | This field provides the SYSOUT file name in a field with a length of 250 bytes. You must use this field for the name of the SYSOUT file for a UNIX or Windows job (instead of P-SYSOUT-FILE) to avoid truncation. | |
| +P-JI-JOB-TYPE | The job type (A3). For valid values, see the three-letter codes in <i>Available Job Types</i> in the section <i>Job Maintenance</i> . | |
| +P-JI-DUMMY-FLAG | Reason why a job became a temporary dummy job (dummy due to ...). | |
| | J | JCL check. |
| | D | Definition. |
| | S | Schedule. |
| | R | Recovery. |
| | T | Repetition. |
| | E | Empty JCL. |
| | C | Condition. |
| | M | Multiple suffix. |
| K | To be deactivated. | |

Predefined Symbols

For a list of predefined symbols, see [Predefined Symbols](#) in the section [Symbol Table and Symbol Maintenance](#).

Common Considerations for User Exits

All user exits must return the field P-RC (return code). 0 (zero) means OK.

The field P-RT (return text) can be used optionally to pass back some specific information. Entire Operations writes this text into the log and displays it on the **Active Jobs** screen, if supplied.

All other parameters pass environment information to the user exit. Some [parameters](#) and [AIV variables](#) are not always required; see the relevant field descriptions for details.

Decimal Character (DC) Setting

The parameter data area NOPXPL-A contains numbers with decimal characters. The default setting for decimal character in the delivered source of NOPXPL-A is a period (.). If you want to catalog your user exits and Natural programs with another decimal character (e.g. comma, DC=,), you must also modify NOPXPL-A:

- Make sure that the decimal character of your Natural session is set correctly. You can verify this with the system command GLOBALS (described in the *Natural System Commands* documentation).
- Use the Natural Editor to edit NOPXPL-A.
- Change the decimal character to your current DC parameter setting in the numeric fields, which contain a decimal character. Stow NOPXPL-A.

You will now be able to use NOPXPL-A with your own decimal character.

User Exit Coding Restrictions

1. User exits must reside in a Natural library on the FUSER system file but may not reside in the Entire Operations SYSEOR system library.

Sub-objects invoked by user exits (subprograms, etc.) and global user exits (see the *Administration* documentation) and must reside in the SYSEORU system library.

2. ON ERROR routines are allowed in Entire Operations user exits, with the following restriction: The ON ERROR block must not be left by any ESCAPE ROUTINE, ESCAPE MODULE, TERMINATE or similar statement. The purpose of this restriction is that the common Entire Operations Monitor (or Entire Operations online) error transaction gets control after the execution of the user-defined ON ERROR block. The common Entire Operations error transaction performs some common error handling, logging, notifications etc.
3. No programs with their own GDA (global data area) may be invoked.

4. The names of user exits must not begin with the letter V, particularly if they are to be stored in the library SYSEOR, because the prefix V is reserved for the internal Entire Operations exit directory.
5. The following Natural statements must *not* be coded in any user exit invoked by Entire Operations:
 - END TRANSACTION

The transaction logic is handled by the Entire Operations Monitor itself.
 - BACKOUT TRANSACTION
 - STOP
 - TERMINATE
 - FETCH **without** RETURN (FETCH RETURN is allowed)
6. Entire System Server node logons and logoffs should be avoided. This applies for mainframe nodes (view NATPROC-LOGON), UNIX nodes, and Windows nodes. If any logons and/or logoffs to Entire System Server nodes were made in a user exit, the exit must invoke the Entire System Server node invalidation [API NOPUNI1N](#) prior to termination. This forces subsequent new logons to these nodes.
7. Do not code any screen and map input/output in user exits. An exception is the symbol prompting user exit in online usage mode. See also [Specifying User Exits for Symbol Modification](#) in the section [Symbol Table and Symbol Maintenance](#).
8. In general, the execution of all kinds of code, which can disturb the Entire Operations Monitor execution, is forbidden in user exits (exits). If in doubt, contact Software AG technical support.

Notes:

1. If you want to use the values of the special parameters in Macro JCL, you must first read them with the special statement [#GET-SYMBOL](#) (described in the section [System Overview](#)).
2. See also [User Exits for Validation Checks of Symbol Values](#). For foreground usage, this exit may use maps (with some restrictions).

Generation of Dynamic JCL and SYSOUT File Names (BS2000 only)

For MAC-type jobs, you can generate dynamic JCL: see [Dynamic JCL Generation \(JCL Location MAC\)](#) in the section [Job Maintenance](#).

In a BS2000 environment, you can generate file names for SYSOUT: see [NOPFB2-N: Generate SYSOUT File Names for BS2000](#) in the section [API Routines](#).

User Exits for Resource Master Determination

For each resource master, you can define a resource amount determination exit: see *Using a Resource Master Determination Exit* in the *Administration* documentation.

User Exits for Setting Input Conditions

Before Entire Operations can submit a job, all its input conditions must be fulfilled.

If a user exit is defined for a condition, Entire Operations invokes the defined exit (of the type **ICO**) each time it checks the condition status. See *Return Code Settings for an Input Condition User Exit* for the meaning of the return codes.

Otherwise, the condition checking will be continued.

You can set a return text in the P-RT parameter additionally.

User Exits for End-of-Job Checking and Actions

You can define user exits as part of End-of-Job checking. Entire Operations bases its End-of-Job checking on the occurrence of defined events during job execution. You can define a user exit as an event check. Entire Operations automatically executes the user exit when the job terminates.

Typically, such a user exit routine can check the result of a job, for example. The user exit returns a code which determines the event status. A return code zero means `Check OK`, any other return code means `Check not OK`. Condition codes returned by user exits can determine End-of-Job status.

End-of-Job action user exits can be used to perform any actions after job termination.

End-of-Job checking and action user exits are supplied with both the job number and the name of the SYSOUT file in which Entire Operations collected the job SYSOUT (BS2000 only).

For End-of-Job user exits, the common exit parameter list **NOPXPL-A** must be used. The parameter P-CALL-PLACE contains EJC for End-of-Job checking user exits or EJA for End-of-Job action user exits.

Related Topic:

- *Defining Action User Exits* in the section *Defining and Managing End-of-Job (EOJ) Checking and Actions*

This section covers the following topics:

- [Example](#)

Example

An End-of-Job checking user exit is shown in the example below.

This user exit routine adds up the contents of a numeric field in the SYSOUT and compares it with a given value. If the sum of the contents equals the sum of the given value, the event is treated as ok, otherwise as not ok.

```

DEFINE DATA PARAMETER USING NOPXPL-A
LOCAL
1 READ-SPOOL VIEW OF READ-SPOOL      /* AN ENTIRE SYSTEM SERVER VIEW
  2 RECORD
  2 REDEFINE RECORD
    3 RECORD-HEADER    (A05)
*
1 #NF          (I02) CONST <10>    /* MAX. NUMBER FOR SEPARATION
1 #SUM         (N08) INIT  <0>
1 #SUM-EXPECTED (N08) CONST <2000>
1 #FIELD      (A10/1:#NF)
1 #USERID     (A08)
1 #DBENV      (A10)
1 #NETWORK-VERSION (A10)

1 #LOG-STATUS (N04)
1 #LOG-MESSAGE (A60)
1 #LOG-TARGET (A03) CONST <'NOP'>
1 #USE-NAT-MSG-CACHE (L) CONST <FALSE>
END-DEFINE

```

```

* -----
* This EOJ User Exit will read the Job SYSOUT (data set 2)
* and will summarize a defined field.
* If the sum is equal to a given value, this routine returns
* an 'OK' (P-RC = 0), otherwise 'NOT OK'.
*
* A log record will be written to document the result.
*
RESET #SUM
RS. FIND READ-SPOOL
  WITH NODE = P-EXECUTION-NODE AND JOB-NUMBER = P-JOB-ID
  AND TYPE = 'SO' AND DATA-SET = 2 AND RECORD-NUMBER >= 1
ACCEPT IF RS.RECORD-HEADER = 'REC01'      /* interesting only
SEPARATE RS.RECORD LEFT JUSTIFIED INTO #FIELD(*)
ADD VAL(#FIELD(3)) TO #SUM

```

```

END-FIND
*
IF #SUM = #SUM-EXPECTED
  RESET P-RC
  MOVE 'Sum check is ok' TO #LOG-MESSAGE
ELSE
  MOVE 1 TO P-RC
  COMPRESS 'Sum:' #SUM 'Expected:' #SUM-EXPECTED INTO #LOG-MESSAGE
END-IF
#USERID := *USER
MOVE 9999 TO #LOG-STATUS
CALLNAT 'NOPULW93N'          /* WRITE LOG RECORD

```

User Exits for Symbol Functions

You can perform user-specific symbol functions via a user exit. For the symbol functions available, see [Functions for Symbol Replacement](#) in the section [Symbol Table and Symbol Maintenance](#).

- [Symbol Function Syntax](#)
- [Symbol Function Coding Rules](#)
- [Symbol Function Parameter List](#)
- [Example of a Symbol Function](#)

Symbol Function Syntax

Syntax for symbol functions:

```
$!|?function[parm,...]
```

Symbol Function Coding Rules

- As for other user exits (exits), the [user exit coding restrictions](#) must be adhered to.
- For a function to be recognized, an exclamation mark (!) or a question mark (?) must always follow the escape character. In BS2000 the exclamation mark (!) is represented by an ö character.
- The parameter list is optional and is enclosed in square brackets ([]). No spaces are allowed between function name and parameter list.
- Parameters must be separated by commas.
- The total length of the function call may not be longer than 20.
- The symbol functions must be located in the SYSEORU library.

- The Entire Operations Monitor performs logging of symbol replacements. Additional logging may also be performed.
- After successful replacement, the symbol value is written to the active symbol table of the job. The symbol function is not called for subsequent replacements. Instead, the value is read from the active table.

The names of the symbol function exits begin with `SX`. Since the length of the names of Natural objects is limited to 8 characters, the function name (the exclamation mark (!) not counted) can have a maximum length of 6 characters.

Symbol Function Parameter List

The function `!RANDOM` is handled by the Natural subprogram `SXRANDOM`.

The symbol function exits are called with the parameter list `NOPXPL-A`, so the first line of the exit should be:

```
DEFINE DATA PARAMETER USING NOPXPL-A
```

Meaning of the parameters in `NOPXPL-A`:

| Parameter |
|------------------|
| P-CALL-PLACE |
| P-RC |
| P-RT |
| P-OWNER |
| P-NETWORK |
| P-JOB |
| P-RUN |
| P-EXECUTION-NODE |
| P-SYMBOL-TABLE |
| P-SYMBOL |
| P-SYMBOL-VALUE |

We strongly recommend that you only use the fields listed in the previous table. Using any other field from `NOPXPL-A`, can cause unpredictable results.

Notes:

1. Caller supplied `SFX` (symbol function exit) for `P-CALL-PLACE`.
2. Set `P-RC` to either of the following return codes:

0 (Function ok.), or

4531 (Symbol not found.)

3. P-SYMBOL only transfers the function parameters (without brackets). The function names can be identified from the Natural variable *PROGRAM (described in the *Natural System Variables* documentation).

Example of a Symbol Function

User Exit Subprogram SXQS

```
* SYMBOL FUNCTION EXIT EXAMPLE
* SXQS<PARM1>
* CROSSFOOTING OF THE PARAMETER
* -----
DEFINE DATA PARAMETER USING NOPXPL-A
LOCAL
1 #I    (I02)
1 #N    (I02)
1 #SUM  (I02)
1 #A    (A01)
END-DEFINE
* -----
RESET #SUM
F1. FOR #I = 1 TO 20
  #A := SUBSTR (P-SYMBOL,#I,1)
  IF #A IS (N1)
    #N := VAL(#A)
    ADD #N TO #SUM
  END-IF
END-FOR    /* F1.
P-SYMBOL-VALUE := #SUM
RESET P-RC P-RT
END
```

Master JCL

```
//SN000001 JOB ,SN,CLASS=K
//IEFBR14 EXEC PGM=IEFBR14
//*
/* +!D<AQ+1>
/* §!D<AQ+1>
/*
/* +!QS<4711>
/* §!QS<4711>

| !QS<4711> | A E 13 | EORMON 11.01.08 17:25 |
| X | A E x | SN 10.11.08 13:13 |

User Exits for Validation Checks of Symbol Values

You can write a user exit routine ([front-end user exit](#)) that defines your own prompting screens and validation (plausibility) checks for symbol prompting during job network activation. For more information on symbol prompting, see [Symbol Prompting during Network or Job Activation](#) in the section [Symbol Table and Symbol Maintenance](#).

The user exit is called by the Entire Operations Monitor after the creation of the active symbol tables, but before the JCL loading. If the user exit is missing or receives a run time error, network activation is stopped and a message is sent to the mailbox, which is assigned to the network as

the message recipient. If no mailbox is assigned, the message is sent to the SYSDBA mailbox. For details, see the section [Mailboxes](#).

When writing the user exit routine, use the mandatory parameter data area NOPXPL-A and the parameter list [NOPSYP3A](#).

NOPXPL-A contains the owner, symbol table, symbol name, etc. It can therefore be used for different symbols.

[NOPSYP3A](#) contains all needed environment parameters. The list of symbol tables used for this network activation will be passed to the Entire Operations API routine.

The symbols must be read and updated by the Entire Operations API routine NOPUSY_xN which allows sequential reading in the active symbol table. *x* denotes a sequential version number of 1 through 6, where 6 is the most recent version of the API.

The parameters P-RC (return code) and P-RT (return text) are examined by the caller after execution of the user exit. If P-RC is zero, the symbol is accepted as OK. Otherwise, the symbol is not accepted.

If the text from P-RT is not blank, it will be displayed to the user with message code EOR1855. If P-RT is not zero and blank, a standard error message is displayed.

As in other user exits, Adabas, Entire System Server and Natural system variables can provide a lot of flexibility to symbol checking.

This section covers the following topic:

- [Parameter List NOPSYP3A](#)
- [Symbol Modification without Prompting](#)

Parameter List NOPSYP3A

```
*

```

Reserved Symbols for UNIX and Windows Environment Variables

A set of reserved symbols can be used to set environment variables in the JCL frame script (UNIX) or in the JCL frame BAT file (Windows) for jobs submitted on UNIX or Windows nodes.

Prerequisite: The symbols must be defined in the Natural text object NOPVS001 supplied in the SYSEORU system library.

- [Special Usage Considerations](#)

- [Example of Using Reserved Symbols for Environment Variables](#)

Special Usage Considerations

Consider the following when using reserved symbols as environment variables:

- For valid format/length specifications of the reserved symbols, see [Table of Predefined Symbols](#) in the section *Symbol Table and Symbol Maintenance*.
- Dash signs (-) within a symbol name are converted to underscore signs (_) as indicated in the following example.
- For UNIX:

Environment variables are exported. Therefore, they are available in all subscripts and executables called from the frame script.

- For Windows:

Environment variables are set in the frame BAT file. They are available in the user BAT or PS1 file.

Example of Using Reserved Symbols for Environment Variables

The following is an example of using reserved symbols to set environment variables.

Variables defined in the NOPVS001 text object:

```
P-SYSF1
P-OWNER
P-NETWORK
P-NETWORK-VERSION
P-RUN
P-RUN5
P-JOB
P-REPEAT
P-ESC-ACT
P-ESC-SUB
P-SYMTAB
P-SYMTAB-VERSION
P-JCL-NODE
P-EXEC-NODE
P-SUL
P-SUG
P-NADIR
P-SYSOUT
P-DATE
P-C-OWNER
P-C-NETWORK
P-C-NETWORK-VERSION
P-C-RUN
```

```
P-C-RUN5
P-C-JOB
```

Excerpt of the generated JCL frame script for UNIX:

```
...
# setting of variables defined in SYSEORU/NOPVS001

Passing Files to Entire Output Management

60

Passing Files to Entire Output Management

- Basic Requirements for File Transfers to Entire Output Management 870
- Listing Files Defined for Entire Output Management 871
- Adding and Modifying File Definitions 873
- Deleting File Definitions 877
- Handing Over SYSOUT and Files to Entire Output Management 878

You can define and pass job SYSOUT and/or one or more other files (for example, output files of a job) to Entire Output Management (NOM) to further process the output in this environment.

Basic Requirements for File Transfers to Entire Output Management

This section describes the requirements for transferring files from Entire Operations to Entire Output Management.

1. An `NTLFILE` or `LFILE` definition for the Entire Output Management system file must be entered in the start parameters for System Automation Tools or Entire Operations. For further information, see the section *Installing Entire Operations on Mainframes and UNIX* in the *Installation and Setup* documentation.
2. If Entire Output Management (`LFILE 206`) is defined, and if the Entire Operations Monitor receives a NAT0082 message calling the Entire Output Management API, the message `NOM Trigger interface not active` will be written to log before Entire Operations task restart. Subsequent attempts to pass SYSOUT to Entire Output Management will be ignored with the message `Passing to NOM impossible`.
3. If SYSOUT or another file cannot be passed to the Entire Output Management API, the Entire Output Management API calls for a job to be **retried**. Check the Entire Operations log for more detailed error information.
4. In Entire Output Management, the report name is EOR-SOUT.
5. For UNIX and Windows, refer to [Passing SYSOUT from UNIX and Windows Nodes to Entire Output Management](#).

See also:

- [Handing over SYSOUT and Files to Entire Output Management](#).
- The Entire Operations default setting **NOM API Settings** described in *Defaults for Other Settings* in the *Administration* documentation.
- The Entire Operations default setting **Copy SYSOUT File before passing it to NOM** described in *Defaults for Other Settings* in the *Administration* documentation.

Listing Files Defined for Entire Output Management

> To list files defined for processing with Entire Output Management

- 1 Select a job and open the **EOJ Checking** page shown in the following example:

OGC - Maintenance Job Master JOB-01 [EXAMPLE,B60-FLOW]

Job name: Use symbol as execution node
 Execution node:

Description:

Job type: Special type:

Scheduling Parameters | User Defined Log Data | Long Description | OS Specials
 Main | Resources | Input Conditions | **EOJ Checking** | JCL Definition

| Action | Step | will be checked for | means |
|----------|------|--------------------------------------|-----------|
| | | Occurrence of String 'INVALID RE | n.ok |
| T | | Additional Actions for Job-ok | ok |
| AC | | All Checks ok | |
| | | Any Check not ok | |

Add
 Modify
 Delete
 Edit

Apply OK Cancel Help

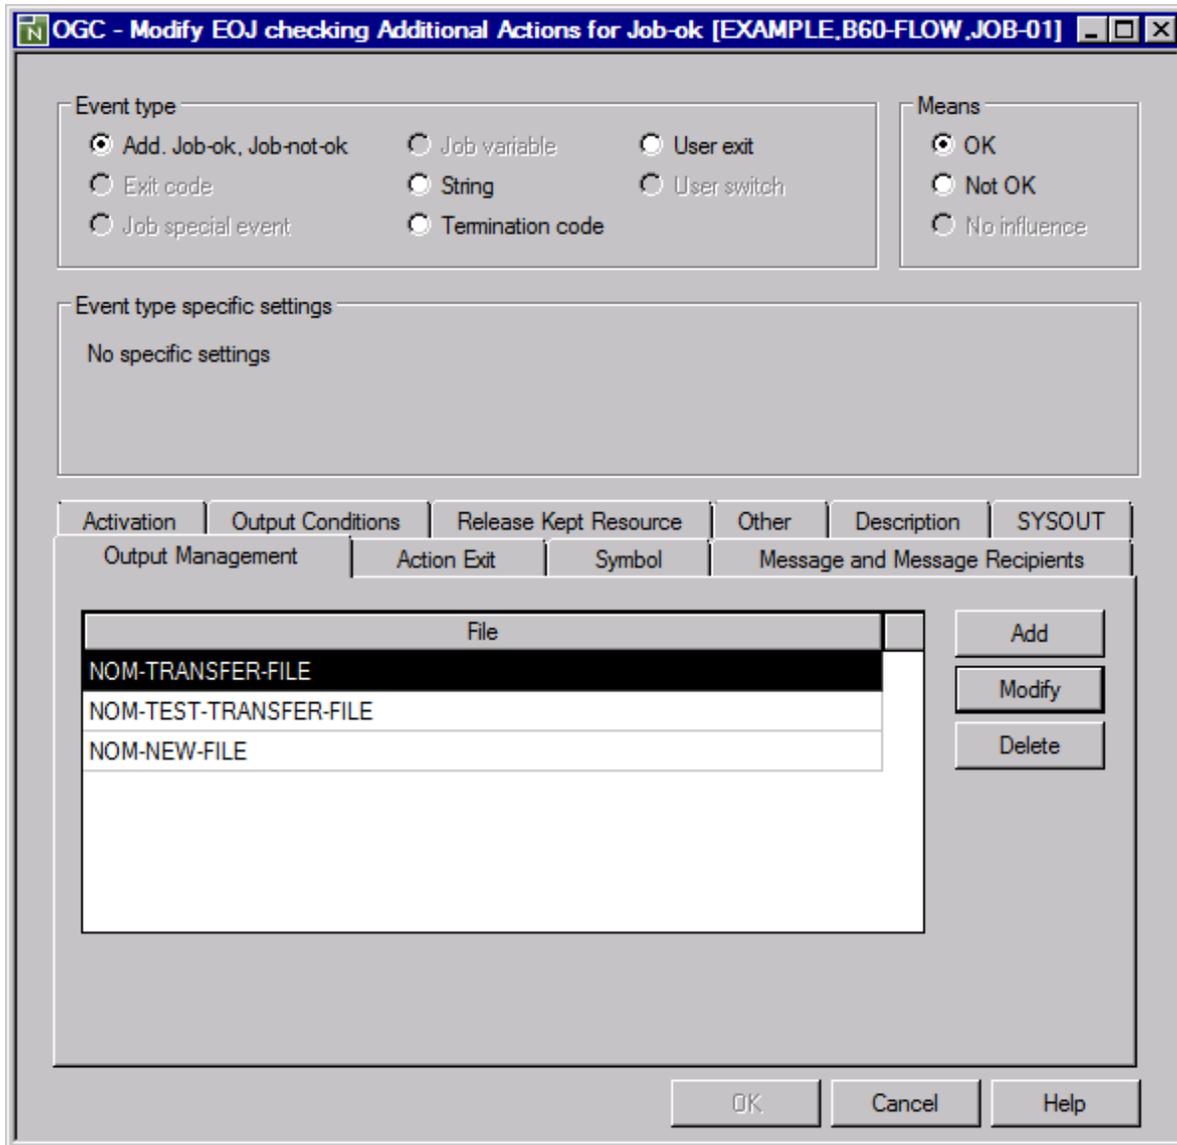

The letter **T** in the **Action** column indicates whether an EOJ (End-of-Job) action for Entire Output Management exists.

The **columns** and **functions** available on the page are described in the section *Defining and Managing End-of-Job (EOJ) Checking and Actions*.

- 2 Select the table row that contains the letter **T** and choose **Modify**.

An **EOJ checking** window similar to the example below opens.

- 3 Open the tabbed page **Output Management** shown in the following example:

The page contains a list of all files defined as EOJ action for transfer to Entire Output Management.

Adding and Modifying File Definitions

This section provides instructions for adding and modifying file definitions for processing in Entire Output Management.

Note: The number of files you can define per job event is limited to 10. If you want to specify more than 10 files for a job, define one or more additional events of the type **Add. Job-ok**, **Job-not-ok**, and define the extra files for these events.

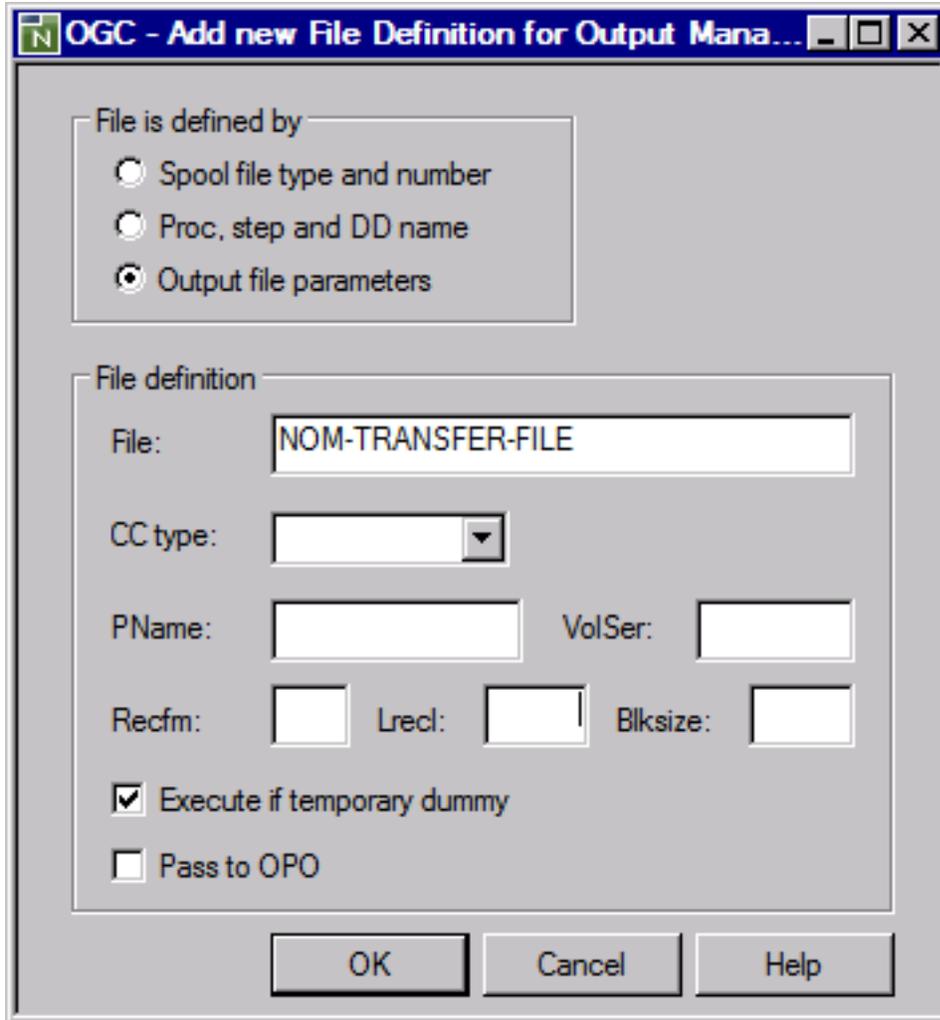

➤ **To add or modify a file definition**

- 1 In a **Maintenance Job Master** window, open the tabbed page **EOJ Checking**.
- 2 Choose **Add** for a new EOJ (End-of-Job) action, or select an EOJ action defined for Entire Output Management (indicated by the letter **T** in the **Action** column) from the window table and choose **Modify**.

An **EOJ checking window** opens.

- 3 Open the **Output Management page**.
- 4 Choose **Add** for a new file definition, or select an existing definition and choose **Modify** for a file definition listed in the window.

A **File Definition for Output Management** window similar to the example below opens:

The fields available in the window depend on the option selected in the **File is defined by** section:

- For **Spool file type and number** and **Proc. step and DD name**, the fields are described in [Fields: File Definition](#).
- For **Output file parameters**, the fields are described in [Fields: Output File Parameter Definitions](#).

5 Make your definitions and choose **OK**.

The new file is assigned to Entire Output Management.

- [Fields: File Definition](#)

- Fields: Output File Parameter Definitions

Fields: File Definition

The fields required to define a file of the job SYSOUT to be handled are provided using the **Spool file type and number** and **Proc. step and DD name** options of the **File Definition for Output Management** window:

| Field Option | Description |
|------------------------------------|--|
| Spool file type and number: | |
| Spool file type | Spool file type, for example, SO for JES SYSOUT. |
| Spool file number | (Not required for z/VSE) Spool file number. |
| Proc. step and DD name: | |
| Procname | PROCNAME that identifies the file. |
| Stepname | STEPNAME that identifies the file. |
| DD name | DD name that identifies the file. |

For more information on spool file types and report identification, see *Attributes of a Report* in the section *Reports* of the *Entire Output Management User's Guide*.

Fields: Output File Parameter Definitions

The fields available to define an output file of the job to be handled are described in the following table.

The fields are provided if you select **Output file parameters** in the **File Definition for Output Management** window.

| Field | Description |
|----------------|---|
| File | File to be passed to Entire Output Management. If the file name contains the activation escape character, a symbol replacement is performed, using the job's active symbol table. If the file name contains the submission escape character, a symbol replacement is performed using the job's active symbol table. By using a wildcard in the file name, you may pass all files to Entire Output Management at once, which are matching the wildcard. |
| CC Type | Not applicable to z/OS. Carriage control type. |

| Field | Description |
|-----------------------------------|--|
| | If the file contains carriage control characters, you must specify their type: see Carriage Control Type (CC Type) . |
| PName | Applies to BS2000 only. If you want to identify the job by the PNAME option of the BS2000 print command (/Print . . . , PNAME=ADAREP), enter the PNAME here. |
| VolSer | For z/VSE, these fields are obligatory. |
| Recfm | Information required to allocate the data set/file: Volume serial number (Blksize), record format (Recfm), record length (Lrecl) and the block size (Blksize) of the file/data set. |
| Lrecl | |
| Blksize | |
| Execute if temporary Dummy | If this check box is selected (this is the default), the End-of-Job action is performed even if the job executed as a temporary dummy. If this check box is not selected, the action is not performed. |
| Pass to OPO | Relevant for execution nodes on UNIX and Windows only. If this check box is selected, the file is passed to the Open Print Option (OPO). In this case, you cannot use wildcards. Passing files to OPO is not performed by default. |

Notes:

1. Entire System Server/UNIX performs wildcard file copying by invocation of a cp (UNIX) or copy (Windows) command, instead of performing the copy by own code.
2. All file copying is performed synchronously.
3. Make sure not to copy too many files at once, due to the limitation of the EntireX Broker timeout, etc.

Normally Entire Output Management identifies report definitions by spool attributes. However, if Entire Operations triggers processing of output files, no such spool attributes exist. Instead, Entire Operations attributes are passed to Entire Output Management as follows:

| Entire Operations Attribute | Entire Output Management Identification | | |
|-----------------------------|---|-------------|---------|
| | z/OS | z/VSE | BS2000 |
| JOBNAME | Job name | Job name | PNAME |
| USER ID | Destination | Destination | User ID |

Carriage Control Type (CC Type)

You must specify a carriage control (CC) type for the output file depending on your operating system and the catalog entries contained in the file catalog.

No specification is required in z/OS, where the carriage control type is taken from the file's catalog entry.

| Operating System | CC Type Setting | Explanation |
|------------------|---------------------|---|
| BS2000 | <i>blank</i> | If the file was created with RECFORM=(... ,M) or (... ,A), CC type can be taken from the file's catalog entry; otherwise, it must be specified in the CC Type field. |
| | ASA code | ASA code |
| | Machine code | Machine code |
| | EBCDIC | BS2000 EBCDIC carriage control characters |
| z/VSE | | ASA code |
| | Machine code | Machine code |
| z/OS | <i>blank</i> | CC type not required |

Deleting File Definitions

You can delete single or multiple file definition for Entire Output Management by either deleting the EOJ (End-of-Job) action that corresponds to the file definition(s), or by deleting a single file defined for the EOJ action.

➤ To delete an EOJ action

- 1 From a **Maintenance Job Master** window, open the tabbed page **EOJ Checking**.
- 2 Select an EOJ action defined for Entire Output Management (indicated by a **T** in the **Action** column) and choose **Delete**.

A confirmation window opens.

- 3 Choose **Yes** to confirm the deletion.

The EOJ action with all file definitions for Entire Output Management is deleted.

➤ To delete single files defined for an EOJ action

- 1 From a **Maintenance Job Master** window, open the tabbed page **EOJ Checking**.
- 2 Select an EOJ action defined for Entire Output Management (indicated by a **T** in the **Action** column) and choose **Add** or **Modify**.

An **EOJ checking** window opens.

- 3 Open the tabbed page **Output Management**.
- 4 Select the file you want to delete and choose **Delete**.

A confirmation window opens.

- 5 Choose **Yes** to confirm the deletion.

The selected file is removed from the tabbed page **Output Management**.

Handing Over SYSOUT and Files to Entire Output Management

This section covers the following topics:

- [Repetition if File is missing or open](#)
- [Copying Files before passing them to Entire Output Management](#)
- [File Copy to another Entire System Server Node](#)
- [Connection with Defined Recovery Action](#)
- [SYSOUT Line Limit](#)
- [Passing SYSOUT from UNIX and Windows Nodes to Entire Output Management](#)
- [Naming Rules for Files copied into the EOR_NOM Directory \(UNIX and Windows\)](#)

Repetition if File is missing or open

If the file to be handed over did not (yet) exist or was (not) yet closed, the handover will be retried.

The following rules apply:

| Case | Retries | Interval between retries |
|---|---------|--------------------------|
| Output file cannot be found (does not apply to spool files) | 3 | 5 minutes |
| All other cases | 1000 | 30 minutes |

The retry queue will not be deleted in case of a Monitor shutdown and restart.

Copying Files before passing them to Entire Output Management

In the default settings, you can define that the SYSOUT files are copied physically before handover to Entire Output Management.

The advantage of this is that exclusive use (as well as renaming and deleting) of the copy by Entire Output Management can still be looked at in Entire Operations. This, however, means that SYSOUT files need more space.

File Copy to another Entire System Server Node

Under the following conditions, the SYSOUT copy is created on another node:

- The symbol `SYSOUT-NODE-GLOBAL` exists in the symbol table SYSDBA/A and contains a valid node number.
- In the target environment, the same PubIDs and BS2000 user IDs exist as in the source environment.

Connection with Defined Recovery Action

Defined recovery actions for an erroneous job are only executed, after all activities for the handover of the SYSOUT to Entire Output Management have been concluded, or after the maximum number of handover tries has been reached.

In case of a recovery action, the SYSOUT of all job runs are handed over to Entire Output Management. For further information, see [Defining Recovery Actions](#) in the section *Defining and Managing End-of-Job (EOJ) Checking and Actions*.

SYSOUT Line Limit

If the SYSOUT file or spool data set exceeds a given line limit, the copied file will be truncated: see **SYSOUT line limit** in *Defaults for Network Options* in the *Administration* documentation.

Passing SYSOUT from UNIX and Windows Nodes to Entire Output Management

On UNIX and Windows, the environment variable `EOR_NOM` must be defined. It must contain a valid directory name. Entire Operations copies the SYSOUT files for Entire Output Management into this directory. If the directory does not exist, Entire System Server/UNIX (Entire System Server/Windows) creates it at the first usage attempt.

➤ To define the copying of SYSOUT to Entire Output Management

- From the [EOJ Checking](#) page, open the tabbed page **SYSOUT** and **Pass to EOM** from the **SYSOUT action** list box. See also [Defining SYSOUT Actions](#) in the section *Defining and Managing End-of-Job (EOJ) Checking and Actions*.

This is a job-level definition that only applies to the selected job.

Entire Operations creates the SYSOUT file copies in this directory with unique names.

It is up to Entire Output Management to fetch the files from there.

Notes:

1. If copied SYSOUT files are not fetched by Entire Output Management within the retention period for active jobs, they are removed by Entire Operations cleanup after that time.
2. If the SYSOUT file or spool data set exceeds a given line limit, the copied file will be truncated: see **SYSOUT line limit** in *Defaults for Network Options* in the *Administration* documentation.

Naming Rules for Files copied into the EOR_NOM Directory (UNIX and Windows)

SYSOUT Files

The file names for SYSOUT files for the \$EOR_NOM directory have the following syntax:

```
dbid-fnr.owner.network.run.job.txt
```

| File Name | Meaning |
|-----------------|---------------------------------------|
| <i>dbid-fnr</i> | Concatenated DBID and FNR, 10 digits. |
| <i>owner</i> | Owner of job. |
| <i>network</i> | Network of job. |
| <i>run</i> | Run number of job. |
| <i>job</i> | Job. |

Other Files

The file names for other files for the \$EOR_NOM directory have the following syntax:

Format A with the components:

```
yymmdd.hhisst.rrrr.filename.ext
```

| File Name | Meaning |
|-----------------|---|
| <i>yymmdd</i> | Year, month, day. |
| <i>hhisst</i> | Time, incl. 1/10 sec. |
| <i>rrrr</i> | Entire Operations run number, with leading zeros. |
| <i>filename</i> | Unqualified part of original file name. |
| <i>ext</i> | Extension of original file name. |

Format B with the components:

```
yymmdd.hhisst.rrrr.job.ix
```

| File Name | Meaning |
|----------------|---|
| <i>yymmdd</i> | Year, month, day. |
| <i>hhissst</i> | Time, incl. 1/10 sec. |
| <i>rrrr</i> | Entire Operations run number, with leading zeros. |
| <i>job</i> | Entire Operations job name. |
| <i>ix</i> | Index of file definition in Entire Operations (2 digits). |

Note: Format B is used only if the length of *filename.ext* is longer than 20 characters, because of a size limitation in Entire Output Management.
