

About this Documentation

Using the application programming interface (API), you can invoke Entire Connection functions directly from a program. An ActiveX control provides a common interface for development with Visual Basic .NET, C++ and C#.

This section provides the following information:

- General Information
- Overview of API Calls
- Other Events, Key Codes and Error Codes

It is assumed that you are familiar with ActiveX controls (with Visual Basic .NET, C++ or C#) and Entire Connection.

This description should be read in conjunction with the sample code which is provided on the Entire Connection CD-ROM. The sample code can be found in the *Windows\API* folder of the CD-ROM.
